Chapter 1

Removing Legacy Authentication Support

- Database Remove the legacy field from the Users table.
- Config Remove the "salt" parameter from the global config.
- Queries Remove/update queries which reference the legacy field.
- Auth Remove the legacy struct from the auth_t typedef.
- Code Remove the legacy routines and any code which references the auth->legacy structure, and all references to the auth_legact_t structure.
- Structures auth_t (legacy) auth_legacy_t

Chapter 2

Chapter 4

Data Structure Documentation

4.1 __attribute__ Struct Reference

```
#include <http.h>
```

Data Fields

- struct {
  - int_t cookie
  - int_t connection

  } response

- session_t * session
- http_method_t method
- inx_t * pairs
- inx_t * headers
- int_t mode
- int_t merged
- int_t port
- stringer_t * host
- stringer_t * location
- stringer_t * cookie
- stringer_t * agent
- stringer_t * body
- union {
  - struct {
    - uint64_t id
    - json_t * request
    - json_t * params

    } portal

  };

- bool_t expunge
- meta_user_t * user
- int_t session_state
- stringer_t * username
- uint64_t usernum

4.1.1 Detailed Description

Definition at line 53 of file http.h.

4.1.2 Field Documentation

4.1.2.1 union { ... }

4.1.2.2 stringer_t ∗ __attribute__::agent

Definition at line 64 of file http.h.

4.1.2.3 stringer_t ∗ __attribute__::body

Definition at line 64 of file http.h.

4.1.2.4 int_t __attribute__::connection

Definition at line 57 of file http.h.

4.1.2.5 stringer_t ∗ __attribute__::cookie

Definition at line 64 of file http.h.

4.1.2.6 int_t __attribute__::cookie

Definition at line 56 of file http.h.

4.1.2.7 bool_t __attribute__::expunge

Definition at line 12 of file pop.h.

4.1.2.8 inx_t ∗ __attribute__::headers

Definition at line 62 of file http.h.

4.1.2.9 stringer_t∗ __attribute__::host

Definition at line 64 of file http.h.

4.1.2.10 uint64_t __attribute__::id

Definition at line 68 of file http.h.

4.1.2.11 stringer_t ∗ __attribute__::location

Definition at line 64 of file http.h.

4.1.2.12 int_t __attribute__::merged

Definition at line 63 of file http.h.

4.1.2.13 http_method_t __attribute__::method

Definition at line 61 of file http.h.

4.1.2.14 int_t __attribute__::mode

Definition at line 63 of file http.h.

4.1.2.15 inx_t* __attribute__::pairs

Definition at line 62 of file http.h.

4.1.2.16 json_t * __attribute__::params

Definition at line 69 of file http.h.

4.1.2.17 int_t __attribute__::port

Definition at line 63 of file http.h.

4.1.2.18 struct { ... } __attribute__::portal

4.1.2.19 json_t* __attribute__::request

Definition at line 69 of file http.h.

4.1.2.20 struct { ... } __attribute__::response

4.1.2.21 session_t* __attribute__::session

Definition at line 60 of file http.h.

4.1.2.22 int_t __attribute__::session_state

Definition at line 14 of file pop.h.

Referenced by __attribute__().

4.1.2.23 meta_user_t* __attribute__::user

Definition at line 13 of file pop.h.

Referenced by __attribute__().

4.1.2.24 stringer_t* __attribute__::username

Definition at line 15 of file pop.h.

Referenced by __attribute__().

4.1.2.25 uint64_t __attribute__::usernum

Definition at line 16 of file pop.h.

Referenced by __attribute__().

4.2 api_lookup_t Struct Reference

Data Fields

- chr_t * string
- void(* callback)(connection_t *con)

4.2.1 Detailed Description

Definition at line 10 of file json_api.c.

4.2.2 Field Documentation

4.2.2.1 void(* api_lookup_t::callback)(connection_t *con)

Referenced by json_api_dispatch().

4.2.2.2 chr_t* api_lookup_t::string

Definition at line 11 of file json_api.c.

Referenced by json_api_dispatch().

4.3 attachment_t Struct Reference

```
#include <sessions.h>
```

Data Fields

- uint64_t attach_id
- stringer_t * filename
- stringer_t * filedata

4.3.1 Detailed Description

Definition at line 17 of file sessions.h.

4.3.2 Field Documentation

4.3.2.1 uint64_t attachment_t::attach_id

Definition at line 18 of file sessions.h.

Referenced by portal_endpoint_attachments_add().

4.3.2.2 stringer_t* attachment_t::filedata

Definition at line 20 of file sessions.h.

Referenced by portal_get_upload_attachment(), portal_smtp_create_data(), portal_upload(), and sess_release_attachment().

4.3.2.3 stringer_t* attachment_t::filename

Definition at line 19 of file sessions.h.

Referenced by portal_endpoint_attachments_add(), portal_smtp_create_data(), and sess_release_attachment().

4.4 auth_legacy_t Struct Reference

```
#include <auth.h>
```

Data Fields

- stringer_t * key
- stringer_t * token

4.4.1 Detailed Description

Definition at line 26 of file auth.h.

4.4.2 Field Documentation

4.4.2.1 stringer_t* auth_legacy_t::key

Definition at line 27 of file auth.h.

Referenced by auth_legacy(), auth_legacy_free(), and auth_login().

4.4.2.2 stringer_t* auth_legacy_t::token

Definition at line 28 of file auth.h.

Referenced by auth_legacy(), auth_legacy_free(), and auth_login().

4.5 auth_stacie_t Struct Reference

```
#include <auth.h>
```

Data Fields

- struct {
  stringer_t * master
  stringer_t * password
  } keys

- struct {
  stringer_t * verification
  stringer_t * ephemeral
  } tokens

4.5.1 Detailed Description

Definition at line 31 of file auth.h.

4.5.2 Field Documentation

4.5.2.1 stringer_t* auth_stacie_t::ephemeral

Definition at line 40 of file auth.h.

Referenced by auth_response(), auth_stacie(), and auth_stacie_free().

4.5.2.2 struct { ... } auth_stacie_t::keys

Referenced by auth_login(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.5.2.3 stringer_t* auth_stacie_t::master

Definition at line 34 of file auth.h.

Referenced by auth_login(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.5.2.4 stringer_t* auth_stacie_t::password

Definition at line 35 of file auth.h.

Referenced by auth_stacie(), and auth_stacie_free().

4.5.2.5 struct { ... } auth_stacie_t::tokens

Referenced by auth_login(), auth_response(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.5.2.6 stringer_t* auth_stacie_t::verification

Definition at line 39 of file auth.h.

Referenced by auth_login(), auth_stacie(), auth_stacie_free(), and register_data_insert_user().

4.6 auth_t Struct Reference

```
#include <auth.h>
```

Data Fields

- uint64_t usernum
- stringer_t * username
- struct {
  uint8_t locked
  } status
- struct {
  uint64_t bonus
  stringer_t * salt
  stringer_t * nonce
  } seasoning
- struct {
  stringer_t * master
  } keys
- struct {
  stringer_t * ephemeral
  stringer_t * verification
  } tokens
- struct {
  stringer_t * key
  stringer_t * token
  } legacy

4.6.1 Detailed Description

Definition at line 45 of file auth.h.

4.6.2 Field Documentation

4.6.2.1 uint64_t auth_t::bonus

Definition at line 55 of file auth.h.

Referenced by auth_data_fetch(), auth_login(), and auth_response().

4.6.2.2 stringer_t* auth_t::ephemeral

Definition at line 65 of file auth.h.

Referenced by auth_free(), and auth_response().

4.6.2.3 stringer_t* auth_t::key

Definition at line 70 of file auth.h.

Referenced by auth_free(), and auth_login().

4.6.2.4 struct { ... } auth_t::keys

Referenced by api_endpoint_auth(), auth_free(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.5 struct { ... } auth_t::legacy

Referenced by auth_data_fetch(), auth_free(), and auth_login().

4.6.2.6 uint8_t auth_t::locked

Definition at line 51 of file auth.h.

Referenced by auth_data_fetch(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.7 stringer_t* auth_t::master

Definition at line 61 of file auth.h.

Referenced by api_endpoint_auth(), auth_free(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.8 stringer_t* auth_t::nonce

Definition at line 57 of file auth.h.

Referenced by auth_challenge(), auth_free(), and auth_response().

4.6.2.9 stringer_t* auth_t::salt

Definition at line 56 of file auth.h.

Referenced by api_endpoint_auth(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.10 struct { ... } auth_t::seasoning

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.11 struct { ... } auth_t::status

Referenced by auth_data_fetch(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.12 stringer_t* auth_t::token

Definition at line 71 of file auth.h.

Referenced by auth_data_fetch(), auth_free(), and auth_login().

4.6.2.13 struct { ... } auth_t::tokens

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_-pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

4.6.2.14 stringer_t* auth_t::username

Definition at line 48 of file auth.h.

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_-pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

4.6.2.15 uint64_t auth_t::usernum

Definition at line 47 of file auth.h.

Referenced by api_endpoint_auth(), auth_data_fetch(), auth_login(), imap_login(), pop_pass(), and portal_endpoint_auth().

4.6.2.16 stringer_t* auth_t::verification

Definition at line 66 of file auth.h.

Referenced by api_endpoint_auth(), auth_challenge(), auth_data_fetch(), auth_free(), auth_login(), auth_response(), imap_login(), pop_-pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

4.7 batch_heap_t Struct Reference

```
#include <ed25519-donna-batchverify.h>
```

Data Fields

- unsigned char r [heap_batch_size][16]
- ge25519 points [heap_batch_size]
- bignum256modm scalars [heap_batch_size]
- heap_index_t heap [heap_batch_size]
- size_t size

4.7.1 Detailed Description

Definition at line 13 of file ed25519-donna-batchverify.h.

4.7.2 Field Documentation

4.7.2.1 heap_index_t batch_heap_t::heap[heap_batch_size]

Definition at line 17 of file ed25519-donna-batchverify.h.

4.7.2.2 ge25519 batch_heap_t::points[heap_batch_size]

Definition at line 15 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.7.2.3 unsigned char batch_heap_t::r[heap_batch_size][16]

Definition at line 14 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.7.2.4 bignum256modm batch_heap_t::scalars[heap_batch_size]

Definition at line 16 of file ed25519-donna-batchverify.h.

Referenced by ed25519_sign_open_batch().

4.7.2.5 size_t batch_heap_t::size

Definition at line 18 of file ed25519-donna-batchverify.h.

4.8 cache_keys_t Struct Reference

```
#include <cache.h>
```

Data Fields

- size_t offset
- multi_t norm
- char * name
- char * description
- bool_t required

4.8.1 Detailed Description

Definition at line 11 of file cache.h.

4.8.2 Field Documentation

4.8.2.1 char* cache_keys_t::description

Definition at line 15 of file cache.h.

4.8.2.2 char* cache_keys_t::name

Definition at line 14 of file cache.h.

Referenced by cache_set_value().

4.8.2.3 multi_t cache_keys_t::norm

Definition at line 13 of file cache.h.

Referenced by cache_free(), cache_output_help(), cache_output_settings(), cache_set_value(), and cache_validate().

4.8.2.4 size_t cache_keys_t::offset

Definition at line 12 of file cache.h.

Referenced by cache_free(), cache_output_settings(), cache_set_value(), and cache_validate().

4.8.2.5 bool_t cache_keys_t::required

Definition at line 16 of file cache.h.

Referenced by cache_output_help().

4.9 cache_t Struct Reference

```
#include <cache.h>
```

Data Fields

- char * name
- uint32_t port
- uint32_t weight

4.9.1 Detailed Description

Definition at line 19 of file cache.h.

4.9.2 Field Documentation

4.9.2.1 char* cache_t::name

Definition at line 20 of file cache.h.

4.9.2.2 uint32_t cache_t::port

Definition at line 21 of file cache.h.

4.9.2.3 uint32_t cache_t::weight

Definition at line 22 of file cache.h.

4.10 cached_object Struct Reference

```
#include <cache.h>
```

Data Fields

- time_t timestamp
  The UTC timestamp for when this object was cached. Used with ttl.
- unsigned char id [32]
  The identifier of the cached item as a SHA-256 hash.
- cached_data_type_t dtype
  The type of the cached data being stored.
- unsigned long ttl
  Optional time-to-live in seconds.
- time_t expiration
  The time when the record will expire, in UTC.
- int relaxed
  Whether or not the cache follows a relaxed eviction policy.
- void ∗ data
  The data associated with the cached object.
- struct cached_object ∗ prev
  A pointer to the previous cached object in the linked list.
- struct cached_object ∗ next
  A pointer to the next cached object in the linked list.
- unsigned char persists
  Not everything in the cache should be persisted.
- struct cached_object ∗ shadow

4.10.1 Detailed Description

Definition at line 34 of file cache.h.

4.10.2 Field Documentation

4.10.2.1 void∗ cached_object::data

The data associated with the cached object.

Definition at line 41 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), _cached_object_exists_cmp(), _clone_cached_object(), _create_cached_object(), _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache(), _dump_cache_data(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _get_cache_obj_data(), _get_dime_record(), _load_cache_contents(), _remove_cached_object_cmp(), _save_cache_contents(), and _unlink_object().

4.10.2.2 cached_data_type_t cached_object::dtype

The type of the cached data being stored.

Definition at line 37 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _destroy_cache_entry(), _dump_cache_data(), _get_cache_obj_data(), _load_cache_contents(), _replace_object(), and _unlink_object().

4.10.2.3 time_t cached_object::expiration

The time when the record will expire, in UTC.

Definition at line 39 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dump_cache(), _get_dime_record(), _is_object_expired(), and _load_cache_contents().

4.10.2.4 unsigned char cached_object::id[32]

The identifier of the cached item as a SHA-256 hash.

Definition at line 36 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _clone_cached_object(), _find_cached_object(), _load_cache_contents(), _remove_cached_object(), and _replace_object().

4.10.2.5 struct cached_object* cached_object::next [read]

A pointer to the next cached object in the linked list.

Definition at line 43 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), _replace_object(), _save_cache_contents(), and _unlink_object().

4.10.2.6 unsigned char cached_object::persists

Not everything in the cache should be persisted.

Definition at line 44 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dump_cache(), _fixup_dnskey_validation(), _load_cache_contents(), and _save_cache_contents().

4.10.2.7 struct cached_object* cached_object::prev [read]

A pointer to the previous cached object in the linked list.

Definition at line 42 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _replace_object(), and _unlink_object().

4.10.2.8 int cached_object::relaxed

Whether or not the cache follows a relaxed eviction policy.

Definition at line 40 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dump_cache(), and _is_object_expired().

4.10.2.9 struct cached_object* cached_object::shadow [read]

A saved copy of the "real" cache entry to be saved, if this cached object is merely temporarily overriding it.

Definition at line 45 of file cache.h.

Referenced by _dump_cache(), _replace_object(), and _save_cache_contents().

4.10.2.10 time_t cached_object::timestamp

The UTC timestamp for when this object was cached. Used with ttl.

Definition at line 35 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dump_cache(), _is_object_expired(), and _load_-cache_contents().

4.10.2.11 unsigned long cached_object::ttl

Optional time-to-live in seconds.

Definition at line 38 of file cache.h.

Referenced by _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dump_cache(), _is_object_expired(), and _load_-cache_contents().

4.11 cached_store_t Struct Reference

```
#include <cache.h>
```

Data Fields

- cached_data_type_t dtype

  The type of data that will be stored within.

- const char ∗ description

  A text description of the cache store.

- unsigned char internal
- cached_object_t ∗ head

  A pointer to the head of the cached object list.

- pthread_mutex_t lock

  For multi-threaded safe code.

- void(∗ destructor)(void ∗)

  A function pointer to a destructor used to free cached object data.

- void ∗(∗ serialize)(void ∗, size_t ∗)

  A function pointer to a routine used to serialize cached data.

- void ∗(∗ deserialize)(void ∗, size_t)

  A function pointer to a routine used to deserialize cached data.

- void(∗ dump)(FILE ∗, void ∗, int)

  A function pointer to a routine used to dump the cached data.

- void ∗(∗ clone)(void ∗)

4.11.1 Detailed Description

Definition at line 50 of file cache.h.

4.11.2 Field Documentation

4.11.2.1 void∗(∗ cached_store_t::clone)(void ∗)

An optional pointer to a routine that can be used to clone data. If not specified, the serialize and deserialize routine will be used together to recreate the functionality of this function.

Referenced by _clone_cached_object().

4.11.2.2 const char∗ cached_store_t::description

A text description of the cache store.

Definition at line 52 of file cache.h.

4.11.2.3 void∗(∗ cached_store_t::deserialize)(void ∗, size_t)

A function pointer to a routine used to deserialize cached data.

Referenced by _clone_cached_object(), and _load_cache_contents().

4.11.2.4 void(∗ cached_store_t::destructor)(void ∗)

A function pointer to a destructor used to free cached object data.

Referenced by _destroy_cache_entry(), and _unlink_object().

4.11.2.5 cached_data_type_t cached_store_t::dtype

The type of data that will be stored within.

Definition at line 51 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _dump_cache().

4.11.2.6 void(∗ cached_store_t::dump)(FILE ∗, void ∗, int)

A function pointer to a routine used to dump the cached data.

Referenced by _dump_cache_data(), and _unlink_object().

4.11.2.7 cached_object_t∗ cached_store_t::head

A pointer to the head of the cached object list.

Definition at line 55 of file cache.h.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), _replace_object(), _save_cache_contents(), and _unlink_object().

4.11.2.8 unsigned char cached_store_t::internal

Determines whether the cached store is for internal use only. If it is, objects will not be cloned before being returned to the caller.

Definition at line 53 of file cache.h.

Referenced by _clone_cached_object(), and _get_cache_obj_data().

4.11.2.9 pthread_mutex_t cached_store_t::lock

For multi-threaded safe code.

Definition at line 56 of file cache.h.

Referenced by _lock_cache_store(), and _unlock_cache_store().

4.11.2.10 void∗(∗ cached_store_t::serialize)(void ∗, size_t ∗)

A function pointer to a routine used to serialize cached data.

Referenced by _clone_cached_object().

4.12 client_t Struct Reference

```
#include <network.h>
```

Data Fields

- ip_t * ip
- void * tls
- int sockd
- int status
- placer_t line
- stringer_t * buffer

4.12.1 Detailed Description

Definition at line 33 of file network.h.

4.12.2 Field Documentation

4.12.2.1 stringer_t* client_t::buffer

Definition at line 39 of file network.h.

Referenced by client_close(), client_connect(), client_read(), client_read_line(), smtp_client_connect(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

4.12.2.2 ip_t* client_t::ip

Definition at line 34 of file network.h.

Referenced by client_close(), client_connect(), client_read(), client_read_line(), and client_write().

4.12.2.3 placer_t client_t::line

Definition at line 38 of file network.h.

Referenced by client_connect(), client_read(), client_read_line(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), smtp_client_send_rcptto(), and smtp_relay_message().

4.12.2.4 int client_t::sockd

Definition at line 36 of file network.h.

Referenced by client_close(), client_connect(), client_print(), client_read(), client_read_line(), client_secure(), client_status(), client_write(), and smtp_client_connect().

4.12.2.5 int client_t::status

Definition at line 37 of file network.h.

Referenced by client_connect(), client_print(), client_read(), client_read_line(), client_secure(), client_status(), and client_write().

4.12.2.6 void* client_t::tls

Definition at line 35 of file network.h.

Referenced by client_close(), client_read(), client_read_line(), client_secure(), client_status(), and client_write().

4.13 command_t Struct Reference

```
#include <network.h>
```

Data Fields

- char * string
- size_t length
- void * function

4.13.1 Detailed Description

Definition at line 26 of file network.h.

4.13.2 Field Documentation

4.13.2.1 void* command_t::function

Definition at line 29 of file network.h.

Referenced by dmtp_process(), imap_process(), molten_parse(), pop_process(), portal_endpoint(), and smtp_process().

4.13.2.2 size_t command_t::length

Definition at line 28 of file network.h.

Referenced by dmtp_compare(), dmtp_process(), imap_compare(), imap_process(), molten_compare(), molten_parse(), pop_compare(), pop_process(), portal_endpoint(), portal_endpoint_compare(), smtp_compare(), smtp_disabled(), and smtp_process().

4.13.2.3 char* command_t::string

Definition at line 27 of file network.h.

Referenced by dmtp_compare(), dmtp_process(), imap_compare(), imap_process(), molten_compare(), molten_parse(), pop_compare(), pop_process(), portal_endpoint(), portal_endpoint_compare(), smtp_compare(), smtp_disabled(), smtp_parse_helo_domain(), smtp_parse_-mail_from_path(), smtp_parse_rcpt_to(), and smtp_process().

4.14 composition_t Struct Reference

```
#include <sessions.h>
```

Data Fields

- uint64_t comp_id
- uint64_t attached
- inx_t * attachments

4.14.1 Detailed Description

Definition at line 23 of file sessions.h.

4.14.2 Field Documentation

4.14.2.1 uint64_t composition_t::attached

Definition at line 25 of file sessions.h.

Referenced by portal_endpoint_attachments_add().

4.14.2.2 inx_t* composition_t::attachments

Definition at line 26 of file sessions.h.

Referenced by portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_send(), portal_get_upload_attachment(), and sess_release_composition().

4.14.2.3 uint64_t composition_t::comp_id

Definition at line 24 of file sessions.h.

Referenced by portal_endpoint_messages_compose().

4.15 connection_t Struct Reference

```
#include <network.h>
```

Data Fields

4.15.1 Detailed Description

Definition at line 42 of file network.h.

4.15.2 Field Documentation

4.15.2.1 union { ... }

4.15.2.2 stringer_t* connection_t::buffer

Definition at line 61 of file network.h.

Referenced by con_destroy(), con_init_network_buffer(), con_read(), con_read_line(), http_body(), imap_parse_literal(), imap_starttls(), pop_starttls(), protocol_secure(), smtp_data_finish(), smtp_data_read(), and smtp_starttls().

4.15.2.3 command_t* connection_t::command

Definition at line 73 of file network.h.

Referenced by dmtp_process(), imap_process(), molten_parse(), pop_process(), smtp_disabled(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), and smtp_process().

4.15.2.4 dmtp_session_t connection_t::dmtp

Definition at line 47 of file network.h.

4.15.2.5 stringer_t* connection_t::domain

Definition at line 66 of file network.h.

4.15.2.6 http_session_t connection_t::http

Definition at line 48 of file network.h.

Referenced by api_endpoint_auth(), api_endpoint_change_password(), api_endpoint_delete_user(), api_endpoint_register(), api_error(), api_response(), contact_process(), http_body(), http_data_get(), http_data_value_parse(), http_parse_context(), http_parse_header(), http_parse_method(), http_parse_pairs(), http_print_301(), http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_print_500_log(), http_print_501(), http_process(), http_requeue(), http_response(), http_response_connection(), http_response_cookie(), http_response_header(), http_response_options(), http_session_reset(), json_api_dispatch(), portal_endpoint(), portal_endpoint_ad(), portal_endpoint_alert_acknowledge(), portal_endpoint_alert_list(), portal_endpoint_aliases(), portal_endpoint_attachments_add(), portal_endpoint_attachments_progress(), portal_endpoint_attachments_remove(), portal_endpoint_auth(), portal_endpoint_config_edit(), portal_endpoint_config_load(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_list(), portal_endpoint_contacts_load(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_cookies(), portal_endpoint_error(), portal_endpoint_folders_add(), portal_endpoint_folders_list(), portal_endpoint_folders_remove(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_logout(), portal_endpoint_messages_compose(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_load(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_endpoint_response(), portal_endpoint_search(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), portal_folder_mail_remove(), portal_get_upload_attachment(), portal_meta(), portal_settings_changepass(), portal_settings_identity(), portal_upload(), portal_validate_request(), register_process(), sess_create(), sess_get(), teacher_add_cookie(), teacher_print_message(), and teacher_process().

4.15.2.7 imap_session_t connection_t::imap

Definition at line 45 of file network.h.

Referenced by imap_append(), imap_append_message(), imap_capability(), imap_check(), imap_close(), imap_command_parser(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_fetch_message(), imap_fetch_return_header(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_text(), imap_id(), imap_idle(), imap_invalid(), imap_list(), imap_login(), imap_logout(), imap_lsub(), imap_message_copier(), imap_message_expunge(), imap_noop(), imap_parse_arguments(), imap_process(), imap_rename(), imap_search(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_starttls(), imap_status(), imap_store(), imap_subscribe(), and imap_unsubscribe().

4.15.2.8 ip_t* connection_t::ip

Definition at line 64 of file network.h.

4.15.2.9 placer_t connection_t::line

Definition at line 60 of file network.h.

Referenced by con_init_network_buffer(), con_read(), con_read_line(), dmtp_process(), http_data_header_parse(), http_parse_method(), http_process(), imap_command_parser(), imap_parse_literal(), imap_process(), imap_starttls(), molten_parse(), pop_num_parse(), pop_pass_parse(), pop_process(), pop_starttls(), pop_top_parse(), pop_user_parse(), smtp_auth_login(), smtp_auth_plain(), smtp_data_finish(), smtp_data_read(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), smtp_process(), and smtp_starttls().

4.15.2.10 pthread_mutex_t connection_t::lock

Definition at line 71 of file network.h.

Referenced by con_decrement_refs(), con_destroy(), con_increment_refs(), con_init(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_status(), and protocol_secure().

4.15.2.11 struct { ... } connection_t::network

Referenced by con_addr(), con_destroy(), con_init(), con_init_network_buffer(), con_localhost(), con_print(), con_private(), con_read(), con_read_line(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_lookup(), con_reverse_status(), con_secure(), con_status(), con_write_bl(), dmtp_process(), http_body(), http_data_header_parse(), http_parse_method(), http_process(), imap_command_parser(), imap_parse_literal(), imap_process(), imap_starttls(), molten_parse(), pop_num_parse(), pop_pass_parse(), pop_process(), pop_starttls(), pop_top_parse(), pop_user_parse(), protocol_secure(), smtp_auth_login(), smtp_auth_plain(), smtp_data_finish(), smtp_data_read(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), smtp_process(), and smtp_starttls().

4.15.2.12 pop_session_t connection_t::pop

Definition at line 44 of file network.h.

Referenced by pop_capa(), pop_dele(), pop_last(), pop_list(), pop_pass(), pop_process(), pop_retr(), pop_rset(), pop_session_destroy(), pop_session_reset(), pop_starttls(), pop_stat(), pop_top(), pop_uidl(), and pop_user().

4.15.2.13 struct { ... } connection_t::protocol

Referenced by api_endpoint_auth(), dmtp_invalid(), dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_invalid(), imap_login(), imap_process(), imap_requeue(), pop_invalid(), pop_pass(), pop_process(), pop_requeue(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_disabled(), smtp_invalid(), smtp_process(), and smtp_requeue().

4.15.2.14 uint64_t connection_t::refs

Definition at line 70 of file network.h.

Referenced by con_decrement_refs(), con_increment_refs(), and con_reverse_enqueue().

4.15.2.15 struct { ... } connection_t::reverse

Referenced by con_addr(), con_destroy(), con_init(), con_localhost(), con_private(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), and con_reverse_status().

4.15.2.16 server_t* connection_t::server

Definition at line 72 of file network.h.

Referenced by con_destroy(), con_init(), con_secure(), dmtp_ehlo(), dmtp_helo(), dmtp_init(), dmtp_invalid(), dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_fetch_message(), imap_fetch_return_header(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_text(), imap_init(), imap_invalid(), imap_process(), imap_requeue(), imap_search_messages_body(), imap_search_messages_date(), imap_search_messages_header(), imap_search_messages_text(), imap_starttls(), mail_add_inbound_headers(), mail_add_outbound_headers(), pop_invalid(), pop_process(), pop_requeue(), pop_retr(), pop_starttls(), pop_top(), portal_endpoint_messages_list(), portal_endpoint_messages_load(), protocol_enqueue(), protocol_secure(), protocol_type(), smtp_accept_message(), smtp_disabled(), smtp_ehlo(), smtp_helo(), smtp_init(), smtp_invalid(), smtp_process(), smtp_requeue(), and smtp_starttls().

4.15.2.17 smtp_session_t connection_t::smtp

Definition at line 46 of file network.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), mail_add_required_headers(), smtp_accept_message(), smtp_add_inbound(), smtp_add_outbound(), smtp_add_recipient(), smtp_auth_login(), smtp_auth_plain(), smtp_bounce(), smtp_check_duplicate_recipient(), smtp_check_greylist(), smtp_data(), smtp_data_inbound(), smtp_data_outbound(), smtp_data_read(), smtp_ehlo(), smtp_helo(), smtp_init(), smtp_mail_from(), smtp_parse_mail_from_path(), smtp_rcpt_to(), smtp_relay_message(), smtp_session_destroy(), smtp_session_reset(), smtp_update_receive_stats(), smtp_update_transmission_stats(), and submission_init().

4.15.2.18 int connection_t::sockd

Definition at line 58 of file network.h.

Referenced by con_destroy(), con_init(), con_print(), con_read(), con_read_line(), con_reverse_lookup(), con_status(), con_write_bl(), imap_starttls(), pop_starttls(), protocol_secure(), and smtp_starttls().

4.15.2.19 uint32_t connection_t::spins

Definition at line 52 of file network.h.

Referenced by dmtp_process(), http_process(), imap_process(), pop_process(), and smtp_process().

4.15.2.20 int_t connection_t::status

Definition at line 65 of file network.h.

4.15.2.21 int connection_t::status

Definition at line 59 of file network.h.

Referenced by con_print(), con_read(), con_read_line(), con_status(), con_write_bl(), imap_starttls(), pop_starttls(), and smtp_starttls().

4.15.2.22 void* connection_t::tls

Definition at line 57 of file network.h.

Referenced by con_destroy(), con_read(), con_read_line(), con_secure(), con_status(), con_write_bl(), imap_starttls(), pop_starttls(), protocol_secure(), and smtp_starttls().

4.15.2.23 uint32_t connection_t::violations

Definition at line 53 of file network.h.

Referenced by api_endpoint_auth(), dmtp_invalid(), dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_invalid(), imap_login(), imap_process(), imap_requeue(), pop_invalid(), pop_pass(), pop_process(), pop_requeue(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_disabled(), smtp_invalid(), smtp_process(), and smtp_requeue().

4.16 derror_t Struct Reference

```
#include <error_codes.h>
```

Data Fields

- dime_errcode_t code
- char const * message

4.16.1 Detailed Description

Definition at line 12 of file error_codes.h.

4.16.2 Field Documentation

4.16.2.1 dime_errcode_t derror_t::code

Definition at line 13 of file error_codes.h.

4.16.2.2 char const* derror_t::message

Definition at line 14 of file error_codes.h.

4.17 dime_ctx Struct Reference

Data Fields

- log_function_t log_callback

4.17.1 Detailed Description

Definition at line 57 of file dime_ctx.c.

4.17.2 Field Documentation

4.17.2.1 log_function_t dime_ctx::log_callback

Definition at line 58 of file dime_ctx.c.

Referenced by dime_ctx_log().

4.18 dime_record_t Struct Reference

```
#include <mrec.h>
```

Data Fields

- unsigned short version

  The DIME management record syntax version.

- unsigned char ** pubkey

  An array of 32-byte ED25519 organizational public key(s) (POKs).

- unsigned char ** tlssig

  An array of 64-byte TLS signature(s) for MX (or DX/KS) by the POK(s).

- dime_msg_policy policy

  Policy for sending/accepting messages.

- char * syndicates

  Alternative authoritative signet lookup sources.

- char ** dx

  An array of CNAME(s) for DIME delivery host (if not present, then MX).

- unsigned long expiry

  Number of days before a cached management record is discarded.

- dime_sub_policy subdomain

  Determines whether subdomains will have authority over their own records.

- int validated

  1 if validated by DNSSEC; 0 if not DNSSEC-protected; -1 if DNSSEC sig failed.

4.18.1 Detailed Description

Definition at line 32 of file mrec.h.

4.18.2 Field Documentation

4.18.2.1 char** dime_record_t::dx

An array of CNAME(s) for DIME delivery host (if not present, then MX).

Definition at line 38 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_-record_cb(), and _sgnt_resolv_dmtp_connect().

4.18.2.2 unsigned long dime_record_t::expiry

Number of days before a cached management record is discarded.

Definition at line 39 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _get_dime_record(), and _serialize_dime_record_cb().

4.18.2.3 dime_msg_policy dime_record_t::policy

Policy for sending/accepting messages.

Definition at line 36 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _validate_dime_record().

4.18.2.4 unsigned char** dime_record_t::pubkey

An array of 32-byte ED25519 organizational public key(s) (POKs).

Definition at line 34 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), _get_signet(), _parse_dime_record(), _serialize_dime_record_cb(), _validate_dime_record(), and _verify_dx_certificate().

4.18.2.5 dime_sub_policy dime_record_t::subdomain

Determines whether subdomains will have authority over their own records.

Definition at line 40 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _validate_dime_record().

4.18.2.6 char* dime_record_t::syndicates

Alternative authoritative signet lookup sources.

Definition at line 37 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), and _serialize_dime_record_cb().

4.18.2.7 unsigned char** dime_record_t::tlssig

An array of 64-byte TLS signature(s) for MX (or DX/KS) by the POK(s).

Definition at line 35 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _verify_dx_certificate().

4.18.2.8 int dime_record_t::validated

1 if validated by DNSSEC; 0 if not DNSSEC-protected; -1 if DNSSEC sig failed.

Definition at line 41 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _get_dime_record(), _serialize_dime_record_cb(), _sgnt_resolv_dmtp_connect(), and _verify_dx_certificate().

4.18.2.9 unsigned short dime_record_t::version

The DIME management record syntax version.

Definition at line 33 of file mrec.h.

Referenced by _deserialize_dime_record_cb(), _dump_dime_record_cb(), _parse_dime_record(), _serialize_dime_record_cb(), and _-validate_dime_record().

4.19 dmime_chunk_key_t Struct Reference

```
#include <common.h>
```

Data Fields

- unsigned int required
- unsigned int unique
- unsigned int encrypted
- unsigned int sequential
- dmime_chunk_section_t section
- dmime_payload_type_t payload
- unsigned int auth_keyslot
- unsigned int orig_keyslot
- unsigned int dest_keyslot
- unsigned int recp_keyslot
- const char * name
- const char * description

4.19.1 Detailed Description

Definition at line 120 of file common.h.

4.19.2 Field Documentation

4.19.2.1 unsigned int dmime_chunk_key_t::auth_keyslot

Definition at line 129 of file common.h.

4.19.2.2 const char* dmime_chunk_key_t::description

Definition at line 135 of file common.h.

4.19.2.3 unsigned int dmime_chunk_key_t::dest_keyslot

Definition at line 131 of file common.h.

4.19.2.4 unsigned int dmime_chunk_key_t::encrypted

Definition at line 123 of file common.h.

4.19.2.5 const char* dmime_chunk_key_t::name

Definition at line 134 of file common.h.

4.19.2.6 unsigned int dmime_chunk_key_t::orig_keyslot

Definition at line 130 of file common.h.

4.19.2.7 dmime_payload_type_t dmime_chunk_key_t::payload

Definition at line 127 of file common.h.

4.19.2.8 unsigned int dmime_chunk_key_t::recp_keyslot

Definition at line 132 of file common.h.

4.19.2.9 unsigned int dmime_chunk_key_t::required

Definition at line 121 of file common.h.

4.19.2.10 dmime_chunk_section_t dmime_chunk_key_t::section

Definition at line 126 of file common.h.

4.19.2.11 unsigned int dmime_chunk_key_t::sequential

Definition at line 124 of file common.h.

4.19.2.12 unsigned int dmime_chunk_key_t::unique

Definition at line 122 of file common.h.

4.20 dmime_common_headers_t Struct Reference

```
#include <common.h>
```

Data Fields

- sds headers [DMIME_NUM_COMMON_HEADERS]

4.20.1 Detailed Description

Definition at line 24 of file common.h.

4.20.2 Field Documentation

4.20.2.1 sds dmime_common_headers_t::headers[DMIME_NUM_COMMON_HEADERS]

Definition at line 25 of file common.h.

4.21 dmime_envelope_object_t Struct Reference

```
#include <parse.h>
```

Data Fields

- sds auth_recp
- sds auth_recp_fp
- sds dest_orig
- sds dest_orig_fp

4.21.1 Detailed Description

Definition at line 12 of file parse.h.

4.21.2 Field Documentation

4.21.2.1 sds dmime_envelope_object_t::auth_recp

Definition at line 13 of file parse.h.

4.21.2.2 sds dmime_envelope_object_t::auth_recp_fp

Definition at line 14 of file parse.h.

4.21.2.3 sds dmime_envelope_object_t::dest_orig

Definition at line 15 of file parse.h.

4.21.2.4 sds dmime_envelope_object_t::dest_orig_fp

Definition at line 16 of file parse.h.

4.22 dmime_header_key_t Struct Reference

```
#include <parse.h>
```

Data Fields

- int required
- const char * label
- size_t label_length

4.22.1 Detailed Description

Definition at line 6 of file parse.h.

4.22.2 Field Documentation

4.22.2.1 const char* dmime_header_key_t::label

Definition at line 8 of file parse.h.

4.22.2.2 size_t dmime_header_key_t::label_length

Definition at line 9 of file parse.h.

4.22.2.3 int dmime_header_key_t::required

Definition at line 7 of file parse.h.

4.25 dmtp_argument_t Struct Reference

```
#include <commands.h>
```

Data Fields

- char const * arg_name
- size_t arg_name_len
- dmtp_argument_type_t type
- size_t size

4.25.1 Detailed Description

Definition at line 50 of file commands.h.

4.25.2 Field Documentation

4.25.2.1 char const* dmtp_argument_t::arg_name

Definition at line 51 of file commands.h.

4.25.2.2 size_t dmtp_argument_t::arg_name_len

Definition at line 52 of file commands.h.

4.25.2.3 size_t dmtp_argument_t::size

Definition at line 54 of file commands.h.

4.25.2.4 dmtp_argument_type_t dmtp_argument_t::type

Definition at line 53 of file commands.h.

4.26 dmtp_command_key_t Struct Reference

```
#include <commands.h>
```

Data Fields

- char const * com_name
- size_t com_name_len
- dmtp_argument_t args [DMTP_MAX_ARGUMENT_NUM]

4.26.1 Detailed Description

Definition at line 62 of file commands.h.

4.26.2 Field Documentation

4.26.2.1 dmtp_argument_t dmtp_command_key_t::args[DMTP_MAX_ARGUMENT_NUM]

Definition at line 65 of file commands.h.

4.26.2.2 char const* dmtp_command_key_t::com_name

Definition at line 63 of file commands.h.

4.26.2.3 size_t dmtp_command_key_t::com_name_len

Definition at line 64 of file commands.h.

4.27 dmtp_command_t Struct Reference

```
#include <commands.h>
```

Data Fields

- dmtp_command_type_t type
- sds args [DMTP_MAX_ARGUMENT_NUM]

4.27.1 Detailed Description

Definition at line 57 of file commands.h.

4.27.2 Field Documentation

4.27.2.1 sds dmtp_command_t::args[DMTP_MAX_ARGUMENT_NUM]

Definition at line 59 of file commands.h.

Referenced by dime_dmtp_command_ehlo(), dime_dmtp_command_helo(), dime_dmtp_command_hist(), dime_dmtp_command_mail(), dime_dmtp_command_noop(), dime_dmtp_command_rcpt(), dime_dmtp_command_sgnt_domain(), dime_dmtp_command_sgnt_user(), dime_dmtp_command_starttls(), dime_dmtp_command_vrfy_domain(), and dime_dmtp_command_vrfy_user().

4.27.2.2 dmtp_command_type_t dmtp_command_t::type

Definition at line 58 of file commands.h.

4.28 dmtp_session_t Struct Reference

```
#include <dmtp.h>
```

Data Fields

- char * domain

  The name of the dark domain underlying the DMTP connection.

- char * dx

  The canonical name of the DX that we're connected to.

- SSL * con

  The handle to this DMTP session's underlying SSL connection.

- dime_record_t * drec

  The DIME management record associated with this dark domain.

- dmtp_mode_t mode

  The current mode of this connection (if made through dual mode).

- unsigned int active

  Boolean flag: whether or not this session is active.

- int _fd
- unsigned char _inbuf [DMTP_LINE_BUF_SIZE+1]
- size_t _inpos

4.28.1 Detailed Description

Definition at line 12 of file dmtp.h.

4.28.2 Field Documentation

4.28.2.1 int dmtp_session_t::_fd

Definition at line 37 of file dmtp.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _sgnt_resolv_destroy_dmtp_session(), _sgnt_resolv_dmtp_initiate_starttls(), _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_dmtp_quit(), _sgnt_resolv_dmtp_write_data(), and _sgnt_resolv_read_dmtp_line().

4.28.2.2 unsigned char dmtp_session_t::_inbuf[DMTP_LINE_BUF_SIZE+1]

Definition at line 38 of file dmtp.h.

Referenced by _sgnt_resolv_destroy_dmtp_session(), and _sgnt_resolv_read_dmtp_line().

4.28.2.3 size_t dmtp_session_t::_inpos

Definition at line 39 of file dmtp.h.

Referenced by _sgnt_resolv_read_dmtp_line().

4.28.2.4 unsigned int dmtp_session_t::active

Boolean flag: whether or not this session is active.

Definition at line 35 of file dmtp.h.

Referenced by _dx_connect_dual(), _sgnt_resolv_dmtp_quit(), and _sgnt_resolv_read_dmtp_line().

4.28.2.5 SSL* dmtp_session_t::con

The handle to this DMTP session's underlying SSL connection.

Definition at line 32 of file dmtp.h.

Referenced by _dx_connect_standard(), _sgnt_resolv_destroy_dmtp_session(), _sgnt_resolv_dmtp_initiate_starttls(), _sgnt_resolv_-dmtp_issue_command(), _sgnt_resolv_dmtp_quit(), _sgnt_resolv_dmtp_write_data(), _sgnt_resolv_read_dmtp_line(), and _verify_dx_-certificate().

4.28.2.6 char* dmtp_session_t::domain

The name of the dark domain underlying the DMTP connection.

Definition at line 30 of file dmtp.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), and _sgnt_resolv_destroy_dmtp_session().

4.28.2.7 dime_record_t* dmtp_session_t::drec

The DIME management record associated with this dark domain.

Definition at line 33 of file dmtp.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _get_signet(), _sgnt_resolv_destroy_dmtp_session(), and _verify_dx_-certificate().

4.28.2.8 char* dmtp_session_t::dx

The canonical name of the DX that we're connected to.

Definition at line 31 of file dmtp.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _sgnt_resolv_destroy_dmtp_session(), and _verify_dx_certificate().

4.28.2.9 dmtp_mode_t dmtp_session_t::mode

The current mode of this connection (if made through dual mode).

Definition at line 34 of file dmtp.h.

Referenced by _dx_connect_dual(), _dx_connect_standard(), _sgnt_resolv_dmtp_initiate_starttls(), and _sgnt_resolv_read_dmtp_line().

4.29 dnskey Struct Reference

```
#include <dns.h>
```

Data Fields

- char * label
- unsigned char algorithm
- unsigned char is_zone
- unsigned char is_sep
- RSA * pubkey
- unsigned int keytag
- size_t rdlen
- unsigned char * rdata
- dnskey_t ** signkeys

  The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DNSKEY.

- ds_t ** dse

  The DS RR(s) that match this DNSKEY record.

- unsigned int validated

  Has this key been validated?

- unsigned int do_cache

  If set, this DNSKEY will be persisted IFF it has been validated.

4.29.1 Detailed Description

Definition at line 105 of file dns.h.

4.29.2 Field Documentation

4.29.2.1 unsigned char dnskey::algorithm

Definition at line 107 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _dump_dnskey_record_cb(), _get_-ds_by_dnskey(), and _serialize_dnskey_record_cb().

4.29.2.2 unsigned int dnskey::do_cache

If set, this DNSKEY will be persisted IFF it has been validated.

Definition at line 117 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), and _fixup_dnskey_validation().

4.29.2.3 ds_t** dnskey::dse

The DS RR(s) that match this DNSKEY record.

Definition at line 115 of file dns.h.

Referenced by _clone_dnskey_record_cb(), _destroy_dnskey(), _dump_dnskey_record_cb(), and _lookup_ds().

4.29.2.4 unsigned char dnskey::is_sep

Definition at line 109 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _dump_dnskey_record_cb(), and _serialize_dnskey_record_cb().

4.29.2.5 unsigned char dnskey::is_zone

Definition at line 108 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _dump_dnskey_record_cb(), and _serialize_dnskey_record_cb().

4.29.2.6 unsigned int dnskey::keytag

Definition at line 111 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _dnskey_tag_comparator(), _dump_dnskey_record_cb(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), and _serialize_dnskey_record_cb().

4.29.2.7 char* dnskey::label

Definition at line 106 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _compute_dnskey_sha_hash(), _deserialize_dnskey_record_cb(), _destroy_dnskey(), _dnskey_domain_comparator(), _dnskey_tag_comparator(), _dump_dnskey_record_cb(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), _is_validated_key(), _load_dnskey_file(), and _serialize_dnskey_record_cb().

4.29.2.8 RSA* dnskey::pubkey

Definition at line 110 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _destroy_dnskey(), _serialize_dnskey_record_cb(), and _validate_rrsig_rr().

4.29.2.9 unsigned char* dnskey::rdata

Definition at line 113 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _compute_dnskey_sha_hash(), _deserialize_dnskey_record_cb(), _destroy_dnskey(), and _serialize_dnskey_record_cb().

4.29.2.10 size_t dnskey::rdlen

Definition at line 112 of file dns.h.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _compute_dnskey_sha_hash(), _deserialize_dnskey_record_cb(), _dump_dnskey_record_cb(), and _serialize_dnskey_record_cb().

4.29.2.11 dnskey_t** dnskey::signkeys

The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DNSKEY.

Definition at line 114 of file dns.h.

Referenced by _clone_dnskey_record_cb(), _destroy_dnskey(), _dump_dnskey_record_cb(), and _is_validated_key().

4.29.2.12 unsigned int dnskey::validated

Has this key been validated?

Definition at line 116 of file dns.h.

Referenced by _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), _fixup_dnskey_validation(), _is_validated_key(), _load_dnskey_file(), and _serialize_dnskey_record_cb().

4.30 ds Struct Reference

```
#include <dns.h>
```

Data Fields

- char * label
- unsigned char algorithm
- unsigned char digest_type
- unsigned int keytag
- unsigned char * digest
- size_t diglen
- unsigned char validated

  This is for the cache.

- dnskey_t ** signkeys

  The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DS.

4.30.1 Detailed Description

Our own internal representation of certain RRs.

Definition at line 94 of file dns.h.

4.30.2 Field Documentation

4.30.2.1 unsigned char ds::algorithm

Definition at line 96 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.2 unsigned char* ds::digest

Definition at line 99 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _destroy_ds(), _ds_comparator(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.3 unsigned char ds::digest_type

Definition at line 97 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.4 size_t ds::diglen

Definition at line 100 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _ds_comparator(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.5 unsigned int ds::keytag

Definition at line 98 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _ds_comparator(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.6 char* ds::label

Definition at line 95 of file dns.h.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), _destroy_ds(), _ds_comparator(), _dump_ds_record_cb(), _get_ds_by_dnskey(), and _serialize_ds_record_cb().

4.30.2.7 dnskey_t** ds::signkeys

The DNSKEY(s) that were used to sign the RRSIG guaranteeing this DS.

Definition at line 102 of file dns.h.

Referenced by _destroy_ds(), and _dump_ds_record_cb().

4.30.2.8 unsigned char ds::validated

This is for the cache.

Definition at line 101 of file dns.h.

Referenced by _deserialize_ds_record_cb(), _dump_ds_record_cb(), and _serialize_ds_record_cb().

4.31 ED25519_KEY Struct Reference

```
#include <dcrypto.h>
```

Data Fields

- ed25519_secret_key private_key
- ed25519_public_key public_key

4.31.1 Detailed Description

Definition at line 26 of file dcrypto.h.

4.31.2 Field Documentation

4.31.2.1 ed25519_secret_key ED25519_KEY::private_key

Definition at line 27 of file dcrypto.h.

Referenced by _deserialize_ed25519_privkey(), _ed25519_sign_data(), _generate_ed25519_keypair(), and _load_ed25519_privkey().

4.31.2.2 ed25519_public_key ED25519_KEY::public_key

Definition at line 28 of file dcrypto.h.

Referenced by _deserialize_ed25519_privkey(), _deserialize_ed25519_pubkey(), _ed25519_sign_data(), _ed25519_verify_sig(), _generate_-ed25519_keypair(), _load_ed25519_privkey(), and _verify_dx_certificate().

4.32 encrypt_ctx Struct Reference

Data Fields

- EC_GROUP * encryption_group
- EVP_MD const * ecies_envelope_evp

4.32.1 Detailed Description

Definition at line 11 of file encrypt.c.

4.32.2 Field Documentation

4.32.2.1 EVP_MD const* encrypt_ctx::ecies_envelope_evp

Definition at line 13 of file encrypt.c.

4.32.2.2 EC_GROUP* encrypt_ctx::encryption_group

Definition at line 12 of file encrypt.c.

Referenced by encrypt_ctx_free(), and encrypt_keypair_generate().

4.33 encrypt_keypair_t Struct Reference

```
#include <encrypt.h>
```

Data Fields

- char unused [1]

4.33.1 Detailed Description

Definition at line 8 of file encrypt.h.

4.33.2 Field Documentation

4.33.2.1 char encrypt_keypair_t::unused[1]

Definition at line 8 of file encrypt.h.

4.34 err_desc_t Struct Reference

```
#include <error.h>
```

Data Fields

- unsigned int errcode
- const char * errmsg

4.34.1 Detailed Description

Definition at line 59 of file error.h.

4.34.2 Field Documentation

4.34.2.1 unsigned int err_desc_t::errcode

Definition at line 60 of file error.h.

4.34.2.2 const char* err_desc_t::errmsg

Definition at line 61 of file error.h.

Referenced by get_error_string().

- fe xy2d

4.43.1 Detailed Description

Definition at line 1697 of file ed25519-ref10.c.

4.43.2 Field Documentation

4.43.2.1 fe ge_precomp::xy2d

Definition at line 1700 of file ed25519-ref10.c.

4.43.2.2 fe ge_precomp::yminusx

Definition at line 1699 of file ed25519-ref10.c.

4.43.2.3 fe ge_precomp::yplusx

Definition at line 1698 of file ed25519-ref10.c.

4.44 generated_data_t Struct Reference

Data Fields

- unsigned char pk [32]
- unsigned char sig [64]
- int valid

4.44.1 Detailed Description

Definition at line 121 of file fuzz-ed25519.c.

4.44.2 Field Documentation

4.44.2.1 unsigned char generated_data_t::pk[32]

Definition at line 122 of file fuzz-ed25519.c.

Referenced by main().

4.44.2.2 unsigned char generated_data_t::sig[64]

Definition at line 123 of file fuzz-ed25519.c.

Referenced by main().

4.44.2.3 int generated_data_t::valid

Definition at line 124 of file fuzz-ed25519.c.

Referenced by main().

4.45 http_content_t Struct Reference

```
#include <http.h>
```

Data Fields

- stringer_t ∗ location
- stringer_t ∗ resource
- stringer_t ∗ type
- struct http_content_t ∗ next

4.45.1 Detailed Description

Definition at line 41 of file http.h.

4.45.2 Field Documentation

4.45.2.1 stringer_t∗ http_content_t::location

Definition at line 42 of file http.h.

Referenced by http_free_content().

4.45.2.2 struct http_content_t∗ http_content_t::next [read]

Definition at line 43 of file http.h.

4.45.2.3 stringer_t ∗ http_content_t::resource

Definition at line 42 of file http.h.

Referenced by http_free_content(), http_page_get(), http_response(), register_print_message(), register_print_step1(), register_print_step2(), and register_print_step3().

4.45.2.4 stringer_t ∗ http_content_t::type

Definition at line 42 of file http.h.

Referenced by contact_print_form(), contact_print_message(), http_free_content(), http_get_static(), http_get_template(), http_response(), portal_print_login(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), teacher_print_form(), and teacher_print_message().

4.46 http_data_t Struct Reference

```
#include <http.h>
```

Data Fields

- HTTP_DATA source
- stringer_t * name
- stringer_t * value

4.46.1 Detailed Description

Definition at line 36 of file http.h.

4.46.2 Field Documentation

4.46.2.1 stringer_t* http_data_t::name

Definition at line 38 of file http.h.

Referenced by http_data_free(), http_data_get(), http_data_header_parse_line(), http_data_value_parse(), http_parse_header(), and portal_upload().

4.46.2.2 HTTP_DATA http_data_t::source

Definition at line 37 of file http.h.

Referenced by http_data_get(), http_data_header_parse_line(), and http_data_value_parse().

4.46.2.3 stringer_t * http_data_t::value

Definition at line 38 of file http.h.

Referenced by contact_business(), contact_print_form(), http_body(), http_data_free(), http_data_header_parse_line(), http_data_value_parse(), http_parse_header(), http_response_allow_cross(), multipart_get_boundary(), portal_upload(), register_business_step1(), register_business_step2(), register_process(), and teacher_process().

4.47 http_page_t Struct Reference

```
#include <http.h>
```

Data Fields

- xmlDocPtr doc_obj
- http_content_t * content
- xmlParserCtxtPtr doc_ctx
- xmlXPathContextPtr xpath_ctx

4.47.1 Detailed Description

Definition at line 46 of file http.h.

4.47.2 Field Documentation

4.47.2.1 http_content_t* http_page_t::content

Definition at line 48 of file http.h.

Referenced by contact_print_form(), contact_print_message(), http_page_get(), portal_print_login(), teacher_print_form(), and teacher_print_message().

4.47.2.2 xmlParserCtxtPtr http_page_t::doc_ctx

Definition at line 49 of file http.h.

Referenced by http_page_free(), and http_page_get().

4.47.2.3 xmlDocPtr http_page_t::doc_obj

Definition at line 47 of file http.h.

Referenced by contact_print_form(), contact_print_message(), http_page_free(), http_page_get(), portal_print_login(), teacher_print_form(), and teacher_print_message().

4.47.2.4 xmlXPathContextPtr http_page_t::xpath_ctx

Definition at line 50 of file http.h.

Referenced by contact_business_add_error(), contact_print_form(), contact_print_message(), http_page_free(), http_page_get(), portal_print_login(), teacher_add_error(), teacher_print_form(), and teacher_print_message().

4.48 imap_fetch_dataitems_t Struct Reference

```
#include <imap.h>
```

Data Fields

- int_t uid
- int_t flags
- int_t internaldate
- int_t envelope
- int_t bodystructure
- int_t rfc822
- int_t rfc822_header
- int_t rfc822_size
- int_t rfc822_text
- int_t body
- array_t * peek
- array_t * peek_partial
- array_t * normal
- array_t * normal_partial

4.48.1 Detailed Description

Definition at line 18 of file imap.h.

4.48.2 Field Documentation

4.48.2.1 int_t imap_fetch_dataitems_t::body

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.2 int_t imap_fetch_dataitems_t::bodystructure

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.3 int_t imap_fetch_dataitems_t::envelope

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.4 int_t imap_fetch_dataitems_t::flags

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.5 int_t imap_fetch_dataitems_t::internaldate

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.6 array_t ∗ imap_fetch_dataitems_t::normal

Definition at line 20 of file imap.h.

Referenced by imap_fetch(), imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.7 array_t ∗ imap_fetch_dataitems_t::normal_partial

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.8 array_t∗ imap_fetch_dataitems_t::peek

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.9 array_t ∗ imap_fetch_dataitems_t::peek_partial

Definition at line 20 of file imap.h.

Referenced by imap_fetch_free_items(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.10 int_t imap_fetch_dataitems_t::rfc822

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.11 int_t imap_fetch_dataitems_t::rfc822_header

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.12 int_t imap_fetch_dataitems_t::rfc822_size

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.48.2.13 int_t imap_fetch_dataitems_t::rfc822_text

Definition at line 19 of file imap.h.

Referenced by imap_fetch(), imap_fetch_message(), and imap_parse_dataitems().

4.48.2.14 int_t imap_fetch_dataitems_t::uid

Definition at line 19 of file imap.h.

Referenced by imap_fetch_message(), and imap_parse_dataitems().

4.49 imap_fetch_response_t Struct Reference

```
#include <imap.h>
```

Data Fields

- stringer_t * key
- stringer_t * value
- struct imap_fetch_response_t * next

4.49.1 Detailed Description

Definition at line 23 of file imap.h.

4.49.2 Field Documentation

4.49.2.1 stringer_t* imap_fetch_response_t::key

Definition at line 24 of file imap.h.

Referenced by imap_fetch(), imap_fetch_response_add(), imap_fetch_response_free(), smtp_check_greylist(), and smtp_store_spamsig().

4.49.2.2 struct imap_fetch_response_t* imap_fetch_response_t::next [read]

Definition at line 25 of file imap.h.

Referenced by imap_fetch(), imap_fetch_response_add(), and imap_fetch_response_free().

4.49.2.3 stringer_t * imap_fetch_response_t::value

Definition at line 24 of file imap.h.

Referenced by imap_fetch(), imap_fetch_response_add(), imap_fetch_response_free(), imap_parse_address(), and smtp_check_greylist().

4.50 imap_folder_status_t Struct Reference

```
#include <imap.h>
```

Data Fields

- uint64_t foldernum
- uint64_t recent
- uint64_t unseen
- uint64_t uidnext
- uint64_t messages
- uint64_t first

4.50.1 Detailed Description

Definition at line 14 of file imap.h.

4.50.2 Field Documentation

4.50.2.1 uint64_t imap_folder_status_t::first

Definition at line 15 of file imap.h.

Referenced by imap_examine(), imap_folder_status(), and imap_select().

4.50.2.2 uint64_t imap_folder_status_t::foldernum

Definition at line 15 of file imap.h.

Referenced by imap_examine(), imap_folder_status(), imap_select(), and imap_status().

4.50.2.3 uint64_t imap_folder_status_t::messages

Definition at line 15 of file imap.h.

Referenced by imap_examine(), imap_folder_status(), imap_select(), and imap_status().

4.50.2.4 uint64_t imap_folder_status_t::recent

Definition at line 15 of file imap.h.

Referenced by imap_examine(), imap_folder_status(), imap_select(), and imap_status().

4.50.2.5 uint64_t imap_folder_status_t::uidnext

Definition at line 15 of file imap.h.

Referenced by imap_examine(), imap_folder_status(), imap_select(), and imap_status().

4.50.2.6 uint64_t imap_folder_status_t::unseen

Definition at line 15 of file imap.h.

Referenced by imap_folder_status(), and imap_status().

4.51 inx_t Struct Reference

```
#include <indexes.h>
```

Data Fields

- void ∗ index
- void ∗ last
- pthread_rwlock_t lock
- uint64_t count
- uint64_t serial
- uint64_t automatic
- uint64_t options
- uint64_t references
- void(∗ data_free)(void ∗data)
- void(∗ index_free)(void ∗index)
- void(∗ index_truncate)(void ∗index)
- bool_t(∗ delete)(void ∗index, multi_t envelope)
- bool_t(∗ insert)(void ∗index, multi_t envelope, void ∗data)
- bool_t(∗ append)(void ∗index, multi_t envelope, void ∗data)
- void ∗(∗ find)(void ∗index, multi_t envelope)
- void(∗ cursor_free)(void ∗cursor)
- void(∗ cursor_reset)(void ∗cursor)
- void ∗(∗ cursor_alloc)(void ∗index)
- void ∗(∗ cursor_value_next)(void ∗cursor)
- void ∗(∗ cursor_value_active)(void ∗cursor)
- multi_t(∗ cursor_key_next)(void ∗cursor)
- multi_t(∗ cursor_key_active)(void ∗cursor)

4.51.1 Detailed Description

Definition at line 34 of file indexes.h.

4.51.2 Field Documentation

4.51.2.1 bool_t(∗ inx_t::append)(void ∗index, multi_t envelope, void ∗data)

Referenced by hashed_alloc(), inx_append(), linked_alloc(), and tree_alloc().

4.51.2.2 uint64_t inx_t::automatic

Definition at line 39 of file indexes.h.

Referenced by inx_alloc(), inx_auto_read(), inx_auto_unlock(), inx_auto_write(), inx_lock_read(), inx_lock_write(), and inx_unlock().

4.51.2.3 uint64_t inx_t::count

Definition at line 39 of file indexes.h.

Referenced by hashed_delete(), hashed_insert(), hashed_truncate(), inx_count(), linked_append(), linked_delete(), linked_find(), linked_insert(), linked_truncate(), tree_delete(), tree_insert(), and tree_truncate().

4.51.2.4 void∗(∗ inx_t::cursor_alloc)(void ∗index)

Referenced by hashed_alloc(), inx_cursor_alloc(), linked_alloc(), and tree_alloc().

4.51.2.5 void(∗ inx_t::cursor_free)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.6 multi_t(∗ inx_t::cursor_key_active)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.7 multi_t(∗ inx_t::cursor_key_next)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.8 void(∗ inx_t::cursor_reset)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.9 void∗(∗ inx_t::cursor_value_active)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.10 void∗(∗ inx_t::cursor_value_next)(void ∗cursor)

Referenced by hashed_alloc(), linked_alloc(), and tree_alloc().

4.51.2.11 void(∗ inx_t::data_free)(void ∗data)

Referenced by hashed_alloc(), hashed_delete(), hashed_free(), hashed_truncate(), linked_alloc(), linked_record_free(), tree_alloc(), tree_-delete(), and tree_truncate().

4.51.2.12 bool_t(∗ inx_t::delete)(void ∗index, multi_t envelope)

Referenced by hashed_alloc(), inx_delete(), inx_replace(), linked_alloc(), and tree_alloc().

4.51.2.13 void∗(∗ inx_t::find)(void ∗index, multi_t envelope)

Referenced by hashed_alloc(), inx_find(), linked_alloc(), and tree_alloc().

4.51.2.14 void∗ inx_t::index

Definition at line 37 of file indexes.h.

Referenced by hashed_alloc(), hashed_delete(), hashed_find(), hashed_free(), hashed_insert(), hashed_truncate(), linked_alloc(), linked_-append(), linked_delete(), linked_find(), linked_free(), linked_insert(), linked_truncate(), tree_alloc(), tree_count(), tree_cursor_alloc(), tree_-delete(), tree_free(), tree_insert(), and tree_truncate().

4.51.2.15 void(∗ inx_t::index_free)(void ∗index)

Referenced by hashed_alloc(), inx_free(), linked_alloc(), and tree_alloc().

4.51.2.16 void(∗ inx_t::index_truncate)(void ∗index)

Referenced by hashed_alloc(), inx_truncate(), linked_alloc(), and tree_alloc().

4.51.2.17 bool_t(∗ inx_t::insert)(void ∗index, multi_t envelope, void ∗data)

Referenced by hashed_alloc(), inx_insert(), inx_replace(), linked_alloc(), and tree_alloc().

4.51.2.18 void ∗ inx_t::last

Definition at line 37 of file indexes.h.

Referenced by hashed_alloc(), linked_alloc(), linked_append(), linked_delete(), linked_insert(), linked_truncate(), and tree_alloc().

4.51.2.19 pthread_rwlock_t inx_t::lock

Definition at line 38 of file indexes.h.

Referenced by inx_alloc(), inx_auto_read(), inx_auto_unlock(), inx_auto_write(), inx_free(), inx_lock_read(), inx_lock_write(), and inx_-unlock().

4.51.2.20 uint64_t inx_t::options

Definition at line 39 of file indexes.h.

Referenced by hashed_alloc(), inx_options(), linked_alloc(), and tree_alloc().

4.51.2.21 uint64_t inx_t::references

Definition at line 39 of file indexes.h.

Referenced by inx_alloc(), inx_cursor_alloc(), and inx_free().

4.51.2.22 uint64_t inx_t::serial

Definition at line 39 of file indexes.h.

Referenced by hashed_delete(), hashed_insert(), hashed_truncate(), inx_serial(), linked_append(), linked_delete(), linked_insert(), linked_-truncate(), tree_delete(), tree_insert(), and tree_truncate().

4.52 ip_t Struct Reference

```
#include <host.h>
```

Data Fields

- sa_family_t family
- union {
  struct in_addr ip4
  struct in6_addr ip6
  void * ip
  };

4.52.1 Detailed Description

Definition at line 68 of file host.h.

4.52.2 Field Documentation

4.52.2.1 union { ... }

4.52.2.2 sa_family_t ip_t::family

Definition at line 69 of file host.h.

Referenced by client_connect(), ip_addr_eq(), ip_addr_st(), ip_family(), ip_matches_subnet(), ip_octet(), ip_presentation(), ip_reversed(), ip_segment(), ip_standard(), ip_subnet(), ip_subnet_st(), ip_word(), signal_shutdown(), spf_check(), and tcp_addr_ip().

4.52.2.3 void* ip_t::ip

Definition at line 73 of file host.h.

Referenced by ip_matches_subnet().

4.52.2.4 struct in_addr ip_t::ip4 [read]

Definition at line 71 of file host.h.

Referenced by client_connect(), ip_addr_eq(), ip_addr_st(), ip_octet(), ip_presentation(), ip_reversed(), ip_segment(), ip_standard(), ip_subnet(), ip_word(), signal_shutdown(), spf_check(), and tcp_addr_ip().

4.52.2.5 struct in6_addr ip_t::ip6 [read]

Definition at line 72 of file host.h.

Referenced by client_connect(), ip_addr_eq(), ip_addr_st(), ip_localhost(), ip_octet(), ip_presentation(), ip_private(), ip_reversed(), ip_segment(), ip_standard(), ip_subnet(), ip_word(), signal_shutdown(), spf_check(), and tcp_addr_ip().

4.53 key_pair_t Struct Reference

```
#include <meta.h>
```

Data Fields

- stringer_t * public
- stringer_t * private

4.53.1 Detailed Description

Definition at line 11 of file meta.h.

4.53.2 Field Documentation

4.53.2.1 stringer_t* key_pair_t::private

Definition at line 13 of file meta.h.

Referenced by meta_crypto_keys_create(), meta_data_fetch_keys(), meta_data_insert_keys(), and meta_update_keys().

4.53.2.2 stringer_t* key_pair_t::public

Definition at line 12 of file meta.h.

Referenced by meta_crypto_keys_create(), meta_data_fetch_keys(), meta_data_insert_keys(), and meta_update_keys().

4.54 log_level_t Struct Reference

```
#include <dime_ctx.h>
```

Data Fields

- log_code_t code
- char const * name

4.54.1 Detailed Description

Definition at line 16 of file dime_ctx.h.

4.54.2 Field Documentation

4.54.2.1 log_code_t log_level_t::code

Definition at line 17 of file dime_ctx.h.

4.54.2.2 char const* log_level_t::name

Definition at line 18 of file dime_ctx.h.

4.55 magma_keys_t Struct Reference

```
#include <global.h>
```

Data Fields

- void * store
- multi_t norm
- chr_t * name
- chr_t * description
- bool_t file
- bool_t database
- bool_t overwrite
- bool_t set
- bool_t required

4.55.1 Detailed Description

Definition at line 11 of file global.h.

4.55.2 Field Documentation

4.55.2.1 bool_t magma_keys_t::database

Definition at line 17 of file global.h.

Referenced by config_load_database_settings().

4.55.2.2 chr_t* magma_keys_t::description

Definition at line 15 of file global.h.

4.55.2.3 bool_t magma_keys_t::file

Definition at line 16 of file global.h.

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

4.55.2.4 chr_t* magma_keys_t::name

Definition at line 14 of file global.h.

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), config_output_value(), and config_value_set().

4.55.2.5 multi_t magma_keys_t::norm

Definition at line 13 of file global.h.

Referenced by config_free(), config_output_help(), config_output_value(), and config_value_set().

4.55.2.6 bool_t magma_keys_t::overwrite

Definition at line 18 of file global.h.

Referenced by config_load_database_settings().

4.55.2.7 bool_t magma_keys_t::required

Definition at line 20 of file global.h.

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), and config_output_help().

4.55.2.8 bool_t magma_keys_t::set

Definition at line 19 of file global.h.

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), and config_validate_settings().

4.55.2.9 void* magma_keys_t::store

Definition at line 12 of file global.h.

Referenced by config_output_value(), and config_value_set().

4.56 magma_t Struct Reference

4.56.1 Detailed Description

Definition at line 23 of file global.h.

4.56.2 Field Documentation

4.56.2.1 stringer_t* magma_t::abuse

Definition at line 35 of file global.h.

Referenced by config_validate_settings(), contact_business(), http_response(), smtp_accept_message(), and smtp_rcpt_to().

4.56.2.2 stringer_t* magma_t::active

Definition at line 94 of file global.h.

Referenced by imap_append_message(), mail_create_directory(), mail_db_insert_duplicate_message(), mail_db_insert_message(), and mail_message_path().

4.56.2.3 uint32_t magma_t::address_length_limit

Definition at line 101 of file global.h.

Referenced by smtp_parse_mail_from_path(), and smtp_parse_rcpt_to().

4.56.2.4 struct { ... } magma_t::admin

Referenced by config_validate_settings(), contact_business(), http_response(), register_business_step2(), smtp_accept_message(), and smtp_-rcpt_to().

4.56.2.5 bool_t magma_t::allow_cross_domain

Definition at line 118 of file global.h.

4.56.2.6 bool_t magma_t::available

Definition at line 182 of file global.h.

4.56.2.7 struct { ... } magma_t::blacklists

Referenced by config_free(), config_output_value(), config_output_value_generic(), config_value_set(), and smtp_check_rbl().

4.56.2.8 stringer_t* magma_t::bypass_addr

Definition at line 112 of file global.h.

4.56.2.9 inx_t* magma_t::bypass_subnets

Definition at line 113 of file global.h.

Referenced by smtp_add_bypass_entry(), and smtp_bypass_check().

4.56.2.10 struct { ... } magma_t::cache

4.56.2.11 stringer_t* magma_t::cache

Definition at line 188 of file global.h.

Referenced by cache_alloc(), cache_free(), cache_output_settings(), cache_start(), cache_stop(), cache_validate(), and config_validate_settings().

4.56.2.12 bool_t magma_t::close

Definition at line 117 of file global.h.

4.56.2.13 struct { ... } magma_t::config

Referenced by args_parse(), config_load_file_settings(), config_output_settings(), config_validate_settings(), lib_load(), and system_init_resource_limits().

4.56.2.14 uint32_t magma_t::connections

Definition at line 177 of file global.h.

4.56.2.15 struct { ... } magma_t::contact

4.56.2.16 stringer_t* magma_t::contact

Definition at line 34 of file global.h.

Referenced by config_validate_settings(), contact_business(), http_response(), register_business_step2(), smtp_accept_message(), and smtp_rcpt_to().

4.56.2.17 bool_t magma_t::content

Definition at line 83 of file global.h.

Referenced by http_content_load_fonts(), and http_load_file().

4.56.2.18 uint64_t magma_t::core_dump_size_limit

Definition at line 58 of file global.h.

Referenced by system_init_core_dumps().

4.56.2.19 struct { ... } magma_t::count

4.56.2.20 uint32_t magma_t::count

Definition at line 108 of file global.h.

Referenced by relay_counter(), and smtp_client_connect().

4.56.2.21 struct { ... } magma_t::cryptography

Referenced by dh_params_generate(), rand_start(), rand_thread_start(), and tls_server_create().

4.56.2.22 bool_t magma_t::daemonize

Definition at line 49 of file global.h.

Referenced by color_supported(), config_validate_settings(), and system_fork_daemon().

4.56.2.23 struct { ... } magma_t::database

Referenced by sql_open(), sql_start(), sql_stop(), stmt_start(), and stmt_stop().

4.56.2.24 bool_t magma_t::dhparams_large_keys

Definition at line 164 of file global.h.

4.56.2.25 bool_t magma_t::dhparams_rotate

Definition at line 163 of file global.h.

4.56.2.26 struct { ... } magma_t::dime

Referenced by config_validate_settings(), and prime_start().

4.56.2.27 struct { ... } magma_t::dkim

Referenced by config_validate_settings(), dkim_signature_create(), dkim_start(), mail_add_forward_headers(), and mail_add_outbound_headers().

4.56.2.28 chr_t* magma_t::domain

Definition at line 149 of file global.h.

4.56.2.29 stringer_t* magma_t::domain[MAGMA_BLACKLIST_INSTANCES]

Definition at line 60 of file global.h.

Referenced by auth_sanitize_username(), config_validate_settings(), dkim_signature_create(), register_business_step2(), register_data_insert_user(), smtp_bounce(), and smtp_client_send_helo().

4.56.2.30 bool_t magma_t::enable

Definition at line 65 of file global.h.

4.56.2.31 bool_t magma_t::enable_core_dumps

Definition at line 57 of file global.h.

Referenced by system_init_core_dumps().

4.56.2.32 bool_t magma_t::enabled

Definition at line 148 of file global.h.

Referenced by config_validate_settings(), dkim_signature_create(), dkim_start(), mail_add_forward_headers(), and mail_add_outbound_headers().

4.56.2.33 bool_t magma_t::file

Definition at line 75 of file global.h.

4.56.2.34 chr_t* magma_t::file

Definition at line 44 of file global.h.

4.56.2.35 chr_t magma_t::file[MAGMA_FILEPATH_MAX+1]

Definition at line 30 of file global.h.

Referenced by args_parse(), color_supported(), config_load_file_settings(), config_output_settings(), config_validate_settings(), lib_load(), log_internal(), log_rotate(), and log_start().

4.56.2.36 chr_t* magma_t::fonts

Definition at line 119 of file global.h.

4.56.2.37 bool_t magma_t::function

Definition at line 89 of file global.h.

Referenced by log_internal().

4.56.2.38 uint32_t magma_t::helo_length_limit

Definition at line 102 of file global.h.

Referenced by smtp_parse_helo_domain().

4.56.2.39 cache_t* magma_t::host[MAGMA_CACHE_INSTANCES]

Definition at line 192 of file global.h.

4.56.2.40 chr_t* magma_t::host

Definition at line 168 of file global.h.

4.56.2.41 relay_t* magma_t::host[MAGMA_RELAY_INSTANCES]

Definition at line 126 of file global.h.

4.56.2.42 struct { ... } magma_t::host

Referenced by config_fetch_host_number(), config_fetch_settings(), config_load_database_settings(), config_output_settings(), process_start(), relay_alloc(), relay_counter(), relay_free(), relay_output_settings(), relay_validate(), servers_network_start(), sess_create(), smtp_client_connect(), and smtp_client_send_helo().

4.56.2.43 struct { ... } magma_t::http

4.56.2.44 bool_t magma_t::http

Definition at line 82 of file global.h.

Referenced by config_validate_settings(), http_body(), http_content_load_fonts(), http_content_refresh(), http_content_start(), http_data_value_parse(), http_load_file(), http_parse_header(), http_parse_method(), http_response_connection(), http_response_header(), http_response_options(), register_captcha_random_font(), and sess_get().

4.56.2.45 struct { ... } magma_t::iface

Referenced by cache_alloc(), cache_free(), cache_output_settings(), cache_start(), cache_stop(), cache_validate(), config_validate_settings(), dh_params_generate(), rand_start(), rand_thread_start(), spf_start(), spf_stop(), sql_open(), sql_start(), sql_stop(), stmt_start(), stmt_stop(), tls_server_create(), virus_check(), virus_engine_create(), virus_engine_refresh(), virus_sigs_total(), virus_start(), and virus_stop().

4.56.2.46 bool_t magma_t::imap

Definition at line 81 of file global.h.

Referenced by imap_command_parser().

4.56.2.47 char* magma_t::impersonate_user

Definition at line 51 of file global.h.

Referenced by system_init_impersonation().

4.56.2.48 bool_t magma_t::increase_resource_limits

Definition at line 52 of file global.h.

Referenced by system_init_resource_limits().

4.56.2.49 bool_t magma_t::indent

Definition at line 136 of file global.h.

4.56.2.50 uint32_t magma_t::init

Definition at line 215 of file global.h.

Referenced by process_start(), and process_stop().

4.56.2.51 stringer_t* magma_t::key

Definition at line 151 of file global.h.

Referenced by config_validate_settings(), dkim_signature_create(), dkim_start(), and prime_start().

4.56.2.52 uint64_t magma_t::length

Definition at line 66 of file global.h.

4.56.2.53 struct { ... } magma_t::library

Referenced by config_validate_settings(), lib_load(), and lib_unload().

4.56.2.54 bool_t magma_t::line

Definition at line 86 of file global.h.

Referenced by log_internal().

4.56.2.55 stringer_t* magma_t::links

Definition at line 70 of file global.h.

4.56.2.56 struct { ... } magma_t::location

4.56.2.57 pthread_rwlock_t magma_t::lock

Definition at line 216 of file global.h.

4.60.2.3 chr_t mappings_t::characters[64]

Definition at line 34 of file encodings.h.

Referenced by base64_encode(), base64_encode_mod(), base64_encode_wrap(), and zbase32_encode().

4.60.2.4 chr_t mappings_t::values[128] ()

Definition at line 34 of file encodings.h.

Referenced by base64_decode(), base64_decode_mod(), and zbase32_decode().

4.60.2.5 struct { ... } mappings_t::zbase32

Referenced by zbase32_decode(), and zbase32_encode().

4.61 media_type_t Struct Reference

```
#include <mail.h>
```

Data Fields

- chr_t * extension
- bool_t bin
- chr_t * name

4.61.1 Detailed Description

Definition at line 36 of file mail.h.

4.61.2 Field Documentation

4.61.2.1 bool_t media_type_t::bin

Definition at line 38 of file mail.h.

Referenced by mail_mime_encode_part().

4.61.2.2 chr_t* media_type_t::extension

Definition at line 37 of file mail.h.

4.61.2.3 chr_t* media_type_t::name

Definition at line 39 of file mail.h.

Referenced by mail_mime_encode_part().

4.62 meta_folder_t Struct Reference

```
#include <meta.h>
```

Data Fields

- chr_t name [128]
- uint32_t order
- uint64_t parent
- uint64_t foldernum

4.62.1 Detailed Description

Definition at line 88 of file meta.h.

4.62.2 Field Documentation

4.62.2.1 uint64_t meta_folder_t::foldernum

Definition at line 91 of file meta.h.

Referenced by imap_append(), imap_append_message(), imap_copy(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_folder_status(), imap_narrow_folders(), meta_data_fetch_folders(), meta_messages_update_sequences(), portal_endpoint_folders_list(), and portal_folder_mail_add().

4.62.2.2 chr_t meta_folder_t::name[128]

Definition at line 89 of file meta.h.

Referenced by imap_folder_create(), imap_folder_rename(), imap_list(), imap_lsub(), meta_data_fetch_folders(), meta_folders_name(), and portal_endpoint_folders_list().

4.62.2.3 uint32_t meta_folder_t::order

Definition at line 90 of file meta.h.

Referenced by imap_folder_create(), imap_folder_rename(), imap_next_folder_order(), and meta_data_fetch_folders().

4.62.2.4 uint64_t meta_folder_t::parent

Definition at line 91 of file meta.h.

Referenced by imap_folder_create(), imap_folder_rename(), imap_list(), imap_lsub(), imap_next_folder_order(), meta_data_fetch_folders(), meta_folders_children(), meta_folders_name(), and portal_endpoint_folders_list().

4.63 meta_message_t Struct Reference

```
#include <meta.h>
```

Data Fields

- size_t size
- array_t * tags
- chr_t server [33]
- uint32_t status
- uint32_t updated
- uint64_t messagenum
- uint64_t foldernum
- uint64_t sequencenum
- uint64_t signum
- uint64_t sigkey
- uint64_t created

4.63.1 Detailed Description

Definition at line 80 of file meta.h.

4.63.2 Field Documentation

4.63.2.1 uint64_t meta_message_t::created

Definition at line 85 of file meta.h.

Referenced by imap_fetch_message(), imap_message_copier(), imap_search_messages_date(), meta_data_fetch_messages(), meta_messages_copier(), portal_endpoint_messages_list(), and portal_message_server().

4.63.2.2 uint64_t meta_message_t::foldernum

Definition at line 85 of file meta.h.

Referenced by imap_append(), imap_close(), imap_copy(), imap_examine(), imap_expunge(), imap_folder_remove(), imap_folder_status(), imap_narrow_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_update_flags(), meta_data_fetch_messages(), meta_data_flags_remove(), meta_data_flags_replace(), meta_folders_stats_tags(), meta_messages_mover(), meta_messages_update_sequences(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), and portal_message_meta().

4.63.2.3 uint64_t meta_message_t::messagenum

Definition at line 85 of file meta.h.

Referenced by imap_copy(), imap_duplicate_messages(), imap_fetch_message(), imap_folder_remove(), imap_folder_status(), imap_message_copier(), imap_message_expunge(), imap_narrow_messages(), imap_search(), imap_search_messages(), imap_search_messages_range(), imap_store(), mail_load_message(), meta_data_delete_tag(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), meta_data_insert_tag(), meta_data_truncate_tags(), meta_messages_copier(), meta_messages_mover(), pop_session_destroy(), pop_uidl(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), and portal_message_meta().

4.63.2.4 uint64_t meta_message_t::sequencenum

Definition at line 85 of file meta.h.

Referenced by imap_copy(), imap_expunge(), imap_fetch(), imap_narrow_messages(), imap_search(), imap_search_messages(), imap_-search_messages_range(), imap_store(), and meta_messages_update_sequences().

4.63.2.5 chr_t meta_message_t::server[33]

Definition at line 83 of file meta.h.

Referenced by imap_folder_remove(), imap_message_copier(), imap_message_expunge(), mail_load_message(), meta_data_fetch_-messages(), meta_messages_copier(), pop_session_destroy(), and portal_endpoint_messages_remove().

4.63.2.6 uint64_t meta_message_t::sigkey

Definition at line 85 of file meta.h.

Referenced by imap_message_copier(), mail_load_message(), meta_data_fetch_messages(), and meta_messages_copier().

4.63.2.7 uint64_t meta_message_t::signum

Definition at line 85 of file meta.h.

Referenced by imap_message_copier(), mail_load_message(), meta_data_fetch_messages(), and meta_messages_copier().

4.63.2.8 size_t meta_message_t::size

Definition at line 81 of file meta.h.

Referenced by imap_fetch_message(), imap_folder_remove(), imap_message_copier(), imap_message_expunge(), imap_search_messages_-size(), meta_data_fetch_messages(), meta_messages_copier(), pop_list(), pop_session_destroy(), pop_total_size(), portal_endpoint_-messages_list(), portal_endpoint_messages_remove(), and portal_message_header().

4.63.2.9 uint32_t meta_message_t::status

Definition at line 84 of file meta.h.

Referenced by imap_append(), imap_close(), imap_copy(), imap_examine(), imap_expunge(), imap_fetch(), imap_fetch_message(), imap_-folder_status(), imap_message_copier(), imap_search_messages_inner(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_update_flags(), mail_load_message(), meta_data_fetch_messages(), meta_messages_copier(), meta_messages_mover(), pop_dele(), pop_get_last(), pop_get_message(), pop_list(), pop_retr(), pop_session_destroy(), pop_session_reset(), pop_top(), pop_total_-messages(), pop_total_size(), pop_uidl(), portal_endpoint_messages_flag(), and portal_message_flags_array().

4.63.2.10 array_t* meta_message_t::tags

Definition at line 82 of file meta.h.

Referenced by meta_data_fetch_message_tags(), meta_folders_stats_tags(), meta_message_dupe(), meta_message_free(), portal_endpoint_-messages_list(), portal_endpoint_messages_tag(), and portal_message_tags_array().

4.63.2.11 uint32_t meta_message_t::updated

Definition at line 84 of file meta.h.

Referenced by imap_fetch(), and imap_fetch_message().

4.64 meta_stats_tag_t Struct Reference

```
#include <meta.h>
```

Data Fields

- uint64_t count
- stringer_t * tag

4.64.1 Detailed Description

Definition at line 16 of file meta.h.

4.64.2 Field Documentation

4.64.2.1 uint64_t meta_stats_tag_t::count

Definition at line 17 of file meta.h.

Referenced by meta_folders_stats_tags(), and portal_endpoint_folders_tags().

4.64.2.2 stringer_t* meta_stats_tag_t::tag

Definition at line 18 of file meta.h.

Referenced by meta_folder_stats_tag_alloc(), and portal_endpoint_folders_tags().

4.65 meta_user_t Struct Reference

```
#include <meta.h>
```

Data Fields

4.65.1 Detailed Description

Definition at line 95 of file meta.h.

4.65.2 Field Documentation

4.65.2.1 uint64_t meta_user_t::aliases

Definition at line 115 of file meta.h.

4.65.2.2 inx_t* meta_user_t::aliases

Definition at line 101 of file meta.h.

Referenced by meta_data_fetch_mailbox_aliases(), meta_free(), meta_update_aliases(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.3 uint64_t meta_user_t::contacts

Definition at line 115 of file meta.h.

4.65.2.4 inx_t * meta_user_t::contacts

Definition at line 101 of file meta.h.

Referenced by meta_free(), meta_update_contacts(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.5 META_USER_FLAGS meta_user_t::flags

Definition at line 99 of file meta.h.

Referenced by mail_load_message(), meta_data_fetch_user(), and portal_endpoint_auth().

4.65.2.6 uint64_t meta_user_t::folders

Definition at line 115 of file meta.h.

4.65.2.7 inx_t * meta_user_t::folders

Definition at line 101 of file meta.h.

Referenced by meta_data_fetch_folders(), meta_free(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_folders(), meta_update_message_folders(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.8 uint64_t meta_user_t::generic

Definition at line 120 of file meta.h.

Referenced by meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), and meta_user_ref_total().

4.65.2.9 uint64_t meta_user_t::imap

Definition at line 120 of file meta.h.

Referenced by meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), and meta_user_ref_total().

4.65.2.10 stringer_t* meta_user_t::key

Definition at line 110 of file meta.h.

Referenced by mail_load_message(), meta_free(), and meta_update_keys().

4.65.2.11 pthread_mutex_t meta_user_t::lock

Definition at line 121 of file meta.h.

4.65.2.12 pthread_rwlock_t meta_user_t::lock

Definition at line 98 of file meta.h.

Referenced by meta_alloc(), meta_free(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_-stamp(), meta_user_ref_total(), meta_user_rlock(), meta_user_unlock(), and meta_user_wlock().

4.65.2.13 stringer_t∗ meta_user_t::mail

Definition at line 105 of file meta.h.

Referenced by meta_free(), meta_get(), meta_update_keys(), and meta_update_realms().

4.65.2.14 inx_t ∗ meta_user_t::message_folders

Definition at line 101 of file meta.h.

Referenced by meta_free(), and meta_update_message_folders().

4.65.2.15 uint64_t meta_user_t::messages

Definition at line 115 of file meta.h.

4.65.2.16 inx_t ∗ meta_user_t::messages

Definition at line 101 of file meta.h.

Referenced by meta_data_fetch_messages(), meta_free(), meta_messages_copier(), meta_messages_login_update(), meta_messages_-mover(), meta_messages_update(), meta_update_folders(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.17 uint64_t meta_user_t::pop

Definition at line 120 of file meta.h.

Referenced by meta_messages_login_update(), meta_messages_update(), meta_update_folders(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), and meta_user_ref_total().

4.65.2.18 struct { ... } meta_user_t::prime

Referenced by mail_load_message(), meta_free(), and meta_update_keys().

4.65.2.19 struct { ... } meta_user_t::realm

Referenced by meta_free(), meta_get(), meta_update_keys(), and meta_update_realms().

4.65.2.20 struct { ... } meta_user_t::refs

Referenced by meta_alloc(), meta_free(), meta_messages_login_update(), meta_messages_update(), meta_update_folders(), meta_user_ref_-add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_stamp(), and meta_user_ref_total().

4.65.2.21 struct { ... } meta_user_t::serials

Referenced by meta_messages_login_update(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_-folders(), meta_update_message_folders(), meta_update_user(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.22 stringer_t* meta_user_t::signet

Definition at line 111 of file meta.h.

Referenced by meta_free(), and meta_update_keys().

4.65.2.23 uint64_t meta_user_t::smtp

Definition at line 120 of file meta.h.

Referenced by meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), and meta_user_ref_total().

4.65.2.24 time_t meta_user_t::stamp

Definition at line 119 of file meta.h.

Referenced by meta_user_ref_add(), meta_user_ref_dec(), and meta_user_ref_stamp().

4.65.2.25 uint64_t meta_user_t::user

Definition at line 115 of file meta.h.

Referenced by meta_update_user(), meta_user_serial_get(), and meta_user_serial_set().

4.65.2.26 stringer_t* meta_user_t::username

Definition at line 100 of file meta.h.

Referenced by mail_load_message(), meta_data_fetch_keys(), meta_data_fetch_user(), meta_free(), meta_update_keys(), meta_update_realms(), and meta_update_user().

4.65.2.27 uint64_t meta_user_t::usernum

Definition at line 97 of file meta.h.

Referenced by imap_update_flags(), mail_load_message(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_data_fetch_user(), meta_data_update_log(), meta_inx_find(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), meta_user_serial_check(), portal_endpoint_auth(), and sess_destroy().

4.65.2.28 stringer_t * meta_user_t::verification

Definition at line 100 of file meta.h.

Referenced by meta_data_fetch_user(), meta_free(), meta_get(), and meta_update_user().

4.65.2.29 uint64_t meta_user_t::web

Definition at line 120 of file meta.h.

Referenced by meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), and meta_user_ref_total().

4.67.2.1 char* mx_record_t::name

Definition at line 123 of file dns.h.

4.67.2.2 unsigned short mx_record_t::pref

Definition at line 122 of file dns.h.

4.68 nvp_t Struct Reference

```
#include <formats.h>
```

Data Fields

- MAGMA_INDEX options
- struct {
  char comment
  char value
  char line
  } tokens
- inx_t * pairs

4.68.1 Detailed Description

Definition at line 13 of file formats.h.

4.68.2 Field Documentation

4.68.2.1 char nvp_t::comment

Definition at line 16 of file formats.h.

Referenced by nvp_alloc(), and nvp_parse().

4.68.2.2 char nvp_t::line

Definition at line 16 of file formats.h.

Referenced by nvp_alloc(), and nvp_parse().

4.68.2.3 MAGMA_INDEX nvp_t::options

Definition at line 14 of file formats.h.

4.68.2.4 inx_t* nvp_t::pairs

Definition at line 18 of file formats.h.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), nvp_alloc(), nvp_free(), and nvp_parse().

4.68.2.5 struct { ... } nvp_t::tokens

Referenced by nvp_alloc(), and nvp_parse().

4.68.2.6 char nvp_t::value

Definition at line 16 of file formats.h.

Referenced by nvp_alloc(), and nvp_parse().

4.69 object_cache_t Struct Reference

```
#include <objects.h>
```

Data Fields

- inx_t * meta
- inx_t * sessions

4.69.1 Detailed Description

Definition at line 30 of file objects.h.

4.69.2 Field Documentation

4.69.2.1 inx_t* object_cache_t::meta

Definition at line 31 of file objects.h.

Referenced by meta_inx_find(), meta_inx_remove(), obj_cache_prune(), obj_cache_start(), and obj_cache_stop().

4.69.2.2 inx_t * object_cache_t::sessions

Definition at line 31 of file objects.h.

Referenced by obj_cache_prune(), obj_cache_start(), obj_cache_stop(), sess_create(), and sess_get().

4.70 object_chunk Struct Reference

```
#include <crypto.h>
```

Data Fields

- struct object_chunk * next
- dmime_chunk_type_t type
- unsigned char flags
- size_t data_size
- unsigned char * data

4.70.1 Detailed Description

Definition at line 51 of file crypto.h.

4.70.2 Field Documentation

4.70.2.1 unsigned char* object_chunk::data

Definition at line 56 of file crypto.h.

4.70.2.2 size_t object_chunk::data_size

Definition at line 55 of file crypto.h.

4.70.2.3 unsigned char object_chunk::flags

Definition at line 54 of file crypto.h.

4.70.2.4 struct object_chunk* object_chunk::next [read]

Definition at line 52 of file crypto.h.

4.70.2.5 dmime_chunk_type_t object_chunk::type

Definition at line 53 of file crypto.h.

4.71 packedelem32_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- uint32_t u [4]
- xmmi v

4.71.1 Detailed Description

Definition at line 16 of file curve25519-donna-sse2.h.

4.71.2 Field Documentation

4.71.2.1 uint32_t packedelem32_t::u[4]

Definition at line 17 of file curve25519-donna-sse2.h.

4.71.2.2 xmmi packedelem32_t::v

Definition at line 18 of file curve25519-donna-sse2.h.

4.72 packedelem64_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- uint64_t u [2]
- xmmi v

4.72.1 Detailed Description

Definition at line 21 of file curve25519-donna-sse2.h.

4.72.2 Field Documentation

4.72.2.1 uint64_t packedelem64_t::u[2]

Definition at line 22 of file curve25519-donna-sse2.h.

4.72.2.2 xmmi packedelem64_t::v

Definition at line 23 of file curve25519-donna-sse2.h.

4.73 packedelem8_t Union Reference

```
#include <curve25519-donna-sse2.h>
```

Data Fields

- unsigned char u [16]
- xmmi v

4.73.1 Detailed Description

Definition at line 11 of file curve25519-donna-sse2.h.

4.73.2 Field Documentation

4.73.2.1 unsigned char packedelem8_t::u[16]

Definition at line 12 of file curve25519-donna-sse2.h.

4.73.2.2 xmmi packedelem8_t::v

Definition at line 13 of file curve25519-donna-sse2.h.

4.74 pool_t Struct Reference

```
#include <buckets.h>
```

Data Fields

- uint32_t count
- uint32_t timeout
- uint64_t failures
- sem_t available
- pthread_mutex_t lock
- status_t * status
- void ** objects

4.74.1 Detailed Description

Definition at line 58 of file buckets.h.

4.74.2 Field Documentation

4.74.2.1 sem_t pool_t::available

Definition at line 62 of file buckets.h.

Referenced by pool_alloc(), pool_free(), pool_get_available(), pool_pull(), and pool_release().

4.74.2.2 uint32_t pool_t::count

Definition at line 59 of file buckets.h.

Referenced by pool_alloc(), pool_get_count(), and pool_pull().

4.74.2.3 uint64_t pool_t::failures

Definition at line 61 of file buckets.h.

Referenced by pool_get_failures(), and pool_pull().

4.74.2.4 pthread_mutex_t pool_t::lock

Definition at line 63 of file buckets.h.

Referenced by pool_alloc(), pool_free(), pool_get_failures(), pool_get_obj(), pool_pull(), pool_release(), pool_set_obj(), and pool_swap_-obj().

4.74.2.5 void** pool_t::objects

Definition at line 65 of file buckets.h.

Referenced by pool_alloc(), pool_get_obj(), and pool_set_obj().

4.74.2.6 status_t* pool_t::status

Definition at line 64 of file buckets.h.

Referenced by pool_alloc(), pool_get_status(), and pool_set_status().

4.74.2.7 uint32_t pool_t::timeout

Definition at line 60 of file buckets.h.

Referenced by pool_alloc(), pool_get_timeout(), and pool_pull().

4.75 queue_t Struct Reference

Public Member Functions

- void(∗ requeue (void ∗data))(∗)

Data Fields

- void(∗ function)(void ∗data)
- void(∗)(∗)∗ data
- struct queue_t ∗ next

4.75.1 Detailed Description

Definition at line 10 of file queue.c.

4.75.2 Member Function Documentation

4.75.2.1 void(∗ queue_t::requeue (void ∗ *data*)

Referenced by dequeue(), and requeue().

4.75.3 Field Documentation

4.75.3.1 void(∗)(∗) ∗ queue_t::data

Definition at line 11 of file queue.c.

Referenced by dequeue(), and requeue().

4.75.3.2 void(∗ queue_t::function)(void ∗data)

Referenced by dequeue(), and requeue().

4.75.3.3 struct queue_t∗ queue_t::next [read]

Definition at line 12 of file queue.c.

Referenced by dequeue(), and requeue().

4.76 random_data_t Struct Reference

Data Fields

- unsigned char sk [32]
- unsigned char m [128]

4.76.1 Detailed Description

Definition at line 116 of file fuzz-ed25519.c.

4.76.2 Field Documentation

4.76.2.1 unsigned char random_data_t::m[128]

Definition at line 118 of file fuzz-ed25519.c.

Referenced by main().

4.76.2.2 unsigned char random_data_t::sk[32]

Definition at line 117 of file fuzz-ed25519.c.

Referenced by main().

4.77 register_session_t Struct Reference

```
#include <register.h>
```

Data Fields

- uint64_t usernum
- uint16_t plan
- stringer_t * username
- stringer_t * password
- stringer_t * hvf_value
- stringer_t * hvf_input
- stringer_t * name

4.77.1 Detailed Description

Definition at line 17 of file register.h.

4.77.2 Field Documentation

4.77.2.1 stringer_t * register_session_t::hvf_input

Definition at line 20 of file register.h.

Referenced by register_business_step1(), register_session_cache(), register_session_free(), and register_session_get().

4.77.2.2 stringer_t * register_session_t::hvf_value

Definition at line 20 of file register.h.

Referenced by register_business_step1(), register_print_captcha(), register_session_cache(), register_session_free(), and register_session_get().

4.77.2.3 stringer_t * register_session_t::name

Definition at line 20 of file register.h.

Referenced by register_print_step1(), register_print_step2(), register_session_cache(), register_session_free(), register_session_generate(), and register_session_get().

4.77.2.4 stringer_t * register_session_t::password

Definition at line 20 of file register.h.

Referenced by register_business_step1(), register_business_step2(), register_session_cache(), register_session_free(), and register_session_get().

4.77.2.5 uint16_t register_session_t::plan

Definition at line 19 of file register.h.

Referenced by register_business_step2(), register_session_cache(), and register_session_get().

4.77.2.6 stringer_t* register_session_t::username

Definition at line 20 of file register.h.

Referenced by register_business_step1(), register_business_step2(), register_print_step1(), register_session_cache(), register_session_free(), and register_session_get().

4.77.2.7 uint64_t register_session_t::usernum

Definition at line 18 of file register.h.

Referenced by register_business_step2(), register_process(), register_session_cache(), and register_session_get().

4.78 relay_keys_t Struct Reference

```
#include <relay.h>
```

Data Fields

- size_t offset
- multi_t norm
- chr_t * name
- chr_t * description
- bool_t required

4.78.1 Detailed Description

Definition at line 11 of file relay.h.

4.78.2 Field Documentation

4.78.2.1 chr_t* relay_keys_t::description

Definition at line 15 of file relay.h.

4.78.2.2 chr_t* relay_keys_t::name

Definition at line 14 of file relay.h.

Referenced by relay_set_value().

4.78.2.3 multi_t relay_keys_t::norm

Definition at line 13 of file relay.h.

Referenced by relay_free(), relay_output_help(), relay_output_settings(), relay_set_value(), and relay_validate().

4.78.2.4 size_t relay_keys_t::offset

Definition at line 12 of file relay.h.

Referenced by relay_free(), relay_output_settings(), relay_set_value(), and relay_validate().

4.78.2.5 bool_t relay_keys_t::required

Definition at line 16 of file relay.h.

Referenced by relay_output_help().

4.79 relay_t Struct Reference

```
#include <relay.h>
```

Data Fields

- bool_t secure
- bool_t premium
- chr_t * name
- uint32_t port

4.79.1 Detailed Description

Definition at line 19 of file relay.h.

4.79.2 Field Documentation

4.79.2.1 chr_t* relay_t::name

Definition at line 22 of file relay.h.

Referenced by smtp_client_connect().

4.79.2.2 uint32_t relay_t::port

Definition at line 23 of file relay.h.

Referenced by smtp_client_connect().

4.79.2.3 bool_t relay_t::premium

Definition at line 21 of file relay.h.

4.79.2.4 bool_t relay_t::secure

Definition at line 20 of file relay.h.

Referenced by smtp_client_connect().

4.80 serialization_t Struct Reference

```
#include <consumers.h>
```

Data Fields

- size_t position
- stringer_t * data

4.80.1 Detailed Description

Definition at line 12 of file consumers.h.

4.80.2 Field Documentation

4.80.2.1 stringer_t* serialization_t::data

Definition at line 14 of file consumers.h.

Referenced by deserialize_int16(), deserialize_int32(), deserialize_int64(), deserialize_ns(), deserialize_st(), deserialize_uint16(), deserialize_uint32(), deserialize_uint64(), register_session_get(), and teacher_data_get().

4.80.2.2 size_t serialization_t::position

Definition at line 13 of file consumers.h.

Referenced by deserialize_int16(), deserialize_int32(), deserialize_int64(), deserialize_ns(), deserialize_st(), deserialize_uint16(), deserialize_uint32(), and deserialize_uint64().

4.81 server_config_t Struct Reference

```
#include <servers.h>
```

Data Fields

- SSL_CTX * tls_ctx
- char * certificate
- int tls_sd
- int normal_sd
- stringer_t * name
- stringer_t * spam
- stringer_t * domain
- stringer_t * banner
- unsigned tls_port
- unsigned tcp_port
- unsigned listen_queue
- unsigned socket_timeout
- unsigned bad_command_cutoff
- unsigned bad_command_delay
- struct server_config_t * next

4.81.1 Detailed Description

Definition at line 58 of file servers.h.

4.81.2 Field Documentation

4.81.2.1 unsigned server_config_t::bad_command_cutoff

Definition at line 63 of file servers.h.

4.81.2.2 unsigned server_config_t::bad_command_delay

Definition at line 63 of file servers.h.

4.81.2.3 stringer_t * server_config_t::banner

Definition at line 62 of file servers.h.

4.81.2.4 char* server_config_t::certificate

Definition at line 60 of file servers.h.

4.81.2.5 stringer_t * server_config_t::domain

Definition at line 62 of file servers.h.

4.81.2.6 unsigned server_config_t::listen_queue

Definition at line 63 of file servers.h.

4.81.2.7 stringer_t* server_config_t::name

Definition at line 62 of file servers.h.

4.81.2.8 struct server_config_t* server_config_t::next [read]

Definition at line 64 of file servers.h.

4.81.2.9 int server_config_t::normal_sd

Definition at line 61 of file servers.h.

4.81.2.10 unsigned server_config_t::socket_timeout

Definition at line 63 of file servers.h.

4.81.2.11 stringer_t * server_config_t::spam

Definition at line 62 of file servers.h.

4.81.2.12 unsigned server_config_t::tcp_port

Definition at line 63 of file servers.h.

4.81.2.13 SSL_CTX* server_config_t::tls_ctx

Definition at line 59 of file servers.h.

4.81.2.14 unsigned server_config_t::tls_port

Definition at line 63 of file servers.h.

4.81.2.15 int server_config_t::tls_sd

Definition at line 61 of file servers.h.

4.82 server_keys_t Struct Reference

```
#include <servers.h>
```

Data Fields

- size_t offset
- multi_t norm
- chr_t * name
- chr_t * description
- bool_t required

4.82.1 Detailed Description

Definition at line 27 of file servers.h.

4.82.2 Field Documentation

4.82.2.1 chr_t* server_keys_t::description

Definition at line 31 of file servers.h.

4.82.2.2 chr_t* server_keys_t::name

Definition at line 30 of file servers.h.

Referenced by servers_set_value().

4.82.2.3 multi_t server_keys_t::norm

Definition at line 29 of file servers.h.

Referenced by servers_free(), servers_output_help(), servers_output_settings(), servers_set_value(), and servers_validate().

4.82.2.4 size_t server_keys_t::offset

Definition at line 28 of file servers.h.

Referenced by servers_free(), servers_output_settings(), servers_set_value(), and servers_validate().

4.82.2.5 bool_t server_keys_t::required

Definition at line 32 of file servers.h.

Referenced by servers_output_help().

4.83 server_t Struct Reference

```
#include <servers.h>
```

Data Fields

- struct {
  SSL_CTX * context
  chr_t * certificate
  } tls

- struct {
  int sockd
  bool_t ipv6
  uint32_t port
  uint32_t timeout
  uint32_t listen_queue
  M_PORT type
  } network

- struct {
  uint32_t delay
  uint32_t cutoff
  } violations

- bool_t enabled
- stringer_t * name
- stringer_t * domain
- M_PROTOCOL protocol

4.83.1 Detailed Description

Definition at line 35 of file servers.h.

4.83.2 Field Documentation

4.83.2.1 chr_t* server_t::certificate

Definition at line 38 of file servers.h.

Referenced by servers_encryption_start(), servers_validate(), and tls_server_create().

4.83.2.2 SSL_CTX* server_t::context

Definition at line 37 of file servers.h.

Referenced by con_secure(), protocol_process(), servers_encryption_stop(), tls_server_alloc(), tls_server_create(), and tls_server_destroy().

4.83.2.3 uint32_t server_t::cutoff

Definition at line 50 of file servers.h.

Referenced by dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_process(), imap_requeue(), pop_process(), pop_requeue(), smtp_process(), and smtp_requeue().

4.83.2.4 uint32_t server_t::delay

Definition at line 49 of file servers.h.

Referenced by dmtp_invalid(), imap_invalid(), pop_invalid(), smtp_disabled(), and smtp_invalid().

4.83.2.5 stringer_t * server_t::domain

Definition at line 53 of file servers.h.

Referenced by dmtp_ehlo(), dmtp_helo(), dmtp_init(), imap_init(), mail_add_inbound_headers(), mail_add_outbound_headers(), mail_build_signature(), servers_network_start(), smtp_ehlo(), smtp_helo(), and smtp_init().

4.83.2.6 bool_t server_t::enabled

Definition at line 52 of file servers.h.

Referenced by net_listen(), servers_encryption_start(), servers_encryption_stop(), servers_get_by_protocol(), servers_network_start(), servers_network_stop(), and signal_shutdown().

4.83.2.7 bool_t server_t::ipv6

Definition at line 42 of file servers.h.

Referenced by net_init().

4.83.2.8 uint32_t server_t::listen_queue

Definition at line 45 of file servers.h.

Referenced by net_init().

4.83.2.9 stringer_t* server_t::name

Definition at line 53 of file servers.h.

Referenced by servers_network_start().

4.83.2.10 struct { ... } server_t::network

Referenced by net_accept(), net_init(), net_listen(), net_shutdown(), protocol_process(), protocol_secure(), protocol_type(), servers_alloc(), servers_get_by_protocol(), servers_get_by_socket(), servers_get_count_using_port(), servers_network_stop(), servers_validate(), and signal_shutdown().

4.83.2.11 uint32_t server_t::port

Definition at line 43 of file servers.h.

Referenced by net_init(), protocol_secure(), servers_get_count_using_port(), and servers_validate().

4.83.2.12 M_PROTOCOL server_t::protocol

Definition at line 54 of file servers.h.

Referenced by con_destroy(), protocol_enqueue(), protocol_type(), servers_encryption_start(), servers_get_by_protocol(), and servers_validate().

4.83.2.13 int server_t::sockd

Definition at line 41 of file servers.h.

Referenced by net_accept(), net_init(), net_listen(), net_shutdown(), servers_alloc(), servers_get_by_socket(), servers_network_stop(), and signal_shutdown().

4.83.2.14 uint32_t server_t::timeout

Definition at line 44 of file servers.h.

Referenced by protocol_process().

4.83.2.15 struct { ... } server_t::tls

Referenced by con_secure(), protocol_process(), servers_encryption_start(), servers_encryption_stop(), servers_validate(), tls_server_alloc(), tls_server_create(), and tls_server_destroy().

4.83.2.16 M_PORT server_t::type

Definition at line 46 of file servers.h.

Referenced by protocol_process(), protocol_type(), servers_get_by_protocol(), and servers_validate().

4.83.2.17 struct { ... } server_t::violations

Referenced by dmtp_invalid(), dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_invalid(), imap_process(), imap_requeue(), pop_invalid(), pop_process(), pop_requeue(), smtp_disabled(), smtp_invalid(), smtp_process(), and smtp_requeue().

4.84 session_t Struct Reference

```
#include <sessions.h>
```

Data Fields

- int_t state
- meta_user_t * user
- inx_t * compositions
- uint64_t composed
- struct {
  bool_t secure
  bool_t httponly
  stringer_t * host
  stringer_t * path
  stringer_t * application

Referenced by sess_create(), sess_destroy(), and sess_token().

4.84.2.24 uint64_t session_t::web

Definition at line 57 of file sessions.h.

Referenced by sess_ref_add(), sess_ref_dec(), and sess_ref_total().

4.85 sha_databuf_t Struct Reference

```
#include <misc.h>
```

Data Fields

- void * data
- size_t len

4.85.1 Detailed Description

Definition at line 36 of file misc.h.

4.85.2 Field Documentation

4.85.2.1 void* sha_databuf_t::data

Definition at line 37 of file misc.h.

4.85.2.2 size_t sha_databuf_t::len

Definition at line 38 of file misc.h.

4.86 signet_field_key_t Struct Reference

```
#include <common.h>
```

Data Fields

- unsigned int required
- unsigned int unique
- unsigned char bytes_name_size
- unsigned char bytes_data_size
- uint32_t data_size
- field_data_t data_type
- const char * name
- const char * description

4.86.1 Detailed Description

Definition at line 150 of file common.h.

4.86.2 Field Documentation

4.86.2.1 unsigned char signet_field_key_t::bytes_data_size

Number of bytes for this

Definition at line 156 of file common.h.

4.86.2.2 unsigned char signet_field_key_t::bytes_name_size

Is this a defined field

Definition at line 155 of file common.h.

4.86.2.3 uint32_t signet_field_key_t::data_size

data_size = 0 indicates the size being variable

Definition at line 157 of file common.h.

4.86.2.4 field_data_t signet_field_key_t::data_type

Dump format for the field

Definition at line 159 of file common.h.

4.86.2.5 const char* signet_field_key_t::description

field type description

Definition at line 162 of file common.h.

4.86.2.6 const char* signet_field_key_t::name

Definition at line 161 of file common.h.

4.86.2.7 unsigned int signet_field_key_t::required

is this field required

Definition at line 152 of file common.h.

4.86.2.8 unsigned int signet_field_key_t::unique

can there be multiple fields of this identifier

Definition at line 153 of file common.h.

4.87 signet_field_t Struct Reference

Data Fields

- const signet_t ∗ signet
- signet_field_key_t ∗ key
- unsigned char name_size
- unsigned int data_size
- unsigned int id_offset
- unsigned int name_offset
- unsigned int data_offset
- struct signet_field_t ∗ next

4.87.1 Detailed Description

A signet field index structure for temporary convenience organization of field data

Definition at line 7 of file signet.c.

4.87.2 Field Documentation

4.87.2.1 unsigned int signet_field_t::data_offset

Definition at line 16 of file signet.c.

4.87.2.2 unsigned int signet_field_t::data_size

Definition at line 12 of file signet.c.

4.87.2.3 unsigned int signet_field_t::id_offset

Definition at line 14 of file signet.c.

4.87.2.4 signet_field_key_t∗ signet_field_t::key

Definition at line 10 of file signet.c.

4.87.2.5 unsigned int signet_field_t::name_offset

Definition at line 15 of file signet.c.

4.87.2.6 unsigned char signet_field_t::name_size

Definition at line 11 of file signet.c.

4.87.2.7 struct signet_field_t∗ signet_field_t::next [read]

Definition at line 18 of file signet.c.

4.87.2.8 const signet_t* signet_field_t::signet

Definition at line 9 of file signet.c.

4.88 signet_t Struct Reference

```
#include <signet.h>
```

Data Fields

- signet_type_t type
- uint32_t fields [256]
- uint32_t size
- unsigned char ∗ data

4.88.1 Detailed Description

Definition at line 27 of file signet.h.

4.88.2 Field Documentation

4.88.2.1 unsigned char∗ signet_t::data

Definition at line 32 of file signet.h.

4.88.2.2 uint32_t signet_t::fields[256]

Each index corresponds to a different field type identifier. The value of fields[index] is the byte directly after the first occurence of the corresponding field type identifier. If fields[index] is 0 it means that the corresponding field type identifier occurred 0 times.

Definition at line 29 of file signet.h.

4.88.2.3 uint32_t signet_t::size

Combined length of all the fields

Definition at line 31 of file signet.h.

4.88.2.4 signet_type_t signet_t::type

Definition at line 28 of file signet.h.

4.89 smtp_inbound_filter_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- uint64_t foldernum
- uint64_t rulenum
- unsigned location
- unsigned type
- unsigned action
- stringer_t * field
- stringer_t * label
- stringer_t * expression

4.89.1 Detailed Description

Definition at line 75 of file smtp.h.

4.89.2 Field Documentation

4.89.2.1 unsigned smtp_inbound_filter_t::action

Definition at line 77 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.89.2.2 stringer_t * smtp_inbound_filter_t::expression

Definition at line 78 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_list_free_filter().

4.89.2.3 stringer_t* smtp_inbound_filter_t::field

Definition at line 78 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_list_free_filter().

4.89.2.4 uint64_t smtp_inbound_filter_t::foldernum

Definition at line 76 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.89.2.5 stringer_t * smtp_inbound_filter_t::label

Definition at line 78 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_list_free_filter().

4.89.2.6 unsigned smtp_inbound_filter_t::location

Definition at line 77 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.89.2.7 uint64_t smtp_inbound_filter_t::rulenum

Definition at line 76 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.89.2.8 unsigned smtp_inbound_filter_t::type

Definition at line 77 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.90 smtp_inbound_prefs_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- int_t outcome

- int_t rblaction
- int_t spamaction
- int_t virusaction
- int_t phishaction
- int_t spam_checked
- inx_t * filters
- struct smtp_inbound_prefs_t * next

4.90.1 Detailed Description

Definition at line 82 of file smtp.h.

4.90.2 Field Documentation

4.90.2.1 stringer_t ∗ smtp_inbound_prefs_t::address

Definition at line 86 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_free_inbound().

4.90.2.2 uint64_t smtp_inbound_prefs_t::autoreply

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.3 int_t smtp_inbound_prefs_t::bounces

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_update_receive_stats().

4.90.2.4 uint32_t smtp_inbound_prefs_t::daily_recv_limit

Definition at line 87 of file smtp.h.

Referenced by smtp_check_receive_quota(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.5 uint32_t smtp_inbound_prefs_t::daily_recv_limit_ip

Definition at line 87 of file smtp.h.

Referenced by smtp_check_receive_quota(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.6 int_t smtp_inbound_prefs_t::dkim

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.7 int_t smtp_inbound_prefs_t::dkimaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.8 stringer_t ∗ smtp_inbound_prefs_t::domain

Definition at line 86 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_free_inbound().

4.90.2.9 inx_t∗ smtp_inbound_prefs_t::filters

Definition at line 91 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_filters(), smtp_fetch_inbound(), and smtp_free_inbound().

4.90.2.10 uint64_t smtp_inbound_prefs_t::foldernum

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_filters(), and smtp_store_message().

4.90.2.11 stringer_t * smtp_inbound_prefs_t::forwarded

Definition at line 86 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), smtp_free_inbound(), and smtp_rcpt_to().

4.90.2.12 int_t smtp_inbound_prefs_t::greylist

Definition at line 89 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.13 uint32_t smtp_inbound_prefs_t::greytime

Definition at line 87 of file smtp.h.

Referenced by smtp_check_greylist(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.14 uint64_t smtp_inbound_prefs_t::inbox

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.15 uint32_t smtp_inbound_prefs_t::local_size

Definition at line 87 of file smtp.h.

4.90.2.16 int_t smtp_inbound_prefs_t::mark

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_filters(), and smtp_store_message().

4.90.2.17 uint64_t smtp_inbound_prefs_t::messagenum

Definition at line 88 of file smtp.h.

Referenced by smtp_store_message().

4.90.2.18 struct smtp_inbound_prefs_t* smtp_inbound_prefs_t::next [read]

Definition at line 92 of file smtp.h.

Referenced by mail_add_required_headers(), smtp_add_inbound(), smtp_bounce(), smtp_check_duplicate_recipient(), smtp_data_inbound(), and smtp_free_inbound().

4.90.2.19 int_t smtp_inbound_prefs_t::outcome

Definition at line 83 of file smtp.h.

Referenced by smtp_bounce(), and smtp_data_inbound().

4.90.2.20 int_t smtp_inbound_prefs_t::overquota

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.21 int_t smtp_inbound_prefs_t::phish

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.22 int_t smtp_inbound_prefs_t::phishaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.23 uint64_t smtp_inbound_prefs_t::quota

Definition at line 88 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_rollout().

4.90.2.24 int_t smtp_inbound_prefs_t::rbl

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.25 int_t smtp_inbound_prefs_t::rblaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.26 stringer_t* smtp_inbound_prefs_t::rcptto

Definition at line 86 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_required_headers(), smtp_accept_message(), smtp_bounce(), smtp_fetch_inbound(), smtp_free_inbound(), and smtp_rcpt_to().

4.90.2.27 size_t smtp_inbound_prefs_t::recv_size_limit

Definition at line 85 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.28 int_t smtp_inbound_prefs_t::rollout

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.29 int_t smtp_inbound_prefs_t::secure

Definition at line 89 of file smtp.h.

Referenced by smtp_fetch_inbound().

4.90.2.30 prime_t* smtp_inbound_prefs_t::signet

Definition at line 84 of file smtp.h.

Referenced by smtp_fetch_inbound(), smtp_free_inbound(), and smtp_store_message().

4.90.2.31 uint64_t smtp_inbound_prefs_t::signum

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_store_message(), and smtp_store_spamsig().

4.90.2.32 int_t smtp_inbound_prefs_t::spam

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.33 int_t smtp_inbound_prefs_t::spam_checked

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message().

4.90.2.34 int_t smtp_inbound_prefs_t::spamaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.35 uint64_t smtp_inbound_prefs_t::spamkey

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_store_message(), and smtp_store_spamsig().

4.90.2.36 stringer_t * smtp_inbound_prefs_t::spamsig

Definition at line 86 of file smtp.h.

Referenced by smtp_accept_message(), smtp_free_inbound(), and smtp_insert_spamsig().

4.90.2.37 int_t smtp_inbound_prefs_t::spf

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.38 int_t smtp_inbound_prefs_t::spfaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), smtp_fetch_inbound(), and smtp_rcpt_to().

4.90.2.39 uint64_t smtp_inbound_prefs_t::stor_size

Definition at line 88 of file smtp.h.

Referenced by smtp_fetch_inbound(), and smtp_rollout().

4.90.2.40 uint64_t smtp_inbound_prefs_t::usernum

Definition at line 88 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_duplicate_recipient(), smtp_check_filters(), smtp_check_greylist(), smtp_check_-receive_quota(), smtp_fetch_inbound(), smtp_insert_spamsig(), smtp_rcpt_to(), smtp_rollout(), smtp_store_message(), and smtp_update_-receive_stats().

4.90.2.41 int_t smtp_inbound_prefs_t::virus

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.90.2.42 int_t smtp_inbound_prefs_t::virusaction

Definition at line 89 of file smtp.h.

Referenced by smtp_accept_message(), and smtp_fetch_inbound().

4.91 smtp_message_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- placer_t to
- placer_t date
- placer_t subject
- stringer_t * id
- stringer_t * from
- stringer_t * text
- size_t header_length

4.91.1 Detailed Description

Definition at line 59 of file smtp.h.

4.91.2 Field Documentation

4.91.2.1 placer_t smtp_message_t::date

Definition at line 61 of file smtp.h.

Referenced by mail_add_required_headers(), and mail_headers().

4.91.2.2 stringer_t* smtp_message_t::from

Definition at line 64 of file smtp.h.

Referenced by mail_add_required_headers(), mail_destroy_message(), mail_headers(), and smtp_data_outbound().

4.91.2.3 size_t smtp_message_t::header_length

Definition at line 66 of file smtp.h.

Referenced by mail_add_required_headers(), mail_create_message(), and mail_headers().

4.91.2.4 stringer_t* smtp_message_t::id

Definition at line 63 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), mail_create_message(), mail_destroy_message(), and smtp_-accept_message().

4.91.2.5 placer_t smtp_message_t::subject

Definition at line 62 of file smtp.h.

Referenced by mail_add_required_headers(), and mail_headers().

4.91.2.6 stringer_t* smtp_message_t::text

Definition at line 65 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), mail_add_required_headers(), mail_create_message(), mail_destroy_message(), mail_headers(), smtp_accept_message(), smtp_bounce(), smtp_data_outbound(), and smtp_relay_message().

4.91.2.7 placer_t smtp_message_t::to

Definition at line 60 of file smtp.h.

Referenced by mail_add_required_headers(), and mail_headers().

4.92 smtp_outbound_prefs_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- uint64_t usernum
- stringer_t * domain
- int_t tls
- int_t importance
- uint32_t sent_today
- uint32_t daily_send_limit
- uint32_t send_size_limit
- smtp_recipients_t * recipients

4.92.1 Detailed Description

Definition at line 96 of file smtp.h.

4.92.2 Field Documentation

4.92.2.1 uint32_t smtp_outbound_prefs_t::daily_send_limit

Definition at line 100 of file smtp.h.

Referenced by smtp_check_transmit_quota(), smtp_data_outbound(), smtp_fetch_authorization(), and smtp_rcpt_to().

4.92.2.2 stringer_t* smtp_outbound_prefs_t::domain

Definition at line 98 of file smtp.h.

Referenced by smtp_fetch_authorization(), and smtp_free_outbound().

4.92.2.3 int_t smtp_outbound_prefs_t::importance

Definition at line 99 of file smtp.h.

Referenced by smtp_fetch_authorization(), and smtp_relay_message().

4.92.2.4 smtp_recipients_t* smtp_outbound_prefs_t::recipients

Definition at line 101 of file smtp.h.

Referenced by mail_add_outbound_headers(), mail_add_required_headers(), smtp_add_recipient(), smtp_data(), smtp_free_outbound(), smtp_relay_message(), and smtp_session_reset().

4.92.2.5 uint32_t smtp_outbound_prefs_t::send_size_limit

Definition at line 100 of file smtp.h.

Referenced by smtp_auth_login(), smtp_auth_plain(), smtp_fetch_authorization(), and smtp_rcpt_to().

4.92.2.6 uint32_t smtp_outbound_prefs_t::sent_today

Definition at line 100 of file smtp.h.

Referenced by smtp_check_transmit_quota(), smtp_fetch_authorization(), and smtp_rcpt_to().

4.92.2.7 int_t smtp_outbound_prefs_t::tls

Definition at line 99 of file smtp.h.

Referenced by smtp_fetch_authorization(), and smtp_rcpt_to().

4.92.2.8 uint64_t smtp_outbound_prefs_t::usernum

Definition at line 97 of file smtp.h.

Referenced by smtp_data_outbound(), smtp_fetch_authorization(), and smtp_update_transmission_stats().

4.93 smtp_recipients_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- stringer_t * address
- struct smtp_recipients_t * next

4.93.1 Detailed Description

Definition at line 70 of file smtp.h.

4.93.2 Field Documentation

4.93.2.1 stringer_t* smtp_recipients_t::address

Definition at line 71 of file smtp.h.

Referenced by mail_add_outbound_headers(), mail_add_required_headers(), smtp_add_recipient(), smtp_free_recipients(), and smtp_relay_-message().

4.93.2.2 struct smtp_recipients_t* smtp_recipients_t::next [read]

Definition at line 72 of file smtp.h.

Referenced by mail_add_required_headers(), smtp_add_recipient(), smtp_free_recipients(), and smtp_relay_message().

4.94 smtp_session_t Struct Reference

```
#include <smtp.h>
```

Data Fields

- bool_t esmtp
- bool_t submission
- bool_t authenticated
- bool_t suggested_eight_bit
- size_t max_length
- size_t num_recipients
- size_t suggested_length
- stringer_t * helo
- stringer_t * mailfrom

  } checked

- smtp_message_t * message
- smtp_inbound_prefs_t * in_prefs
- smtp_outbound_prefs_t * out_prefs
- bool_t bypass

4.94.1 Detailed Description

Definition at line 104 of file smtp.h.

4.94.2 Field Documentation

4.94.2.1 bool_t smtp_session_t::authenticated

Definition at line 107 of file smtp.h.

Referenced by mail_add_required_headers(), smtp_auth_login(), smtp_auth_plain(), smtp_data(), smtp_mail_from(), and smtp_rcpt_to().

4.94.2.2 bool_t smtp_session_t::bypass

Definition at line 130 of file smtp.h.

Referenced by smtp_accept_message(), smtp_check_greylist(), smtp_init(), and smtp_rcpt_to().

4.94.2.3 struct { ... } smtp_session_t::checked

Referenced by smtp_accept_message(), smtp_bounce(), smtp_rcpt_to(), and smtp_session_reset().

4.94.2.4 int_t smtp_session_t::dkim

Definition at line 122 of file smtp.h.

Referenced by smtp_accept_message(), smtp_bounce(), and smtp_session_reset().

4.94.2.5 bool_t smtp_session_t::esmtp

Definition at line 105 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), smtp_ehlo(), and smtp_helo().

4.94.2.6 stringer_t* smtp_session_t::helo

Definition at line 114 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), smtp_data(), smtp_ehlo(), smtp_helo(), smtp_mail_from(), smtp_rcpt_to(), and smtp_session_destroy().

4.94.2.7 smtp_inbound_prefs_t* smtp_session_t::in_prefs

Definition at line 127 of file smtp.h.

Referenced by mail_add_required_headers(), smtp_add_inbound(), smtp_bounce(), smtp_check_duplicate_recipient(), smtp_data(), smtp_-data_inbound(), smtp_session_destroy(), and smtp_session_reset().

4.94.2.8 uint32_t smtp_session_t::ip_address_v4

Definition at line 117 of file smtp.h.

4.94.2.9 stringer_t* smtp_session_t::mailfrom

Definition at line 115 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_required_headers(), smtp_accept_message(), smtp_bounce(), smtp_data(), smtp_-data_outbound(), smtp_mail_from(), smtp_rcpt_to(), smtp_relay_message(), smtp_session_destroy(), smtp_session_reset(), and smtp_-update_receive_stats().

4.94.2.10 size_t smtp_session_t::max_length

Definition at line 110 of file smtp.h.

Referenced by smtp_auth_login(), smtp_auth_plain(), smtp_data(), smtp_data_read(), smtp_rcpt_to(), and smtp_session_reset().

4.94.2.11 smtp_message_t* smtp_session_t::message

Definition at line 126 of file smtp.h.

Referenced by mail_add_inbound_headers(), mail_add_outbound_headers(), smtp_accept_message(), smtp_bounce(), smtp_data(), smtp_-data_outbound(), smtp_relay_message(), smtp_session_destroy(), and smtp_session_reset().

4.94.2.12 size_t smtp_session_t::num_recipients

Definition at line 111 of file smtp.h.

Referenced by mail_add_outbound_headers(), smtp_add_inbound(), smtp_add_recipient(), smtp_data_inbound(), smtp_data_outbound(), smtp_rcpt_to(), smtp_session_reset(), and smtp_update_transmission_stats().

4.94.2.13 smtp_outbound_prefs_t* smtp_session_t::out_prefs

Definition at line 128 of file smtp.h.

Referenced by mail_add_outbound_headers(), mail_add_required_headers(), smtp_add_outbound(), smtp_add_recipient(), smtp_-data(), smtp_data_outbound(), smtp_rcpt_to(), smtp_relay_message(), smtp_session_destroy(), smtp_session_reset(), and smtp_update_-transmission_stats().

4.94.2.14 int_t smtp_session_t::rbl

Definition at line 120 of file smtp.h.

Referenced by smtp_accept_message(), smtp_rcpt_to(), and smtp_session_reset().

4.94.2.15 int_t smtp_session_t::spf

Definition at line 121 of file smtp.h.

Referenced by smtp_accept_message(), smtp_bounce(), smtp_rcpt_to(), and smtp_session_reset().

4.94.2.16 bool_t smtp_session_t::submission

Definition at line 106 of file smtp.h.

Referenced by submission_init().

Chapter 5

File Documentation

5.1 src/core/buckets/arrays.c File Reference

```
#include "magma.h"
```

Functions

- array_t ∗ ar_alloc (size_t size)

  Allocate an array of a specified number of elements.

- size_t ar_avail_get (array_t ∗array)

  Get the maximum number of elements allocated in an array.

- size_t ar_length_get (array_t ∗array)

  Get the number of elements actively stored in an array.

- uint32_t ar_field_type (array_t ∗array, size_t element)
- stringer_t ∗ ar_field_st (array_t ∗array, size_t element)

  Return the value of an element in an array that holds a managed string.

- chr_t ∗ ar_field_ns (array_t ∗array, size_t element)

  Return the value of an element in an array that holds a null-terminated string.

- array_t ∗ ar_field_ar (array_t ∗array, size_t element)

  Return the value of an element in an array that holds another array.

- placer_t ∗ ar_field_pl (array_t ∗array, size_t element)

  Return the value of an element in an array that holds a placer.

- void ∗ ar_field_ptr (array_t ∗array, size_t element)

  Return the value of an element in an array that holds a pointer.

- void ar_length_set (array_t ∗array, size_t used)

  Manually set the number of used elements in an array.

- int_t ar_append (array_t ∗∗array, uint32_t type, void ∗item)
- void ar_free (array_t ∗array)

  Free an array object and all of its underlying elements.

- array_t * ar_dupe (array_t *array)

  Create a duplicate copy of the array.

5.1.1 Function Documentation

5.1.1.1 array_t* ar_alloc (size_t *size*)

Allocate an array of a specified number of elements. arrays.c

Parameters:

size the number of elements the array is capable of holding.

Returns:

NULL on failure, or a pointer to the newly allocated array on success.

Definition at line 15 of file arrays.c.

References ARRAY_MAX_ELEMENTS, log_error, log_pedantic, and mm_wipe().

Referenced by ar_append(), ar_dupe(), mail_mime_part(), mail_mime_split(), mail_mime_type_parameters(), and meta_data_fetch_-message_tags().

5.1.1.2 int_t ar_append (array_t ** *array*, uint32_t *type*, void * *item*)

Definition at line 294 of file arrays.c.

References ar_alloc(), ar_avail_get(), ar_length_get(), ar_length_set(), ARRAY_TYPE_EMPTY, log_pedantic, mm_free(), and mm_move().

Referenced by ar_dupe(), imap_parse_arguments(), imap_parse_array(), imap_parse_dataitems(), mail_mime_part(), mail_mime_split(), mail_mime_type_parameters(), meta_data_fetch_message_tags(), and portal_smtp_create_data().

5.1.1.3 size_t ar_avail_get (array_t * *array*)

Get the maximum number of elements allocated in an array.

Parameters:

array a pointer to the array to be examined.

Returns:

NULL on failure, or the number of elements the array can hold.

Definition at line 52 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_dupe(), ar_free(), and ar_length_set().

5.1.1.4 array_t* ar_dupe (array_t * *array*)

Create a duplicate copy of the array.

Note:

The new array might not correspond precisely to the layout of the original.
Deep copies will be made of all elements that are also arrays.. Managed strinsg will be copied, but neither empty strings nor pointers will be.

Parameters:

array a pointer to the array to be copied.

Returns:

NULL on failure, or a pointer to the new copy of the array on success.

Definition at line 411 of file arrays.c.

References ar_alloc(), ar_append(), ar_avail_get(), ar_dupe(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_EMPTY, ARRAY_TYPE_-POINTER, ARRAY_TYPE_STRINGER, st_dupe(), and type().

Referenced by ar_dupe(), and meta_message_dupe().

5.1.1.5 array_t∗ ar_field_ar (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds another array.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to an array object with the element's data on success.

Definition at line 182 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_ARRAY, and log_pedantic.

Referenced by imap_fetch_body().

5.1.1.6 chr_t∗ ar_field_ns (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a null-terminated string.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the element's data on success.

Definition at line 153 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_NULLER, and log_pedantic.

5.1.1.7 placer_t∗ ar_field_pl (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a placer.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a placer with the element's data on success.

Definition at line 211 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_PLACER, log_pedantic, and placer_t.

5.1.1.8 void∗ ar_field_ptr (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a pointer.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a generic pointer to the element's data on success.

Definition at line 240 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_POINTER, and log_pedantic.

Referenced by imap_fetch_body_part(), imap_fetch_bodystructure(), mail_mime_free(), mail_mime_generate_boundary(), portal_message_-attachments(), and portal_message_body().

5.1.1.9 stringer_t∗ ar_field_st (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a managed string.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a managed string with the element's data on success.

Definition at line 124 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_STRINGER, and log_pedantic.

Referenced by imap_fetch_bodystructure(), mail_mime_part(), meta_folders_stats_tags(), portal_endpoint_messages_list(), portal_-endpoint_messages_tag(), and portal_message_tags_array().

5.1.1.10 uint32_t ar_field_type (array_t ∗ *array*, size_t *element*)

Definition at line 93 of file arrays.c.

References ar_length_get(), ARRAY_TYPE_EMPTY, and log_pedantic.

Referenced by ar_field_ar(), ar_field_ns(), ar_field_pl(), ar_field_ptr(), ar_field_st(), and imap_fetch_body().

5.1.1.11 void ar_free (array_t ∗ *array*)

Free an array object and all of its underlying elements.

Note:

Array elements that are managed strings, and aren't empty or of ARRAY_TYPE_POINTER will be freed.

Returns:

This function returns no value.

Definition at line 368 of file arrays.c.

References ar_avail_get(), ar_free(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_EMPTY, ARRAY_TYPE_PLACER, ARRAY_TYPE_-POINTER, ARRAY_TYPE_STRINGER, log_pedantic, mm_free(), st_free(), and type().

Referenced by ar_free(), imap_command_parser(), imap_fetch_bodystructure(), imap_parse_arguments(), imap_parse_array(), imap_-session_destroy(), mail_mime_free(), mail_mime_part(), mail_mime_type_parameters(), meta_message_free(), portal_endpoint_messages_-tag(), and portal_smtp_create_data().

5.1.1.12 size_t ar_length_get (array_t * *array*)

Get the number of elements actively stored in an array.

Parameters:

array a pointer to the array to be counted.

Returns:

NULL on failure, or the number of elements currently held in the array.

Definition at line 71 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_field_ar(), ar_field_ns(), ar_field_pl(), ar_field_ptr(), ar_field_st(), ar_field_type(), imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_fetch_body(), imap_-fetch_body_header(), imap_fetch_body_tag(), imap_fetch_bodystructure(), imap_flag_parse(), imap_get_ar_ar(), imap_get_ptr(), imap_-get_st_ar(), imap_get_type_ar(), imap_id(), imap_list(), imap_login(), imap_lsub(), imap_parse_dataitems(), imap_rename(), imap_-search(), imap_search_messages_inner(), imap_select(), imap_status(), imap_store(), imap_subscribe(), mail_mime_free(), mail_-mime_generate_boundary(), mail_mime_part(), mail_mime_type_parameters(), meta_folders_stats_tags(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_message_attachments(), portal_message_tags_array(), and portal_smtp_create_data().

5.1.1.13 void ar_length_set (array_t * *array*, size_t *used*)

Manually set the number of used elements in an array.

Parameters:

array a pointer to the array to be adjusted.

used the new number of elements (less than the array's maximum size) to be set as the array's used length.

Returns:

This function returns no value.

Definition at line 269 of file arrays.c.

References ar_avail_get(), and log_pedantic.

Referenced by ar_append().

Typedefs

- typedef char array_t
- typedef M_POOL_STATUS status_t

Enumerations

- enum M_POOL_STATUS { PL_ERROR = -1, PL_AVAILABLE = 0, PL_RESERVED = 1 }

Functions

- void pool_free (pool_t *pool)

  Free an object pool.

- uint32_t pool_get_count (pool_t *pool)

  Return the total number of items allocated inside a pool.

- uint32_t pool_get_timeout (pool_t *pool)

  Get the timeout value for a pool.

- uint64_t pool_get_failures (pool_t *pool)

  Get the number of failed requests for a pool.

- uint32_t pool_get_available (pool_t *pool)

  Return the total number of items actively available in a pool.

- pool_t * pool_alloc (uint32_t count, uint32_t timeout)

  Allocate a new object pool.

- status_t pool_get_status (pool_t *pool, uint32_t item)

Get the status flag for an item in a pool.

- status_t pool_set_status (pool_t *pool, uint32_t item, status_t status)

  Set the status flag for an item in a pool.

- void pool_release (pool_t *pool, uint32_t item)

  Return an object to a pool and set its status to PL_AVAILABLE.

- void * pool_get_obj (pool_t *pool, uint32_t item)

  Return a specified object from a pool.

- status_t pool_pull (pool_t *pool, uint32_t *item)

  Return the first available object in a pool.

- void * pool_swap_obj (pool_t *pool, uint32_t item, void *object)

  Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

- void * pool_set_obj (pool_t *pool, uint32_t item, void *object)

  Set the object pointer for a given item in a pool.

- array_t * ar_alloc (size_t size)

  arrays.c

- int_t ar_append (array_t **array, uint32_t type, void *item)
- size_t ar_avail_get (array_t *array)

  Get the maximum number of elements allocated in an array.

- array_t * ar_dupe (array_t *array)

  Create a duplicate copy of the array.

- array_t * ar_field_ar (array_t *array, size_t element)

  Return the value of an element in an array that holds another array.

- chr_t * ar_field_ns (array_t *array, size_t element)

  Return the value of an element in an array that holds a null-terminated string.

- placer_t * ar_field_pl (array_t *array, size_t element)

  Return the value of an element in an array that holds a placer.

- void * ar_field_ptr (array_t *array, size_t element)

  Return the value of an element in an array that holds a pointer.

- stringer_t * ar_field_st (array_t *array, size_t element)

  Return the value of an element in an array that holds a managed string.

- uint32_t ar_field_type (array_t *array, size_t element)
- void ar_free (array_t *array)

  Free an array object and all of its underlying elements.

- size_t ar_length_get (array_t *array)

  Get the number of elements actively stored in an array.

- void ar_length_set (array_t *array, size_t used)

Manually set the number of used elements in an array.

- int_t stacker_push (stacker_t *stack, void *data)
  stacked.c
- stacker_t * stacker_alloc (void *free_function)
  Allocate a new instance of a stacked list.
- unsigned long stacker_nodes (stacker_t *stack)
  Get the number of nodes in a stacked list.
- void * stacker_pop (stacker_t *stack)
  Pop the last entry off a stacked list.
- void stacker_free (stacker_t *stack)
  Free a stacked list and all of its underlying data nodes.

5.2.4.3 size_t ar_avail_get (array_t ∗ *array*)

Get the maximum number of elements allocated in an array.

Parameters:

array a pointer to the array to be examined.

Returns:

NULL on failure, or the number of elements the array can hold.

Definition at line 52 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_dupe(), ar_free(), and ar_length_set().

5.2.4.4 array_t∗ ar_dupe (array_t ∗ *array*)

Create a duplicate copy of the array.

Note:

The new array might not correspond precisely to the layout of the original.
Deep copies will be made of all elements that are also arrays.. Managed strinsg will be copied, but neither empty strings nor pointers will be.

Parameters:

array a pointer to the array to be copied.

Returns:

NULL on failure, or a pointer to the new copy of the array on success.

Definition at line 411 of file arrays.c.

References ar_alloc(), ar_append(), ar_avail_get(), ar_dupe(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_EMPTY, ARRAY_TYPE_-POINTER, ARRAY_TYPE_STRINGER, st_dupe(), and type().

Referenced by ar_dupe(), and meta_message_dupe().

5.2.4.5 array_t∗ ar_field_ar (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds another array.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to an array object with the element's data on success.

Definition at line 182 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_ARRAY, and log_pedantic.

Referenced by imap_fetch_body().

5.2.4.6 chr_t∗ ar_field_ns (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a null-terminated string.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the element's data on success.

Definition at line 153 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_NULLER, and log_pedantic.

5.2.4.7 placer_t∗ ar_field_pl (array_t ∗ *array*, size_t *element*)

Return the value of an element in an array that holds a placer.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a placer with the element's data on success.

Definition at line 211 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_PLACER, log_pedantic, and placer_t.

5.2.4.8 void* ar_field_ptr (array_t * *array*, size_t *element*)

Return the value of an element in an array that holds a pointer.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a generic pointer to the element's data on success.

Definition at line 240 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_POINTER, and log_pedantic.

Referenced by imap_fetch_body_part(), imap_fetch_bodystructure(), mail_mime_free(), mail_mime_generate_boundary(), portal_message_-attachments(), and portal_message_body().

5.2.4.9 stringer_t* ar_field_st (array_t * *array*, size_t *element*)

Return the value of an element in an array that holds a managed string.

Parameters:

array a pointer to the array to be examined. element the index of the element in the array to be queried.

Returns:

NULL on failure, or a pointer to a managed string with the element's data on success.

Definition at line 124 of file arrays.c.

References ar_field_type(), ar_length_get(), ARRAY_TYPE_STRINGER, and log_pedantic.

Referenced by imap_fetch_bodystructure(), mail_mime_part(), meta_folders_stats_tags(), portal_endpoint_messages_list(), portal_-endpoint_messages_tag(), and portal_message_tags_array().

5.2.4.10 uint32_t ar_field_type (array_t * *array*, size_t *element*)

Definition at line 93 of file arrays.c.

References ar_length_get(), ARRAY_TYPE_EMPTY, and log_pedantic.

Referenced by ar_field_ar(), ar_field_ns(), ar_field_pl(), ar_field_ptr(), ar_field_st(), and imap_fetch_body().

5.2.4.11 void ar_free (array_t * *array*)

Free an array object and all of its underlying elements.

Note:

Array elements that are managed strings, and aren't empty or of ARRAY_TYPE_POINTER will be freed.

Returns:

This function returns no value.

Definition at line 368 of file arrays.c.

References ar_avail_get(), ar_free(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_EMPTY, ARRAY_TYPE_PLACER, ARRAY_TYPE_-POINTER, ARRAY_TYPE_STRINGER, log_pedantic, mm_free(), st_free(), and type().

Referenced by ar_free(), imap_command_parser(), imap_fetch_bodystructure(), imap_parse_arguments(), imap_parse_array(), imap_-session_destroy(), mail_mime_free(), mail_mime_part(), mail_mime_type_parameters(), meta_message_free(), portal_endpoint_messages_-tag(), and portal_smtp_create_data().

5.2.4.12 size_t ar_length_get (array_t * *array*)

Get the number of elements actively stored in an array.

Parameters:

array a pointer to the array to be counted.

Returns:

NULL on failure, or the number of elements currently held in the array.

Definition at line 71 of file arrays.c.

References log_pedantic.

Referenced by ar_append(), ar_field_ar(), ar_field_ns(), ar_field_pl(), ar_field_ptr(), ar_field_st(), ar_field_type(), imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_fetch_body(), imap_-fetch_body_header(), imap_fetch_body_tag(), imap_fetch_bodystructure(), imap_flag_parse(), imap_get_ar_ar(), imap_get_ptr(), imap_-get_st_ar(), imap_get_type_ar(), imap_id(), imap_list(), imap_login(), imap_lsub(), imap_parse_dataitems(), imap_rename(), imap_-search(), imap_search_messages_inner(), imap_select(), imap_status(), imap_store(), imap_subscribe(), mail_mime_free(), mail_-mime_generate_boundary(), mail_mime_part(), mail_mime_type_parameters(), meta_folders_stats_tags(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_message_attachments(), portal_message_tags_array(), and portal_smtp_create_data().

5.2.4.13 void ar_length_set (array_t * *array*, size_t *used*)

Manually set the number of used elements in an array.

Parameters:

array a pointer to the array to be adjusted.

used the new number of elements (less than the array's maximum size) to be set as the array's used length.

Returns:

This function returns no value.

Definition at line 269 of file arrays.c.

References ar_avail_get(), and log_pedantic.

Referenced by ar_append().

5.2.4.14 pool_t* pool_alloc (uint32_t *count*, uint32_t *timeout*)

Allocate a new object pool.

Parameters:

count the number of items the pool can hold.

timeout a timeout for pool requests in seconds (specify 0 for infinite wait).

Returns:

NULL on failure,

Definition at line 33 of file pool.c.

References pool_t::available, pool_t::count, pool_t::lock, log_info, MAGMA_CORE_POOL_OBJECTS_LIMIT, MAGMA_CORE_POOL_-TIMEOUT_LIMIT, mm_alloc(), mm_free(), mutex_init(), pool_t::objects, pool_t::status, and pool_t::timeout.

Referenced by cache_start(), spf_start(), and sql_start().

5.2.4.15 void pool_free (pool_t * *pool*)

Free an object pool.

Warning:

This function will not free the underlying objects contained by the pool!

Parameters:

pool the pool to be released from memory.

Returns:

This function returns no value.

Definition at line 16 of file pool.c.

References pool_t::available, pool_t::lock, mm_free(), and mutex_destroy().

Referenced by cache_stop(), spf_stop(), and sql_stop().

5.2.4.16 uint32_t pool_get_available (pool_t * *pool*)

Return the total number of items actively available in a pool.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the total number of items actively available in the specified pool.

Definition at line 94 of file pool.c.

References pool_t::available.

5.2.4.17 uint32_t pool_get_count (pool_t * *pool*)

Return the total number of items allocated inside a pool.

Note:

Some of the item slots may be unused, but remain reserved.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the allocation count of the pool on success.

Definition at line 83 of file pool.c.

References pool_t::count.

Referenced by pool_get_obj(), and pool_set_obj().

5.2.4.18 uint64_t pool_get_failures (pool_t ∗ *pool*)

Get the number of failed requests for a pool.

Note:

Most of the time, a failure will correspond to a timeout, but can also be triggered by other error conditions.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the number of failed requests made on the specified pool.

Definition at line 119 of file pool.c.

References pool_t::failures, pool_t::lock, mutex_lock(), and mutex_unlock().

5.2.4.19 void∗ pool_get_obj (pool_t ∗ *pool*, uint32_t *item*)

Return a specified object from a pool.

Parameters:

pool the pool containing the object.

item the identifier of the object to query.

Returns:

NULL on failure, or the object corresponding to the specified item number.

Definition at line 241 of file pool.c.

References pool_t::lock, log_pedantic, mutex_lock(), mutex_unlock(), pool_t::objects, and pool_get_count().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), cache_stop(), dspam_check(), dspam_train(), mail_db_update_message_folder(), pool_swap_obj(), spf_check(), spf_stop(), sql_ping(), sql_query_conn(), sql_stop(), stmt_rebuild(), stmt_start(), tran_commit(), tran_rollback(), and tran_start().

5.2.4.20 status_t pool_get_status (pool_t ∗ *pool*, uint32_t *item*)

Get the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be queried.

Returns:

PL_ERROR on failure; otherwise, the status of the specified item.

Definition at line 139 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, PL_RESERVED, and pool_t::status.

Referenced by pool_pull(), and pool_swap_obj().

5.2.4.21 uint32_t pool_get_timeout (pool_t ∗ *pool*)

Get the timeout value for a pool.

Note:

A timeout of zero will cause threads to wait forever.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the timeout value of the specified pool, in seconds.

Definition at line 107 of file pool.c.

References pool_t::timeout.

5.2.4.22 status_t pool_pull (pool_t ∗ *pool*, uint32_t ∗ *item*)

Return the first available object in a pool.

Note:

If no object can be returned immediately, wait for the pool's configured timeout value, in seconds, for an object to become available. If the timeout is zero, wait indefinitely.

Parameters:

item A pointer to a number that will store the zero-based indexed of the first available item in the pool.

Returns:

PL_RESERVED on success or PL_ERROR if an object couldn't be reserved.

Definition at line 178 of file pool.c.

References pool_t::available, pool_t::count, pool_t::failures, pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, PL_ERROR, PL_RESERVED, pool_get_status(), pool_set_status(), and pool_t::timeout.

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_query(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), and tran_start().

5.2.4.23 void pool_release (pool_t * *pool*, uint32_t *item*)

Return an object to a pool and set its status to PL_AVAILABLE.

Parameters:

pool the pool tracking the returned item.
item the identifier of the item being returned.

Returns:

This function returns no value.

Definition at line 226 of file pool.c.

References pool_t::available, pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_query(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), tran_commit(), tran_rollback(), and tran_start().

5.2.4.24 void* pool_set_obj (pool_t * *pool*, uint32_t *item*, void * *object*)

Set the object pointer for a given item in a pool.

Parameters:

pool the pool containing the specified item.
item the item id to be adjusted.
object the new value of the object corresponding to the specified item.

Returns:

NULL on failure, or a pointer to the object that was set.

Definition at line 267 of file pool.c.

References pool_t::lock, log_pedantic, mutex_lock(), mutex_unlock(), pool_t::objects, and pool_get_count().

Referenced by cache_start(), pool_swap_obj(), spf_start(), and sql_start().

5.2.4.25 status_t pool_set_status (pool_t * *pool*, uint32_t *item*, status_t *status*)

Set the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.
item the identifier of the item to be adjusted.
status the new status for the item.

Returns:

PL_ERROR on failure; otherwise, the new status value of the specified item.

Definition at line 159 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, PL_RESERVED, and pool_t::status.

Referenced by pool_pull(), and pool_release().

5.2.4.26 void* pool_swap_obj (pool_t * *pool*, uint32_t *item*, void * *object*)

Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

Parameters:

pool a pointer to the pool to be modified.

item the zero-based index of the object in the pool to be updated.

object the new value of the object corresponding to the specified item.

Returns:

a pointer to the original pool object's value, or NULL on failure.

LOW: Currently the function loops until the requested object is available. A superior implementation would hook into the release function and detect when the desired object is available and perform the swap at that point.

Definition at line 293 of file pool.c.

References pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, pool_get_obj(), pool_get_status(), and pool_set_obj().

5.2.4.27 stacker_t* stacker_alloc (void * *free_function*)

Allocate a new instance of a stacked list.

Parameters:

free_function if not NULL, a pointer to a function that will be used to free the data underlying each node in the stacked list.

Returns:

NULL on failure, or a pointer to the newly created stack list on success.

Definition at line 46 of file stacked.c.

References stacker_t::free_function, log_pedantic, mm_alloc(), mm_free(), stacker_t::mutex, and mutex_init().

5.2.4.28 void stacker_free (stacker_t * *stack*)

Free a stacked list and all of its underlying data nodes.

Parameters:

stack a pointer to the stacked list to be freed.

Returns:

This function returns no value.

Definition at line 15 of file stacked.c.

References stacker_node_t::data, stacker_t::free_function, stacker_t::list, mm_free(), stacker_t::mutex, mutex_destroy(), and stacker_node_t::next.

5.2.4.29 unsigned long stacker_nodes (stacker_t * *stack*)

Get the number of nodes in a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

the number of nodes currently held by the specified stacked list.

Definition at line 75 of file stacked.c.

References stacker_t::items, stacker_t::mutex, mutex_lock(), and mutex_unlock().

5.2.4.30 void∗ stacker_pop (stacker_t ∗ *stack*)

Pop the last entry off a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

NULL on failure or the value of the last node in the stacked list.

Definition at line 141 of file stacked.c.

References stacker_node_t::data, stacker_t::items, stacker_t::last, stacker_t::list, mm_free(), stacker_t::mutex, mutex_lock(), mutex_unlock(), and stacker_node_t::next.

5.2.4.31 int_t stacker_push (stacker_t ∗ *stack*, void ∗ *data*)

stacked.c stacked.c

Parameters:

stack a pointer to the stacked list to be updated.

data a pointer to the data to associated with the new stacked list node.

Returns:

0 on failure or 1 on success.

Definition at line 96 of file stacked.c.

References stacker_node_t::data, stacker_t::items, stacker_t::last, stacker_t::list, log_error, log_pedantic, mm_alloc(), stacker_t::mutex, mutex_lock(), mutex_unlock(), and stacker_node_t::next.

5.3 src/core/buckets/pool.c File Reference

```
#include "magma.h"
```

Functions

- void pool_free (pool_t *pool)
  Free an object pool.
- pool_t * pool_alloc (uint32_t count, uint32_t timeout)
  Allocate a new object pool.
- uint32_t pool_get_count (pool_t *pool)
  Return the total number of items allocated inside a pool.
- uint32_t pool_get_available (pool_t *pool)
  Return the total number of items actively available in a pool.
- uint32_t pool_get_timeout (pool_t *pool)
  Get the timeout value for a pool.
- uint64_t pool_get_failures (pool_t *pool)
  Get the number of failed requests for a pool.
- status_t pool_get_status (pool_t *pool, uint32_t item)
  Get the status flag for an item in a pool.
- status_t pool_set_status (pool_t *pool, uint32_t item, status_t status)
  Set the status flag for an item in a pool.
- status_t pool_pull (pool_t *pool, uint32_t *item)
  Return the first available object in a pool.
- void pool_release (pool_t *pool, uint32_t item)
  Return an object to a pool and set its status to PL_AVAILABLE.
- void * pool_get_obj (pool_t *pool, uint32_t item)
  Return a specified object from a pool.
- void * pool_set_obj (pool_t *pool, uint32_t item, void *object)
  Set the object pointer for a given item in a pool.
- void * pool_swap_obj (pool_t *pool, uint32_t item, void *object)
  Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

5.3.1 Function Documentation

5.3.1.1 pool_t* pool_alloc (uint32_t *count*, uint32_t *timeout*)

Allocate a new object pool.

Parameters:

count the number of items the pool can hold.

timeout a timeout for pool requests in seconds (specify 0 for infinite wait).

Returns:

NULL on failure,

Definition at line 33 of file pool.c.

References pool_t::available, pool_t::count, pool_t::lock, log_info, MAGMA_CORE_POOL_OBJECTS_LIMIT, MAGMA_CORE_POOL_-TIMEOUT_LIMIT, mm_alloc(), mm_free(), mutex_init(), pool_t::objects, pool_t::status, and pool_t::timeout.

Referenced by cache_start(), spf_start(), and sql_start().

5.3.1.2 void pool_free (pool_t ∗ *pool*)

Free an object pool.

Warning:

This function will not free the underlying objects contained by the pool!

Parameters:

pool the pool to be released from memory.

Returns:

This function returns no value.

Definition at line 16 of file pool.c.

References pool_t::available, pool_t::lock, mm_free(), and mutex_destroy().

Referenced by cache_stop(), spf_stop(), and sql_stop().

5.3.1.3 uint32_t pool_get_available (pool_t ∗ *pool*)

Return the total number of items actively available in a pool.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the total number of items actively available in the specified pool.

Definition at line 94 of file pool.c.

References pool_t::available.

5.3.1.4 uint32_t pool_get_count (pool_t ∗ *pool*)

Return the total number of items allocated inside a pool.

Note:

Some of the item slots may be unused, but remain reserved.

Parameters:

pool the pool to be queried.

Returns:

0 on failure, or the allocation count of the pool on success.

Definition at line 83 of file pool.c.

References pool_t::count.

Referenced by pool_get_obj(), and pool_set_obj().

5.3.1.5 uint64_t pool_get_failures (pool_t ∗ *pool*)

Get the number of failed requests for a pool.

Note:

Most of the time, a failure will correspond to a timeout, but can also be triggered by other error conditions.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the number of failed requests made on the specified pool.

Definition at line 119 of file pool.c.

References pool_t::failures, pool_t::lock, mutex_lock(), and mutex_unlock().

5.3.1.6 void∗ pool_get_obj (pool_t ∗ *pool*, uint32_t *item*)

Return a specified object from a pool.

Parameters:

pool the pool containing the object.

item the identifier of the object to query.

Returns:

NULL on failure, or the object corresponding to the specified item number.

Definition at line 241 of file pool.c.

References pool_t::lock, log_pedantic, mutex_lock(), mutex_unlock(), pool_t::objects, and pool_get_count().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), cache_stop(), dspam_check(), dspam_train(), mail_db_update_message_folder(), pool_swap_obj(), spf_check(), spf_stop(), sql_ping(), sql_query_conn(), sql_stop(), stmt_rebuild(), stmt_start(), tran_commit(), tran_rollback(), and tran_start().

5.3.1.7 status_t pool_get_status (pool_t ∗ *pool*, uint32_t *item*)

Get the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.

item the identifier of the item to be queried.

Returns:

PL_ERROR on failure; otherwise, the status of the specified item.

Definition at line 139 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, PL_RESERVED, and pool_t::status.

Referenced by pool_pull(), and pool_swap_obj().

5.3.1.8 uint32_t pool_get_timeout (pool_t ∗ *pool*)

Get the timeout value for a pool.

Note:

A timeout of zero will cause threads to wait forever.

Parameters:

pool a pointer to the pool to be examined.

Returns:

the timeout value of the specified pool, in seconds.

Definition at line 107 of file pool.c.

References pool_t::timeout.

5.3.1.9 status_t pool_pull (pool_t ∗ *pool*, uint32_t ∗ *item*)

Return the first available object in a pool.

Note:

If no object can be returned immediately, wait for the pool's configured timeout value, in seconds, for an object to become available. If the timeout is zero, wait indefinitely.

Parameters:

item A pointer to a number that will store the zero-based indexed of the first available item in the pool.

Returns:

PL_RESERVED on success or PL_ERROR if an object couldn't be reserved.

Definition at line 178 of file pool.c.

References pool_t::available, pool_t::count, pool_t::failures, pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, PL_ERROR, PL_RESERVED, pool_get_status(), pool_set_status(), and pool_t::timeout.

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_query(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), and tran_start().

5.3.1.10 void pool_release (pool_t * *pool*, uint32_t *item*)

Return an object to a pool and set its status to PL_AVAILABLE.

Parameters:

pool the pool tracking the returned item.
item the identifier of the item being returned.

Returns:

This function returns no value.

Definition at line 226 of file pool.c.

References pool_t::available, pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, and pool_set_status().

Referenced by cache_add(), cache_append(), cache_decrement(), cache_delete(), cache_flush(), cache_get(), cache_get_u64(), cache_increment(), cache_set(), cache_set_u64(), cache_silent_add(), dspam_check(), dspam_train(), spf_check(), sql_query(), stmt_exec(), stmt_exec_affected(), stmt_get_result(), stmt_insert(), tran_commit(), tran_rollback(), and tran_start().

5.3.1.11 void* pool_set_obj (pool_t * *pool*, uint32_t *item*, void * *object*)

Set the object pointer for a given item in a pool.

Parameters:

pool the pool containing the specified item.
item the item id to be adjusted.
object the new value of the object corresponding to the specified item.

Returns:

NULL on failure, or a pointer to the object that was set.

Definition at line 267 of file pool.c.

References pool_t::lock, log_pedantic, mutex_lock(), mutex_unlock(), pool_t::objects, and pool_get_count().

Referenced by cache_start(), pool_swap_obj(), spf_start(), and sql_start().

5.3.1.12 status_t pool_set_status (pool_t * *pool*, uint32_t *item*, status_t *status*)

Set the status flag for an item in a pool.

Note:

A value of PL_AVAILABLE indicates the object is available for use,; PL_RESERVED indicates the object is in use by a worker thread.

Parameters:

pool the pool containing the specified item.
item the identifier of the item to be adjusted.
status the new status for the item.

Returns:

PL_ERROR on failure; otherwise, the new status value of the specified item.

Definition at line 159 of file pool.c.

References log_check, log_pedantic, PL_AVAILABLE, PL_ERROR, PL_RESERVED, and pool_t::status.

Referenced by pool_pull(), and pool_release().

5.3.1.13 void* pool_swap_obj (pool_t * *pool*, uint32_t *item*, void * *object*)

Wait to acquire the value of an object in a pool, and return the original value while updating it with a new value.

Parameters:

pool a pointer to the pool to be modified.

item the zero-based index of the object in the pool to be updated.

object the new value of the object corresponding to the specified item.

Returns:

a pointer to the original pool object's value, or NULL on failure.

LOW: Currently the function loops until the requested object is available. A superior implementation would hook into the release function and detect when the desired object is available and perform the swap at that point.

Definition at line 293 of file pool.c.

References pool_t::lock, mutex_lock(), mutex_unlock(), PL_AVAILABLE, pool_get_obj(), pool_get_status(), and pool_set_obj().

5.4 src/core/buckets/stacked.c File Reference

```
#include "magma.h"
```

Functions

- void stacker_free (stacker_t *stack)
  Free a stacked list and all of its underlying data nodes.
- stacker_t * stacker_alloc (void *free_function)
  Allocate a new instance of a stacked list.
- uint64_t stacker_nodes (stacker_t *stack)
  Get the number of nodes in a stacked list.
- int_t stacker_push (stacker_t *stack, void *data)
  Push a new entry onto the end of a stacked list.
- void * stacker_pop (stacker_t *stack)
  Pop the last entry off a stacked list.

5.4.1 Function Documentation

5.4.1.1 stacker_t* stacker_alloc (void * *free_function*)

Allocate a new instance of a stacked list.

Parameters:

free_function if not NULL, a pointer to a function that will be used to free the data underlying each node in the stacked list.

Returns:

NULL on failure, or a pointer to the newly created stack list on success.

Definition at line 46 of file stacked.c.

References stacker_t::free_function, log_pedantic, mm_alloc(), mm_free(), stacker_t::mutex, and mutex_init().

5.4.1.2 void stacker_free (stacker_t * *stack*)

Free a stacked list and all of its underlying data nodes.

Parameters:

stack a pointer to the stacked list to be freed.

Returns:

This function returns no value.

Definition at line 15 of file stacked.c.

References stacker_node_t::data, stacker_t::free_function, stacker_t::list, mm_free(), stacker_t::mutex, mutex_destroy(), and stacker_node_t::next.

5.4.1.3 uint64_t stacker_nodes (stacker_t * *stack*)

Get the number of nodes in a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

the number of nodes currently held by the specified stacked list.

Definition at line 75 of file stacked.c.

References stacker_t::items, stacker_t::mutex, mutex_lock(), and mutex_unlock().

5.4.1.4 void* stacker_pop (stacker_t * *stack*)

Pop the last entry off a stacked list.

Parameters:

stack a pointer to the stacked list to be queried.

Returns:

NULL on failure or the value of the last node in the stacked list.

Definition at line 141 of file stacked.c.

References stacker_node_t::data, stacker_t::items, stacker_t::last, stacker_t::list, mm_free(), stacker_t::mutex, mutex_lock(), mutex_unlock(), and stacker_node_t::next.

5.4.1.5 int_t stacker_push (stacker_t * *stack*, void * *data*)

Push a new entry onto the end of a stacked list. stacked.c

Parameters:

stack a pointer to the stacked list to be updated.

data a pointer to the data to associated with the new stacked list node.

Returns:

0 on failure or 1 on success.

Definition at line 96 of file stacked.c.

References stacker_node_t::data, stacker_t::items, stacker_t::last, stacker_t::list, log_error, log_pedantic, mm_alloc(), stacker_t::mutex, mutex_lock(), mutex_unlock(), and stacker_node_t::next.

5.5 src/core/checksum/adler.c File Reference

```
#include "magma.h"
```

Functions

- uint32_t hash_adler32 (void *buffer, size_t length)

  Return an Adler-32 hash of the specified data.

5.5.1 Function Documentation

5.5.1.1 uint32_t hash_adler32 (void * *buffer*, size_t *length*)

Return an Adler-32 hash of the specified data.

Parameters:

buffer a pointer to the data to be hashed.

length the length, in bytes, of the data to be hashed.

Returns:

a 32 bit number containing the Adler-32 hash of the data.

Definition at line 16 of file adler.c.

Referenced by compress_bzip(), compress_import(), compress_lzo(), compress_zlib(), decompress_bzip(), decompress_lzo(), decompress_zlib(), deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), deprecated_scramble_import(), scramble_decrypt(), scramble_encrypt(), and scramble_import().

5.6 src/core/checksum/checksum.h File Reference

Functions

- uint32_t crc24_init (void)

  crc.c

- uint32_t crc24_final (uint32_t crc)
- uint32_t crc24_checksum (void ∗buffer, size_t length)

  Generate a 24-bit CRC value for the Privacy Enhanced Message format.

- uint32_t crc32_checksum (void ∗buffer, size_t length)

  Get 32-bit CRC value for a specified block of data.

- uint64_t crc64_checksum (void ∗buffer, size_t length)

  Get 64-bit CRC value for a specified block of data.

- uint32_t crc24_update (void ∗buffer, size_t length, uint32_t crc)
- uint32_t crc32_update (void ∗buffer, size_t length, uint32_t crc)

  Update a 32-bit CRC value with a check of additional data.

- uint64_t crc64_update (void ∗buffer, size_t length, uint64_t crc)

  Update a 64-bit CRC value with a check of additional data.

- uint32_t hash_adler32 (void ∗buffer, size_t length)

  Return an Adler-32 hash of the specified data.

- uint32_t hash_murmur32 (void ∗buffer, size_t length)

  Generate a 32-bit Murmur hash of a block of data.

- uint64_t hash_murmur64 (void ∗buffer, size_t length)

  Generate a 64-bit Murmur hash of a block of data.

- uint32_t hash_fletcher32 (void ∗buffer, size_t length)

  Computer a 32-bit Fletcher hash for a block of data.

5.6.1 Function Documentation

5.6.1.1 uint32_t crc24_checksum (void ∗ *buffer*, size_t *length*)

Generate a 24-bit CRC value for the Privacy Enhanced Message format.

Note:

This function uses the predefined initial value and polynomial defined in RFC 4880.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the updated 24-bit CRC value in a 32-bit unsigned integer.

Definition at line 59 of file crc.c.

References crc24_final(), crc24_init(), and CRC24_POLY.

Referenced by prime_pem_unwrap(), and prime_pem_wrap().

5.6.1.2 uint32_t crc24_final (uint32_t *crc*)

Definition at line 48 of file crc.c.

Referenced by crc24_checksum().

5.6.1.3 uint32_t crc24_init (void)

crc.c

Definition at line 26 of file crc.c.

References CRC24_INIT.

Referenced by crc24_checksum().

5.6.1.4 uint32_t crc24_update (void ∗ *buffer*, size_t *length*, uint32_t *crc*)

Definition at line 30 of file crc.c.

References CRC24_POLY.

5.6.1.5 uint32_t crc32_checksum (void ∗ *buffer*, size_t *length*)

Get 32-bit CRC value for a specified block of data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the 32-bit CRC value of the specified data.

Definition at line 115 of file crc.c.

References crc32_update().

5.6.1.6 uint32_t crc32_update (void ∗ *buffer*, size_t *length*, uint32_t *crc*)

Update a 32-bit CRC value with a check of additional data.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

crc the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 32-bit CRC value of the specified data.

Definition at line 83 of file crc.c.

References A, B, C, crc32_table, D, and S8.

Referenced by crc32_checksum().

5.6.1.7 uint64_t crc64_checksum (void ∗ *buffer*, size_t *length*)

Get 64-bit CRC value for a specified block of data.

Parameters:

buffer a pointer to the data to be checked.
length the length, in bytes, of the input buffer.

Returns:

the 64-bit CRC value of the specified data.

Definition at line 156 of file crc.c.

References crc64_update().

Referenced by smtp_bounce(), and smtp_reply().

5.6.1.8 uint64_t crc64_update (void ∗ *buffer*, size_t *length*, uint64_t *crc*)

Update a 64-bit CRC value with a check of additional data.

Parameters:

buffer a pointer to the data to be checked.
length the length, in bytes, of the input buffer.
crc the previously computed CRC value, or 0 if this is the initial pass.

Returns:

the updated 64-bit CRC value of the specified data.

Definition at line 126 of file crc.c.

References A, A1, B, C, crc64_table, D, S32, and S8.

Referenced by crc64_checksum().

5.6.1.9 uint32_t hash_adler32 (void ∗ *buffer*, size_t *length*)

Return an Adler-32 hash of the specified data.

Parameters:

buffer a pointer to the data to be hashed.
length the length, in bytes, of the data to be hashed.

Returns:

a 32 bit number containing the Adler-32 hash of the data.

Definition at line 16 of file adler.c.

Referenced by compress_bzip(), compress_import(), compress_lzo(), compress_zlib(), decompress_bzip(), decompress_lzo(), decompress_zlib(), deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), deprecated_scramble_import(), scramble_decrypt(), scramble_encrypt(), and scramble_import().

5.6.1.10 uint32_t hash_fletcher32 (void * *buffer*, size_t *length*)

Computer a 32-bit Fletcher hash for a block of data.

Parameters:

buffer a pointer to the data buffer to be checked.

length the length, in bytes, of the data to be checked.

Returns:

a 32-bit number containing the Fletcher hash of the specified data.

Definition at line 16 of file fletcher.c.

Referenced by hashed_bucket().

5.6.1.11 uint32_t hash_murmur32 (void * *buffer*, size_t *length*)

Generate a 32-bit Murmur hash of a block of data.

Parameters:

buffer a pointer to the block of data to be hashed.

length the length, in bytes, of the block of data to be hashed.

Returns:

the 32-bit value of the Murmur hash of the specified block of data.

Definition at line 17 of file murmur.c.

References data.

5.6.1.12 uint64_t hash_murmur64 (void * *buffer*, size_t *length*)

Generate a 64-bit Murmur hash of a block of data.

Parameters:

buffer a pointer to the block of data to be hashed.

length the length, in bytes, of the block of data to be hashed.

Returns:

the 64-bit value of the Murmur hash of the specified block of data.

Definition at line 72 of file murmur.c.

References data.

  Generate a 64-bit Murmur hash of a block of data.

5.9.1 Function Documentation

5.9.1.1 uint32_t hash_murmur32 (void ∗ *buffer*, size_t *length*)

Generate a 32-bit Murmur hash of a block of data.

Parameters:

buffer a pointer to the block of data to be hashed.

length the length, in bytes, of the block of data to be hashed.

Returns:

the 32-bit value of the Murmur hash of the specified block of data.

Definition at line 17 of file murmur.c.

References data.

5.9.1.2 uint64_t hash_murmur64 (void ∗ *buffer*, size_t *length*)

Generate a 64-bit Murmur hash of a block of data.

Parameters:

buffer a pointer to the block of data to be hashed.

length the length, in bytes, of the block of data to be hashed.

Returns:

the 64-bit value of the Murmur hash of the specified block of data.

Definition at line 72 of file murmur.c.

References data.

5.10 src/core/classify/ascii.c File Reference

```
#include "magma.h"
```

Functions

- bool_t chr_ascii (uchr_t c)

  Determine whether a specified character is an ASCII character.

- bool_t chr_printable (uchr_t c)

  Determine whether a specified character is a printable character.

- bool_t chr_alphanumeric (uchr_t c)

  Determine whether a specified character is alpha-numeric.

- bool_t chr_lower (uchr_t c)

  Determine whether a specified character is a lowercase character.

- bool_t chr_upper (uchr_t c)

  Determine whether a specified character is an uppercase character.

- bool_t chr_numeric (uchr_t c)

  Determine whether a specified character is a numeric character.

- bool_t chr_punctuation (uchr_t c)

  Determine whether a specified character is a punctuation character.

- bool_t chr_blank (uchr_t c)

  Determine whether a specified character is a blank character (space or tab).

- bool_t chr_whitespace (uchr_t c)

  Determine whether a specified character is a whitespace character (blank or).

- bool_t chr_is_class (uchr_t c, uchr_t *chrs, size_t chrlen)

  Determine whether a character belongs to a custom set of values.

5.10.1 Function Documentation

5.10.1.1 bool_t chr_alphanumeric (uchr_t *c*)

Determine whether a specified character is alpha-numeric. ascii.c

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 43 of file ascii.c.

5.10.1.2 bool_t chr_ascii (uchr_t *c*)

Determine whether a specified character is an ASCII character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 15 of file ascii.c.

5.10.1.3 bool_t chr_blank (uchr_t *c*)

Determine whether a specified character is a blank character (space or tab).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 113 of file ascii.c.

5.10.1.4 bool_t chr_is_class (uchr_t *c*, uchr_t * *chrs*, size_t *chrlen*)

Determine whether a character belongs to a custom set of values.

Parameters:

c the character to be verified.

chrs a pointer to a buffer containing the family of valid character values.

chrlen the number of characters in the testing set.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 143 of file ascii.c.

5.10.1.5 bool_t chr_lower (uchr_t *c*)

Determine whether a specified character is a lowercase character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 57 of file ascii.c.

5.10.1.6 bool_t chr_numeric (uchr_t *c*)

Determine whether a specified character is a numeric character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 85 of file ascii.c.

Referenced by process_find_pid(), and process_kill().

5.10.1.7 bool_t chr_printable (uchr_t *c*)

Determine whether a specified character is a printable character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 29 of file ascii.c.

Referenced by contact_validate_detail(), contact_validate_name(), and hex_encode_st_debug().

5.10.1.8 bool_t chr_punctuation (uchr_t *c*)

Determine whether a specified character is a punctuation character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 99 of file ascii.c.

5.10.1.9 bool_t chr_upper (uchr_t *c*)

Determine whether a specified character is an uppercase character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 71 of file ascii.c.

5.10.1.10 bool_t chr_whitespace (uchr_t *c*)

Determine whether a specified character is a whitespace character (blank or

).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 127 of file ascii.c.

Referenced by auth_sanitize_address(), and imap_command_log_safe().

  Determine whether a character belongs to a custom set of values.

5.11.1 Function Documentation

5.11.1.1 bool_t chr_alphanumeric (uchr_t *c*)

ascii.c ascii.c

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 43 of file ascii.c.

5.11.1.2 bool_t chr_ascii (uchr_t *c*)

Determine whether a specified character is an ASCII character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 15 of file ascii.c.

5.11.1.3 bool_t chr_blank (uchr_t *c*)

Determine whether a specified character is a blank character (space or tab).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 113 of file ascii.c.

5.11.1.4 bool_t chr_is_class (uchr_t *c*, uchr_t * *chrs*, size_t *chrlen*)

Determine whether a character belongs to a custom set of values.

Parameters:

c the character to be verified.

chrs a pointer to a buffer containing the family of valid character values.

chrlen the number of characters in the testing set.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 143 of file ascii.c.

5.11.1.5 bool_t chr_lower (uchr_t *c*)

Determine whether a specified character is a lowercase character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 57 of file ascii.c.

5.11.1.6 bool_t chr_numeric (uchr_t *c*)

Determine whether a specified character is a numeric character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 85 of file ascii.c.

Referenced by process_find_pid(), and process_kill().

5.11.1.7 bool_t chr_printable (uchr_t *c*)

Determine whether a specified character is a printable character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 29 of file ascii.c.

Referenced by contact_validate_detail(), contact_validate_name(), and hex_encode_st_debug().

5.11.1.8 bool_t chr_punctuation (uchr_t *c*)

Determine whether a specified character is a punctuation character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 99 of file ascii.c.

5.11.1.9 bool_t chr_upper (uchr_t *c*)

Determine whether a specified character is an uppercase character.

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 71 of file ascii.c.

5.11.1.10 bool_t chr_whitespace (uchr_t *c*)

Determine whether a specified character is a whitespace character (blank or

).

Parameters:

c the character to be verified.

Returns:

true if the character passed the test, or false otherwise.

Definition at line 127 of file ascii.c.

Referenced by auth_sanitize_address(), and imap_command_log_safe().

5.12.1 Function Documentation

5.12.1.1 int_t mm_cmp_ci_eq (void * *a*, void * *b*, size_t *len*)

equal.c equal.c

Parameters:

a a pointer to the first buffer in memory to be compared.

b a pointer to the second buffer in memory to be compared.

len the length, in bytes, of the comparison that is to take place.

Returns:

-1 if a < b, 1 if b < a, or 0 if the two memory blocks are equal.

Definition at line 52 of file equal.c.

References lower_chr(), and mm_empty().

Referenced by imap_fetch_body_header(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_discover_encoding(), mail_discover_type(), mail_header_fetch_all(), mail_headers(), mail_message(), mail_message_cleanup(), mail_mime_encoding(), and mail_mime_type().

5.12.1.2 int_t mm_cmp_cs_eq (void * *a*, void * *b*, size_t *len*)

Perform a case-sensitive comparison of two memory blocks.

Parameters:

a a pointer to the first buffer in memory to be compared.

b a pointer to the second buffer in memory to be compared.

len the length, in bytes, of the comparison that is to take place.

Returns:

-1 if a < b, 1 if b < a, or 0 if the two memory blocks are equal.

Definition at line 17 of file equal.c.

References mm_empty().

Referenced by args_parse(), mail_get_chunk(), mail_mime_child(), mail_mime_count(), and mail_mime_get_media_type().

5.12.1.3 int_t st_cmp_ci_ends (stringer_t * *s*, stringer_t * *ends*)

ends.c ends.c

Note:

The value of the result depends on a backwards character comparison pattern, not a forward one.

Parameters:

s the managed string to have its ending characters examined.

ends the managed string to be compared against the end of s.

Returns:

-1 if s < ends, 1 if ends < s or 0 if s ends with the content of ends.

Definition at line 60 of file ends.c.

References lower_chr(), and st_empty_out().

Referenced by http_content_load_fonts(), http_load_file(), and register_captcha_random_font().

5.12.1.4 int_t st_cmp_ci_eq (stringer_t * *a*, stringer_t * *b*)

Perform a case-insensitive comparison of two managed strings.

Parameters:

a the first managed string to be compared.

b the second managed string to be compared.

Returns:

-1 if a < b, 1 if b < a, or 0 if the two memory blocks are equal.

Definition at line 126 of file equal.c.

References lower_chr(), and st_empty_out().

5.12.1.5 int_t st_cmp_ci_starts (stringer_t * *s*, stringer_t * *starts*)

starts.c starts.c

Parameters:

s the managed string to have its beginning characters examined.

starts the managed string to be compared against the beginning of s.

Returns:

-1 if s < starts, 1 if starts < s or 0 if s begins with starts.

Definition at line 54 of file starts.c.

References lower_chr(), and st_empty_out().

Referenced by cache_config(), config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), dmtp_compare(), http_parse_context(), http_parse_method(), http_parse_origin(), http_response(), imap_compare(), mail_add_forward_headers(), mail_count_received(), mail_header_fetch_cleaned(), mail_mod_subject(), molten_compare(), pop_compare(), portal_endpoint_cookies(), register_abuse_check_blocklist(), relay_config(), servers_config(), smtp_compare(), smtp_parse_mail_from_path(), and virus_check().

5.12.1.6 int_t st_cmp_cs_ends (stringer_t * *s*, stringer_t * *ends*)

Perform a case-sensitive check to see if one string ends in another, comparing backwards.

Note:

The value of the result depends on a backwards character comparison pattern, not a forward one.

Parameters:

s the managed string to have its ending characters examined.

ends the managed string to be compared against the end of s.

Returns:

-1 if s < ends, 1 if ends < s or 0 if s ends with the content of ends.

Definition at line 17 of file ends.c.

References st_empty_out().

Referenced by folder_count(), http_content_load_directory(), http_content_load_fonts(), http_content_start(), http_load_file(), smtp_client_send_data(), and stats_sum_errors().

5.12.1.7 int_t st_cmp_cs_eq (stringer_t * *a*, stringer_t * *b*)

Perform a case-sensitive comparison of two managed strings.

Parameters:

a the first managed string to be compared.

b the second managed string to be compared.

Returns:

-1 if a < b, 1 if b < a, or 0 if the two memory blocks are equal.

Definition at line 85 of file equal.c.

References st_empty_out().

5.12.1.8 int_t st_cmp_cs_starts (stringer_t * *s*, stringer_t * *starts*)

Perform a case-sensitive check to see if one string starts with another.

Parameters:

s the managed string to have its beginning characters examined.

starts the managed string to be compared against the beginning of s.

Returns:

-1 if s < starts, 1 if starts < s or 0 if s begins with starts.

Definition at line 16 of file starts.c.

References st_empty_out().

Referenced by http_response(), imap_parse_dataitems(), mail_add_forward_headers(), process_kill(), st_replace(), stats_sum_errors(), and teacher_process().

5.12.1.9 bool_t st_search_chr (stringer_t * *haystack*, chr_t *needle*, size_t * *location*)

Search for a character inside of a managed string, and save its location.

Parameters:

haystack the managed string to be searched.

needle the character to be found in the string.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the specified character was found or false otherwise.

Definition at line 117 of file search.c.

References log_pedantic, and st_empty_out().

Referenced by auth_data_fetch().

5.12.1.10 bool_t st_search_ci (stringer_t * *haystack*, stringer_t * *needle*, size_t * *location*)

search.c search.c

Parameters:

haystack the managed string to be searched.

needle the managed string to be found.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the string is found or false otherwise.

Definition at line 68 of file search.c.

References log_pedantic, lower_chr(), and st_empty_out().

Referenced by imap_command_log_safe(), imap_search_messages_body(), imap_search_messages_header(), imap_search_messages_text(), mail_get_boundary(), mail_mime_boundary(), mail_mime_generate_boundary(), and pattern_check().

5.12.1.11 bool_t st_search_cs (stringer_t * *haystack*, stringer_t * *needle*, size_t * *location*)

Search one managed string for an occurrence of another in a case-sensitive manner, and save its location.

Parameters:

haystack the managed string to be searched.

needle the managed string to be found.

location if not NULL, a pointer to store the index of needle if found, or 0 on no match.

Returns:

true if the string is found or false otherwise.

Definition at line 17 of file search.c.

```

Functions

- int_t st_cmp_cs_starts (stringer_t *s, stringer_t *starts)

  Perform a case-sensitive check to see if one string starts with another.

- int_t st_cmp_ci_starts (stringer_t *s, stringer_t *starts)

  Perform a case-insensitive check to see if one string starts with another.

5.17.1 Function Documentation

5.17.1.1 int_t st_cmp_ci_starts (stringer_t * *s*, stringer_t * *starts*)

Perform a case-insensitive check to see if one string starts with another. starts.c

Parameters:

s the managed string to have its beginning characters examined.

starts the managed string to be compared against the beginning of s.

Returns:

-1 if s < starts, 1 if starts < s or 0 if s begins with starts.

Definition at line 54 of file starts.c.

References lower_chr(), and st_empty_out().

Referenced by cache_config(), config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), dmtp_compare(), http_parse_context(), http_parse_method(), http_parse_origin(), http_response(), imap_compare(), mail_add_forward_headers(), mail_count_received(), mail_header_fetch_cleaned(), mail_mod_subject(), molten_compare(), pop_compare(), portal_endpoint_cookies(), register_abuse_check_blocklist(), relay_config(), servers_config(), smtp_compare(), smtp_parse_mail_from_path(), and virus_check().

5.17.1.2 int_t st_cmp_cs_starts (stringer_t * *s*, stringer_t * *starts*)

Perform a case-sensitive check to see if one string starts with another.

Parameters:

s the managed string to have its beginning characters examined.

starts the managed string to be compared against the beginning of s.

Returns:

-1 if s < starts, 1 if starts < s or 0 if s begins with starts.

Definition at line 16 of file starts.c.

5.18.3 Enumeration Type Documentation

5.18.3.1 anonymous enum

Enumerator:

EMPTY

Definition at line 157 of file core.h.

5.18.3.2 enum M_TYPE

Different types used throughout.

Enumerator:

M_TYPE_EMPTY

M_TYPE_MULTI M_TYPE_MULTI is multi_t.

M_TYPE_ENUM M_TYPE_ENUM is enum.

M_TYPE_BOOLEAN M_TYPE_BOOLEAN is bool_t.

M_TYPE_BLOCK M_TYPE_BLOCK is void pointer.

M_TYPE_NULLER M_TYPE_NULLER is char pointer.

M_TYPE_PLACER M_TYPE_PLACER is placer_t struct.
M_TYPE_STRINGER M_TYPE_STRINGER is stringer_t pointer.
M_TYPE_INT8 M_TYPE_INT8 is int8_t.
M_TYPE_INT16 M_TYPE_INT16 is int16_t.
M_TYPE_INT32 M_TYPE_INT32 is int32_t.
M_TYPE_INT64 M_TYPE_INT64 is int64_t.
M_TYPE_UINT8 M_TYPE_UINT8 is uint8_t.
M_TYPE_UINT16 M_TYPE_UINT16 is uint16_t.
M_TYPE_UINT32 M_TYPE_UINT32 is uint32_t.
M_TYPE_UINT64 M_TYPE_UINT64 is uint64_t.
M_TYPE_FLOAT M_TYPE_FLOAT is float.
M_TYPE_DOUBLE M_TYPE_DOUBLE is double.

Definition at line 136 of file core.h.

5.18.4 Function Documentation

5.18.4.1 struct __attribute__ ((packed)) [read]

< The type of the rr set covered by this record.

< The numerical id of the cryptographic algorithm used to generate the signature.

< The number of labels in the original RRSIG RR owner name.

< The original TTL of the covered rrset as it appears in the authoritative zone.

< The expiration date after which the RRSIG record must not be used for authentication.

< The inception date before which the RRSIG record must not be used for authentication.

< A tag (selector) identifying the corresponding DNSKEY RR (which isn't necessarily unique) that validates this record.

< A label identifying the owner name of the DNSKEY RR validating this signature (must not use name compression).

Definition at line 94 of file core.h.

5.18.4.2 char* type (M_TYPE *type*)

Takes a type code and returns the fully enumerated string associated with that type.

Parameters:

type The type code to evaluate.

Returns:

Null terminated string containing type name. String is stored in static buffer and returned as a pointer.

Definition at line 17 of file type.c.

Functions

- size_t base64_encoded_length_mod (size_t length)

  TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().

- size_t base64_encoded_length (size_t length)
- size_t base64_encoded_length_wrap (size_t length, size_t wrap, base64_wrap_t type)

  Calculate the length of a binary buffer after being encoded with using base64.

- size_t base64_decoded_length_mod (size_t length)
- size_t base64_decoded_length (size_t length)
- stringer_t * base64_encode (stringer_t *s, stringer_t *output)

  Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

- stringer_t * base64_encode_wrap (stringer_t *s, size_t wrap, base64_wrap_t type, stringer_t *output)

  Encode a binary buffer using base64, with a configurable line length, and terminating character.

- stringer_t * base64_encode_mod (stringer_t *s, stringer_t *output)

  Perform modified base64 encoding on a managed string without padding or line splitting.

- stringer_t * base64_encode_opts (stringer_t *s, uint32_t opts, bool_t modified)

  Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

- stringer_t * base64_decode (stringer_t *s, stringer_t *output)

  Perform base64 decoding on a managed string.

- stringer_t * base64_decode_mod (stringer_t *s, stringer_t *output)

  Perform modified base64 decoding on a managed string. without padding or line splitting.

- stringer_t * base64_decode_opts (stringer_t *s, uint32_t opts, bool_t modified)

  Perform base64 decoding on a managed string.

5.19.1 Function Documentation

5.19.1.1 stringer_t* base64_decode (stringer_t * *s*, stringer_t * *output*)

Perform base64 decoding on a managed string. base64.c

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the decoded result on success.

Definition at line 536 of file base64.c.

References mappings_t::base64, base64_decoded_length(), log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by base64_decode_opts(), mail_insert_chunk_base64(), prime_pem_unwrap(), smtp_auth_login(), and smtp_auth_plain().

5.19.1.2 stringer_t* base64_decode_mod (stringer_t * *s*, stringer_t * *output*)

Perform modified base64 decoding on a managed string. without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified decoded result on success.

Definition at line 636 of file base64.c.

References base64_decoded_length_mod(), mappings_t::base64_mod, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by auth_data_fetch(), base64_decode_opts(), meta_data_fetch_keys(), meta_data_fetch_shard(), meta_data_fetch_user(), and smtp_fetch_inbound().

5.19.1.3 stringer_t* base64_decode_opts (stringer_t * *s*, uint32_t *opts*, bool_t *modified*)

Perform base64 decoding on a managed string.

Parameters:

s the managed string to be base64 decoded.

opts the options value of the managed string which will be allocated and receive the decoded output.

modified if true, use modified base64 encoding; if false, use normal base64 decoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the decoded result on success.

Definition at line 734 of file base64.c.

References base64_decode(), base64_decode_mod(), base64_decoded_length(), base64_decoded_length_mod(), log_pedantic, st_alloc_opts(), st_empty_out(), and st_free().

5.19.1.4 size_t base64_decoded_length (size_t *length*)

Definition at line 130 of file base64.c.

Referenced by base64_decode(), and base64_decode_opts().

5.19.1.5 size_t base64_decoded_length_mod (size_t *length*)

Definition at line 111 of file base64.c.

Referenced by base64_decode_mod(), and base64_decode_opts().

5.19.1.6 stringer_t* base64_encode (stringer_t * *s*, stringer_t * *output*)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a a pointer to the managed string containing the encoded result on success.

Definition at line 156 of file base64.c.

References mappings_t::base64, base64_encoded_length(), BASE64_LINE_WRAP_LENGTH, mappings_t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by base64_encode_opts(), mail_insert_chunk_base64(), and mail_mime_encode_part().

5.19.1.7 stringer_t* base64_encode_mod (stringer_t * *s*, stringer_t * *output*)

Perform modified base64 encoding on a managed string without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 modified-encoded.

output a managed string to receive the encoded output; if passed as NULL, an output buffer will be allocated which must be freed by the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified encoded result on success.

Definition at line 412 of file base64.c.

References base64_encoded_length_mod(), mappings_t::base64_mod, mappings_t::characters, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_login(), base64_encode_opts(), meta_data_insert_keys(), meta_data_insert_shard(), register_data_insert_user(), and smtp_fetch_authorization().

5.19.1.8 stringer_t* base64_encode_opts (stringer_t * *s*, uint32_t *opts*, bool_t *modified*)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

opts the options value of the managed string which will be allocated and receive the encoded output.

modified if true, use modified base64 encoding; if false, use normal base64 encoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded result on success.

Definition at line 496 of file base64.c.

References base64_encode(), base64_encode_mod(), base64_encoded_length(), base64_encoded_length_mod(), log_pedantic, st_alloc_-opts(), st_empty_out(), and st_free().

5.19.1.9 stringer_t* base64_encode_wrap (stringer_t * *s*, size_t *wrap*, base64_wrap_t *type*, stringer_t * *output*)

Encode a binary buffer using base64, with a configurable line length, and terminating character.

Parameters:

s the managed string to be base64 encoded.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller. *

Returns:

Definition at line 271 of file base64.c.

References mappings_t::base64, base64_encoded_length_wrap(), BASE64_LINE_WRAP_CRLF, BASE64_LINE_WRAP_LF, mappings_-t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by prime_pem_wrap().

5.19.1.10 size_t base64_encoded_length (size_t *length*)

Definition at line 34 of file base64.c.

References BASE64_LINE_WRAP_LENGTH.

Referenced by base64_encode(), and base64_encode_opts().

5.19.1.11 size_t base64_encoded_length_mod (size_t *length*)

TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().

Definition at line 12 of file base64.c.

Referenced by base64_encode_mod(), and base64_encode_opts().

5.19.1.12 size_t base64_encoded_length_wrap (size_t *length*, size_t *wrap*, base64_wrap_t *type*)

Calculate the length of a binary buffer after being encoded with using base64.

Note:

If line wrapping is enabled, the output will assume a trailing end of line sequence.

Parameters:

length the length of the binary buffer.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

Returns:

the length of the encoded output.

Definition at line 71 of file base64.c.

References BASE64_LINE_WRAP_NONE, and log_pedantic.

Referenced by base64_encode_wrap(), and prime_pem_wrap().

Data Structures

- struct mappings_t

Defines

- #define URL_MAX_LENGTH 1048576
- #define QP_LINE_WRAP_LENGTH 76
- #define BASE64_LINE_WRAP_LENGTH 76

Enumerations

- enum base64_wrap_t { BASE64_LINE_WRAP_NONE = 0, BASE64_LINE_WRAP_LF = 1, BASE64_LINE_WRAP_CRLF = 2 }

Functions

- stringer_t * base64_decode (stringer_t *s, stringer_t *output)

  base64.c

- stringer_t * base64_decode_mod (stringer_t *s, stringer_t *output)

  Perform modified base64 decoding on a managed string. without padding or line splitting.

- stringer_t * base64_decode_opts (stringer_t *s, uint32_t opts, bool_t modified)

  Perform base64 decoding on a managed string.

- size_t base64_decoded_length (size_t length)
- size_t base64_decoded_length_mod (size_t length)
- stringer_t * base64_encode (stringer_t *s, stringer_t *output)

  Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

- stringer_t * base64_encode_mod (stringer_t *s, stringer_t *output)

  Perform modified base64 encoding on a managed string without padding or line splitting.

- stringer_t * base64_encode_opts (stringer_t *s, uint32_t opts, bool_t modified)

  Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

- stringer_t * base64_encode_wrap (stringer_t *s, size_t wrap, base64_wrap_t type, stringer_t *output)

  Encode a binary buffer using base64, with a configurable line length, and terminating character.

- size_t base64_encoded_length (size_t length)
- size_t base64_encoded_length_mod (size_t length)

  TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().

- size_t base64_encoded_length_wrap (size_t length, size_t wrap, base64_wrap_t type)

  Calculate the length of a binary buffer after being encoded with using base64.

- bool_t hex_valid_chr (uchr_t c)

  hex.c

- byte_t hex_decode_chr (uchr_t a, uchr_t b)

Decode a hex character pair as a single byte (usually for URL decoding).

- size_t hex_count_st (stringer_t *s)

  Count the number of hex characters in a string.

- size_t hex_valid_st (stringer_t *s)

  Determine whether a managed string is a properly formatted hex string and return the number found.

- stringer_t * hex_decode_st (stringer_t *h, stringer_t *output)

  Convert a hex string into a binary data blob.

- stringer_t * hex_encode_st (stringer_t *b, stringer_t *output)

  Convert a block of binary data into a hex string.

- uchr_t * hex_encode_chr (byte_t b, uchr_t *output)
- stringer_t * hex_encode_st_debug (stringer_t *input, size_t maxlen)

  Encode data in a human readable way, for debugging purposes.

- stringer_t * hex_encode_opts (stringer_t *input, uint32_t opts)

  Allocates an output string of appropriate size with specified opts for hex encoding of input.

- stringer_t * hex_decode_opts (stringer_t *input, uint32_t opts)

  Allocates an output string of appropriate size with specified opts for hex decoding of input.

- stringer_t * qp_decode (stringer_t *s)

  qp.c

- stringer_t * qp_encode (stringer_t *s)

  Perform QP (quoted-printable) encoding of a string.

- bool_t url_valid_chr (uchr_t c)

  url.c

- size_t url_valid_st (stringer_t *s)

  Check a URL string for validity.

- stringer_t * url_decode (stringer_t *s)

  Decode a URL-encoded string into its original representation.

- stringer_t * url_encode (stringer_t *s)

  Encode a data buffer as a valid URL component.

- stringer_t * zbase32_decode (stringer_t *s)

  zbase32.c

- stringer_t * zbase32_encode (stringer_t *s)

  Encode data as a zbase32 string.

Variables

- mappings_t mappings

5.20.1 Define Documentation

5.20.1.1 #define BASE64_LINE_WRAP_LENGTH 76

Definition at line 24 of file encodings.h.

Referenced by base64_encode(), and base64_encoded_length().

5.20.1.2 #define QP_LINE_WRAP_LENGTH 76

Definition at line 23 of file encodings.h.

Referenced by qp_encode().

5.20.1.3 #define URL_MAX_LENGTH 1048576

Note:

When considering a change to the URL length limit, the following statistics may be useful:

Internet Explorer: 2,048 characters for the host/path and 2,083 characters overall Firefox: limited to 65,536 visible characters, but longer URL will still work Safari: at least 80,000 characters Opera: at least 190,000 characters IIS: by default the limit is 16,384 but can be increased Apache: by default 4,000 characters

Definition at line 22 of file encodings.h.

5.20.2.1 enum base64_wrap_t

Enumerator:

BASE64_LINE_WRAP_NONE
BASE64_LINE_WRAP_LF
BASE64_LINE_WRAP_CRLF

Definition at line 26 of file encodings.h.

5.20.3 Function Documentation

5.20.3.1 stringer_t* base64_decode (stringer_t * *s*, stringer_t * *output*)

base64.c base64.c

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the decoded result on success.

Definition at line 536 of file base64.c.

References mappings_t::base64, base64_decoded_length(), log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by base64_decode_opts(), mail_insert_chunk_base64(), prime_pem_unwrap(), smtp_auth_login(), and smtp_auth_plain().

5.20.3.2 stringer_t* base64_decode_mod (stringer_t * *s*, stringer_t * *output*)

Perform modified base64 decoding on a managed string. without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 decoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified decoded result on success.

Definition at line 636 of file base64.c.

References base64_decoded_length_mod(), mappings_t::base64_mod, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), st_valid_tracked(), and mappings_t::values.

Referenced by auth_data_fetch(), base64_decode_opts(), meta_data_fetch_keys(), meta_data_fetch_shard(), meta_data_fetch_user(), and smtp_fetch_inbound().

5.20.3.3 stringer_t* base64_decode_opts (stringer_t * *s*, uint32_t *opts*, bool_t *modified*)

Perform base64 decoding on a managed string.

Parameters:

s the managed string to be base64 decoded.

opts the options value of the managed string which will be allocated and receive the decoded output.

modified if true, use modified base64 encoding; if false, use normal base64 decoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the decoded result on success.

Definition at line 734 of file base64.c.

References base64_decode(), base64_decode_mod(), base64_decoded_length(), base64_decoded_length_mod(), log_pedantic, st_alloc_opts(), st_empty_out(), and st_free().

5.20.3.4 size_t base64_decoded_length (size_t *length*)

Definition at line 130 of file base64.c.

Referenced by base64_decode(), and base64_decode_opts().

5.20.3.5 size_t base64_decoded_length_mod (size_t *length*)

Definition at line 111 of file base64.c.

Referenced by base64_decode_mod(), and base64_decode_opts().

5.20.3.6 stringer_t* base64_encode (stringer_t * *s*, stringer_t * *output*)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller.

Returns:

NULL on failure, or a a pointer to the managed string containing the encoded result on success.

Definition at line 156 of file base64.c.

References mappings_t::base64, base64_encoded_length(), BASE64_LINE_WRAP_LENGTH, mappings_t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by base64_encode_opts(), mail_insert_chunk_base64(), and mail_mime_encode_part().

5.20.3.7 stringer_t* base64_encode_mod (stringer_t * *s*, stringer_t * *output*)

Perform modified base64 encoding on a managed string without padding or line splitting.

Note:

In this function, the '+' and '/' characters are replaced with '-' and '_' respectively, making the output suitable for use in URL parameters without additional encoding.

Parameters:

s the managed string to be base64 modified-encoded.

output a managed string to receive the encoded output; if passed as NULL, an output buffer will be allocated which must be freed by the caller.

Returns:

NULL on failure, or a newly allocated managed string containing the modified encoded result on success.

Definition at line 412 of file base64.c.

References base64_encoded_length_mod(), mappings_t::base64_mod, mappings_t::characters, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_login(), base64_encode_opts(), meta_data_insert_keys(), meta_data_insert_shard(), register_data_insert_user(), and smtp_fetch_authorization().

5.20.3.8 stringer_t* base64_encode_opts (stringer_t * *s*, uint32_t *opts*, bool_t *modified*)

Perform base64 encoding on a managed string with padding and line splitting at BASE64_LINE_WRAP_LENGTH characters.

Parameters:

s the managed string to be base64 encoded.

opts the options value of the managed string which will be allocated and receive the encoded output.

modified if true, use modified base64 encoding; if false, use normal base64 encoding.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded result on success.

Definition at line 496 of file base64.c.

References base64_encode(), base64_encode_mod(), base64_encoded_length(), base64_encoded_length_mod(), log_pedantic, st_alloc_-opts(), st_empty_out(), and st_free().

5.20.3.9 stringer_t* base64_encode_wrap (stringer_t * *s*, size_t *wrap*, base64_wrap_t *type*, stringer_t * *output*)

Encode a binary buffer using base64, with a configurable line length, and terminating character.

Parameters:

s the managed string to be base64 encoded.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

output a managed string to receive the encoded output; if passed as NULL, one will be allocated to the caller. *

Returns:

Definition at line 271 of file base64.c.

References mappings_t::base64, base64_encoded_length_wrap(), BASE64_LINE_WRAP_CRLF, BASE64_LINE_WRAP_LF, mappings_-t::characters, log_error, log_pedantic, mappings, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by prime_pem_wrap().

5.20.3.10 size_t base64_encoded_length (size_t *length*)

Definition at line 34 of file base64.c.

References BASE64_LINE_WRAP_LENGTH.

Referenced by base64_encode(), and base64_encode_opts().

5.20.3.11 size_t base64_encoded_length_mod (size_t *length*)

TODO: Switch to always using the "_wrap" length function, which can then become base64_(en|de)coded_length().

Definition at line 12 of file base64.c.

Referenced by base64_encode_mod(), and base64_encode_opts().

5.20.3.12 size_t base64_encoded_length_wrap (size_t *length*, size_t *wrap*, base64_wrap_t *type*)

Calculate the length of a binary buffer after being encoded with using base64.

Note:

If line wrapping is enabled, the output will assume a trailing end of line sequence.

Parameters:

length the length of the binary buffer.

wrap the maximum length of each line, or 0 to disable line wrapping.

type the line delimiter sequence being used.

Returns:

the length of the encoded output.

Definition at line 71 of file base64.c.

References BASE64_LINE_WRAP_NONE, and log_pedantic.

Referenced by base64_encode_wrap(), and prime_pem_wrap().

5.20.3.13 size_t hex_count_st (stringer_t ∗ *s*)

Count the number of hex characters in a string.

Parameters:

s the managed string to be scanned.

Returns:

the number of valid hexadecimal characters found in the string.

Definition at line 58 of file hex.c.

References hex_valid_chr(), and st_empty_out().

Referenced by hex_decode_st().

5.20.3.14 byte_t hex_decode_chr (uchr_t *a*, uchr_t *b*)

Decode a hex character pair as a single byte (usually for URL decoding).

Parameters:

a the higher order 4-bit hexadecimal character of the byte to be encoded.

b the lower order 4-bit hexadecimal character of the byte to be decoded.

Returns:

a byte containing the value of the decoded hexadecimal character pair, or 0 on failure.

Definition at line 252 of file hex.c.

References hex_valid_chr(), log_pedantic, and lower_chr().

Referenced by hex_decode_st(), http_data_value_decode(), qp_decode(), and url_decode().

5.20.3.15 stringer_t∗ hex_decode_opts (stringer_t ∗ *input*, uint32_t *opts*)

Allocates an output string of appropriate size with specified opts for hex decoding of input.

Parameters:

input Input stringer to be decoded.

Returns:

NULL on failure, otherwise allocated stringer with decoded data.

Definition at line 383 of file hex.c.

References hex_decode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.20.3.16 stringer_t* hex_decode_st (stringer_t * *h*, stringer_t * *output*)

Convert a hex string into a binary data blob.

Note:

All hex strings should be composed of pairs of two hex characters representing individual bytes. Invalid hex characters will simply be ignored during processing.

Parameters:

h a managed string containing the input hex string to be decoded.

output if not NULL, a pointer to a managed string to contain the decoded binary output; if NULL, a new string will be allocated and returned to the caller.

Returns:

a pointer to a managed string containing the decoded output, or NULL on failure.

Definition at line 287 of file hex.c.

References hex_count_st(), hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_data_fetch(), and hex_decode_opts().

5.20.3.17 uchr_t* hex_encode_chr (byte_t *b*, uchr_t * *output*)

Converts a binary octet into a pair of lowercase hex characters. The result is returned inside a thread specific static character buffer. If a valid pointer is also supplied using the output variable then the result will also be written to the memory the pointer indicates.

Parameters:

b The binary octet being encoded.

output A pointer to the memory where the result should be stored or NULL if the result should only be returned.

Returns:

Returns the two character hex representation of the binary input using a thread localized character buffer.

Definition at line 84 of file hex.c.

References mm_wipe(), and number.

Referenced by hex_encode_st(), and hex_encode_st_debug().

5.20.3.18 stringer_t* hex_encode_opts (stringer_t * *input*, uint32_t *opts*)

Allocates an output string of appropriate size with specified opts for hex encoding of input.

Parameters:

input Input stringer to be encoded.

Returns:

NULL on failure, otherwise allocated stringer with encoded data.

Definition at line 346 of file hex.c.

References hex_encode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.20.3.19 stringer_t* hex_encode_st (stringer_t * *b*, stringer_t * *output*)

Convert a block of binary data into a hex string.

Parameters:

b a managed string containing the raw data to be encoded.

output if not NULL, a pointer to a managed string that will store the encoded output; if NULL, a new managed string will be allocated and returned to the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the hex-encoded output on success.

Definition at line 124 of file hex.c.

References hex_encode_chr(), log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_-valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_login(), and hex_encode_opts().

5.20.3.20 stringer_t* hex_encode_st_debug (stringer_t * *input*, size_t *maxlen*)

Encode data in a human readable way, for debugging purposes.

Note:

All printable ASCII data will be displayed as-is; all other characters will be shown as formatted hex pairs.

Parameters:

input a pointer to a managed string containing the data to be formatted.

maxlen the maximum number of bytes to be displayed. If more characters are available, an ellipsis will be shown in the middle of the string to represent the abridged data, with only the leading and trailing characters returned as part of the display string.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded debug data on success.

Definition at line 178 of file hex.c.

References chr_printable(), hex_encode_chr(), log_error, st_alloc(), st_char_get(), st_length_get(), and st_length_set().

5.20.3.21 bool_t hex_valid_chr (uchr_t *c*)

hex.c hex.c

Parameters:

c the character to be tested.

Returns:

true if the character is a valid hexadecimal character; false otherwise.

Definition at line 15 of file hex.c.

Referenced by hex_count_st(), hex_decode_chr(), hex_decode_st(), hex_valid_st(), qp_decode(), url_decode(), and url_valid_st().

5.20.3.22 size_t hex_valid_st (stringer_t * *s*)

Determine whether a managed string is a properly formatted hex string and return the number found.

Note:

A valid hex string consists of only hexadecimal characters and whitespace, and the number of hex characters is divisible by two.

Parameters:

s the managed string to be tested.

Returns:

0 on failure, or the number of hexadecimal characters found in the managed string.

Definition at line 28 of file hex.c.

References hex_valid_chr(), and st_empty_out().

5.20.3.23 stringer_t* qp_decode (stringer_t * *s*)

qp.c qp.c

Parameters:

s the managed string containing data to be decoded.

Returns:

a pointer to a managed string containing the 8-bit decoded output, or NULL on failure.

Definition at line 99 of file qp.c.

References hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_length_get(), and st_length_set().

5.20.3.24 stringer_t* qp_encode (stringer_t * *s*)

Perform QP (quoted-printable) encoding of a string.

Parameters:

s a pointer to a managed string containing data to be encoded.

Returns:

a pointer to a managed string containing the QP encoded data, or NULL on failure.

Definition at line 17 of file qp.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, PLACER, QP_LINE_WRAP_LENGTH, st_alloc_opts(), st_append, st_data_-get(), and st_empty_out().

Referenced by mail_build_signature(), and mail_mime_encode_part().

5.20.3.25 stringer_t* url_decode (stringer_t * *s*)

Decode a URL-encoded string into its original representation.

Parameters:

s a managed string containing the UR componentL to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the original data represented by the URL-encoded input on success.

Definition at line 127 of file url.c.

References hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_length_get(), and st_length_set().

5.20.3.26 stringer_t* url_encode (stringer_t * *s*)

Encode a data buffer as a valid URL component.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the fully-escaped string suitable for use in a URL.

Definition at line 65 of file url.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, PLACER, st_alloc_opts(), st_append, st_data_get(), st_empty_out(), st_length_-set(), and url_valid_chr().

5.20.3.27 bool_t url_valid_chr (uchr_t *c*)

url.c url.c

Parameters:

c the character to be examined.

Returns:

true if the character is valid in a URL or false if it must be escaped.

Definition at line 15 of file url.c.

Referenced by url_encode(), and url_valid_st().

5.20.3.28 size_t url_valid_st (stringer_t * *s*)

Check a URL string for validity.

Note:

This function confirms that the URL consists of only legal characters and that all escaped sequences are also valid.

Parameters:

s a managed string containing the URL to be verified.

Returns:

0 on failure, or the number of valid characters in the URL if the string is valid.

Definition at line 28 of file url.c.

References hex_valid_chr(), st_empty_out(), and url_valid_chr().

5.20.3.29 stringer_t* zbase32_decode (stringer_t * s)

zbase32.c zbase32.c

Parameters:

s a managed string containing the data to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-decoded data on success.

Definition at line 64 of file zbase32.c.

References log_pedantic, mappings, st_alloc(), st_data_get(), st_empty_out(), st_free(), st_length_set(), mappings_t::values, and mappings_t::zbase32.

Referenced by sess_get().

5.20.3.30 stringer_t* zbase32_encode (stringer_t * s)

Encode data as a zbase32 string.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-encoded data on success.

Definition at line 16 of file zbase32.c.

References mappings_t::characters, log_pedantic, mappings, st_alloc(), st_data_get(), st_empty_out(), st_length_set(), and mappings_t::zbase32.

Referenced by sess_token().

5.20.4 Variable Documentation

5.20.4.1 mappings_t mappings

Definition at line 10 of file mappings.c.

Referenced by base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), zbase32_decode(), and zbase32_encode().

Functions

- bool_t hex_valid_chr (uchr_t c)

  Determine whether a character is a valid hexadecimal (base 16) character.

- size_t hex_valid_st (stringer_t *s)

  Determine whether a managed string is a properly formatted hex string and return the number found.

- size_t hex_count_st (stringer_t *s)

  Count the number of hex characters in a string.

- uchr_t * hex_encode_chr (byte_t b, uchr_t *output)
- stringer_t * hex_encode_st (stringer_t *b, stringer_t *output)

  Convert a block of binary data into a hex string.

- stringer_t * hex_encode_st_debug (stringer_t *input, size_t maxlen)

  Encode data in a human readable way, for debugging purposes.

- byte_t hex_decode_chr (uchr_t a, uchr_t b)

  Decode a hex character pair as a single byte (usually for URL decoding).

- stringer_t * hex_decode_st (stringer_t *h, stringer_t *output)

  Convert a hex string into a binary data blob.

- stringer_t * hex_encode_opts (stringer_t *input, uint32_t opts)

  Allocates an output string of appropriate size with specified opts for hex encoding of input.

- stringer_t * hex_decode_opts (stringer_t *input, uint32_t opts)

  Allocates an output string of appropriate size with specified opts for hex decoding of input.

5.21.1 Function Documentation

5.21.1.1 size_t hex_count_st (stringer_t * *s*)

Count the number of hex characters in a string.

Parameters:

s the managed string to be scanned.

Returns:

the number of valid hexadecimal characters found in the string.

Definition at line 58 of file hex.c.

References hex_valid_chr(), and st_empty_out().

Referenced by hex_decode_st().

5.21.1.2 byte_t hex_decode_chr (uchr_t *a*, uchr_t *b*)

Decode a hex character pair as a single byte (usually for URL decoding).

Parameters:

a the higher order 4-bit hexadecimal character of the byte to be encoded.

b the lower order 4-bit hexadecimal character of the byte to be decoded.

Returns:

a byte containing the value of the decoded hexadecimal character pair, or 0 on failure.

Definition at line 252 of file hex.c.

References hex_valid_chr(), log_pedantic, and lower_chr().

Referenced by hex_decode_st(), http_data_value_decode(), qp_decode(), and url_decode().

5.21.1.3 stringer_t* hex_decode_opts (stringer_t * *input*, uint32_t *opts*)

Allocates an output string of appropriate size with specified opts for hex decoding of input.

Parameters:

input Input stringer to be decoded.

Returns:

NULL on failure, otherwise allocated stringer with decoded data.

Definition at line 383 of file hex.c.

References hex_decode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.21.1.4 stringer_t* hex_decode_st (stringer_t * *h*, stringer_t * *output*)

Convert a hex string into a binary data blob.

Note:

All hex strings should be composed of pairs of two hex characters representing individual bytes. Invalid hex characters will simply be ignored during processing.

Parameters:

h a managed string containing the input hex string to be decoded.

output if not NULL, a pointer to a managed string to contain the decoded binary output; if NULL, a new string will be allocated and returned to the caller.

Returns:

a pointer to a managed string containing the decoded output, or NULL on failure.

Definition at line 287 of file hex.c.

References hex_count_st(), hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_data_fetch(), and hex_decode_opts().

5.21.1.5 uchr_t* hex_encode_chr (byte_t *b*, uchr_t * *output*)

Converts a binary octet into a pair of lowercase hex characters. The result is returned inside a thread specific static character buffer. If a valid pointer is also supplied using the output variable then the result will also be written to the memory the pointer indicates.

Parameters:

b The binary octet being encoded.

output A pointer to the memory where the result should be stored or NULL if the result should only be returned.

Returns:

Returns the two character hex representation of the binary input using a thread localized character buffer.

Definition at line 84 of file hex.c.

References mm_wipe(), and number.

Referenced by hex_encode_st(), and hex_encode_st_debug().

5.21.1.6 stringer_t* hex_encode_opts (stringer_t * *input*, uint32_t *opts*)

Allocates an output string of appropriate size with specified opts for hex encoding of input.

Parameters:

input Input stringer to be encoded.

Returns:

NULL on failure, otherwise allocated stringer with encoded data.

Definition at line 346 of file hex.c.

References hex_encode_st(), log_error, log_pedantic, st_alloc_opts(), st_empty, st_free(), and st_length_get().

5.21.1.7 stringer_t* hex_encode_st (stringer_t * *b*, stringer_t * *output*)

Convert a block of binary data into a hex string.

Parameters:

b a managed string containing the raw data to be encoded.

output if not NULL, a pointer to a managed string that will store the encoded output; if NULL, a new managed string will be allocated and returned to the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the hex-encoded output on success.

Definition at line 124 of file hex.c.

References hex_encode_chr(), log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty_out(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

Referenced by auth_login(), and hex_encode_opts().

5.21.1.8 stringer_t* hex_encode_st_debug (stringer_t * *input*, size_t *maxlen*)

Encode data in a human readable way, for debugging purposes.

Note:

All printable ASCII data will be displayed as-is; all other characters will be shown as formatted hex pairs.

Parameters:

input a pointer to a managed string containing the data to be formatted.

maxlen the maximum number of bytes to be displayed. If more characters are available, an ellipsis will be shown in the middle of the string to represent the abridged data, with only the leading and trailing characters returned as part of the display string.

Returns:

NULL on failure, or a pointer to a newly allocated managed string containing the encoded debug data on success.

Definition at line 178 of file hex.c.

References chr_printable(), hex_encode_chr(), log_error, st_alloc(), st_char_get(), st_length_get(), and st_length_set().

5.21.1.9 bool_t hex_valid_chr (uchr_t *c*)

Determine whether a character is a valid hexadecimal (base 16) character. hex.c

Parameters:

c the character to be tested.

Returns:

true if the character is a valid hexadecimal character; false otherwise.

Definition at line 15 of file hex.c.

Referenced by hex_count_st(), hex_decode_chr(), hex_decode_st(), hex_valid_st(), qp_decode(), url_decode(), and url_valid_st().

5.21.1.10 size_t hex_valid_st (stringer_t * *s*)

Determine whether a managed string is a properly formatted hex string and return the number found.

Note:

A valid hex string consists of only hexadecimal characters and whitespace, and the number of hex characters is divisible by two.

Parameters:

s the managed string to be tested.

Returns:

0 on failure, or the number of hexadecimal characters found in the managed string.

Definition at line 28 of file hex.c.

References hex_valid_chr(), and st_empty_out().

```

Functions

- stringer_t ∗ qp_encode (stringer_t ∗s)
  Perform QP (quoted-printable) encoding of a string.
- stringer_t ∗ qp_decode (stringer_t ∗s)
  Perform QP (quoted-printable) decoding of a string.

5.23.1 Function Documentation

5.23.1.1 stringer_t∗ qp_decode (stringer_t ∗ *s*)

Perform QP (quoted-printable) decoding of a string. qp.c

Parameters:

s the managed string containing data to be decoded.

Returns:

a pointer to a managed string containing the 8-bit decoded output, or NULL on failure.

Definition at line 99 of file qp.c.

References hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_length_get(), and st_length_set().

5.23.1.2 stringer_t∗ qp_encode (stringer_t ∗ *s*)

Perform QP (quoted-printable) encoding of a string.

Parameters:

s a pointer to a managed string containing data to be encoded.

Returns:

a pointer to a managed string containing the QP encoded data, or NULL on failure.

Definition at line 17 of file qp.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, PLACER, QP_LINE_WRAP_LENGTH, st_alloc_opts(), st_append, st_data_-get(), and st_empty_out().

Referenced by mail_build_signature(), and mail_mime_encode_part().

5.24 src/core/encodings/url.c File Reference

```
#include "magma.h"
```

Functions

- bool_t url_valid_chr (uchr_t c)

  Determine whether a given character is a valid character in a URL.

- size_t url_valid_st (stringer_t *s)

  Check a URL string for validity.

- stringer_t * url_encode (stringer_t *s)

  Encode a data buffer as a valid URL component.

- stringer_t * url_decode (stringer_t *s)

  Decode a URL-encoded string into its original representation.

5.24.1 Function Documentation

5.24.1.1 stringer_t* url_decode (stringer_t * *s*)

Decode a URL-encoded string into its original representation.

Parameters:

s a managed string containing the UR componentL to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the original data represented by the URL-encoded input on success.

Definition at line 127 of file url.c.

References hex_decode_chr(), hex_valid_chr(), log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_length_get(), and st_length_set().

5.24.1.2 stringer_t* url_encode (stringer_t * *s*)

Encode a data buffer as a valid URL component.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the fully-escaped string suitable for use in a URL.

Definition at line 65 of file url.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, PLACER, st_alloc_opts(), st_append, st_data_get(), st_empty_out(), st_length_set(), and url_valid_chr().

5.24.1.3 bool_t url_valid_chr (uchr_t *c*)

Determine whether a given character is a valid character in a URL. url.c

Parameters:

c the character to be examined.

Returns:

true if the character is valid in a URL or false if it must be escaped.

Definition at line 15 of file url.c.

Referenced by url_encode(), and url_valid_st().

5.24.1.4 size_t url_valid_st (stringer_t ∗ *s*)

Check a URL string for validity.

Note:

This function confirms that the URL consists of only legal characters and that all escaped sequences are also valid.

Parameters:

s a managed string containing the URL to be verified.

Returns:

0 on failure, or the number of valid characters in the URL if the string is valid.

Definition at line 28 of file url.c.

References hex_valid_chr(), st_empty_out(), and url_valid_chr().

5.25 src/core/encodings/zbase32.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t * zbase32_encode (stringer_t *s)
  Encode data as a zbase32 string.
- stringer_t * zbase32_decode (stringer_t *s)
  Decode a zbase32 string.

5.25.1 Function Documentation

5.25.1.1 stringer_t* zbase32_decode (stringer_t * *s*)

Decode a zbase32 string. zbase32.c

Parameters:

s a managed string containing the data to be decoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-decoded data on success.

Definition at line 64 of file zbase32.c.

References log_pedantic, mappings, st_alloc(), st_data_get(), st_empty_out(), st_free(), st_length_set(), mappings_t::values, and mappings_t::zbase32.

Referenced by sess_get().

5.25.1.2 stringer_t* zbase32_encode (stringer_t * *s*)

Encode data as a zbase32 string.

Parameters:

s a managed string containing the data to be encoded.

Returns:

NULL on failure, or a freshly allocated managed string containing the zbase32-encoded data on success.

Definition at line 16 of file zbase32.c.

References mappings_t::characters, log_pedantic, mappings, st_alloc(), st_data_get(), st_empty_out(), st_length_set(), and mappings_t::zbase32.

Referenced by sess_token().

Functions

- void http_print_301 (connection_t *con, chr_t *location, int_t tls)
  Redirect the browser to a new location with an HTTP 301 response.
- void http_print_400 (connection_t *con)
  Return an HTTP 400 bad client request response to the client.
- void http_print_403 (connection_t *con)
  Return an HTTP 403 access denied response to the client.
- void http_print_404 (connection_t *con)
  Return an HTTP 404 location not found response to the client.
- void http_print_405 (connection_t *con)
  Return an HTTP 405 method not allowed response to the client.
- void http_print_500 (connection_t *con)
  Return an HTTP 500 internal server error response to the client.
- void http_print_500_log (connection_t *con, chr_t *logmsg)
  Return an HTTP 500 internal server error response to the client, with additional logging information.
- void http_print_501 (connection_t *con)
  Return an HTTP 501 method not implemented response to the client.

5.28.1 Function Documentation

5.28.1.1 void http_print_301 (connection_t * *con*, chr_t * *location*, int_t *tls*)

Redirect the browser to a new location with an HTTP 301 response. errors.c

Note:

SSL downgrades are not possible; in order for an ssl upgrade, magma.web.ssl_redirect must first be set.

Parameters:

con the client's http connection handle.

location the url to which the client will be redirected.

tls if 1, direct to `https://` else direct to `http://` address.

Returns:

This function returns no value.

LOW: This function should probably move to the response file and be updated to use the cookie/xss helper functions.

Definition at line 18 of file errors.c.

References con_print(), con_secure(), connection_t::http, HTTP_COMPLETE, http_print_403(), http_print_500(), log_pedantic, magma, st_char_get(), st_cleanup, st_dupe(), st_free(), st_length_int(), st_merge, magma_t::tls_redirect, and magma_t::web.

Referenced by contact_process(), portal_endpoint(), portal_process(), portal_upload(), register_process(), and teacher_process().

5.28.1.2 void http_print_400 (connection_t * *con*)

Return an HTTP 400 bad client request response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 80 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.28.1.3 void http_print_403 (connection_t * *con*)

Return an HTTP 403 access denied response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 94 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_print_301(), and http_requeue().

5.28.1.4 void http_print_404 (connection_t * *con*)

Return an HTTP 404 location not found response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 108 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.28.1.5 void http_print_405 (connection_t * *con*)

Return an HTTP 405 method not allowed response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 122 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.28.1.6 void http_print_500 (connection_t * *con*)

Return an HTTP 500 internal server error response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 136 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, and PLACER.

Referenced by contact_print_message(), http_print_301(), http_requeue(), portal_print_login(), register_print_captcha(), register_print_-message(), register_print_step3(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.28.1.7 void http_print_500_log (connection_t * *con*, chr_t * *logmsg*)

Return an HTTP 500 internal server error response to the client, with additional logging information.

Parameters:

con the client's http connection handle.

logmsg a pointer to a null-terminated string with an message describing the cause of the http 500 error.

Returns:

This function returns no value.

Definition at line 154 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, and PLACER.

Referenced by contact_print_message(), register_print_step1(), and register_print_step2().

5.28.1.8 void http_print_501 (connection_t * *con*)

Return an HTTP 501 method not implemented response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 169 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.29 src/core/host/files.c File Reference

```
#include "magma.h"
```

Functions

- int_t file_read (const char *name, stringer_t *output)
  Get the contents of a file on disk.
- stringer_t * file_load (const char *name)
  Get the contents of a file on disk.
- int_t file_temp_handle (chr_t *pdir, stringer_t **tmpname)
  Get a file handle to a temporary file created in a specified directory.
- bool_t file_accessible (const chr_t *path)
  Determine whether a given filename or directory path is accessible by a user.
- bool_t file_readwritable (const chr_t *path)
  Determine whether a given filename or directory path is readable and writable by a user.
- bool_t file_world_accessible (const chr_t *path)
  Determine whether a given filename or directory path is readable or writable by other users.

5.29.1 Function Documentation

5.29.1.1 bool_t file_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is accessible by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for existence/access.

Returns:

true if the pathname exists and is readable, or false otherwise.

Definition at line 155 of file files.c.

5.29.1.2 stringer_t* file_load (const char * *name*)

Get the contents of a file on disk. files.c

Parameters:

name a character pointer to the full pathname of the file to be opened.

Returns:

NULL on failure, or a managed string containing all the data in the file.

Definition at line 51 of file files.c.

References log_info, st_alloc(), st_avail_get(), st_data_get(), and st_length_set().

Referenced by config_load_file_settings(), dkim_start(), and prime_start().

5.29.1.3 int_t file_read (const char * *name*, stringer_t * *output*)

Get the contents of a file on disk.

See also:

file_load()

Note:

This is similar in function to file_load() but there is no read() length checking, so it can be used on non-regular files.

Parameters:

name a character pointer to the full pathname of the file to be opened.

output a managed string where the results of the file read operation will be stored.

Returns:

-1 on failure or the number of bytes read from the file on success.

Definition at line 18 of file files.c.

References log_info, log_pedantic, MEMORYBUF, st_avail_get(), st_data_get(), and st_length_set().

Referenced by process_find_pid(), and process_kill().

5.29.1.4 bool_t file_readwritable (const chr_t * *path*)

Determine whether a given filename or directory path is readable and writable by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for permissions.

Returns:

true if the pathname exists and is readable and writable, or false otherwise.

Definition at line 165 of file files.c.

Referenced by servers_validate().

5.29.1.5 int_t file_temp_handle (chr_t * *pdir*, stringer_t ** *tmpname*)

Get a file handle to a temporary file created in a specified directory.

Parameters:

pdir the parent directory in which to create the temporary file, or NULL for the default spool dir.

tmpname an optional pointer to a managed string to receive the name of the created temp file.

Returns:

-1 on failure or the new temporary file's file descriptor on success.

Definition at line 98 of file files.c.

References CONSTANT, HEAP, JOINTED, log_pedantic, MAGMA_SPOOL_BASE, MANAGED_T, ns_length_get(), spool_path(), st_-append, st_char_get(), st_dupe(), st_dupe_opts(), st_free(), and st_import().

5.29.1.6 bool_t file_world_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is readable or writable by other users.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for world permissions.

Returns:

true if the pathname exists and is readable or writable by others, or false otherwise.

Definition at line 175 of file files.c.

Referenced by dkim_start(), prime_start(), and servers_validate().

5.30 src/core/host/folder.c File Reference

```
#include "magma.h"
```

Functions

- int_t folder_exists (stringer_t *path, bool_t create)

  Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

- int_t folder_count (stringer_t *path, bool_t recursive, bool_t strict)

  Count the number of files in a folder.

5.30.1 Function Documentation

5.30.1.1 int_t folder_count (stringer_t * *path*, bool_t *recursive*, bool_t *strict*)

Count the number of files in a folder. folder.c

Definition at line 39 of file folder.c.

References count, folder_count(), log_info, MEMORYBUF, NULLER, PLACER, st_char_get(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_empty, st_free(), and st_merge.

Referenced by folder_count().

5.30.1.2 int_t folder_exists (stringer_t * *path*, bool_t *create*)

Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

Parameters:

path a managed string containing the ful pathname of the directory.

create if true, attempt to create the directory if it does not already exist.

Returns:

-1 if the directory doesn't exist or couldn't be created, 0 if the directory exists, or 1 if the directory was created.

Definition at line 16 of file folder.c.

References st_char_get().

Referenced by log_start(), and spool_check().

5.31 src/core/host/host.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t * host_platform (stringer_t *output)
  Get a description of the local operating system.
- stringer_t * host_version (stringer_t *output)
  Get release information about the local OS.

5.31.1 Function Documentation

5.31.1.1 stringer_t* host_platform (stringer_t * *output*)

Get a description of the local operating system. host.c

Parameters:

output a pointer to a managed string to receive the OS description.

Returns:

NULL on failure, or the user-specified managed string containing the OS info on success.

Definition at line 15 of file host.c.

References log_pedantic, ns_length_get(), st_avail_get(), and st_sprint().

Referenced by lib_load().

5.31.1.2 stringer_t* host_version (stringer_t * *output*)

Get release information about the local OS.

Parameters:

output a pointer to a managed string to receive the release information.

Returns:

NULL on failure, or the user-specified managed string containing the release info on success.

Definition at line 41 of file host.c.

References log_pedantic, ns_length_get(), st_avail_get(), and st_sprint().

Referenced by lib_load().

- stringer_t ∗ file_load (const char ∗name)

  files.c

- int_t file_read (const char ∗name, stringer_t ∗output)

  Get the contents of a file on disk.

- int_t file_temp_handle (chr_t ∗pdir, stringer_t ∗∗tmpname)

  Get a file handle to a temporary file created in a specified directory.

- bool_t file_accessible (const chr_t *path)

  Determine whether a given filename or directory path is accessible by a user.

- bool_t file_readwritable (const chr_t *path)

  Determine whether a given filename or directory path is readable and writable by a user.

- bool_t file_world_accessible (const chr_t *path)

  Determine whether a given filename or directory path is readable or writable by other users.

- ip_t * tcp_addr_ip (int sockd, ip_t *output)

  tcp.c

- stringer_t * tcp_addr_st (int sockd, stringer_t *output)
- int tcp_continue (int sockd, int result, int syserror)

  Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

- int_t tcp_error (int error)

  Determine whether the error is a permanent/fatal failure, or a transient error.

- int tcp_read (int sockd, void *buffer, int length, bool_t block)

  Read data from a TCP/IP network socket.

- int_t tcp_status (int sockd)

  Determine whether the socket connection provided by sockd is still valid.

- int tcp_wait (int sockd)

  Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

- int tcp_write (int sockd, const void *buffer, int length, bool_t block)

  Write data to an open TCP/IP network socket.

- stringer_t * host_platform (stringer_t *output)

  host.c

- stringer_t * host_version (stringer_t *output)

  Get release information about the local OS.

- chr_t * errno_name (int error)

  errors.c

- chr_t * signal_name (int signal, char *buffer, size_t length)

  signals.c

- int_t folder_count (stringer_t *path, bool_t recursive, bool_t strict)

  folder.c

- int_t folder_exists (stringer_t *path, bool_t create)

  Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

- pid_t process_find_pid (stringer_t *name)

  process.c

- int_t process_kill (stringer_t *name, int_t signum, int_t wait)
  Kill a named process with the specified signal, and retry if necessary.
- pid_t process_my_pid (void)
  Return the current process identifier using appropriate function for the current system.
- int_t spool_check (stringer_t *path)
  spool.c
- int_t spool_check_file (const char *file, const struct stat *info, int type)
  An internal function used by the ftw() function to cleanup the file contents of a spool directory.
- int_t spool_cleanup (void)
  Clean up the file contents in the spool base directory.
- uint64_t spool_error_stats (void)
  Get the number of spool errors encountered.
- int_t spool_mktemp (int_t spool, chr_t *prefix)
  Create a temporary file in a specified spool directory.
- stringer_t * spool_path (int_t spool)
  Get the full path to a requested spool directory.
- bool_t spool_start (void)
  Create and check the spool directories, and clean them for use.
- void spool_stop (void)
  Clean up the file contents in the spool base directory.
- bool_t ip_addr_eq (ip_t *ip1, ip_t *ip2)
  ip.c
- ip_t * ip_copy (ip_t *dst, ip_t *src)
  Create a copy of an IP address object.
- int_t ip_family (ip_t *address)
  An abstract method of retrieving the address family for an IP structure.
- bool_t ip_localhost (ip_t *address)
  Determine whether an IP address matches the localhost loopback address.
- bool_t ip_matches_subnet (subnet_t *subnet, ip_t *addr)
  Determines whether a given IP address matches a subnet mask.
- octet_t ip_octet (ip_t *address, int_t position)
  Extract a specified 8 bit octet from an IPv4 or IPv6 address.
- stringer_t * ip_presentation (ip_t *address, stringer_t *output)
  Convert an IP address structure into a readable string.
- bool_t ip_private (ip_t *address)
  Determine whether an IP address appears to be associated with a non-routeable, private address space.

- stringer_t * ip_reversed (ip_t *address, stringer_t *output)

  Get a reversed-IP string, for use in an RBL lookup.

- segment_t ip_segment (ip_t *address, int_t position)

  Extract a specified 16 bit segment from an IPv4 or IPv6 address.

- stringer_t * ip_standard (ip_t *address, stringer_t *output)

  Convert an IP address structure to string representation.

- bool_t ip_addr_st (chr_t *ipstr, ip_t *out)

  Convert a string into an IP address object.

- bool_t ip_subnet_st (chr_t *substr, subnet_t *out)

  Convert a string to an IP address object.

- stringer_t * ip_subnet (ip_t *address, stringer_t *output)

  Display the simple subnet string for an IP address.

- int8_t ip_type (ip_t *address)

  Determine whether a structure holds an IPv4 or IPv6 address.

- uint32_t ip_word (ip_t *address, int_t position)

  Get a specified 32-bit segment of an IP address.

Referenced by tcp_continue(), and tls_continue().

5.32.4.39 bool_t file_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is accessible by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for existence/access.

Returns:

true if the pathname exists and is readable, or false otherwise.

Definition at line 155 of file files.c.

5.32.4.40 stringer_t* file_load (const char * *name*)

files.c files.c

Parameters:

name a character pointer to the full pathname of the file to be opened.

Returns:

NULL on failure, or a managed string containing all the data in the file.

Definition at line 51 of file files.c.

References log_info, st_alloc(), st_avail_get(), st_data_get(), and st_length_set().

Referenced by config_load_file_settings(), dkim_start(), and prime_start().

5.32.4.41 int_t file_read (const char * *name*, stringer_t * *output*)

Get the contents of a file on disk.

See also:

file_load()

Note:

This is similar in function to file_load() but there is no read() length checking, so it can be used on non-regular files.

Parameters:

name a character pointer to the full pathname of the file to be opened.

output a managed string where the results of the file read operation will be stored.

Returns:

-1 on failure or the number of bytes read from the file on success.

Definition at line 18 of file files.c.

References log_info, log_pedantic, MEMORYBUF, st_avail_get(), st_data_get(), and st_length_set().

Referenced by process_find_pid(), and process_kill().

5.32.4.42 bool_t file_readwritable (const chr_t * *path*)

Determine whether a given filename or directory path is readable and writable by a user.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for permissions.

Returns:

true if the pathname exists and is readable and writable, or false otherwise.

Definition at line 165 of file files.c.

Referenced by servers_validate().

5.32.4.43 int_t file_temp_handle (chr_t * *pdir*, stringer_t ** *tmpname*)

Get a file handle to a temporary file created in a specified directory.

Parameters:

pdir the parent directory in which to create the temporary file, or NULL for the default spool dir.

tmpname an optional pointer to a managed string to receive the name of the created temp file.

Returns:

-1 on failure or the new temporary file's file descriptor on success.

Definition at line 98 of file files.c.

References CONSTANT, HEAP, JOINTED, log_pedantic, MAGMA_SPOOL_BASE, MANAGED_T, ns_length_get(), spool_path(), st_-append, st_char_get(), st_dupe(), st_dupe_opts(), st_free(), and st_import().

5.32.4.44 bool_t file_world_accessible (const chr_t * *path*)

Determine whether a given filename or directory path is readable or writable by other users.

Parameters:

path a null-terminated string with the name of the filename or directory to be checked for world permissions.

Returns:

true if the pathname exists and is readable or writable by others, or false otherwise.

Definition at line 175 of file files.c.

Referenced by dkim_start(), prime_start(), and servers_validate().

5.32.4.45 int_t folder_count (stringer_t * *path*, bool_t *recursive*, bool_t *strict*)

folder.c

Definition at line 39 of file folder.c.

References count, folder_count(), log_info, MEMORYBUF, NULLER, PLACER, st_char_get(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_-empty, st_free(), and st_merge.

Referenced by folder_count().

5.32.4.46 int_t folder_exists (stringer_t * *path*, bool_t *create*)

Check to see if a specified directory exists, or if specified, create it if it doesn't exist.

Parameters:

path a managed string containing the ful pathname of the directory.

create if true, attempt to create the directory if it does not already exist.

Returns:

-1 if the directory doesn't exist or couldn't be created, 0 if the directory exists, or 1 if the directory was created.

Definition at line 16 of file folder.c.

References st_char_get().

Referenced by log_start(), and spool_check().

5.32.4.47 stringer_t* host_platform (stringer_t * *output*)

host.c host.c

Parameters:

output a pointer to a managed string to receive the OS description.

Returns:

NULL on failure, or the user-specified managed string containing the OS info on success.

Definition at line 15 of file host.c.

5.32.4.48 stringer_t* host_version (stringer_t * *output*)

Get release information about the local OS.

Parameters:

output a pointer to a managed string to receive the release information.

Returns:

NULL on failure, or the user-specified managed string containing the release info on success.

Definition at line 41 of file host.c.

5.32.4.49 bool_t ip_addr_eq (ip_t * *ip1*, ip_t * *ip2*)

ip.c ip.c

Parameters:

ip1 a pointer to the first ip address object in the comparison.

ip2 a pointer to the second ip address object in the comparison.

Returns:

true if the two addresses are equal, or false if they are not.

Definition at line 485 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by sess_get().

5.32.4.50 bool_t ip_addr_st (chr_t * *ipstr*, ip_t * *out*)

Convert a string into an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 507 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, and ns_length_get().

Referenced by ip_subnet_st().

5.32.4.51 ip_t* ip_copy (ip_t * *dst*, ip_t * *src*)

Create a copy of an IP address object.

Parameters:

dst a pointer to the destination IP address object to receive the copy.

src a pointer to the source IP address object to be copied.

NULL on failure, or a pointer to the destination IP address buffer on success.

Definition at line 153 of file ip.c.

References mm_copy().

Referenced by ip_subnet_st(), and sess_create().

5.32.4.52 int_t ip_family (ip_t * *address*)

An abstract method of retrieving the address family for an IP structure.

Returns:

returns a value between AF_UNSPEC (typically defined as 0) and AF_MAX, if an invalid family value is encountered outside this range, then it will be replaced with AF_UNSPEC. If an invalid address strecture is provided, -1 will be returned.

Definition at line 17 of file ip.c.

References ip_t::family.

Referenced by ip_type().

5.32.4.53 bool_t ip_localhost (ip_t * *address*)

Determine whether an IP address matches the localhost loopback address.

Note:

This function only matches if the remote peer is connected using IPv4 from the 127.0.0.0/8 range, from the same range using an IPv4 to IPv6 mapping, or frm the specific IPv6 using IPv6 from the ::1/128 address by IPv6.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from the local host, and thus dictating that the packets associated with the connection never travel across a network cable, which allows us to excempt the peer from transport security requirements, SPF checks. and allow the use of administrative functions without authentication. In theory connections from IP addresses associated with the network interfaces on the local host are just as safe, but we currently only match against the loopback address.

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 75 of file ip.c.

References ip_t::ip6, ip_octet(), ip_type(), and ip_word().

Referenced by con_localhost(), con_private(), and ip_private().

5.32.4.54 bool_t ip_matches_subnet (subnet_t * *subnet*, ip_t * *addr*)

Determines whether a given IP address matches a subnet mask.

Parameters:

subnet a pointer to a subnet that the address will be compared against.

addr a pointer to the IP address of interest.

Returns:

true if the specified IP address falls into the subnet, or false if it does not.

Definition at line 617 of file ip.c.

References subnet_t::address, ip_t::family, ip_t::ip, and subnet_t::mask.

Referenced by smtp_bypass_check().

5.32.4.55 octet_t ip_octet (ip_t ∗ *address*, int_t *position*)

Extract a specified 8 bit octet from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the zero-indexed (starting at least-significant byte) byte number of the IP address to be evaluated.

Returns:

-1 on failure, or the 16 bit-widened octet extracted from the supplied IP address.

Definition at line 168 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_octet(), ip_localhost(), and ip_private().

5.32.4.56 stringer_t∗ ip_presentation (ip_t ∗ *address*, stringer_t ∗ *output*)

Convert an IP address structure into a readable string.

Parameters:

address a pointer to the IP address to be displayed.

output a managed string to store the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the IP address as text on success.

Definition at line 296 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, MEMORYBUF, ns_length_get(), st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by client_read(), client_read_line(), client_write(), con_addr_presentation(), signal_shutdown(), and tcp_addr_st().

5.32.4.57 bool_t ip_private (ip_t ∗ *address*)

Determine whether an IP address appears to be associated with a non-routeable, private address space.

Note:

This function looks for the IP addresses in the address ranges set aside for private networks. For IPv4 the ranges 10.0.0.0/8, 172.16.0.0/12 and 192.168.0.0/16 are reserved. For IPv6 the range fc00::/7 has been set aside. By convention addresses in these ranges are unrouteable on the open internet, so if a peer appears to be connecting from a private address then it should be on the same private network.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from hosts on the same (internal) network, and thus treat those connections differently than connections from the public internet.

Returns:

false by default, and true if the address falls inside the ranges reserved for private networks.

Definition at line 106 of file ip.c.

References ip_t::ip6, ip_localhost(), ip_octet(), ip_type(), and ip_word().

5.32.4.58 stringer_t* ip_reversed (ip_t * *address*, stringer_t * *output*)

Get a reversed-IP string, for use in an RBL lookup.

Parameters:

address a pointer to the IP address to be displayed as a string.

output a pointer to the managed string to receive the reversed-IP string, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing the reversed-IP string on success.

Definition at line 413 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_length_set(), st_sprint(), st_valid_destination(), and st_valid_tracked().

Referenced by con_addr_reversed().

5.32.4.59 segment_t ip_segment (ip_t * *address*, int_t *position*)

Extract a specified 16 bit segment from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the 0-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 193 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_segment().

5.32.4.60 stringer_t* ip_standard (ip_t * *address*, stringer_t * *output*)

Convert an IP address structure to string representation.

Parameters:

address a pointer to the IP address to be converted.

output a pointer to the managed string to receive the converted value, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 339 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_sprint(), st_valid_destination(), st_valid_tracked(), and st_wipe().

Referenced by con_addr_standard().

5.32.4.61 stringer_t* ip_subnet (ip_t * *address*, stringer_t * *output*)

Display the simple subnet string for an IP address.

Note:

IPv4 addresses will yield a /24 subnet address, and IPv6 addresses will result in a /64 subnet address. Neither address will be displayed with the trailing zero-octet(s).

Parameters:

address a pointer to the ip address to be examined.

output a pointer to a managed string to receive the subnet string, or if passed as NULL, it will be allocated for the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the result on success.

Definition at line 243 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_free(), st_length_get(), st_sprint(), st_valid_avail(), and st_valid_destination().

Referenced by con_addr_subnet().

5.32.4.62 bool_t ip_subnet_st (chr_t * *substr*, subnet_t * *out*)

Convert a string to an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 557 of file ip.c.

References subnet_t::address, ip_t::family, ip_addr_st(), ip_copy(), subnet_t::mask, ns_free(), ns_import(), ns_length_get(), NULLER, pl_char_get(), pl_length_get(), placer_t, tok_get_count_st(), tok_get_ns(), and uint8_conv_bl().

Referenced by smtp_add_bypass_entry().

5.32.4.63 int8_t ip_type (ip_t * *address*)

Determine whether a structure holds an IPv4 or IPv6 address.

Returns:

returns -1 for invalid inputs, or system errors, 0 if the function isn't provided with a TCP/IP address, the number 4 if the address is IPv4 and 6 if the address is IPv6.

Definition at line 37 of file ip.c.

References ip_family().

Referenced by ip_localhost(), and ip_private().

5.32.4.64 uint32_t ip_word (ip_t * *address*, int_t *position*)

Get a specified 32-bit segment of an IP address.

Note:

This function operates on both ipv4 and ipv6 addresses.

Parameters:

address a pointer to the IP address object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

0 on error, or the specified 32-bit segment of the passed address.

Definition at line 221 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_word(), ip_localhost(), and ip_private().

5.32.4.65 pid_t process_find_pid (stringer_t * *name*)

process.c process.c

Note:

Only returns the first match, and will never return the process identifier for the currently running process.

Parameters:

name the name of the executable to find.

Returns:

0 if the process was not found, otherwise the a process identifier is returned.

Definition at line 23 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGED-BUF, MEMORYBUF, pid, process_my_pid(), st_cmp_cs_eq(), and st_trim().

Referenced by main().

5.32.4.66 int_t process_kill (stringer_t * *name*, int_t *signum*, int_t *wait*)

Kill a named process with the specified signal, and retry if necessary.

Parameters:

name the name of the process to kill (matches any process that starts with the specified name).

signum the signal number to be sent to the matching process.

wait the number of times to re-send the signal, with one second rest intervals in between.

Returns:

-2 for a generic failure, -1 on timeout, 0 if process not found, and 1 if the process was successfully killed.

Definition at line 61 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGEDBUF, MEMORYBUF, pid, process_my_pid(), st_char_get(), st_cmp_cs_starts(), st_length_int(), and st_swap().

5.32.4.67 pid_t process_my_pid (void)

Return the current process identifier using appropriate function for the current system.

Definition at line 13 of file process.c.

Referenced by process_find_pid(), process_kill(), and status_process().

5.32.4.68 chr_t* signal_name (int *signal*, char * *buffer*, size_t *length*)

signals.c signals.c

Parameters:

signal the input signal number.

buffer a buffer to receive the signal description.

length the length of the buffer to receive the output, which should be greater than 32 bytes.

Returns:

a pointer to a null-terminated string containing the textual name of the specified signal.

Definition at line 17 of file signals.c.

References log_pedantic.

Referenced by signal_segfault(), signal_shutdown(), and signal_status().

5.32.4.69 int_t spool_check (stringer_t * *path*)

spool.c spool.c

Parameters:

path a managed string with the spool directory to be checked.

Returns:

0 if the specified spool path exists, 1 if it was created, or -1 on error.

Definition at line 75 of file spool.c.

References folder_exists(), log_critical, log_info, mutex_lock(), mutex_unlock(), st_char_get(), and st_length_int().

Referenced by spool_mktemp(), spool_start(), and virus_start().

5.32.4.70 int_t spool_check_file (const char * *file*, const struct stat * *info*, int *type*)

An internal function used by the ftw() function to cleanup the file contents of a spool directory.

Parameters:

file a pointer to a null-terminated string containing the pathname of the spool file.

info a pointer to a stat object containing the filesystem info of the specified file.

the ftw type flag of the specified file (only FTW_F is handled).

Returns:

This function always returns 0.

Definition at line 185 of file spool.c.

References log_error, MEMORYBUF, mutex_lock(), mutex_unlock(), NULLER, PLACER, and st_cmp_cs_eq().

Referenced by spool_cleanup(), and spool_stop().

5.32.4.71 int_t spool_cleanup (void)

Clean up the file contents in the spool base directory.

Returns:

-1 on error or the number of files that were purged from the spool base directory.

Definition at line 213 of file spool.c.

References log_error, log_pedantic, MAGMA_SPOOL_BASE, rwlock_lock_write(), rwlock_unlock(), spool_check_file(), spool_path(), st_-char_get(), st_free(), and st_length_int().

Referenced by spool_start().

5.32.4.72 uint64_t spool_error_stats (void)

Get the number of spool errors encountered.

Returns:

the total number of spool errors.

Definition at line 26 of file spool.c.

References mutex_lock(), and mutex_unlock().

Referenced by stats_derived_value().

5.32.4.73 int_t spool_mktemp (int_t *spool*, chr_t * *prefix*)

Create a temporary file in a specified spool directory.

Note:

The temp file is automatically unlinked as soon as it is created.

Parameters:

spool the spool directory id in which the temp file will be stored (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_-SPOOL_SCAN).

prefix an optional prefix for the temp file name ("magma" will be used if prefix is NULL0.

Returns:

-1 on failure or the file descriptor to the newly created temp file on success.

Definition at line 113 of file spool.c.

References log_critical, log_pedantic, MAGMA_SPOOL_BASE, MEMORYBUF, mutex_lock(), mutex_unlock(), rand_get_uint64(), rwlock_lock_read(), rwlock_unlock(), spool_check(), spool_path(), st_aprint(), st_char_get(), st_free(), st_length_int(), and thread_get_-thread_id().

Referenced by st_alloc_opts(), and virus_check().

5.32.4.74 stringer_t∗ spool_path (int_t *spool*)

Get the full path to a requested spool directory.

Parameters:

the spool id (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_SPOOL_SCAN); defaults to MAGMA_SPOOL_-DATA.

Returns:

NULL on failure, or a managed string pointing to the requested path inside the magma spool parent directory, or /tmp/magma if the spool isn't configured.

Definition at line 40 of file spool.c.

References CONTIGUOUS, HEAP, magma, MAGMA_SPOOL_BASE, MAGMA_SPOOL_SCAN, ns_length_get(), NULLER_T, magma_-t::spool, and st_merge_opts().

Referenced by dspam_check(), dspam_train(), file_temp_handle(), spool_cleanup(), spool_mktemp(), spool_start(), and virus_start().

5.32.4.75 bool_t spool_start (void)

Create and check the spool directories, and clean them for use.

Returns:

true on success or false on failure.

Definition at line 279 of file spool.c.

References log_critical, MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, MAGMA_SPOOL_SCAN, mutex_lock(), mutex_unlock(), spool_check(), spool_cleanup(), spool_path(), st_char_get(), st_free(), and st_length_int().

Referenced by process_start().

5.32.4.76 void spool_stop (void)

Clean up the file contents in the spool base directory.

Note:

This is like a fast version of spool_cleanup().

Returns:

This function returns no value.

Definition at line 252 of file spool.c.

References log_pedantic, spool_check_file(), st_char_get(), st_free(), and st_length_int().

Referenced by process_stop().

5.32.4.77 ip_t* tcp_addr_ip (int *sockd*, ip_t * *output*)

tcp.c

Definition at line 164 of file tcp.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, MEMORYBUF, mm_alloc(), and mm_copy().

Referenced by con_init(), and tcp_addr_st().

5.32.4.78 stringer_t* tcp_addr_st (int *sockd*, stringer_t * *output*)

Definition at line 193 of file tcp.c.

References ip_presentation(), and tcp_addr_ip().

5.32.4.79 int tcp_continue (int *sockd*, int *result*, int *syserror*)

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 83 of file tcp.c.

References errno_name(), log_pedantic, MEMORYBUF, and status.

Referenced by tcp_read(), and tcp_write().

5.32.4.80 int_t tcp_error (int *error*)

Determine whether the error is a permanent/fatal failure, or a transient error.

Returns:

return 0 for errors we should ignore, and -1 for permanent/fatal failures.

Definition at line 15 of file tcp.c.

References log_pedantic, and MEMORYBUF.

Referenced by tcp_status().

5.32.4.81 int tcp_read (int *sockd*, void * *buffer*, int *length*, bool_t *block*)

Read data from a TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll read the data from.

buffer a pointer to the buffer where the data will be stored.

length the maximum length, in bytes, we can read into the buffer.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 if the network connection is no longer viable, otherwise the number bytes read, while a 0 may indicate the connection wasn't ready (when using non-blocking read calls), or a non-network error may have ocurred.

Definition at line 110 of file tcp.c.

References log_pedantic, and tcp_continue().

Referenced by con_read(), and con_read_line().

5.32.4.82 int_t tcp_status (int *sockd*)

Determine whether the socket connection provided by sockd is still valid.

Parameters:

sockd The socket connection being checked.

Returns:

return 0 for valid connections

Definition at line 42 of file tcp.c.

References MANAGEDBUF, and tcp_error().

Referenced by client_read(), client_read_line(), client_status(), client_write(), and con_status().

5.32.4.83 int tcp_wait (int *sockd*)

Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

Parameters:

sockd

Returns:

Definition at line 74 of file tcp.c.

5.32.4.84 int tcp_write (int *sockd*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll write the data to.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 on error, or the number of bytes written to the network connection.

Definition at line 141 of file tcp.c.

References log_pedantic, and tcp_continue().

Referenced by con_write_bl().

5.33 src/core/host/ip.c File Reference

Generic interface for parsing, and manipulating the IP address structure. `#include "magma.h"`

Functions

- int_t ip_family (ip_t *address)
  An abstract method of retrieving the address family for an IP structure.
- int8_t ip_type (ip_t *address)
  Determine whether a structure holds an IPv4 or IPv6 address.
- bool_t ip_localhost (ip_t *address)
  Determine whether an IP address matches the localhost loopback address.
- bool_t ip_private (ip_t *address)
  Determine whether an IP address appears to be associated with a non-routeable, private address space.
- ip_t * ip_copy (ip_t *dst, ip_t *src)
  Create a copy of an IP address object.
- octet_t ip_octet (ip_t *address, int_t position)
  Extract a specified 8 bit octet from an IPv4 or IPv6 address.
- segment_t ip_segment (ip_t *address, int_t position)
  Extract a specified 16 bit segment from an IPv4 or IPv6 address.
- uint32_t ip_word (ip_t *address, int_t position)
  Get a specified 32-bit segment of an IP address.
- stringer_t * ip_subnet (ip_t *address, stringer_t *output)
  Display the simple subnet string for an IP address.
- stringer_t * ip_presentation (ip_t *address, stringer_t *output)
  Convert an IP address structure into a readable string.
- stringer_t * ip_standard (ip_t *address, stringer_t *output)
  Convert an IP address structure to string representation.
- stringer_t * ip_reversed (ip_t *address, stringer_t *output)
  Get a reversed-IP string, for use in an RBL lookup.
- bool_t ip_addr_eq (ip_t *ip1, ip_t *ip2)
  Determine whether two IP addresses are equal.
- bool_t ip_addr_st (chr_t *ipstr, ip_t *out)
  Convert a string into an IP address object.
- bool_t ip_subnet_st (chr_t *substr, subnet_t *out)
  Convert a string to an IP address object.
- bool_t ip_matches_subnet (subnet_t *subnet, ip_t *addr)
  Determines whether a given IP address matches a subnet mask.

5.33.1 Detailed Description

Generic interface for parsing, and manipulating the IP address structure.

Definition in file ip.c.

5.33.2 Function Documentation

5.33.2.1 bool_t ip_addr_eq (ip_t * *ip1*, ip_t * *ip2*)

Determine whether two IP addresses are equal. ip.c

Parameters:

ip1 a pointer to the first ip address object in the comparison.
ip2 a pointer to the second ip address object in the comparison.

Returns:

true if the two addresses are equal, or false if they are not.

Definition at line 485 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by sess_get().

5.33.2.2 bool_t ip_addr_st (chr_t * *ipstr*, ip_t * *out*)

Convert a string into an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.
out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 507 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, and ns_length_get().

Referenced by ip_subnet_st().

5.33.2.3 ip_t* ip_copy (ip_t * *dst*, ip_t * *src*)

Create a copy of an IP address object.

Parameters:

dst a pointer to the destination IP address object to receive the copy.
src a pointer to the source IP address object to be copied.
NULL on failure, or a pointer to the destination IP address buffer on success.

Definition at line 153 of file ip.c.

References mm_copy().

Referenced by ip_subnet_st(), and sess_create().

5.33.2.4 int_t ip_family (ip_t * *address*)

An abstract method of retrieving the address family for an IP structure.

Returns:

returns a value between AF_UNSPEC (typically defined as 0) and AF_MAX, if an invalid family value is encountered outside this range, then it will be replaced with AF_UNSPEC. If an invalid address strecture is provided, -1 will be returned.

Definition at line 17 of file ip.c.

References ip_t::family.

Referenced by ip_type().

5.33.2.5 bool_t ip_localhost (ip_t * *address*)

Determine whether an IP address matches the localhost loopback address.

Note:

This function only matches if the remote peer is connected using IPv4 from the 127.0.0.0/8 range, from the same range using an IPv4 to IPv6 mapping, or frm the specific IPv6 using IPv6 from the ::1/128 address by IPv6.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from the local host, and thus dictating that the packets associated with the connection never travel across a network cable, which allows us to excempt the peer from transport security requirements, SPF checks. and allow the use of administrative functions without authentication. In theory connections from IP addresses associated with the network interfaces on the local host are just as safe, but we currently only match against the loopback address.

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 75 of file ip.c.

References ip_t::ip6, ip_octet(), ip_type(), and ip_word().

Referenced by con_localhost(), con_private(), and ip_private().

5.33.2.6 bool_t ip_matches_subnet (subnet_t * *subnet*, ip_t * *addr*)

Determines whether a given IP address matches a subnet mask.

Parameters:

subnet a pointer to a subnet that the address will be compared against.

addr a pointer to the IP address of interest.

Returns:

true if the specified IP address falls into the subnet, or false if it does not.

Definition at line 617 of file ip.c.

References subnet_t::address, ip_t::family, ip_t::ip, and subnet_t::mask.

Referenced by smtp_bypass_check().

5.33.2.7 octet_t ip_octet (ip_t * *address*, int_t *position*)

Extract a specified 8 bit octet from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the zero-indexed (starting at least-significant byte) byte number of the IP address to be evaluated.

Returns:

-1 on failure, or the 16 bit-widened octet extracted from the supplied IP address.

Definition at line 168 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_octet(), ip_localhost(), and ip_private().

5.33.2.8 stringer_t* ip_presentation (ip_t * *address*, stringer_t * *output*)

Convert an IP address structure into a readable string.

Parameters:

address a pointer to the IP address to be displayed.

output a managed string to store the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the IP address as text on success.

Definition at line 296 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, MEMORYBUF, ns_length_get(), st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by client_read(), client_read_line(), client_write(), con_addr_presentation(), signal_shutdown(), and tcp_addr_st().

5.33.2.9 bool_t ip_private (ip_t * *address*)

Determine whether an IP address appears to be associated with a non-routeable, private address space.

Note:

This function looks for the IP addresses in the address ranges set aside for private networks. For IPv4 the ranges 10.0.0.0/8, 172.16.0.0/12 and 192.168.0.0/16 are reserved. For IPv6 the range fc00::/7 has been set aside. By convention addresses in these ranges are unrouteable on the open internet, so if a peer appears to be connecting from a private address then it should be on the same private network.

Remarks:

The rationale behind this function is to make it easy for us to detect connections from hosts on the same (internal) network, and thus treat those connections differently than connections from the public internet.

Returns:

false by default, and true if the address falls inside the ranges reserved for private networks.

Definition at line 106 of file ip.c.

References ip_t::ip6, ip_localhost(), ip_octet(), ip_type(), and ip_word().

5.33.2.10 stringer_t* ip_reversed (ip_t * *address*, stringer_t * *output*)

Get a reversed-IP string, for use in an RBL lookup.

Parameters:

address a pointer to the IP address to be displayed as a string.

output a pointer to the managed string to receive the reversed-IP string, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing the reversed-IP string on success.

Definition at line 413 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_length_set(), st_sprint(), st_valid_destination(), and st_valid_tracked().

Referenced by con_addr_reversed().

5.33.2.11 segment_t ip_segment (ip_t * *address*, int_t *position*)

Extract a specified 16 bit segment from an IPv4 or IPv6 address.

Parameters:

address the IP address object to be examined.

position the 0-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 193 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_segment().

5.33.2.12 stringer_t* ip_standard (ip_t * *address*, stringer_t * *output*)

Convert an IP address structure to string representation.

Parameters:

address a pointer to the IP address to be converted.

output a pointer to the managed string to receive the converted value, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 339 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_char_get(), st_free(), st_length_set(), st_sprint(), st_valid_destination(), st_valid_tracked(), and st_wipe().

Referenced by con_addr_standard().

5.33.2.13 stringer_t* ip_subnet (ip_t * *address*, stringer_t * *output*)

Display the simple subnet string for an IP address.

Note:

IPv4 addresses will yield a /24 subnet address, and IPv6 addresses will result in a /64 subnet address. Neither address will be displayed with the trailing zero-octet(s).

Parameters:

address a pointer to the ip address to be examined.

output a pointer to a managed string to receive the subnet string, or if passed as NULL, it will be allocated for the caller.

Returns:

NULL on failure, or a pointer to a managed string containing the result on success.

Definition at line 243 of file ip.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, st_alloc(), st_avail_get(), st_free(), st_length_get(), st_sprint(), st_valid_avail(), and st_valid_destination().

Referenced by con_addr_subnet().

5.33.2.14 bool_t ip_subnet_st (chr_t * *substr*, subnet_t * *out*)

Convert a string to an IP address object.

Parameters:

ipstr a pointer to a null-terminated string containing the IP string to be parsed.

out a pointer to an IP address object that will receive result of the operation.

Returns:

true if the input string was a valid IP address or false if it was unable to be parsed.

Definition at line 557 of file ip.c.

References subnet_t::address, ip_t::family, ip_addr_st(), ip_copy(), subnet_t::mask, ns_free(), ns_import(), ns_length_get(), NULLER, pl_-char_get(), pl_length_get(), placer_t, tok_get_count_st(), tok_get_ns(), and uint8_conv_bl().

Referenced by smtp_add_bypass_entry().

5.33.2.15 int8_t ip_type (ip_t * *address*)

Determine whether a structure holds an IPv4 or IPv6 address.

Returns:

returns -1 for invalid inputs, or system errors, 0 if the function isn't provided with a TCP/IP address, the number 4 if the address is IPv4 and 6 if the address is IPv6.

Definition at line 37 of file ip.c.

References ip_family().

Referenced by ip_localhost(), and ip_private().

5.33.2.16 uint32_t ip_word (ip_t * *address*, int_t *position*)

Get a specified 32-bit segment of an IP address.

Note:

This function operates on both ipv4 and ipv6 addresses.

Parameters:

address a pointer to the IP address object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

0 on error, or the specified 32-bit segment of the passed address.

Definition at line 221 of file ip.c.

References ip_t::family, ip_t::ip4, and ip_t::ip6.

Referenced by con_addr_word(), ip_localhost(), and ip_private().

5.34 src/core/host/process.c File Reference

```
#include "magma.h"
```

Functions

- pid_t process_my_pid (void)
  Return the current process identifier using appropriate function for the current system.
- pid_t process_find_pid (stringer_t *name)
  Find the process identifier for a named executable and return it.
- int_t process_kill (stringer_t *name, int_t signum, int_t wait)
  Kill a named process with the specified signal, and retry if necessary.

5.34.1 Function Documentation

5.34.1.1 pid_t process_find_pid (stringer_t * *name*)

Find the process identifier for a named executable and return it. process.c

Note:

Only returns the first match, and will never return the process identifier for the currently running process.

Parameters:

name the name of the executable to find.

Returns:

0 if the process was not found, otherwise the a process identifier is returned.

Definition at line 23 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGEDBUF, MEMORYBUF, pid, process_my_pid(), st_cmp_cs_eq(), and st_trim().

Referenced by main().

5.34.1.2 int_t process_kill (stringer_t * *name*, int_t *signum*, int_t *wait*)

Kill a named process with the specified signal, and retry if necessary.

Parameters:

name the name of the process to kill (matches any process that starts with the specified name).

signum the signal number to be sent to the matching process.

wait the number of times to re-send the signal, with one second rest intervals in between.

Returns:

-2 for a generic failure, -1 on timeout, 0 if process not found, and 1 if the process was successfully killed.

Definition at line 61 of file process.c.

References chr_numeric(), file_read(), int32_conv_ns(), log_pedantic, MAGMA_FILEPATH_MAX, MAGMA_PROC_PATH, MANAGEDBUF, MEMORYBUF, pid, process_my_pid(), st_char_get(), st_cmp_cs_starts(), st_length_int(), and st_swap().

5.34.1.3 pid_t process_my_pid (void)

Return the current process identifier using appropriate function for the current system.

Definition at line 13 of file process.c.

Referenced by process_find_pid(), process_kill(), and status_process().

Functions

- void process_maint (void)
  The entry point for the process maintenance thread, which runs in a continuous loop unless canceled.
- void process_stop (void)
  Execute the magma shutdown routines.
- bool_t process_start (void)
  Execute the magma initializations routines, making sure they all run properly.

Variables

- bool_t exit_and_dump
- uint64_t day = 0
- pthread_t * maint = NULL

5.35.1 Function Documentation

5.35.1.1 void process_maint (void)

The entry point for the process maintenance thread, which runs in a continuous loop unless canceled.

Note:

Execute once daily: rotate the log files, update the warehouse, and perform tank maintenance. Execute every few (0-10) minutes: refresh the virus engine and prune the object cache.

Returns:

This function returns no value.

Definition at line 20 of file process.c.

References day, log_rotate(), obj_cache_prune(), rand_get_uint32(), status, thread_cancel_disable(), thread_cancel_enable(), thread_start(), thread_stop(), time_datestamp(), time_till_midnight(), virus_engine_refresh(), and warehouse_update().

Referenced by process_start().

5.35.1.2 bool_t process_start (void)

Execute the magma initializations routines, making sure they all run properly.

Note:

If any of the init routines returns with failure, this function fails and logs an error message. Certain checks are made that the init routines are run in a particular order, especially in waiting for daemonization and privilege dropping before starting logging. The system maintenance thread is also launched from here.

Returns:

true if all starter functions returned true, or false if any of them failed..

Definition at line 162 of file process.c.

References cache_start(), config_load_cmdline_settings(), config_load_database_settings(), config_load_defaults(), config_load_file_-settings(), config_validate_settings(), deprecated_ecies_start(), dkim_start(), dspam_start(), exit_and_dump, magma_t::host, http_content_-start(), magma_t::init, lib_load(), log_critical, log_info, log_start(), magma, MAGMA_HOSTNAME_MAX, mail_cache_start(), maint, mm_alloc(), mm_free(), mm_sec_start(), magma_t::name, obj_cache_start(), magma_t::page_length, prime_start(), process_maint(), protocol_init(), queue_init(), rand_start(), sanity_check(), servers_encryption_start(), servers_network_start(), signal_start(), spf_start(), spool_start(), sql_start(), ssl_start(), stats_init(), status_process(), system_change_root_directory(), system_fork_daemon(), system_init_-core_dumps(), system_init_impersonation(), system_init_resource_limits(), system_init_umask(), tank_start(), thread_launch(), virus_start(), warehouse_start(), and xml_start().

Referenced by main().

5.35.1.3 void process_stop (void)

Execute the magma shutdown routines.

Note:

This function will execute a shutdown routine for each of the startup initialization routines that was performed. It will also signal and terminate the maintenance thread.

Returns:

This function returns no value.

Definition at line 66 of file process.c.

References cache_stop(), config_free(), deprecated_ecies_stop(), dkim_stop(), dspam_stop(), http_content_stop(), magma_t::init, lib_-unload(), log_critical, log_info, log_pedantic, magma, mail_cache_stop(), maint, mm_free(), mm_sec_stop(), obj_cache_stop(), prime_-stop(), queue_shutdown(), rand_stop(), servers_encryption_stop(), servers_network_stop(), spf_stop(), spool_stop(), sql_stop(), ssl_stop(), stats_shutdown(), status, tank_stop(), thread_join(), thread_signal(), virus_stop(), warehouse_stop(), and xml_stop().

5.36 src/core/host/signals.c File Reference

Functions to help handle signals. `#include "magma.h"`

Functions

- chr_t ∗ signal_name (int signal, char ∗buffer, size_t length)
  Translate a numeric signal into a human readable name.

5.36.1 Detailed Description

Functions to help handle signals.

Definition in file signals.c.

5.36.2 Function Documentation

5.36.2.1 chr_t∗ signal_name (int *signal*, char ∗ *buffer*, size_t *length*)

Translate a numeric signal into a human readable name. signals.c

Parameters:

signal the input signal number.

buffer a buffer to receive the signal description.

length the length of the buffer to receive the output, which should be greater than 32 bytes.

Returns:

a pointer to a null-terminated string containing the textual name of the specified signal.

Definition at line 17 of file signals.c.

References log_pedantic.

Referenced by signal_segfault(), signal_shutdown(), and signal_status().

5.37 src/core/host/spool.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t spool_error_stats (void)

  Get the number of spool errors encountered.

- stringer_t ∗ spool_path (int_t spool)

  Get the full path to a requested spool directory.

- int_t spool_check (stringer_t ∗path)

  Check to see if the specified spool directory exists.

- int_t spool_mktemp (int_t spool, chr_t ∗prefix)

  Create a temporary file in a specified spool directory.

- int_t spool_check_file (const char ∗file, const struct stat ∗info, int type)

  An internal function used by the ftw() function to cleanup the file contents of a spool directory.

- int_t spool_cleanup (void)

  Clean up the file contents in the spool base directory.

- void spool_stop (void)

  Clean up the file contents in the spool base directory.

- bool_t spool_start (void)

  Create and check the spool directories, and clean them for use.

5.37.1 Function Documentation

5.37.1.1 int_t spool_check (stringer_t ∗ *path*)

Check to see if the specified spool directory exists. spool.c

Parameters:

path a managed string with the spool directory to be checked.

Returns:

0 if the specified spool path exists, 1 if it was created, or -1 on error.

Definition at line 75 of file spool.c.

References folder_exists(), log_critical, log_info, mutex_lock(), mutex_unlock(), st_char_get(), and st_length_int().

Referenced by spool_mktemp(), spool_start(), and virus_start().

5.37.1.2 int_t spool_check_file (const char * *file*, const struct stat * *info*, int *type*)

An internal function used by the ftw() function to cleanup the file contents of a spool directory.

Parameters:

file a pointer to a null-terminated string containing the pathname of the spool file.

info a pointer to a stat object containing the filesystem info of the specified file.

the ftw type flag of the specified file (only FTW_F is handled).

Returns:

This function always returns 0.

Definition at line 185 of file spool.c.

References log_error, MEMORYBUF, mutex_lock(), mutex_unlock(), NULLER, PLACER, and st_cmp_cs_eq().

Referenced by spool_cleanup(), and spool_stop().

5.37.1.3 int_t spool_cleanup (void)

Clean up the file contents in the spool base directory.

Returns:

-1 on error or the number of files that were purged from the spool base directory.

Definition at line 213 of file spool.c.

References log_error, log_pedantic, MAGMA_SPOOL_BASE, rwlock_lock_write(), rwlock_unlock(), spool_check_file(), spool_path(), st_-char_get(), st_free(), and st_length_int().

Referenced by spool_start().

5.37.1.4 uint64_t spool_error_stats (void)

Get the number of spool errors encountered.

Returns:

the total number of spool errors.

Definition at line 26 of file spool.c.

References mutex_lock(), and mutex_unlock().

Referenced by stats_derived_value().

5.37.1.5 int_t spool_mktemp (int_t *spool*, chr_t * *prefix*)

Create a temporary file in a specified spool directory.

Note:

The temp file is automatically unlinked as soon as it is created.

Parameters:

spool the spool directory id in which the temp file will be stored (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_-SPOOL_SCAN).

prefix an optional prefix for the temp file name ("magma" will be used if prefix is NULL0.

Returns:

-1 on failure or the file descriptor to the newly created temp file on success.

Definition at line 113 of file spool.c.

References log_critical, log_pedantic, MAGMA_SPOOL_BASE, MEMORYBUF, mutex_lock(), mutex_unlock(), rand_get_uint64(), rwlock_lock_read(), rwlock_unlock(), spool_check(), spool_path(), st_aprint(), st_char_get(), st_free(), st_length_int(), and thread_get_thread_id().

Referenced by st_alloc_opts(), and virus_check().

5.37.1.6 stringer_t∗ spool_path (int_t *spool*)

Get the full path to a requested spool directory.

Parameters:

the spool id (MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, or MAGMA_SPOOL_SCAN); defaults to MAGMA_SPOOL_DATA.

Returns:

NULL on failure, or a managed string pointing to the requested path inside the magma spool parent directory, or /tmp/magma if the spool isn't configured.

Definition at line 40 of file spool.c.

References CONTIGUOUS, HEAP, magma, MAGMA_SPOOL_BASE, MAGMA_SPOOL_SCAN, ns_length_get(), NULLER_T, magma_t::spool, and st_merge_opts().

Referenced by dspam_check(), dspam_train(), file_temp_handle(), spool_cleanup(), spool_mktemp(), spool_start(), and virus_start().

5.37.1.7 bool_t spool_start (void)

Create and check the spool directories, and clean them for use.

Returns:

true on success or false on failure.

Definition at line 279 of file spool.c.

References log_critical, MAGMA_SPOOL_BASE, MAGMA_SPOOL_DATA, MAGMA_SPOOL_SCAN, mutex_lock(), mutex_unlock(), spool_check(), spool_cleanup(), spool_path(), st_char_get(), st_free(), and st_length_int().

Referenced by process_start().

5.37.1.8 void spool_stop (void)

Clean up the file contents in the spool base directory.

Note:

This is like a fast version of spool_cleanup().

Returns:

This function returns no value.

Definition at line 252 of file spool.c.

References log_pedantic, spool_check_file(), st_char_get(), st_free(), and st_length_int().

Referenced by process_stop().

5.38 src/core/host/tcp.c File Reference

Generic fuctions for interaction with TCP/IP socket connections. `#include "magma.h"`

Functions

- int_t tcp_error (int error)

  Determine whether the error is a permanent/fatal failure, or a transient error.

- int_t tcp_status (int sockd)

  Determine whether the socket connection provided by sockd is still valid.

- int tcp_wait (int sockd)

  Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

- int tcp_continue (int sockd, int result, int syserror)

  Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

- int tcp_read (int sockd, void ∗buffer, int length, bool_t block)

  Read data from a TCP/IP network socket.

- int tcp_write (int sockd, const void ∗buffer, int length, bool_t block)

  Write data to an open TCP/IP network socket.

- ip_t ∗ tcp_addr_ip (int sockd, ip_t ∗output)

  tcp.c

- stringer_t ∗ tcp_addr_st (int sockd, stringer_t ∗output)

5.38.1 Detailed Description

Generic fuctions for interaction with TCP/IP socket connections.

Definition in file tcp.c.

5.38.2 Function Documentation

5.38.2.1 ip_t∗ tcp_addr_ip (int *sockd*, ip_t ∗ *output*)

tcp.c

Definition at line 164 of file tcp.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, MEMORYBUF, mm_alloc(), and mm_copy().

Referenced by con_init(), and tcp_addr_st().

5.38.2.2 stringer_t∗ tcp_addr_st (int *sockd*, stringer_t ∗ *output*)

Definition at line 193 of file tcp.c.

References ip_presentation(), and tcp_addr_ip().

5.38.2.3 int tcp_continue (int *sockd*, int *result*, int *syserror*)

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 83 of file tcp.c.

References errno_name(), log_pedantic, MEMORYBUF, and status.

Referenced by tcp_read(), and tcp_write().

5.38.2.4 int_t tcp_error (int *error*)

Determine whether the error is a permanent/fatal failure, or a transient error.

Returns:

return 0 for errors we should ignore, and -1 for permanent/fatal failures.

Definition at line 15 of file tcp.c.

References log_pedantic, and MEMORYBUF.

Referenced by tcp_status().

5.38.2.5 int tcp_read (int *sockd*, void * *buffer*, int *length*, bool_t *block*)

Read data from a TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll read the data from.

buffer a pointer to the buffer where the data will be stored.

length the maximum length, in bytes, we can read into the buffer.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 if the network connection is no longer viable, otherwise the number bytes read, while a 0 may indicate the connection wasn't ready (when using non-blocking read calls), or a non-network error may have ocurred.

Definition at line 110 of file tcp.c.

References log_pedantic, and tcp_continue().

Referenced by con_read(), and con_read_line().

5.38.2.6 int_t tcp_status (int *sockd*)

Determine whether the socket connection provided by sockd is still valid.

Parameters:

sockd The socket connection being checked.

Returns:

return 0 for valid connections

Definition at line 42 of file tcp.c.

References MANAGEDBUF, and tcp_error().

Referenced by client_read(), client_read_line(), client_status(), client_write(), and con_status().

5.38.2.7 int tcp_wait (int *sockd*)

Blocks until a socket is ready for a read/write operation, or otherwise becomes invalid.

Parameters:

sockd

Returns:

Definition at line 74 of file tcp.c.

5.38.2.8 int tcp_write (int *sockd*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TCP/IP network socket.

Parameters:

sockd the socket file descriptor we'll write the data to.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

block a boolean to indicating whether to make a blocking write call.

Returns:

-1 on error, or the number of bytes written to the network connection.

Definition at line 141 of file tcp.c.

References log_pedantic, and tcp_continue().

Referenced by con_write_bl().

5.39 src/core/indexes/cursors.c File Reference

```
#include "magma.h"
```

Functions

- void inx_cursor_reset (inx_cursor_t *cursor)

  Reset the position of an inx cursor.

- void inx_cursor_free (inx_cursor_t *cursor)

  Free an inx cursor and the inx object it points to, if the inx reference count hits zero.

- inx_cursor_t * inx_cursor_alloc (inx_t *index)

  Create a new cursor to iterate through an inx object.

- multi_t inx_cursor_key_next (inx_cursor_t *cursor)

  Get the key at the next inx cursor position.

- multi_t inx_cursor_key_active (inx_cursor_t *cursor)

  Get the key at the current inx cursor position.

- void * inx_cursor_value_next (inx_cursor_t *cursor)

  Get the key at the next inx cursor position.

- void * inx_cursor_value_active (inx_cursor_t *cursor)

  Get the value at the current inx cursor position.

5.39.1 Function Documentation

5.39.1.1 inx_cursor_t* inx_cursor_alloc (inx_t * *index*)

Create a new cursor to iterate through an inx object. cursors.c

Parameters:

index a pointer to the inx object to be traversed.

Returns:

NULL on failure, or a pointer to a new inx cursor for the specified inx object on success.

Definition at line 52 of file cursors.c.

References inx_t::cursor_alloc, inx_auto_unlock(), inx_auto_write(), inx_cursor_t, and inx_t::references.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), contact_find_detail(), contact_find_name(), contacts_fetch(), contacts_update(), http_data_get(), imap_append(), imap_close(), imap_copy(), imap_duplicate_messages(), imap_examine(), imap_expunge(), imap_fetch(), imap_folder_remove(), imap_folder_status(), imap_list(), imap_lsub(), imap_narrow_folders(), imap_narrow_messages(), imap_next_folder_order(), imap_search(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_update_flags(), magma_folder_children(), magma_folder_find_full_name(), magma_folder_find_name(), messages_update(), meta_data_fetch_messages(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), meta_folders_by_name(), meta_folders_by_number(), meta_folders_children(), meta_folders_stats_tags(), meta_message_by_number(), meta_messages_update_sequences(), obj_cache_prune(), pattern_check(), pop_get_last(), pop_get_message(), pop_list(),

pop_session_destroy(), pop_session_reset(), pop_total_messages(), pop_total_size(), pop_uidl(), portal_config_collection(), portal_contact_details(), portal_endpoint_alert_list(), portal_endpoint_aliases(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_list(), portal_endpoint_folders_list(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_smtp_create_data(), portal_smtp_merge_headers(), portal_smtp_relay_message(), portal_upload(), register_abuse_check_blocklist(), signature_tree_get(), signature_tree_verify(), smtp_bypass_check(), smtp_check_filters(), and teacher_print_message().

5.39.1.2 void inx_cursor_free (inx_cursor_t * *cursor*)

Free an inx cursor and the inx object it points to, if the inx reference count hits zero.

Parameters:

cursor the inx cursor to be freed.

Returns:

This function returns no value.

Definition at line 29 of file cursors.c.

References inx_auto_unlock(), inx_auto_write(), and inx_free().

Referenced by config_load_cmdline_settings(), config_load_file_settings(), contact_find_detail(), contact_find_name(), contacts_fetch(), contacts_update(), http_data_get(), imap_append(), imap_close(), imap_copy(), imap_duplicate_messages(), imap_examine(), imap_expunge(), imap_fetch(), imap_folder_remove(), imap_folder_status(), imap_list(), imap_lsub(), imap_narrow_folders(), imap_narrow_messages(), imap_next_folder_order(), imap_search(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_update_flags(), magma_folder_children(), magma_folder_find_full_name(), magma_folder_find_name(), messages_update(), meta_data_fetch_messages(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), meta_folders_by_name(), meta_folders_by_number(), meta_folders_children(), meta_folders_stats_tags(), meta_message_by_number(), meta_messages_update_sequences(), obj_cache_prune(), pattern_check(), pop_get_last(), pop_get_message(), pop_list(), pop_session_destroy(), pop_session_reset(), pop_total_messages(), pop_total_size(), pop_uidl(), portal_config_collection(), portal_contact_details(), portal_endpoint_alert_list(), portal_endpoint_aliases(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_list(), portal_endpoint_folders_list(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_smtp_create_data(), portal_smtp_merge_headers(), portal_smtp_relay_message(), portal_upload(), register_abuse_check_blocklist(), signature_tree_get(), signature_tree_verify(), smtp_bypass_check(), smtp_check_filters(), and teacher_print_message().

5.39.1.3 multi_t inx_cursor_key_active (inx_cursor_t * *cursor*)

Get the key at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the specified inx cursor.

Definition at line 92 of file cursors.c.

References inx_auto_read(), inx_auto_unlock(), and mt_get_null().

Referenced by imap_search_messages(), and obj_cache_prune().

5.39.1.4 multi_t inx_cursor_key_next (inx_cursor_t * *cursor*)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 74 of file cursors.c.

References inx_auto_read(), inx_auto_unlock(), and mt_get_null().

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.39.1.5 void inx_cursor_reset (inx_cursor_t * *cursor*)

Reset the position of an inx cursor.

Parameters:

cursor a pointer to the inx cursor to be reset.

Returns:

This function returns no value.

Definition at line 15 of file cursors.c.

Referenced by imap_fetch(), imap_list(), imap_lsub(), obj_cache_prune(), and portal_smtp_create_data().

5.39.1.6 void* inx_cursor_value_active (inx_cursor_t * *cursor*)

Get the value at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or the value at the current position of the specified inx cursor.

Definition at line 128 of file cursors.c.

References inx_auto_read(), and inx_auto_unlock().

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.39.1.7 void* inx_cursor_value_next (inx_cursor_t * *cursor*)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 110 of file cursors.c.

References inx_auto_read(), and inx_auto_unlock().

Referenced by contact_find_detail(), contact_find_name(), contacts_fetch(), contacts_update(), http_data_get(), imap_append(), imap_close(), imap_copy(), imap_duplicate_messages(), imap_examine(), imap_expunge(), imap_fetch(), imap_folder_remove(), imap_folder_status(), imap_list(), imap_lsub(), imap_narrow_folders(), imap_narrow_messages(), imap_next_folder_order(), imap_search(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_update_flags(), magma_folder_children(), magma_folder_find_full_name(), magma_folder_find_name(), messages_update(), meta_data_fetch_messages(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), meta_folders_by_name(), meta_folders_by_number(), meta_folders_children(), meta_folders_stats_tags(), meta_message_by_number(), meta_messages_update_sequences(), obj_cache_prune(), pattern_check(), pop_get_last(), pop_get_message(), pop_list(), pop_session_destroy(), pop_session_reset(), pop_total_messages(), pop_total_size(), pop_uidl(), portal_config_collection(), portal_contact_details(), portal_endpoint_alert_list(), portal_endpoint_aliases(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_list(), portal_endpoint_folders_list(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_smtp_create_data(), portal_smtp_merge_headers(), portal_smtp_relay_message(), portal_upload(), register_abuse_check_blocklist(), signature_tree_get(), signature_tree_verify(), smtp_bypass_check(), smtp_check_filters(), and teacher_print_message().

5.40.2.3 uint32_t hashed_bucket (uint32_t *buckets*, multi_t *key*)

Get the hash bucket for a key.

Note:

If the key is passed as a string, it will be mapped to a bucket using the Fletcher32 hash.

Parameters:

buckets the total number of buckets for grouping items.

key a multi-type key with the value to be looked up; numbers and strings are supported.

Returns:

the number of the hash bucket corresponding to the specified key.

Definition at line 40 of file hashed.c.

References bitwise_count(), count, hash_fletcher32(), log_check, mt_get_char(), mt_get_length(), mt_get_number(), and mt_is_number().

Referenced by hashed_delete(), hashed_find(), and hashed_insert().

5.40.2.4 void hashed_bucket_add (hashed_bucket_t * *bucket*, hashed_bucket_t * *new*)

Definition at line 119 of file hashed.c.

References hashed_bucket_t.

Referenced by hashed_insert().

5.40.2.5 hashed_bucket_t* hashed_bucket_alloc (multi_t *key*, void * *data*)

Allocate and initialize hashed bucket object.

Parameters:

key a multi-type key that will be hashed on lookup.

data a pointer to a data buffer associated with the key.

Returns:

NULL on failure, or a pointer to the newly allocated hashed bucket object on success.

Definition at line 70 of file hashed.c.

References hashed_bucket_t, mm_alloc(), and mt_dupe().

Referenced by hashed_insert().

5.40.2.6 void* hashed_bucket_find_key (hashed_bucket_t * *bucket*, multi_t *key*)

Definition at line 173 of file hashed.c.

5.40.2.8 void hashed_bucket_set_ptr (hashed_index_t * *hashed*, uint32_t *num*, hashed_bucket_t * *bucket*)

Definition at line 103 of file hashed.c.

References hashed_bucket_t, hashed_index_t, and log_pedantic.

Referenced by hashed_delete(), hashed_insert(), and hashed_truncate().

5.40.2.9 hashed_bucket_t* hashed_cursor_active (hashed_cursor_t * *cursor*)

BUG: It's a little unclear what's happening, but when this function gets called, the serials don't match, and the count is greater than the number of available data buckets, because a bucket has been removed, the cursor will get stuck returning the last item endlessly (I think).

Definition at line 274 of file hashed.c.

5.41.1 Define Documentation

5.41.1.1 #define MAGMA_INDEX_OPTION (M_INX_INDEX_LOCK)

The different index options.

Definition at line 32 of file indexes.h.

5.41.1.2 #define MAGMA_INDEX_TYPE (M_INX_TREE | M_INX_LINKED | M_INX_HASHED)

The different types of indexes.

Definition at line 27 of file indexes.h.

Referenced by inx_alloc().

5.41.2 Enumeration Type Documentation

5.41.2.1 enum MAGMA_INDEX

Index types and options.

Enumerator:

M_INX_TREE M_INX_BTREE.

M_INX_HASHED M_INX_HASHED.

M_INX_LINKED M_INX_LINKED.

M_INX_LOCK_MANUAL M_INX_LOCK_MANUAL.

Definition at line 15 of file indexes.h.

5.41.3 Function Documentation

5.41.3.1 struct __attribute__ ((packed)) [read]

Definition at line 64 of file indexes.h.

5.41.3.2 inx_t* hashed_alloc (uint64_t *options*, void * *data_free*)

hashed.c hashed.c

Parameters:

options an options value for the hash table.

data_free a pointer to a function

Returns:

NULL on failure, or a pointer to the newly allocated hash table object on success.

Definition at line 496 of file hashed.c.

References inx_t::append, inx_t::cursor_alloc, inx_t::cursor_free, inx_t::cursor_key_active, inx_t::cursor_key_next, inx_t::cursor_reset, inx_t::cursor_value_active, inx_t::cursor_value_next, inx_t::data_free, inx_t::delete, inx_t::find, hashed_bucket_t, hashed_cursor_alloc(), hashed_cursor_free(), hashed_cursor_key_active(), hashed_cursor_key_next(), hashed_cursor_reset(), hashed_cursor_value_active(), hashed_cursor_value_next(), hashed_delete(), hashed_find(), hashed_free(), hashed_index_t, hashed_insert(), hashed_truncate(), inx_t::index, inx_t::index_free, inx_t::index_truncate, inx_t::insert, inx_t::last, MAGMA_HASHED_BUCKETS, mm_alloc(), mm_free(), and inx_t::options.

Referenced by inx_alloc().

5.41.3.3 inx_t* inx_alloc (uint64_t *options*, void * *data_free*)

inx.c inx.c

Parameters:

options a value indicating the inx type. Can be M_INX_TREE for a binary tree, M_INX_LINKED for a linked list, or M_INX_HASHED for a hash tree.

data_free a function pointer to a routine to free the data associated with an inx record.

Returns:

NULL on failure or a pointer to the newly created inx object on success.

Definition at line 319 of file inx.c.

References inx_t::automatic, hashed_alloc(), linked_alloc(), inx_t::lock, log_options, M_INX_HASHED, M_INX_LINKED, M_INX_-LOCK_MANUAL, M_INX_TREE, M_LOG_ERROR, M_LOG_STACK_TRACE, MAGMA_INDEX_TYPE, inx_t::references, rwlock_-init(), and tree_alloc().

5.41.3.4 bool_t inx_append (inx_t * *inx*, multi_t *key*, void * *data*)

Append a new record onto an inx holder.

Note:

This function only provides benefits for some inx types (like linked lists). For other index types, it simply functions as an alias for the insert function.

Parameters:

inx a pointer to the inx object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 140 of file inx.c.

References inx_t::append, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by imap_append_message(), imap_duplicate_messages(), imap_message_copier(), imap_narrow_messages(), imap_search_-messages(), meta_data_fetch_folder_messages(), and meta_data_fetch_messages().

5.41.3.5 void inx_auto_read (inx_t * *inx*)

Definition at line 41 of file inx.c.

Referenced by inx_append(), inx_cursor_alloc(), inx_cursor_free(), inx_delete(), inx_free(), inx_insert(), inx_replace(), and inx_truncate().

5.41.3.8 void inx_cleanup (inx_t * *inx*)

Perform a checked free of an inx object.

See also:

inx_free()

Parameters:

inx the inx instance to be freed.

Definition at line 306 of file inx.c.

References inx_free().

Referenced by contact_free(), contacts_update(), domain_stop(), http_content_stop(), http_session_reset(), imap_narrow_messages(), magma_folder_free(), messages_update(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_free(), pattern_stop(), pattern_update(), sess_destroy(), sess_release_composition(), smtp_free_inbound(), and user_config_free().

5.41.3.9 uint64_t inx_count (inx_t * *inx*)

Return the total number of items held by an inx object.

Parameters:

inx a pointer to the inx object to be examined.

Returns:

the total number of items held by the inx object.

Definition at line 95 of file inx.c.

References inx_t::count, count, inx_auto_read(), inx_auto_unlock(), and log_pedantic.

Referenced by contact_folder_remove(), imap_copy(), imap_login(), imap_narrow_messages(), message_folder_remove(), obj_cache_-prune(), pop_pass(), signature_tree_add(), signature_tree_get(), and signature_tree_verify().

5.41.3.10 inx_cursor_t* inx_cursor_alloc (inx_t * *index*)

cursors.c cursors.c

Parameters:

index a pointer to the inx object to be traversed.

Returns:

NULL on failure, or a pointer to a new inx cursor for the specified inx object on success.

Definition at line 52 of file cursors.c.

References inx_t::cursor_alloc, inx_auto_unlock(), inx_auto_write(), inx_cursor_t, and inx_t::references.

5.41.3.11 void inx_cursor_free (inx_cursor_t * *cursor*)

Free an inx cursor and the inx object it points to, if the inx reference count hits zero.

Parameters:

cursor the inx cursor to be freed.

Returns:

This function returns no value.

Definition at line 29 of file cursors.c.

References inx_auto_unlock(), inx_auto_write(), and inx_free().

Referenced by config_load_cmdline_settings(), config_load_file_settings(), contact_find_detail(), contact_find_name(), contacts_fetch(), contacts_update(), http_data_get(), imap_append(), imap_close(), imap_copy(), imap_duplicate_messages(), imap_examine(), imap_expunge(), imap_fetch(), imap_folder_remove(), imap_folder_status(), imap_list(), imap_lsub(), imap_narrow_folders(), imap_narrow_messages(), imap_next_folder_order(), imap_search(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_update_flags(), magma_folder_children(), magma_folder_find_full_name(), magma_folder_find_name(), messages_update(), meta_data_fetch_messages(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), meta_folders_by_name(), meta_folders_by_number(), meta_folders_children(), meta_folders_stats_tags(), meta_message_by_number(), meta_messages_update_sequences(), obj_cache_prune(), pattern_check(), pop_get_last(), pop_get_message(), pop_list(), pop_session_destroy(), pop_session_reset(), pop_total_messages(), pop_total_size(), pop_uidl(), portal_config_collection(), portal_contact_details(), portal_endpoint_alert_list(), portal_endpoint_aliases(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_list(), portal_endpoint_folders_list(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_tag(), portal_endpoint_messages_tags(), portal_smtp_create_data(), portal_smtp_merge_headers(), portal_smtp_relay_message(), portal_upload(), register_abuse_check_blocklist(), signature_tree_get(), signature_tree_verify(), smtp_bypass_check(), smtp_check_filters(), and teacher_print_message().

5.41.3.12 multi_t inx_cursor_key_active (inx_cursor_t * *cursor*)

Get the key at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the specified inx cursor.

Definition at line 92 of file cursors.c.

References inx_auto_read(), inx_auto_unlock(), and mt_get_null().

Referenced by imap_search_messages(), and obj_cache_prune().

5.41.3.13 multi_t inx_cursor_key_next (inx_cursor_t * *cursor*)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 74 of file cursors.c.

References inx_auto_read(), inx_auto_unlock(), and mt_get_null().

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.41.3.14 void inx_cursor_reset (inx_cursor_t * *cursor*)

Reset the position of an inx cursor.

Parameters:

cursor a pointer to the inx cursor to be reset.

Returns:

This function returns no value.

Definition at line 15 of file cursors.c.

Referenced by imap_fetch(), imap_list(), imap_lsub(), obj_cache_prune(), and portal_smtp_create_data().

5.41.3.15 void* inx_cursor_value_active (inx_cursor_t * *cursor*)

Get the value at the current inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or the value at the current position of the specified inx cursor.

Definition at line 128 of file cursors.c.

References inx_auto_read(), and inx_auto_unlock().

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.41.3.16 void* inx_cursor_value_next (inx_cursor_t * *cursor*)

Get the key at the next inx cursor position.

Parameters:

cursor the inx cursor to be examined.

Returns:

NULL on failure, or a multi-type data object containing the key of the next inx cursor position.

Definition at line 110 of file cursors.c.

References inx_auto_read(), and inx_auto_unlock().

5.41.3.17 bool_t inx_delete (inx_t * *inx*, multi_t *key*)

Delete a child of an inx object with a specified key.

Parameters:

inx a pointer to the inx object to be searched.

key the target key of the object to be deleted.

Returns:

true if the delete operation succeeded or false if it did not.

Definition at line 218 of file inx.c.

References inx_t::delete, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_edit(), contact_folder_remove(), contact_move(), imap_folder_remove(), imap_message_expunge(), message_folder_remove(), obj_cache_prune(), pop_session_destroy(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_remove(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), sess_get(), and user_config_edit().

5.41.3.18 void* inx_find (inx_t * *inx*, multi_t *key*)

Find the value associated with a particular key within the children of an inx object.

Parameters:

inx a pointer to the inx object to be searched.

key the target key to be found.

Returns:

NULL on failure, or the value associated with the requested key on success.

Definition at line 242 of file inx.c.

References inx_t::find, inx_auto_read(), inx_auto_unlock(), and log_pedantic.

Referenced by contact_find_detail(), contact_find_number(), contact_folder_remove(), contact_folder_rename(), domain_dkim(), domain_mailboxes(), domain_restricted(), domain_spf(), domain_wildcard(), http_get_static(), http_get_template(), imap_search_messages(), magma_folder_find_number(), message_folder_remove(), meta_folders_stats_tags(), meta_inx_find(), meta_inx_remove(), meta_messages_mover(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_load(), portal_endpoint_messages_compose(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_load(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_get_upload_attachment(), sess_get(), and user_config_edit().

5.41.3.19 void inx_free (inx_t * *inx*)

Definition at line 260 of file inx.c.

References inx_t::index_free, inx_auto_unlock(), inx_auto_write(), inx_t::lock, log_pedantic, mm_free(), inx_t::references, and rwlock_destroy().

5.41.3.20 bool_t inx_insert (inx_t * *inx*, multi_t *key*, void * *data*)

Insert a new record into an inx holder.

Parameters:

inx a pointer to the inx object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 165 of file inx.c.

References inx_t::insert, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_details_fetch(), contact_folder_create(), contact_move(), contacts_fetch(), http_content_load_fonts(), http_data_value_parse(), http_load_file(), http_parse_header(), imap_folder_create(), imap_folder_rename(), imap_narrow_folders(), magma_folder_fetch(), message_folder_create(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_folders_stats_tags(), meta_inx_find(), meta_messages_copier(), nvp_parse(), portal_endpoint_attachments_add(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_messages_compose(), portal_endpoint_messages_flag(), portal_endpoint_messages_tag(), portal_parse_json_str_array(), register_data_fetch_blocklist(), sess_create(), signature_tree_add(), smtp_add_bypass_entry(), smtp_fetch_inbound(), teacher_add_cookie(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.41.3.21 void inx_lock_read (inx_t * *inx*)

Acquire a reader's lock for an inx object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 34 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_lock_read().

Referenced by meta_inx_remove(), obj_cache_prune(), and sess_get().

5.41.3.22 void inx_lock_write (inx_t ∗ *inx*)

Acquire a writer's lock for an inx object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 53 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_lock_write().

Referenced by meta_inx_find(), and obj_cache_prune().

5.41.3.23 uint64_t inx_options (inx_t ∗ *inx*)

Return the options value of an inx object.

Parameters:

inx a pointer to the inx object to be examined.

Returns:

0 on failure, or the options value of the inx object on success.

Definition at line 72 of file inx.c.

References inx_auto_read(), inx_auto_unlock(), log_pedantic, and inx_t::options.

5.41.3.24 bool_t inx_replace (inx_t ∗ *inx*, multi_t *key*, void ∗ *data*)

Replace the value of a key in an inx holder.

Parameters:

inx a pointer to the inx object where the specified key will be replaced.

key a multi-type value specifying the identifier of the record to be replaced.

data a pointer to the new data to be associated with the specified key.

Returns:

true if the specified key's value was replaced successfully, or false on failure.

Definition at line 190 of file inx.c.

References inx_t::delete, inx_t::insert, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_edit(), and user_config_edit().

5.41.3.25 uint64_t inx_serial (inx_t * *inx*)

Definition at line 113 of file inx.c.

References inx_auto_read(), inx_auto_unlock(), log_pedantic, and inx_t::serial.

5.41.3.26 void inx_truncate (inx_t * *inx*)

Definition at line 285 of file inx.c.

References inx_t::index_truncate, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by meta_data_fetch_messages(), and user_config_update().

5.41.3.27 void inx_unlock (inx_t * *inx*)

Unlock an inx object.

Parameters:

inx a pointer to the inx object to be unlocked.

Returns:

This function returns no value.

Definition at line 15 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_unlock().

Referenced by meta_inx_find(), meta_inx_remove(), obj_cache_prune(), and sess_get().

5.41.3.28 inx_t* linked_alloc (uint64_t *options*, void * *data_free*)

linked.c linked.c

Parameters:

options an options value for the newly created linked list object.

data_free a pointer to a function used to free linked list items.

Returns:

NULL on failure or a pointer to the newly allocated linked list object on success.

Definition at line 531 of file linked.c.

References inx_t::append, inx_t::cursor_alloc, inx_t::cursor_free, inx_t::cursor_key_active, inx_t::cursor_key_next, inx_t::cursor_reset, inx_t::cursor_value_active, inx_t::cursor_value_next, inx_t::data_free, inx_t::delete, inx_t::find, inx_t::index, inx_t::index_free, inx_t::index_truncate, inx_t::insert, inx_t::last, linked_append(), linked_cursor_alloc(), linked_cursor_free(), linked_cursor_key_active(), linked_cursor_key_next(), linked_cursor_reset(), linked_cursor_value_active(), linked_cursor_value_next(), linked_delete(), linked_find(), linked_free(), linked_insert(), linked_truncate(), mm_alloc(), and inx_t::options.

Referenced by inx_alloc().

Functions

- void inx_unlock (inx_t *inx)

  Unlock an inx object.

- void inx_auto_unlock (inx_t *inx)
- void inx_lock_read (inx_t *inx)

  Acquire a reader's lock for an inx object.

- void inx_auto_read (inx_t *inx)
- void inx_lock_write (inx_t *inx)

  Acquire a writer's lock for an inx object.

- void inx_auto_write (inx_t *inx)
- uint64_t inx_options (inx_t *inx)

  Return the options value of an inx object.

- uint64_t inx_count (inx_t *inx)

  Return the total number of items held by an inx object.

- uint64_t inx_serial (inx_t *inx)
- bool_t inx_append (inx_t *inx, multi_t key, void *data)

  Append a new record onto an inx holder.

- bool_t inx_insert (inx_t *inx, multi_t key, void *data)

  Insert a new record into an inx holder.

- bool_t inx_replace (inx_t *inx, multi_t key, void *data)

  Replace the value of a key in an inx holder.

- bool_t inx_delete (inx_t *inx, multi_t key)

  Delete a child of an inx object with a specified key.

- void * inx_find (inx_t *inx, multi_t key)

  Find the value associated with a particular key within the children of an inx object.

- void inx_free (inx_t *inx)
- void inx_truncate (inx_t *inx)
- void inx_cleanup (inx_t *inx)

  Perform a checked free of an inx object.

- inx_t * inx_alloc (uint64_t options, void *data_free)

  Allocate a new inx instance.

5.42.1 Function Documentation

5.42.1.1 inx_t* inx_alloc (uint64_t *options*, void * *data_free*)

Allocate a new inx instance. inx.c

Parameters:

options a value indicating the inx type. Can be M_INX_TREE for a binary tree, M_INX_LINKED for a linked list, or M_INX_HASHED for a hash tree.

data_free a function pointer to a routine to free the data associated with an inx record.

Returns:

NULL on failure or a pointer to the newly created inx object on success.

Definition at line 319 of file inx.c.

References inx_t::automatic, hashed_alloc(), linked_alloc(), inx_t::lock, log_options, M_INX_HASHED, M_INX_LINKED, M_INX_LOCK_MANUAL, M_INX_TREE, M_LOG_ERROR, M_LOG_STACK_TRACE, MAGMA_INDEX_TYPE, inx_t::references, rwlock_init(), and tree_alloc().

Referenced by contact_alloc(), contact_folder_alloc(), http_content_refresh(), http_content_start(), http_parse_header(), http_parse_pairs(), imap_duplicate_messages(), imap_narrow_folders(), imap_narrow_messages(), imap_search_messages(), magma_folder_fetch(), message_folder_alloc(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_folders_stats_tags(), nvp_alloc(), obj_cache_start(), portal_endpoint_messages_compose(), portal_endpoint_messages_flag(), portal_endpoint_messages_tag(), portal_parse_json_str_array(), register_data_fetch_blocklist(), sess_create(), signature_tree_alloc(), smtp_add_bypass_entry(), smtp_fetch_inbound(), teacher_add_cookie(), user_config_alloc(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.42.1.2 bool_t inx_append (inx_t * *inx*, multi_t *key*, void * *data*)

Append a new record onto an inx holder.

Note:

This function only provides benefits for some inx types (like linked lists). For other index types, it simply functions as an alias for the insert function.

Parameters:

inx a pointer to the inx object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 140 of file inx.c.

References inx_t::append, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by imap_append_message(), imap_duplicate_messages(), imap_message_copier(), imap_narrow_messages(), imap_search_messages(), meta_data_fetch_folder_messages(), and meta_data_fetch_messages().

5.42.1.3 void inx_auto_read (inx_t * *inx*)

Definition at line 41 of file inx.c.

5.42.1.4 void inx_auto_unlock (inx_t * *inx*)

Definition at line 22 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_unlock().

Referenced by inx_append(), inx_count(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_active(), inx_cursor_key_next(), inx_cursor_value_active(), inx_cursor_value_next(), inx_delete(), inx_find(), inx_free(), inx_insert(), inx_options(), inx_replace(), inx_serial(), and inx_truncate().

5.42.1.5 void inx_auto_write (inx_t * *inx*)

Definition at line 60 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_lock_write().

Referenced by inx_append(), inx_cursor_alloc(), inx_cursor_free(), inx_delete(), inx_free(), inx_insert(), inx_replace(), and inx_truncate().

5.42.1.6 void inx_cleanup (inx_t * *inx*)

Perform a checked free of an inx object.

See also:

inx_free()

Parameters:

inx the inx instance to be freed.

Definition at line 306 of file inx.c.

References inx_free().

Referenced by contact_free(), contacts_update(), domain_stop(), http_content_stop(), http_session_reset(), imap_narrow_messages(), magma_folder_free(), messages_update(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_free(), pattern_stop(), pattern_update(), sess_destroy(), sess_release_composition(), smtp_free_inbound(), and user_config_free().

5.42.1.7 uint64_t inx_count (inx_t * *inx*)

Return the total number of items held by an inx object.

Parameters:

inx a pointer to the inx object to be examined.

Returns:

the total number of items held by the inx object.

Definition at line 95 of file inx.c.

References inx_t::count, count, inx_auto_read(), inx_auto_unlock(), and log_pedantic.

Referenced by contact_folder_remove(), imap_copy(), imap_login(), imap_narrow_messages(), message_folder_remove(), obj_cache_prune(), pop_pass(), signature_tree_add(), signature_tree_get(), and signature_tree_verify().

5.42.1.8 bool_t inx_delete (inx_t * *inx*, multi_t *key*)

Delete a child of an inx object with a specified key.

Parameters:

inx a pointer to the inx object to be searched.

key the target key of the object to be deleted.

Returns:

true if the delete operation succeeded or false if it did not.

Definition at line 218 of file inx.c.

References inx_t::delete, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_edit(), contact_folder_remove(), contact_move(), imap_folder_remove(), imap_message_expunge(), message_folder_remove(), obj_cache_prune(), pop_session_destroy(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_remove(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), sess_get(), and user_config_edit().

5.42.1.9 void* inx_find (inx_t * *inx*, multi_t *key*)

Find the value associated with a particular key within the children of an inx object.

Parameters:

inx a pointer to the inx object to be searched.

key the target key to be found.

Returns:

NULL on failure, or the value associated with the requested key on success.

Definition at line 242 of file inx.c.

References inx_t::find, inx_auto_read(), inx_auto_unlock(), and log_pedantic.

Referenced by contact_find_detail(), contact_find_number(), contact_folder_remove(), contact_folder_rename(), domain_dkim(), domain_mailboxes(), domain_restricted(), domain_spf(), domain_wildcard(), http_get_static(), http_get_template(), imap_search_messages(), magma_folder_find_number(), message_folder_remove(), meta_folders_stats_tags(), meta_inx_find(), meta_inx_remove(), meta_messages_mover(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_contacts_load(), portal_endpoint_messages_compose(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_load(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_send(), portal_endpoint_messages_tag(), portal_get_upload_attachment(), sess_get(), and user_config_edit().

5.42.1.10 void inx_free (inx_t * *inx*)

Definition at line 260 of file inx.c.

References inx_t::index_free, inx_auto_unlock(), inx_auto_write(), inx_t::lock, log_pedantic, mm_free(), inx_t::references, and rwlock_destroy().

5.42.1.11 bool_t inx_insert (inx_t * *inx*, multi_t *key*, void * *data*)

Insert a new record into an inx holder.

Parameters:

inx a pointer to the inx object that will hold the record.

key a multi-type value specifying the identifier of the record to be inserted.

data a pointer to the data associated with the new key.

Returns:

true if the new record was inserted successfully or false on failure.

Definition at line 165 of file inx.c.

References inx_t::insert, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_details_fetch(), contact_folder_create(), contact_move(), contacts_fetch(), http_content_load_fonts(), http_data_value_parse(), http_load_file(), http_parse_header(), imap_folder_create(), imap_folder_rename(), imap_narrow_folders(), magma_folder_fetch(), message_folder_create(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_folders_stats_tags(), meta_inx_find(), meta_messages_copier(), nvp_parse(), portal_endpoint_attachments_add(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_messages_compose(), portal_endpoint_messages_flag(), portal_endpoint_messages_tag(), portal_parse_json_str_array(), register_data_fetch_blocklist(), sess_create(), signature_tree_add(), smtp_add_bypass_entry(), smtp_fetch_inbound(), teacher_add_cookie(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.42.1.12 void inx_lock_read (inx_t * *inx*)

Acquire a reader's lock for an inx object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 34 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_lock_read().

Referenced by meta_inx_remove(), obj_cache_prune(), and sess_get().

5.42.1.13 void inx_lock_write (inx_t * *inx*)

Acquire a writer's lock for an inx object.

Parameters:

inx a pointer to the inx object to be locked.

Returns:

This function returns no value.

Definition at line 53 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_lock_write().

Referenced by meta_inx_find(), and obj_cache_prune().

5.42.1.14 uint64_t inx_options (inx_t * *inx*)

Return the options value of an inx object.

Parameters:

inx a pointer to the inx object to be examined.

Returns:

0 on failure, or the options value of the inx object on success.

Definition at line 72 of file inx.c.

References inx_auto_read(), inx_auto_unlock(), log_pedantic, and inx_t::options.

5.42.1.15 bool_t inx_replace (inx_t * *inx*, multi_t *key*, void * *data*)

Replace the value of a key in an inx holder.

Parameters:

inx a pointer to the inx object where the specified key will be replaced.

key a multi-type value specifying the identifier of the record to be replaced.

data a pointer to the new data to be associated with the specified key.

Returns:

true if the specified key's value was replaced successfully, or false on failure.

Definition at line 190 of file inx.c.

References inx_t::delete, inx_t::insert, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by contact_edit(), and user_config_edit().

5.42.1.16 uint64_t inx_serial (inx_t * *inx*)

Definition at line 113 of file inx.c.

References inx_auto_read(), inx_auto_unlock(), log_pedantic, and inx_t::serial.

5.42.1.17 void inx_truncate (inx_t * *inx*)

Definition at line 285 of file inx.c.

References inx_t::index_truncate, inx_auto_unlock(), inx_auto_write(), and log_pedantic.

Referenced by meta_data_fetch_messages(), and user_config_update().

5.42.1.18 void inx_unlock (inx_t * *inx*)

Unlock an inx object.

Parameters:

inx a pointer to the inx object to be unlocked.

Returns:

This function returns no value.

Definition at line 15 of file inx.c.

References inx_t::automatic, inx_t::lock, and rwlock_unlock().

Referenced by meta_inx_find(), meta_inx_remove(), obj_cache_prune(), and sess_get().

Functions

- struct __attribute__ ((packed))
- void ∗ linked_record_get_data (linked_record_t ∗record, size_t element)

  Get the data associated with a linked list record.

- multi_t linked_record_get_key (linked_record_t ∗record)

  Get the multi-type key of a linked list record.

- void linked_record_free (inx_t ∗index, linked_record_t ∗record)

  Free a linked list record object and its underlying data.

- linked_record_t ∗ linked_record_alloc (multi_t key, void ∗data)

  Create a new linked list record object.

- void ∗ linked_find (void ∗inx, multi_t key)

  Find a record in a linked list by key.

- bool_t linked_delete (void ∗inx, multi_t key)

  Remove a record from a linked list and free it and its underlying data.

- bool_t linked_insert (void ∗inx, multi_t key, void ∗data)

  Create and append a new record to the end of a linked list.

- bool_t linked_append (void ∗inx, multi_t key, void ∗data)

  Create and append a new record to the end of a linked list.

- linked_node_t ∗ linked_cursor_active (linked_cursor_t ∗cursor)

  Get the current node pointed to by a linked list cursor.

- linked_node_t ∗ linked_cursor_next (linked_cursor_t ∗cursor)

  Get the next node of a linked list cursor.

- void ∗ linked_cursor_value_next (linked_cursor_t ∗cursor)

  Get the data of a linked list cursor's next record, and update the cursor.

- void ∗ linked_cursor_value_active (linked_cursor_t ∗cursor)

  Get the data of a linked list cursor's current record.

- multi_t linked_cursor_key_next (linked_cursor_t ∗cursor)

  Get the multi-type key value of a linked list cursor's next record, and update the cursor.

- multi_t linked_cursor_key_active (linked_cursor_t ∗cursor)

  Get the multi-type key value at the current linked list cursor position.

- void linked_cursor_reset (linked_cursor_t ∗cursor)

  Reset the position of a linked list cursor.

- void linked_cursor_free (linked_cursor_t *cursor)

  Free a linked list cursor.

- void * linked_cursor_alloc (inx_t *inx)

  Allocate a cursor to traverse a linked list.

- void linked_truncate (void *inx)

  Truncate all the nodes in a linked list, but do not free it.

- void linked_free (void *inx)

  Free a linked list object and all of its records.

- inx_t * linked_alloc (uint64_t options, void *data_free)

  Allocate a new linked list instance.

Variables

- linked_record_t
- linked_node_t
- linked_cursor_t

5.43.1 Function Documentation

5.43.1.1 struct __attribute__ ((packed)) [read]

Definition at line 22 of file linked.c.

References count, and linked_node_t.

5.43.1.2 inx_t* linked_alloc (uint64_t *options*, void * *data_free*)

Allocate a new linked list instance. linked.c

Parameters:

options an options value for the newly created linked list object.

data_free a pointer to a function used to free linked list items.

Returns:

NULL on failure or a pointer to the newly allocated linked list object on success.

Definition at line 531 of file linked.c.

References inx_t::append, inx_t::cursor_alloc, inx_t::cursor_free, inx_t::cursor_key_active, inx_t::cursor_key_next, inx_t::cursor_reset, inx_t::cursor_value_active, inx_t::cursor_value_next, inx_t::data_free, inx_t::delete, inx_t::find, inx_t::index, inx_t::index_free, inx_t::index_truncate, inx_t::insert, inx_t::last, linked_append(), linked_cursor_alloc(), linked_cursor_free(), linked_cursor_key_active(), linked_cursor_key_next(), linked_cursor_reset(), linked_cursor_value_active(), linked_cursor_value_next(), linked_delete(), linked_find(), linked_free(), linked_insert(), linked_truncate(), mm_alloc(), and inx_t::options.

Referenced by inx_alloc().

5.43.1.3 bool_t linked_append (void ∗ *inx*, multi_t *key*, void ∗ *data*)

Create and append a new record to the end of a linked list.

Note:

This function deppends on the inx layer to track the list ending via the last variable.

Parameters:

inx a pointer to the linked list that will store the new record.

key a multi-type key value that will be associated with the newly created record.

data a pointer to the data that will be associated with the new record.

Returns:

true on success or false on failure.

Definition at line 244 of file linked.c.

References inx_t::count, inx_t::index, inx_t::last, linked_node_t, linked_record_alloc(), log_info, log_pedantic, mm_alloc(), mm_free(), and inx_t::serial.

Referenced by linked_alloc().

5.43.1.4 linked_node_t∗ linked_cursor_active (linked_cursor_t ∗ *cursor*)

Get the current node pointed to by a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

a pointer to the current node indicated by the specified linked list cursor.

LOW: The logic used to find our place in an index that has been modified could be improved.

- If the index we sort the index keys, we could look for the next highest key value.
- We could store the previous node (or even the previous 10 nodes), and try searching for them instead.
- We could also add a delete path through the cursor that would include positional updates.
- We could simply make a deep copy of the entire list so that updates to the original index don't affect the iteration, or use the copy to reconcile.

Definition at line 291 of file linked.c.

References linked_node_t.

Referenced by linked_cursor_key_active(), linked_cursor_next(), and linked_cursor_value_active().

5.43.1.5 void∗ linked_cursor_alloc (inx_t ∗ *inx*)

Allocate a cursor to traverse a linked list.

Parameters:

inx a pointer the linked list object to be traversed by the cursor.

Returns:

NULL on failure, or a cursor pointing to the head of the linked list on success.

Definition at line 461 of file linked.c.

References linked_cursor_t, log_pedantic, and mm_alloc().

Referenced by linked_alloc().

5.43.1.6 void linked_cursor_free (linked_cursor_t * *cursor*)

Free a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor object to be freed.

Returns:

This function returns no value.

Definition at line 447 of file linked.c.

References mm_free().

Referenced by linked_alloc().

5.43.1.7 multi_t linked_cursor_key_active (linked_cursor_t * *cursor*)

Get the multi-type key value at the current linked list cursor position.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

an empty multi-type key on failure, or the current linked list cursor's record key on success.

Definition at line 416 of file linked.c.

References linked_cursor_active(), linked_node_t, linked_record_get_key(), and mt_get_null().

Referenced by linked_alloc().

5.43.1.8 multi_t linked_cursor_key_next (linked_cursor_t * *cursor*)

Get the multi-type key value of a linked list cursor's next record, and update the cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

an empty multi-type key on failure, or the linked list cursor's next record key on success.

Definition at line 400 of file linked.c.

References linked_cursor_next(), linked_node_t, linked_record_get_key(), and mt_get_null().

Referenced by linked_alloc().

5.43.1.9 linked_node_t* linked_cursor_next (linked_cursor_t * *cursor*)

Get the next node of a linked list cursor.

Note:

The cursor position will be reset if the end of the linked list has been reached.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

a pointer to the next node of the linked list cursor.

Definition at line 348 of file linked.c.

References linked_cursor_active(), and linked_node_t.

Referenced by linked_cursor_key_next(), and linked_cursor_value_next().

5.43.1.10 void linked_cursor_reset (linked_cursor_t * *cursor*)

Reset the position of a linked list cursor.

Parameters:

cursor a pointer to the linked list cursor object to be reset.

Returns:

This function returns no value.

Definition at line 432 of file linked.c.

Referenced by linked_alloc().

5.43.1.11 void* linked_cursor_value_active (linked_cursor_t * *cursor*)

Get the data of a linked list cursor's current record.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

NULL on failure, or a pointer to the data of the linked list cursor's current record.

Definition at line 385 of file linked.c.

References linked_cursor_active(), linked_node_t, and linked_record_get_data().

Referenced by linked_alloc().

5.43.1.12 void* linked_cursor_value_next (linked_cursor_t * *cursor*)

Get the data of a linked list cursor's next record, and update the cursor.

Parameters:

cursor a pointer to the linked list cursor to be queried.

Returns:

NULL on failure, or the data of the linked list cursor's next record on success.

Definition at line 370 of file linked.c.

References linked_cursor_next(), linked_node_t, and linked_record_get_data().

Referenced by linked_alloc().

5.43.1.13 bool_t linked_delete (void ∗ *inx*, multi_t *key*)

Remove a record from a linked list and free it and its underlying data.

Parameters:

inx a pointer to the linked list to be searched for the specified key.

key a multi-type key value to lookup the record that will be deleted from the linked list.

Returns:

true on success or false on failure.

Definition at line 136 of file linked.c.

References inx_t::count, ident_mt_mt(), inx_t::index, inx_t::last, linked_node_t, linked_record_free(), mm_free(), and inx_t::serial.

Referenced by linked_alloc().

5.43.1.14 void∗ linked_find (void ∗ *inx*, multi_t *key*)

Find a record in a linked list by key.

Parameters:

inx a pointer to the linked list to be searched.

key a multi-type key value to be searched against the contents of the inx object.

Returns:

NULL on failure or if the record cannot be found, or a pointer to the data of the matching record on success.

Definition at line 107 of file linked.c.

References inx_t::count, ident_mt_mt(), inx_t::index, linked_node_t, and linked_record_get_data().

Referenced by linked_alloc().

5.43.1.15 void linked_free (void ∗ *inx*)

Free a linked list object and all of its records.

See also:

linked_truncate()

Parameters:

inx a pointer to the linked list object to be freed.

Returns:

This function returns no value.

Definition at line 511 of file linked.c.

References inx_t::index, and linked_truncate().

Referenced by linked_alloc().

5.43.1.16 bool_t linked_insert (void ∗ *inx*, multi_t *key*, void ∗ *data*)

Create and append a new record to the end of a linked list.

Note:

note In the future this should be updated so the key value is used to insert the record in the correct spot.

Parameters:

inx a pointer to the linked list that will store the new record.

key a multi-type key value that will be associated with the newly created record.

data a pointer to the data that will be associated with the new record.

Returns:

true on success or false on failure.

TODO: We are simply looking for the end. The append variation handles this use case. Insert should be using the key value to find the appropriate place to insert the record.

TODO: When the logic is altered to do a comparison, and insert nodes in the proper place this assignment will need to become a conditional.

Definition at line 192 of file linked.c.

References inx_t::count, inx_t::index, inx_t::last, linked_node_t, linked_record_alloc(), log_info, mm_alloc(), mm_free(), and inx_t::serial.

Referenced by linked_alloc().

5.43.1.17 linked_record_t∗ linked_record_alloc (multi_t *key*, void ∗ *data*)

Create a new linked list record object.

Parameters:

key the multi-type key value of the record to be used for data searches.

data a pointer to the data to be associated with the record.

Returns:

a pointer to the newly allocated and initialized linked record object.

Definition at line 88 of file linked.c.

References linked_record_t, mm_alloc(), and mt_dupe().

Referenced by linked_append(), and linked_insert().

5.43.1.18 void linked_record_free (inx_t * *index*, linked_record_t * *record*)

Free a linked list record object and its underlying data.

Parameters:

index a pointer to the linked list containing the specified record.

record a pointer to the linked list record to be freed.

Returns:

This function returns no value.

Definition at line 67 of file linked.c.

References inx_t::data_free, log_pedantic, mm_free(), and mt_free().

Referenced by linked_delete(), and linked_truncate().

5.43.1.19 void* linked_record_get_data (linked_record_t * *record*, size_t *element*)

Get the data associated with a linked list record.

Parameters:

record a pointer to the linked list record to be queried.

element the index of the data element to be retrieved. Must be set to zero.

Returns:

NULL on failure, or a pointer to the specified linked list record's data on success.

Definition at line 34 of file linked.c.

References log_pedantic.

Referenced by linked_cursor_value_active(), linked_cursor_value_next(), and linked_find().

5.43.1.20 multi_t linked_record_get_key (linked_record_t * *record*)

Get the multi-type key of a linked list record.

Parameters:

record a pointer to the linked list record to be queried.

Returns:

an empty multi-type key on failure, or the specified record's multi-type key value on success.

Definition at line 49 of file linked.c.

References log_pedantic, and mt_get_null().

Referenced by linked_cursor_key_active(), and linked_cursor_key_next().

5.43.1.21 void linked_truncate (void * *inx*)

Truncate all the nodes in a linked list, but do not free it.

Parameters:

inx a pointer to the linked list object to have all of its records truncated.

Returns:

This function returns no value.

Definition at line 480 of file linked.c.

References inx_t::count, inx_t::index, inx_t::last, linked_node_t, linked_record_free(), mm_free(), and inx_t::serial.

Referenced by linked_alloc(), and linked_free().

Functions

- uint_t bitwise_count (uint64_t value)

  Count the number of bits that are set in a 64-bit number.

- uchr_t bitwise_or (uchr_t a, uchr_t b)

  Performs a bitwise OR operation on two octets and returns the result as a single octet.

- uchr_t bitwise_xor (uchr_t a, uchr_t b)

  Performs a bitwise XOR operation on two octets and returns the result as a single octet.

- uchr_t bitwise_and (uchr_t a, uchr_t b)

  Performs a bitwise AND operation on two octets and returns the result as a single octet.

5.45.1 Function Documentation

5.45.1.1 uchr_t bitwise_and (uchr_t *a*, uchr_t *b*) [inline]

Performs a bitwise AND operation on two octets and returns the result as a single octet.

Definition at line 44 of file bitwise.c.

Referenced by st_and().

5.45.1.2 uint_t bitwise_count (uint64_t *value*)

Count the number of bits that are set in a 64-bit number. bitwise.c

Parameters:

value an unsigned 64-bit value to be checked.

Returns:

the number of bits in value that are set.

Definition at line 15 of file bitwise.c.

Referenced by hashed_bucket(), slots_count(), and st_valid_opts().

5.45.1.3 uchr_t bitwise_or (uchr_t *a*, uchr_t *b*) [inline]

Performs a bitwise OR operation on two octets and returns the result as a single octet.

Definition at line 30 of file bitwise.c.

Referenced by st_or().

5.45.1.4 uchr_t bitwise_xor (uchr_t *a*, uchr_t *b*) `[inline]`

Performs a bitwise XOR operation on two octets and returns the result as a single octet.

Definition at line 37 of file bitwise.c.

Referenced by st_xor().

5.46 src/core/parsers/bitwise.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t ∗ st_bitwise (stringer_t ∗a, stringer_t ∗b, stringer_t ∗output, uchr_t(∗bitwise)(uchr_t, uchr_t))
  Perform bitwise operation on two input strings.
- stringer_t ∗ st_not (stringer_t ∗s, stringer_t ∗output)
  Perform bitwise NOT operation on a managed string.
- stringer_t ∗ st_or (stringer_t ∗a, stringer_t ∗b, stringer_t ∗output)
  Perform bitwise OR operation between two input strings.
- stringer_t ∗ st_xor (stringer_t ∗a, stringer_t ∗b, stringer_t ∗output)
  Perform bitwise XOR operation between two input strings.
- stringer_t ∗ st_and (stringer_t ∗a, stringer_t ∗b, stringer_t ∗output)
  Perform bitwise AND operation between two input strings.

5.46.1 Function Documentation

5.46.1.1 stringer_t∗ st_and (stringer_t ∗ *a*, stringer_t ∗ *b*, stringer_t ∗ *output*)

Perform bitwise AND operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 149 of file bitwise.c.

References bitwise_and(), and st_bitwise().

5.46.1.2 stringer_t∗ st_bitwise (stringer_t ∗ *a*, stringer_t ∗ *b*, stringer_t ∗ *output*, uchr_t(∗)(uchr_t, uchr_t) *bitwise*)

Perform bitwise operation on two input strings.

Note:

Function pointers are used to determine which bitwise operation is performed. This isn't very efficient, because even though the functions are marked as inline, they aren't actually being inlined by the compiler... but keeping it this way does make it easier to read. If profiling reveals a performance problem, the functions can be moved to the header file, and thus inlined, replaced with a macro, or even a switch statement that keys of an enumerated variable.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

bitwise A function pointer to the bitwise operation.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 24 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

Referenced by st_and(), st_or(), and st_xor().

5.46.1.3 stringer_t* st_not (stringer_t * *s*, stringer_t * *output*)

Perform bitwise NOT operation on a managed string.

Parameters:

s Stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 75 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

5.46.1.4 stringer_t* st_or (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

Perform bitwise OR operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 123 of file bitwise.c.

References bitwise_or(), and st_bitwise().

5.46.1.5 stringer_t* st_xor (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

Perform bitwise XOR operation between two input strings. bitwise.c

Parameters:

- ***a*** First stringer input.
- ***b*** Second stringer input.
- ***output*** Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 136 of file bitwise.c.

References bitwise_xor(), and st_bitwise().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), signature_full_get(), signature_full_verify(), signature_tree_get(), signature_tree_verify(), slots_key(), slots_set(), stacie_decrypt(), stacie_encrypt(), and stacie_realm_key().

```

Functions

- void mm_cleanup_variadic (ssize_t len,...)
  A checked cleanup function which can be used free a variable number memory buffers.
- bool_t mm_empty (void *block, size_t len)
  Determine whether the memory buffer and/or its length encompass an empty block.
- void * mm_copy (void *dst, const void *src, size_t len)
  Copy data from one buffer to another.
- void * mm_move (void *dst, void *src, size_t len)
  Copy the contents of one buffer into another one, allowing for overlapping data.
- void * mm_set (void *block, uint8_t set, size_t len)
  Sets a block of memory to a specified value.
- void * mm_wipe (void *block, size_t len)
  Zero out a block of memory.
- void mm_free (void *block)
  Free a block of memory.
- void * mm_dupe (void *block, size_t len)
  Duplicate a block of memory.
- void * mm_alloc (size_t len)
  Allocate a chunk of memory with the system allocator and zero-wipe it.

5.47.1 Function Documentation

5.47.1.1 void* mm_alloc (size_t *len*)

Allocate a chunk of memory with the system allocator and zero-wipe it. memory.c

Note:

Uses the 'malloc' function attribute to indicate any non-NULL return value is not an alias for any other valid pointer.
The buffer length must be non-zero.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Parameters:

len the amount of memory to allocate.

Returns:

a valid pointer to the allocated memory on success, or NULL on error.

Definition at line 181 of file memory.c.

References log_pedantic, and mm_set().

Referenced by _serialize_ec_privkey(), _serialize_ec_pubkey(), alert_alloc(), alias_alloc(), auth_alloc(), auth_legacy_alloc(), auth_stacie_alloc(), cache_alloc(), client_connect(), compress_alloc(), compress_lzo(), con_init(), con_print(), contact_alloc(), contact_detail_alloc(), cryptex_alloc(), deprecated_cryptex_alloc(), deprecated_ecies_decrypt(), deprecated_ecies_key_public_bin(), deprecated_scramble_alloc(), dkim_memory_alloc(), domain_alloc(), ecies_decrypt(), ecies_key_public_bin(), ed25519_alloc(), encrypted_chunk_alloc(), encrypted_message_alloc(), ephemeral_chunk_alloc(), hashed_alloc(), hashed_bucket_alloc(), hashed_cursor_alloc(), http_data_header_parse_line(), http_data_value_parse(), http_load_file(), http_page_get(), imap_append_message(), imap_copy(), imap_fetch_response_add(), imap_folder_create(), imap_folder_rename(), imap_parse_dataitems(), keks_alloc(), linked_alloc(), linked_append(), linked_cursor_alloc(), linked_insert(), linked_record_alloc(), magma_folder_alloc(), mail_cache_set(), mail_create_message(), mail_message(), mail_mime_part(), message_alloc(), meta_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), ns_alloc(), ns_dupe(), ns_import(), nvp_alloc(), org_key_alloc(), org_key_generate(), org_signet_alloc(), org_signet_generate(), pool_alloc(), portal_endpoint_attachments_add(), portal_endpoint_messages_compose(), prime_alloc(), prime_object_alloc(), process_start(), queue_init(), register_session_generate(), register_session_get(), relay_alloc(), requeue(), res_bind_create(), res_row_store(), res_table_alloc(), scramble_alloc(), servers_alloc(), sess_create(), signature_tree_alloc(), slots_alloc(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), ssl_start(), st_alloc_opts(), st_realloc(), stacker_alloc(), stacker_push(), stmt_start(), system_init_impersonation(), tank_start(), tank_store(), tcp_addr_ip(), teacher_data_fetch(), teacher_data_get(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_alloc(), user_config_alloc(), user_config_entry_alloc(), user_key_alloc(), user_key_generate(), user_request_generate(), user_request_rotation(), user_request_sign(), and user_signet_alloc().

5.47.1.2 void mm_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number memory buffers.

See also:

mm_free

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 18 of file memory.c.

References mm_free().

5.47.1.3 void* mm_copy (void * *dst*, const void * *src*, size_t *len*)

Copy data from one buffer to another.

Note:

For overlapping data regions, bl_move() must be used.

Warning:

This function performs an aligned copy so data directly after the src buffer may end up inside the dst buffer.

Parameters:

dst the destination buffer of the copy operation.

src the source buffer of the copy operation.

len the length, in bytes, of the data to be copied.

Returns:

a pointer to the destination buffer.

Definition at line 58 of file memory.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), alert_alloc(), alias_alloc(), chunk_buffer_size(), chunk_header_size(), chunk_header_write(), client_connect(), contact_alloc(), contact_detail_alloc(), deprecated_scramble_encrypt(), deserialize_ns(), deserialize_st(), domain_alloc(), ed25519_generate(), ed25519_private_get(), ed25519_private_set(), ed25519_public_get(), ed25519_public_set(), encrypted_chunk_get(), encrypted_chunk_set(), imap_folder_create(), imap_folder_rename(), imap_parse_literal(), ip_copy(), magma_folder_alloc(), message_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), mm_sec_realloc(), naked_message_set(), ns_append(), ns_dupe(), ns_import(), prime_field_write(), prime_header_read(), prime_header_write(), prime_reader_size(), res_row_store(), scramble_encrypt(), serialize_ns(), serialize_st(), signal_shutdown(), smtp_auth_plain(), st_append_opts(), st_append_out(), st_copy_in(), st_dupe_opts(), st_import_opts(), st_merge_opts(), st_nullify(), st_realloc(), st_write_variadic(), tank_load(), tank_store(), tcp_addr_ip(), tree_cursor_next(), tree_delete(), and user_config_entry_alloc().

5.47.1.4 void* mm_dupe (void * *block*, size_t *len*)

Duplicate a block of memory.

Parameters:

block a pointer to the block of memory to be duplicated.

len the length, in bytes, of the buffer to be duplicated.

Returns:

a freshly allocated buffer containing a copy of the input data.

Definition at line 152 of file memory.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by contact_name(), imap_command_log_safe(), imap_narrow_folders(), and meta_message_dupe().

5.47.1.5 bool_t mm_empty (void * *block*, size_t *len*)

Determine whether the memory buffer and/or its length encompass an empty block.

Parameters:

block a pointer to the block of memory to be assessed.

len the length, in bytes, of the memory block.

Returns:

false if block is NULL or len is 0; true otherwise.

Definition at line 40 of file memory.c.

Referenced by line_pl_bl(), mm_cmp_ci_eq(), mm_cmp_cs_eq(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_count_bl(), and tok_get_ns().

5.47.1.6 void mm_free (void * *block*)

Free a block of memory.

Note:

block can point to either a secure or insecure memory block.

Parameters:

block a pointer to the block to be freed.

Returns:

This function does not return any value.

Definition at line 128 of file memory.c.

References log_pedantic, and mm_sec_secured().

Referenced by ar_append(), ar_free(), auth_free(), auth_legacy_free(), auth_stacie_free(), cache_free(), cache_get(), cache_get_u64(), client_close(), client_connect(), compress_cleanup(), compress_free(), compress_lzo(), con_destroy(), con_init(), con_print(), config_free(), contact_alloc(), contact_free(), contact_name(), deprecated_ecies_key_public_bin(), deprecated_scramble_cleanup(), deprecated_scramble_free(), dequeue(), dkim_memory_free(), ecies_key_public_bin(), ed25519_free(), encrypted_chunk_free(), encrypted_message_free(), ephemeral_chunk_free(), hashed_alloc(), hashed_cursor_free(), hashed_delete(), hashed_free(), hashed_truncate(), http_data_free(), http_free_content(), http_page_free(), imap_append_message(), imap_command_log_safe(), imap_copy(), imap_fetch_free_items(), imap_fetch_response_add(), imap_fetch_response_free(), imap_folder_create(), imap_folder_rename(), imap_message_copier(), imap_narrow_folders(), inx_free(), keks_free(), linked_append(), linked_cursor_free(), linked_delete(), linked_insert(), linked_record_free(), linked_truncate(), magma_folder_alloc(), magma_folder_free(), mail_cache_destroy(), mail_cache_reset(), mail_cache_set(), mail_create_message(), mail_destroy(), mail_destroy_message(), mail_message(), mail_mime_free(), message_alloc(), meta_alloc(), meta_data_fetch_alerts(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_folders_stats_tags(), meta_free(), meta_message_free(), meta_messages_copier(), mm_cleanup_variadic(), net_listen(), ns_free(), nvp_alloc(), nvp_free(), org_key_free(), org_signet_free(), pool_alloc(), pool_free(), prime_free(), prime_key_generate(), prime_object_free(), process_start(), process_stop(), protocol_secure(), register_session_free(), relay_free(), res_bind_free(), res_table_free(), scramble_cleanup(), scramble_free(), servers_free(), sess_create(), sess_destroy(), sess_release_attachment(), sess_release_composition(), signature_tree_free(), slots_free(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), smtp_free_inbound(), smtp_free_outbound(), smtp_free_recipients(), smtp_list_free_filter(), ssl_stop(), st_alloc_opts(), st_data_set(), st_free(), st_realloc(), stacker_alloc(), stacker_free(), stacker_pop(), stmt_stop(), system_init_impersonation(), tank_stop(), tank_store(), teacher_data_free(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_free(), user_config_alloc(), user_config_entry_free(), user_config_free(), user_key_free(), user_signet_free(), warehouse_fetch_domains(), and xml_dump_doc().

5.47.1.7 void* mm_move (void * *dst*, void * *src*, size_t *len*)

Copy the contents of one buffer into another one, allowing for overlapping data.

See also:

memmove()

Parameters:

dst a pointer to the destination buffer to receive the data to be copied.

src a pointer to the source buffer supplying the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

a pointer to the specified destination buffer.

Definition at line 71 of file memory.c.

Referenced by aes_artifact_decrypt(), ar_append(), auth_response(), client_read(), client_read_line(), con_read(), con_read_line(), imap_parse_literal(), st_trim(), stacie_decrypt(), and stacie_encrypt().

5.47.1.8 void* mm_set (void * *block*, uint8_t *set*, size_t *len*)

Sets a block of memory to a specified value.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be set.

set the byte value to be written to block.

len the number of times to write the value of the byte repeatedly to block.

Returns:

a pointer to the block of memory passed to the function.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Definition at line 85 of file memory.c.

Referenced by mm_alloc(), mm_sec_free(), mm_sec_stop(), mm_wipe(), ns_wipe(), st_alloc_opts(), and st_set().

5.47.1.9 void* mm_wipe (void * *block*, size_t *len*)

Zero out a block of memory.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be zeroed.

len the number of zero bytes to write to memory.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Definition at line 107 of file memory.c.

References log_pedantic, and mm_set().

Defines

- #define MM_SEC_REQUEST_ALIGNMENT 12
- #define MM_SEC_PAGE_ALIGNMENT_MIN 1024
- #define MM_SEC_POOL_LENGTH_MIN 4096
- #define MEMORYBUF(l) (void ∗)&((chr_t [ ]){ [0 ... l] = 0 })
- #define mm_cleanup(...) mm_cleanup_variadic(va_narg(__VA_ARGS__), ##__VA_ARGS__)

Functions

- size_t align (size_t alignment, size_t len)

  align.c

- uint_t bitwise_count (uint64_t value)

  bitwise.c

- uchr_t bitwise_or (uchr_t a, uchr_t b)

  Performs a bitwise OR operation on two octets and returns the result as a single octet.

- uchr_t bitwise_xor (uchr_t a, uchr_t b)

  Performs a bitwise XOR operation on two octets and returns the result as a single octet.

- uchr_t bitwise_and (uchr_t a, uchr_t b)

  Performs a bitwise AND operation on two octets and returns the result as a single octet.

- void mm_sec_stop (void)

  Deallocate and perform a multi-stage secure wipe of the secure memory region.

- bool_t mm_sec_start (void)

  If enabled, allocate and initialize the secure memory slab.

- void mm_sec_free (void ∗block)

  Free a secure memory block and perform a multi-pass wipe of its contents.

- void mm_sec_cleanup (void ∗block)

  Performed a checked memory free.

- bool_t mm_sec_secured (void ∗block)

  Determine whether the data pointer falls within the secure memory block.

- void ∗ mm_sec_alloc (size_t len)

  Allocate a chunk of memory from the secure memory slab.

- void ∗ mm_sec_realloc (void ∗orig, size_t len)

  Allocates a larger block of secure memory if requested. Depends on allocation/free routines to lock the required mutex. If a new block is allocated, the original data is copied and then the block is freed. In the event of an error, the original block is preserved and NULL is returned.

- bool_t mm_sec_stats (size_t ∗total, size_t ∗bytes, size_t ∗items)

  Get the collected secure memory statistics for the caller.

- void ∗ mm_alloc (size_t len)

memory.c

- void mm_cleanup_variadic (ssize_t len,...)
  A checked cleanup function which can be used free a variable number memory buffers.
- void * mm_copy (void *dst, const void *src, size_t len)
  Copy data from one buffer to another.
- void * mm_dupe (void *block, size_t len)
  Duplicate a block of memory.
- bool_t mm_empty (void *block, size_t len)
  Determine whether the memory buffer and/or its length encompass an empty block.
- void mm_free (void *block)
  Free a block of memory.
- void * mm_move (void *dst, void *src, size_t len)
  Copy the contents of one buffer into another one, allowing for overlapping data.
- void * mm_set (void *block, uint8_t set, size_t len)
  Sets a block of memory to a specified value.
- void * mm_wipe (void *block, size_t len)
  Zero out a block of memory.

Definition at line 42 of file memory.h.

5.48.2 Function Documentation

5.48.2.1 size_t align (size_t *alignment*, size_t *len*)

align.c

Definition at line 16 of file align.c.

Referenced by alert_alloc(), alias_alloc(), contact_alloc(), contact_detail_alloc(), domain_alloc(), magma_folder_alloc(), message_alloc(), meta_folder_stats_tag_alloc(), mm_sec_alloc(), st_alloc_opts(), st_realloc(), user_config_alloc(), and user_config_entry_alloc().

5.48.2.2 uchr_t bitwise_and (uchr_t *a*, uchr_t *b*) `[inline]`

Performs a bitwise AND operation on two octets and returns the result as a single octet.

Definition at line 44 of file bitwise.c.

Referenced by st_and().

5.48.2.3 uint_t bitwise_count (uint64_t *value*)

bitwise.c bitwise.c

Parameters:

value an unsigned 64-bit value to be checked.

Returns:

the number of bits in value that are set.

Definition at line 15 of file bitwise.c.

Referenced by hashed_bucket(), slots_count(), and st_valid_opts().

5.48.2.4 uchr_t bitwise_or (uchr_t *a*, uchr_t *b*) `[inline]`

Performs a bitwise OR operation on two octets and returns the result as a single octet.

Definition at line 30 of file bitwise.c.

Referenced by st_or().

5.48.2.5 uchr_t bitwise_xor (uchr_t *a*, uchr_t *b*) [inline]

Performs a bitwise XOR operation on two octets and returns the result as a single octet.

Definition at line 37 of file bitwise.c.

Referenced by st_xor().

5.48.2.6 void* mm_alloc (size_t *len*)

memory.c memory.c

Note:

Uses the 'malloc' function attribute to indicate any non-NULL return value is not an alias for any other valid pointer.
The buffer length must be non-zero.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Parameters:

len the amount of memory to allocate.

Returns:

a valid pointer to the allocated memory on success, or NULL on error.

Definition at line 181 of file memory.c.

References log_pedantic, and mm_set().

Referenced by _serialize_ec_privkey(), _serialize_ec_pubkey(), alert_alloc(), alias_alloc(), auth_alloc(), auth_legacy_alloc(), auth_stacie_alloc(), cache_alloc(), client_connect(), compress_alloc(), compress_lzo(), con_init(), con_print(), contact_alloc(), contact_detail_alloc(), cryptex_alloc(), deprecated_cryptex_alloc(), deprecated_ecies_decrypt(), deprecated_ecies_key_public_bin(), deprecated_scramble_alloc(), dkim_memory_alloc(), domain_alloc(), ecies_decrypt(), ecies_key_public_bin(), ed25519_alloc(), encrypted_chunk_alloc(), encrypted_message_alloc(), ephemeral_chunk_alloc(), hashed_alloc(), hashed_bucket_alloc(), hashed_cursor_alloc(), http_data_header_parse_line(), http_data_value_parse(), http_load_file(), http_page_get(), imap_append_message(), imap_copy(), imap_fetch_response_add(), imap_folder_create(), imap_folder_rename(), imap_parse_dataitems(), keks_alloc(), linked_alloc(), linked_append(), linked_cursor_alloc(), linked_insert(), linked_record_alloc(), magma_folder_alloc(), mail_cache_set(), mail_create_message(), mail_message(), mail_mime_part(), message_alloc(), meta_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), ns_alloc(), ns_dupe(), ns_import(), nvp_alloc(), org_key_alloc(), org_key_generate(), org_signet_alloc(), org_signet_generate(), pool_alloc(), portal_endpoint_attachments_add(), portal_endpoint_messages_compose(), prime_alloc(), prime_object_alloc(), process_start(), queue_init(), register_session_generate(), register_session_get(), relay_alloc(), requeue(), res_bind_create(), res_row_store(), res_table_alloc(), scramble_alloc(), servers_alloc(), sess_create(), signature_tree_alloc(), slots_alloc(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), ssl_start(), st_alloc_opts(), st_realloc(), stacker_alloc(), stacker_push(), stmt_start(), system_init_impersonation(), tank_start(), tank_store(), tcp_addr_ip(), teacher_data_fetch(), teacher_data_get(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_alloc(), user_config_alloc(), user_config_entry_alloc(), user_key_alloc(), user_key_generate(), user_request_generate(), user_request_rotation(), user_request_sign(), and user_signet_alloc().

5.48.2.7 void mm_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number memory buffers.

See also:

mm_free

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 18 of file memory.c.

References mm_free().

5.48.2.8 void∗ mm_copy (void ∗ *dst*, const void ∗ *src*, size_t *len*)

Copy data from one buffer to another.

Note:

For overlapping data regions, bl_move() must be used.

Warning:

This function performs an aligned copy so data directly after the src buffer may end up inside the dst buffer.

Parameters:

dst the destination buffer of the copy operation.

src the source buffer of the copy operation.

len the length, in bytes, of the data to be copied.

Returns:

a pointer to the destination buffer.

Definition at line 58 of file memory.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), alert_alloc(), alias_alloc(), chunk_buffer_size(), chunk_header_size(), chunk_header_write(), client_connect(), contact_alloc(), contact_detail_alloc(), deprecated_scramble_encrypt(), deserialize_ns(), deserialize_st(), domain_alloc(), ed25519_generate(), ed25519_private_get(), ed25519_private_set(), ed25519_public_get(), ed25519_public_set(), encrypted_chunk_get(), encrypted_chunk_set(), imap_folder_create(), imap_folder_rename(), imap_parse_literal(), ip_copy(), magma_folder_alloc(), message_alloc(), meta_data_fetch_folders(), meta_data_fetch_messages(), meta_folder_stats_tag_alloc(), mm_dupe(), mm_sec_realloc(), naked_message_set(), ns_append(), ns_dupe(), ns_import(), prime_field_write(), prime_header_read(), prime_header_write(), prime_reader_size(), res_row_store(), scramble_encrypt(), serialize_ns(), serialize_st(), signal_shutdown(), smtp_auth_plain(), st_append_opts(), st_append_out(), st_copy_in(), st_dupe_opts(), st_import_opts(), st_merge_opts(), st_nullify(), st_realloc(), st_write_variadic(), tank_load(), tank_store(), tcp_addr_ip(), tree_cursor_next(), tree_delete(), and user_config_entry_alloc().

5.48.2.9 void∗ mm_dupe (void ∗ *block*, size_t *len*)

Duplicate a block of memory.

Parameters:

block a pointer to the block of memory to be duplicated.

len the length, in bytes, of the buffer to be duplicated.

Returns:

a freshly allocated buffer containing a copy of the input data.

Definition at line 152 of file memory.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by contact_name(), imap_command_log_safe(), imap_narrow_folders(), and meta_message_dupe().

5.48.2.10 bool_t mm_empty (void * *block*, size_t *len*)

Determine whether the memory buffer and/or its length encompass an empty block.

Parameters:

block a pointer to the block of memory to be assessed.

len the length, in bytes, of the memory block.

Returns:

false if block is NULL or len is 0; true otherwise.

Definition at line 40 of file memory.c.

Referenced by line_pl_bl(), mm_cmp_ci_eq(), mm_cmp_cs_eq(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_count_bl(), and tok_get_ns().

5.48.2.11 void mm_free (void * *block*)

Free a block of memory.

Note:

block can point to either a secure or insecure memory block.

Parameters:

block a pointer to the block to be freed.

Returns:

This function does not return any value.

Definition at line 128 of file memory.c.

References log_pedantic, and mm_sec_secured().

Referenced by ar_append(), ar_free(), auth_free(), auth_legacy_free(), auth_stacie_free(), cache_free(), cache_get(), cache_get_u64(), client_close(), client_connect(), compress_cleanup(), compress_free(), compress_lzo(), con_destroy(), con_init(), con_print(), config_free(), contact_alloc(), contact_free(), contact_name(), deprecated_ecies_key_public_bin(), deprecated_scramble_cleanup(), deprecated_scramble_free(), dequeue(), dkim_memory_free(), ecies_key_public_bin(), ed25519_free(), encrypted_chunk_free(), encrypted_message_free(), ephemeral_chunk_free(), hashed_alloc(), hashed_cursor_free(), hashed_delete(), hashed_free(), hashed_truncate(), http_data_free(), http_free_content(), http_page_free(), imap_append_message(), imap_command_log_safe(), imap_copy(), imap_fetch_free_items(), imap_fetch_response_add(), imap_fetch_response_free(), imap_folder_create(), imap_folder_rename(), imap_message_copier(), imap_narrow_folders(), inx_free(), keks_free(), linked_append(), linked_cursor_free(), linked_delete(), linked_insert(), linked_record_free(), linked_truncate(), magma_folder_alloc(), magma_folder_free(), mail_cache_destroy(), mail_cache_reset(), mail_cache_set(), mail_create_message(), mail_destroy(), mail_destroy_message(), mail_message(), mail_mime_free(), message_alloc(), meta_alloc(), meta_data_fetch_alerts(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_folders_stats_tags(), meta_free(), meta_message_free(), meta_messages_copier(), mm_cleanup_variadic(), net_listen(), ns_free(), nvp_alloc(), nvp_free(), org_key_free(), org_signet_free(), pool_alloc(), pool_free(), prime_free(), prime_key_generate(), prime_object_free(), process_start(), process_stop(), protocol_secure(), register_session_free(), relay_free(), res_bind_free(), res_table_free(), scramble_cleanup(), scramble_free(), servers_free(), sess_create(), sess_destroy(), sess_release_attachment(), sess_release_composition(), signature_tree_free(), slots_free(), smtp_add_bypass_entry(), smtp_add_recipient(), smtp_fetch_authorization(), smtp_fetch_inbound(), smtp_free_inbound(), smtp_free_outbound(),

smtp_free_recipients(), smtp_list_free_filter(), ssl_stop(), st_alloc_opts(), st_data_set(), st_free(), st_realloc(), stacker_alloc(), stacker_free(), stacker_pop(), stmt_stop(), system_init_impersonation(), tank_stop(), tank_store(), teacher_data_free(), thread_alloc(), tls_print(), tree_alloc(), tree_cursor_free(), user_config_alloc(), user_config_entry_free(), user_config_free(), user_key_free(), user_signet_free(), warehouse_fetch_domains(), and xml_dump_doc().

5.48.2.12 void* mm_move (void * *dst*, void * *src*, size_t *len*)

Copy the contents of one buffer into another one, allowing for overlapping data.

See also:

memmove()

Parameters:

dst a pointer to the destination buffer to receive the data to be copied.

src a pointer to the source buffer supplying the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

a pointer to the specified destination buffer.

Definition at line 71 of file memory.c.

Referenced by aes_artifact_decrypt(), ar_append(), auth_response(), client_read(), client_read_line(), con_read(), con_read_line(), imap_parse_literal(), st_trim(), stacie_decrypt(), and stacie_encrypt().

5.48.2.13 void* mm_sec_alloc (size_t *len*)

Allocate a chunk of memory from the secure memory slab.

See also:

mm_sec_chunk_new()

Parameters:

len the length, in bytes, of the secure memory chunk to be allocated.

Returns:

NULL on failure, or a pointer to the freshly allocated chunk of secure memory on success.

Definition at line 251 of file secure.c.

References align(), bytes, items, log_options, log_pedantic, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, mm_sec_chunk_new(), mm_sec_stats(), mm_wipe(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_realloc(), ssl_start(), st_alloc_opts(), and st_realloc().

5.48.2.14 void mm_sec_cleanup (void * *block*)

Performed a checked memory free.

See also:

mm_sec_free

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 236 of file secure.c.

References mm_sec_free().

5.48.2.15 void mm_sec_free (void ∗ *block*)

Free a secure memory block and perform a multi-pass wipe of its contents.

Returns:

This function returns no value.

Definition at line 196 of file secure.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_secured(), mm_set(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_cleanup(), mm_sec_realloc(), ssl_start(), st_alloc_-opts(), st_data_set(), st_free(), and st_realloc().

5.48.2.16 void∗ mm_sec_realloc (void ∗ *orig*, size_t *len*)

Allocates a larger block of secure memory if requested. Depends on allocation/free routines to lock the required mutex. If a new block is allocated, the original data is copied and then the block is freed. In the event of an error, the original block is preserved and NULL is returned.

Definition at line 296 of file secure.c.

References log_pedantic, mm_copy(), mm_sec_alloc(), mm_sec_free(), and secured_t.

5.48.2.17 bool_t mm_sec_secured (void ∗ *block*)

Determine whether the data pointer falls within the secure memory block.

Parameters:

block the data pointer to be tested.

Returns:

true if block points to secure data; false if not, or if block is invalid or secure memory is disabled.

Definition at line 80 of file secure.c.

References slab.

Referenced by mm_free(), mm_sec_chunk_new(), mm_sec_chunk_next(), mm_sec_free(), and st_data_set().

5.48.2.18 bool_t mm_sec_start (void)

If enabled, allocate and initialize the secure memory slab.

Note:

This function will mmap a page-aligned secure memory slab (defaults to 32768 bytes long), mlock() it into memory, and zero-wipe it. Guard pages with empty permissions are created on the boundaries of the slab to prevent memory bungling.

Returns:

true if the secure memory slab has been initialized, or false if the process fails.

Definition at line 357 of file secure.c.

References log_pedantic, magma, magma_t::memory, MEMORYBUF, MM_SEC_PAGE_ALIGNMENT_MIN, MM_SEC_POOL_-LENGTH_MIN, mm_wipe(), magma_t::page_length, magma_t::secure, and secured_t.

Referenced by process_start().

5.48.2.19 bool_t mm_sec_stats (size_t * *total*, size_t * *bytes*, size_t * *items*)

Get the collected secure memory statistics for the caller.

Parameters:

total a pointer to a size_t variable that will store the secure memory region length, in bytes.

bytes a pointer to a size_t variable that will store the number of secure bytes allocated by magma.

items a pointer to a size_t variable that will store the number of secure memory allocations requested by magma.

Returns:

true on success or false on failure.

Definition at line 60 of file secure.c.

References mutex_lock(), and mutex_unlock().

Referenced by mm_sec_alloc(), and stats_derived_value().

5.48.2.20 void mm_sec_stop (void)

Deallocate and perform a multi-stage secure wipe of the secure memory region.

Returns:

This function returns no value.

Definition at line 328 of file secure.c.

References mm_set().

Referenced by process_stop().

5.48.2.21 void* mm_set (void * *block*, uint8_t *set*, size_t *len*)

Sets a block of memory to a specified value.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be set.

set the byte value to be written to block.

len the number of times to write the value of the byte repeatedly to block.

Returns:

a pointer to the block of memory passed to the function.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Definition at line 85 of file memory.c.

Referenced by mm_alloc(), mm_sec_free(), mm_sec_stop(), mm_wipe(), ns_wipe(), st_alloc_opts(), and st_set().

5.48.2.22 void∗ mm_wipe (void ∗ *block*, size_t *len*)

Zero out a block of memory.

Note:

Uses the 'optimize (0)' and 'noinline' function attributes to prevent compiler optimization from removing logic it might consider unnecessary.

Parameters:

block the block of memory to be zeroed.

len the number of zero bytes to write to memory.

See also:

http://gcc.gnu.org/onlinedocs/gcc-4.4.4/gcc/Function-Attributes.html

Definition at line 107 of file memory.c.

References log_pedantic, and mm_set().

5.49.1 Enumeration Type Documentation

5.49.1.1 anonymous enum

Enumerator:

MM_SEC_CHUNK_AVAILABLE
MM_SEC_CHUNK_ALLOCATED

Definition at line 10 of file secure.c.

5.49.2 Function Documentation

5.49.2.1 struct __attribute__ ((packed)) [read]

Definition at line 15 of file secure.c.

References length.

5.49.2.2 void* mm_sec_alloc (size_t *len*)

Allocate a chunk of memory from the secure memory slab.

See also:

mm_sec_chunk_new()

Parameters:

len the length, in bytes, of the secure memory chunk to be allocated.

Returns:

NULL on failure, or a pointer to the freshly allocated chunk of secure memory on success.

Definition at line 251 of file secure.c.

References align(), bytes, items, log_options, log_pedantic, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, mm_sec_chunk_new(), mm_sec_stats(), mm_wipe(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_realloc(), ssl_start(), st_alloc_opts(), and st_realloc().

5.49.2.3 void mm_sec_chunk_merge (secured_t * *chunk*)

If an adjacent region is available, merge them together.

Definition at line 135 of file secure.c.

References MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_next(), mm_sec_chunk_prev(), and secured_t.

Referenced by mm_sec_chunk_new(), and mm_sec_free().

5.49.2.4 secured_t* mm_sec_chunk_new (secured_t * *block*, size_t *size*)

Locates a properly sized chunk of memory and reserves it.

Definition at line 157 of file secure.c.

References MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_chunk_next(), mm_sec_secured(), and secured_t.

Referenced by mm_sec_alloc().

5.49.2.5 secured_t* mm_sec_chunk_next (secured_t * *chunk*)

Get the next chunk of secure memory.

Parameters:

chunk the input secure chunk.

Returns:

a pointer to the next chunk of secure memory, or NULL on failure or if the end of the slab is reached.

Definition at line 102 of file secure.c.

References mm_sec_secured(), and secured_t.

Referenced by mm_sec_chunk_merge(), mm_sec_chunk_new(), and mm_sec_chunk_prev().

5.49.2.6 secured_t* mm_sec_chunk_prev (secured_t * *chunk*)

Get the previous chunk of secure memory.

Parameters:

chunk the input secure chunk.

Returns:

a pointer to the previous chunk of secure memory, or NULL on failure or if the beginning of the slab is reached.

Definition at line 117 of file secure.c.

References mm_sec_chunk_next(), and secured_t.

Referenced by mm_sec_chunk_merge().

5.49.2.7 void mm_sec_cleanup (void * *block*)

Performed a checked memory free.

See also:

mm_sec_free

Parameters:

block the block of memory to be freed.

Returns:

This function returns no value.

Definition at line 236 of file secure.c.

References mm_sec_free().

5.49.2.8 void mm_sec_free (void * *block*)

Free a secure memory block and perform a multi-pass wipe of its contents.

Returns:

This function returns no value.

Definition at line 196 of file secure.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, MM_SEC_CHUNK_ALLOCATED, mm_sec_chunk_merge(), mm_sec_secured(), mm_set(), mutex_lock(), mutex_unlock(), and secured_t.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), mm_sec_cleanup(), mm_sec_realloc(), ssl_start(), st_alloc_-opts(), st_data_set(), st_free(), and st_realloc().

5.49.2.9 void∗ mm_sec_realloc (void ∗ *orig*, size_t *len*)

Allocates a larger block of secure memory if requested. Depends on allocation/free routines to lock the required mutex. If a new block is allocated, the original data is copied and then the block is freed. In the event of an error, the original block is preserved and NULL is returned.

Definition at line 296 of file secure.c.

References log_pedantic, mm_copy(), mm_sec_alloc(), mm_sec_free(), and secured_t.

5.49.2.10 bool_t mm_sec_secured (void ∗ *block*)

Determine whether the data pointer falls within the secure memory block.

Parameters:

block the data pointer to be tested.

Returns:

true if block points to secure data; false if not, or if block is invalid or secure memory is disabled.

Definition at line 80 of file secure.c.

References slab.

Referenced by mm_free(), mm_sec_chunk_new(), mm_sec_chunk_next(), mm_sec_free(), and st_data_set().

5.49.2.11 bool_t mm_sec_start (void)

If enabled, allocate and initialize the secure memory slab.

Note:

This function will mmap a page-aligned secure memory slab (defaults to 32768 bytes long), mlock() it into memory, and zero-wipe it. Guard pages with empty permissions are created on the boundaries of the slab to prevent memory bungling.

Returns:

true if the secure memory slab has been initialized, or false if the process fails.

Definition at line 357 of file secure.c.

References log_pedantic, magma, magma_t::memory, MEMORYBUF, MM_SEC_PAGE_ALIGNMENT_MIN, MM_SEC_POOL_-LENGTH_MIN, mm_wipe(), magma_t::page_length, magma_t::secure, and secured_t.

Referenced by process_start().

5.49.2.12 bool_t mm_sec_stats (size_t * *total*, size_t * *bytes*, size_t * *items*)

Get the collected secure memory statistics for the caller.

Parameters:

total a pointer to a size_t variable that will store the secure memory region length, in bytes.

bytes a pointer to a size_t variable that will store the number of secure bytes allocated by magma.

items a pointer to a size_t variable that will store the number of secure memory allocations requested by magma.

Returns:

true on success or false on failure.

Definition at line 60 of file secure.c.

References mutex_lock(), and mutex_unlock().

Referenced by mm_sec_alloc(), and stats_derived_value().

5.49.2.13 void mm_sec_stop (void)

Deallocate and perform a multi-stage secure wipe of the secure memory region.

Returns:

This function returns no value.

Definition at line 328 of file secure.c.

References mm_set().

Referenced by process_stop().

Functions

- uchr_t upper_chr (uchr_t c)

  Return the uppercase representation of a character.

- uchr_t lower_chr (uchr_t c)

  Return the lowercase representation of a character.

- stringer_t ∗ upper_st (stringer_t ∗s)

  Transform a managed string (in-place) into uppercase.

- stringer_t ∗ lower_st (stringer_t ∗s)

  Transform a managed string (in-place) into lowercase.

5.50.1 Function Documentation

5.50.1.1 uchr_t lower_chr (uchr_t *c*)

Return the lowercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in lowercase.

Definition at line 25 of file case.c.

Referenced by auth_sanitize_address(), hex_decode_chr(), mm_cmp_ci_eq(), pop_user_parse(), smtp_parse_helo_domain(), smtp_parse_-mail_from_path(), smtp_parse_rcpt_to(), st_cmp_ci_ends(), st_cmp_ci_eq(), st_cmp_ci_starts(), and st_search_ci().

5.50.1.2 stringer_t∗ lower_st (stringer_t ∗ *s*)

Transform a managed string (in-place) into lowercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in lowercase.

Definition at line 58 of file case.c.

References log_pedantic, and st_empty_out().

Referenced by api_endpoint_register(), contact_business_valid_email(), http_parse_header(), register_business_step1(), and smtp_rcpt_to().

5.50.1.3 uchr_t upper_chr (uchr_t *c*)

Return the uppercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in uppercase.

Definition at line 15 of file case.c.

5.50.1.4 stringer_t* upper_st (stringer_t * *s*)

Transform a managed string (in-place) into uppercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in uppercase.

Definition at line 35 of file case.c.

References log_pedantic, and st_empty_out().

Data Structures

- struct nvp_t

Functions

- nvp_t ∗ nvp_alloc ()

  Allocate a new name/value pair and initialize it with the default settings.

- void nvp_free (nvp_t ∗nvp)

  Free a name/value pair object from memory.

- void nvp_init (nvp_t ∗nvp)
- int nvp_parse (nvp_t ∗nvp, stringer_t ∗data)

5.51.1 Function Documentation

5.51.1.1 nvp_t∗ nvp_alloc ()

Allocate a new name/value pair and initialize it with the default settings.

Note:

Defaults use "\n" for a line separator, "#" for a comment starting character, and "=" as the assignment character.

Returns:

NULL on failure, or a pointer to the newly allocated name/value pair object.

Definition at line 73 of file nvp.c.

References nvp_t::comment, inx_alloc(), nvp_t::line, log_info, M_INX_HASHED, mm_alloc(), mm_free(), nvp_t::pairs, st_free(), nvp_t::tokens, and nvp_t::value.

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.51.1.2 void nvp_free (nvp_t ∗ *nvp*)

Free a name/value pair object from memory.

Parameters:

nvp the name/value pair object to be freed.

Returns:

This function returns no value.

Definition at line 100 of file nvp.c.

References inx_free(), mm_free(), and nvp_t::pairs.

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.51.1.3 void nvp_init (nvp_t * *nvp*)

5.51.1.4 int nvp_parse (nvp_t * *nvp*, stringer_t * *data*)

on success the number of valid pairs is returned on error -1 is returned

Definition at line 14 of file nvp.c.

References nvp_t::comment, count, inx_insert(), nvp_t::line, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_-STRINGER, mt_set_type(), nvp_t::pairs, pl_char_get(), pl_data_get(), pl_empty(), pl_length_get(), pl_null(), pl_starts_with_char(), pl_-trim(), placer_t, multi_t::st, st_free(), st_import(), st_length_get(), tok_get_bl(), tok_pop(), tok_pop_init_st(), nvp_t::tokens, multi_t::val, and nvp_t::value.

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.52.1.2 void nvp_free (nvp_t * *nvp*)

Free a name/value pair object from memory.

Parameters:

nvp the name/value pair object to be freed.

Returns:

This function returns no value.

Definition at line 100 of file nvp.c.

References inx_free(), mm_free(), and nvp_t::pairs.

Referenced by config_load_cmdline_settings(), and config_load_file_settings().

5.52.1.3 int nvp_parse (nvp_t * *nvp*, stringer_t * *data*)

on success the number of valid pairs is returned on error -1 is returned

Definition at line 14 of file nvp.c.

Functions

- placer_t line_pl_bl (char *block, size_t length, uint64_t number)

  Get a placer pointing to the specified line (' ' delimited) of content in a data buffer.

- placer_t line_pl_ns (char *string, uint64_t number)

  Get a placer pointing to the specified line (' ' delimited) of a null-terminated string.

- placer_t line_pl_st (stringer_t *string, uint64_t number)

  Get a placer pointing to the specified line (' ' delimited) of a managed string.

- placer_t line_pl_pl (placer_t string, uint64_t number)

  Get a placer pointing to the specified line (' ' delimited) of another placer.

5.53.1 Function Documentation

5.53.1.1 placer_t line_pl_bl (char * *block*, size_t *length*, uint64_t *number*)

Get a placer pointing to the specified line (' ' delimited) of content in a data buffer.

Parameters:

block a pointer to the block of data to be scanned.

length the length, in bytes, of the specified data buffer.

number the zero-based index of the line to be retrieved from the buffer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 17 of file line.c.

References log_pedantic, mm_empty(), pl_init(), and pl_null().

Referenced by line_pl_ns(), line_pl_pl(), and line_pl_st().

5.53.1.2 placer_t line_pl_ns (char * *string*, uint64_t *number*)

Get a placer pointing to the specified line (' ' delimited) of a null-terminated string.

See also:

line_pl_bl()

Parameters:

string a pointer to a null-terminated string to be scanned.

number the zero-based index of the line to be retrieved from the string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 60 of file line.c.

References line_pl_bl(), and ns_length_get().

5.53.1.3 placer_t line_pl_pl (placer_t *string*, uint64_t *number*)

Get a placer pointing to the specified line ('

' delimited) of another placer.

Parameters:

string a pointer to the placer to be scanned.

number the zero-based index of the line to be retrieved from the placer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 82 of file line.c.

References line_pl_bl(), pl_char_get(), and pl_length_get().

5.53.1.4 placer_t line_pl_st (stringer_t * *string*, uint64_t *number*)

Get a placer pointing to the specified line ('

' delimited) of a managed string.

Parameters:

string a pointer to the managed string to be scanned.

number the zero-based index of the line to be retrieved from the managed string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 71 of file line.c.

References line_pl_bl(), st_char_get(), and st_length_get().

Referenced by client_read_line(), con_read_line(), and imap_parse_literal().

```
#include "magma.h"
```

Functions

- uint8_t uint8_clamp (uint8_t min, uint8_t max, uint8_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- uint16_t uint16_clamp (uint16_t min, uint16_t max, uint16_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- uint32_t uint32_clamp (uint32_t min, uint32_t max, uint32_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- uint64_t uint64_clamp (uint64_t min, uint64_t max, uint64_t number)

  Ensure a number is between the min and max values, otherwise return tuint_the boundary value.

- int8_t int8_clamp (int8_t min, int8_t max, int8_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- int16_t int16_clamp (int16_t min, int16_t max, int16_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- int32_t int32_clamp (int32_t min, int32_t max, int32_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

- int64_t int64_clamp (int64_t min, int64_t max, int64_t number)

  Ensure a number is between the min and max values, otherwise return the boundary value.

5.54.1 Function Documentation

5.54.1.1 int16_t int16_clamp (int16_t *min*, int16_t *max*, int16_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value. clamp.c

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 125 of file clamp.c.

References log_pedantic.

5.54.1.2 int32_t int32_clamp (int32_t *min*, int32_t *max*, int32_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 146 of file clamp.c.

References log_pedantic.

5.54.1.3 int64_t int64_clamp (int64_t *min*, int64_t *max*, int64_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 167 of file clamp.c.

References log_pedantic.

5.54.1.4 int8_t int8_clamp (int8_t *min*, int8_t *max*, int8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 104 of file clamp.c.

References log_pedantic.

5.54.1.5 uint16_t uint16_clamp (uint16_t *min*, uint16_t *max*, uint16_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 41 of file clamp.c.

References log_pedantic.

5.54.1.6 uint32_t uint32_clamp (uint32_t *min*, uint32_t *max*, uint32_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 62 of file clamp.c.

References log_pedantic.

5.54.1.7 uint64_t uint64_clamp (uint64_t *min*, uint64_t *max*, uint64_t *number*)

Ensure a number is between the min and max values, otherwise return tuint_the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 83 of file clamp.c.

References log_pedantic.

Referenced by stacie_derive_rounds(), and stmt_exec_affected_conn().

5.54.1.8 uint8_t uint8_clamp (uint8_t *min*, uint8_t *max*, uint8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 20 of file clamp.c.

References log_pedantic.

5.55 src/core/parsers/numbers/digits.c File Reference

```
#include "magma.h"
```

Functions

- size_t uint64_digits (uint64_t number)
  Count the number of digits needed to represent a base-10 64-bit unsigned integer.
- size_t uint32_digits (uint32_t number)
  Count the number of digits needed to represent a base-10 32-bit unsigned integer.
- size_t uint16_digits (uint16_t number)
  Count the number of digits needed to represent a base-10 16-bit unsigned integer.
- size_t uint8_digits (uint8_t number)
  Count the number of digits needed to represent a base-10 8-bit unsigned integer.
- size_t int64_digits (int64_t number)
  Count the number of digits needed to represent a base-10 64-bit signed integer.
- size_t int32_digits (int32_t number)
  Count the number of digits needed to represent a base-10 32-bit signed integer.
- size_t int16_digits (int16_t number)
  Count the number of digits needed to represent a base-10 16-bit signed integer.
- size_t int8_digits (int8_t number)
  Count the number of digits needed to represent a base-10 8-bit signed integer.

5.55.1 Function Documentation

5.55.1.1 size_t int16_digits (int16_t *number*)

Count the number of digits needed to represent a base-10 16-bit signed integer. digits.c

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 112 of file digits.c.

References length.

Referenced by serialize_int16().

5.55.1.2 size_t int32_digits (int32_t *number*)

Count the number of digits needed to represent a base-10 32-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 93 of file digits.c.

References length.

Referenced by serialize_int32().

5.55.1.3 size_t int64_digits (int64_t *number*)

Count the number of digits needed to represent a base-10 64-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 74 of file digits.c.

References length.

Referenced by serialize_int64().

5.55.1.4 size_t int8_digits (int8_t *number*)

Count the number of digits needed to represent a base-10 8-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 131 of file digits.c.

References length.

5.55.1.5 size_t uint16_digits (uint16_t *number*)

Count the number of digits needed to represent a base-10 16-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 44 of file digits.c.

References length.

Referenced by serialize_uint16().

5.55.1.6 size_t uint32_digits (uint32_t *number*)

Count the number of digits needed to represent a base-10 32-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 29 of file digits.c.

References length.

Referenced by serialize_uint32().

5.55.1.7 size_t uint64_digits (uint64_t *number*)

Count the number of digits needed to represent a base-10 64-bit unsigned integer.

Returns:

the number of digits needed to represent specified integer.

Definition at line 14 of file digits.c.

References length.

Referenced by mail_build_signature(), serialize_uint64(), sess_key(), and smtp_store_spamsig().

5.55.1.8 size_t uint8_digits (uint8_t *number*)

Count the number of digits needed to represent a base-10 8-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 59 of file digits.c.

References length.

```
#include "magma.h"
```

Functions

- bool_t float_conv (stringer_t *s, float_t *number)
  Convert a managed string to a float.
- bool_t double_conv (stringer_t *s, double_t *number)
  Convert a managed string to a a double.
- bool_t size_conv_bl (void *block, size_t length, size_t *number)
  Convert a numerical string into a size_t value.
- bool_t ssize_conv_bl (void *block, size_t length, ssize_t *number)
  Convert a numerical string into an ssize_t value.
- bool_t uint64_conv_bl (void *block, size_t length, uint64_t *number)
  Convert a numerical string into an unsigned 64-bit integer.
- bool_t uint64_conv_ns (char *string, uint64_t *number)
  Convert a null-terminated string into an unsigned 64-bit integer.
- bool_t uint64_conv_st (stringer_t *string, uint64_t *number)
  Convert a managed string into an unsigned 64-bit integer.
- bool_t uint64_conv_pl (placer_t string, uint64_t *number)
  Convert a placer into an unsigned 64-bit integer.
- bool_t uint32_conv_bl (void *block, size_t length, uint32_t *number)
  Convert a numerical string into an unsigned 32-bit integer.
- bool_t uint32_conv_ns (char *string, uint32_t *number)
  Convert a null-terminated string into an unsigned 32-bit integer.
- bool_t uint32_conv_st (stringer_t *string, uint32_t *number)
  Convert a managed string into an unsigned 32-bit integer.
- bool_t uint16_conv_bl (void *block, size_t length, uint16_t *number)
  Convert a numerical string to a 16-bit unsigned integer.
- bool_t uint16_conv_ns (char *string, uint16_t *number)
  Convert a numerical string to a 16-bit unsigned integer.
- bool_t uint16_conv_st (stringer_t *string, uint16_t *number)
  Convert a numerical string to a 16-bit unsigned integer.
- bool_t uint8_conv_bl (void *block, size_t length, uint8_t *number)
  Convert a numerical string to an unsigned 8-bit unsigned integer.
- bool_t uint8_conv_ns (char *string, uint8_t *number)

Convert a numerical string to an 8-bit unsigned integer.

- bool_t uint8_conv_st (stringer_t *string, uint8_t *number)
  Convert a numerical string to an 8-bit unsigned integer.
- bool_t int64_conv_bl (void *block, size_t length, int64_t *number)
  Convert a numerical string into a signed 64-bit integer.
- bool_t int64_conv_ns (char *string, int64_t *number)
  Convert a null-terminated string into a signed 64-bit integer.
- bool_t int64_conv_st (stringer_t *string, int64_t *number)
  Convert a managed string into a signed 64-bit integer.
- bool_t int32_conv_bl (void *block, size_t length, int32_t *number)
  Convert a numerical string into a signed 32-bit integer.
- bool_t int32_conv_ns (char *string, int32_t *number)
  Convert a null-terminated string into a signed 32-bit integer.
- bool_t int32_conv_st (stringer_t *string, int32_t *number)
  Convert a managed string into a signed 32-bit integer.
- bool_t int16_conv_bl (void *block, size_t length, int16_t *number)
  Convert a numerical string into a signed 16-bit integer.
- bool_t int16_conv_ns (char *string, int16_t *number)
  Convert a null-terminated string into a signed 16-bit integer.
- bool_t int16_conv_st (stringer_t *string, int16_t *number)
  Convert a managed string into a signed 16-bit integer.
- bool_t int8_conv_bl (void *block, size_t length, int8_t *number)
  Convert a numerical string into a signed 8-bit integer.
- bool_t int8_conv_ns (char *string, int8_t *number)
  Convert a null-terminated string into a signed 8-bit integer.
- bool_t int8_conv_st (stringer_t *string, int8_t *number)
  Convert a managed string into a signed 8-bit integer.
- stringer_t * uint32_put_no (uint32_t val)
  Create a stringer, storing a 4-byte value in network byte order.
- stringer_t * uint24_put_no (uint32_t val)
  Create a stringer, storing a 3-byte value in network byte order.
- stringer_t * uint16_put_no (uint16_t val)
  Create a stringer, storing a 2-byte value in network byte order.
- uint32_t uint32_get_no (stringer_t *s)
  Fetch a 4 byte network order value from a stringer and return it in host byte order.

- uint32_t uint24_get_no (stringer_t *s)

  Fetch a 3 byte network order value from a stringer and return it in host byte order.

- uint16_t uint16_get_no (stringer_t *s)

  Fetch a 2 byte network order value from a stringer and return it in host byte order.

5.56.1 Function Documentation

5.56.1.1 bool_t double_conv (stringer_t * *s*, double_t * *number*)

Convert a managed string to a a double. numbers.c

Parameters:

s the managed string to be converted.

number a pointer to a double where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 48 of file numbers.c.

References log_pedantic, st_char_get(), st_empty, st_length_get(), and st_length_int().

5.56.1.2 bool_t float_conv (stringer_t * *s*, float_t * *number*)

Convert a managed string to a float.

Parameters:

s the managed string to be converted.

number a pointer to a float where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 16 of file numbers.c.

References log_pedantic, st_char_get(), st_empty, st_length_get(), and st_length_int().

5.56.1.3 bool_t int16_conv_bl (void * *block*, size_t *length*, int16_t * *number*)

Convert a numerical string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 559 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int16(), int16_conv_ns(), and int16_conv_st().

5.56.1.4 bool_t int16_conv_ns (char * *string*, int16_t * *number*)

Convert a null-terminated string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 615 of file numbers.c.

References int16_conv_bl(), and ns_length_get().

5.56.1.5 bool_t int16_conv_st (stringer_t * *string*, int16_t * *number*)

Convert a managed string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 626 of file numbers.c.

References int16_conv_bl(), st_data_get(), and st_length_get().

Referenced by xml_get_xpath_int16().

5.56.1.6 bool_t int32_conv_bl (void * *block*, size_t *length*, int32_t * *number*)

Convert a numerical string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 480 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int32(), http_parse_header(), imap_fetch_parse_partial(), int32_conv_ns(), and int32_conv_st().

5.56.1.7 bool_t int32_conv_ns (char ∗ *string*, int32_t ∗ *number*)

Convert a null-terminated string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 536 of file numbers.c.

References int32_conv_bl(), and ns_length_get().

Referenced by process_find_pid(), and process_kill().

5.56.1.8 bool_t int32_conv_st (stringer_t ∗ *string*, int32_t ∗ *number*)

Convert a managed string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 547 of file numbers.c.

References int32_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int32().

5.56.1.9 bool_t int64_conv_bl (void * *block*, size_t *length*, int64_t * *number*)

Convert a numerical string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 401 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int64(), int64_conv_ns(), int64_conv_st(), and ssize_conv_bl().

5.56.1.10 bool_t int64_conv_ns (char * *string*, int64_t * *number*)

Convert a null-terminated string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 457 of file numbers.c.

References int64_conv_bl(), and ns_length_get().

5.56.1.11 bool_t int64_conv_st (stringer_t * *string*, int64_t * *number*)

Convert a managed string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 468 of file numbers.c.

References int64_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int64().

5.56.1.12 bool_t int8_conv_bl (void * *block*, size_t *length*, int8_t * *number*)

Convert a numerical string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 638 of file numbers.c.

References data, and log_pedantic.

Referenced by int8_conv_ns(), and int8_conv_st().

5.56.1.13 bool_t int8_conv_ns (char * *string*, int8_t * *number*)

Convert a null-terminated string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 694 of file numbers.c.

References int8_conv_bl(), and ns_length_get().

5.56.1.14 bool_t int8_conv_st (stringer_t * *string*, int8_t * *number*)

Convert a managed string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 705 of file numbers.c.

References int8_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int8().

5.56.1.15 bool_t size_conv_bl (void ∗ *block*, size_t *length*, size_t ∗ *number*)

Convert a numerical string into a size_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an size_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 82 of file numbers.c.

References uint64_conv_bl().

Referenced by http_body().

5.56.1.16 bool_t ssize_conv_bl (void ∗ *block*, size_t *length*, ssize_t ∗ *number*)

Convert a numerical string into an ssize_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an ssize_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 94 of file numbers.c.

References int64_conv_bl().

5.56.1.17 bool_t uint16_conv_bl (void * *block*, size_t *length*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.

length the length, in bytes, of the numerical string.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 259 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint16(), uint16_conv_ns(), and uint16_conv_st().

5.56.1.18 bool_t uint16_conv_ns (char * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 307 of file numbers.c.

References ns_length_get(), and uint16_conv_bl().

5.56.1.19 bool_t uint16_conv_st (stringer_t * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 318 of file numbers.c.

References st_data_get(), st_length_get(), and uint16_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint16().

5.56.1.20 uint16_t uint16_get_no (stringer_t ∗ *s*)

Fetch a 2 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 2 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 852 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.56.1.21 stringer_t∗ uint16_put_no (uint16_t *val*)

Create a stringer, storing a 2-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 2 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 774 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.56.1.22 uint32_t uint24_get_no (stringer_t ∗ *s*)

Fetch a 3 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 3 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 827 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.56.1.23 stringer_t∗ uint24_put_no (uint32_t *val*)

Create a stringer, storing a 3-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 3 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 745 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.56.1.24 bool_t uint32_conv_bl (void ∗ *block*, size_t *length*, uint32_t ∗ *number*)

Convert a numerical string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 188 of file numbers.c.

References data, and log_pedantic.

Referenced by cache_config(), deserialize_uint32(), relay_config(), servers_config(), uint32_conv_ns(), and uint32_conv_st().

5.56.1.25 bool_t uint32_conv_ns (char ∗ *string*, uint32_t ∗ *number*)

Convert a null-terminated string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 236 of file numbers.c.

References ns_length_get(), and uint32_conv_bl().

5.56.1.26 bool_t uint32_conv_st (stringer_t * *string*, uint32_t * *number*)

Convert a managed string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 247 of file numbers.c.

References st_data_get(), st_length_get(), and uint32_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_fetch_body_part(), imap_search_messages_date_compare(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint32().

5.56.1.27 uint32_t uint32_get_no (stringer_t * *s*)

Fetch a 4 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 4 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 801 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.56.1.28 stringer_t* uint32_put_no (uint32_t *val*)

Create a stringer, storing a 4-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 4 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 715 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.56.1.29 bool_t uint64_conv_bl (void * *block*, size_t *length*, uint64_t * *number*)

Convert a numerical string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 106 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint64(), imap_parse_literal(), pop_num_parse(), pop_top_parse(), size_conv_bl(), smtp_check_receive_quota(), uint64_conv_ns(), uint64_conv_pl(), and uint64_conv_st().

5.56.1.30 bool_t uint64_conv_ns (char * *string*, uint64_t * *number*)

Convert a null-terminated string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 154 of file numbers.c.

References ns_length_get(), and uint64_conv_bl().

Referenced by json_api_dispatch(), lib_load_xml(), and portal_endpoint().

5.56.1.31 bool_t uint64_conv_pl (placer_t *string*, uint64_t * *number*)

Convert a placer into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the placer to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 176 of file numbers.c.

References pl_data_get(), pl_length_get(), and uint64_conv_bl().

Referenced by smtp_parse_mail_from_path(), and stamp_counter_check().

5.56.1.32 bool_t uint64_conv_st (stringer_t * *string*, uint64_t * *number*)

Convert a managed string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 165 of file numbers.c.

References st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_narrow_messages(), imap_search_messages_range(), imap_search_messages_-size(), portal_get_upload_attachment(), relay_set_value(), servers_set_value(), teacher_process(), and xml_get_xpath_uint64().

5.56.1.33 bool_t uint8_conv_bl (void * *block*, size_t *length*, uint8_t * *number*)

Convert a numerical string to an unsigned 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.

length the length, in bytes, of the numerical string.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 330 of file numbers.c.

References data, and log_pedantic.

Referenced by ip_subnet_st(), uint8_conv_ns(), and uint8_conv_st().

5.56.1.34 bool_t uint8_conv_ns (char * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 378 of file numbers.c.

References ns_length_get(), and uint8_conv_bl().

5.56.1.35 bool_t uint8_conv_st (stringer_t * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 389 of file numbers.c.

References st_data_get(), st_length_get(), and uint8_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint8().

  clamp.c
- int32_t int32_clamp (int32_t min, int32_t max, int32_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- int64_t int64_clamp (int64_t min, int64_t max, int64_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- int8_t int8_clamp (int8_t min, int8_t max, int8_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- uint16_t uint16_clamp (uint16_t min, uint16_t max, uint16_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- uint32_t uint32_clamp (uint32_t min, uint32_t max, uint32_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- uint64_t uint64_clamp (uint64_t min, uint64_t max, uint64_t number)
  Ensure a number is between the min and max values, otherwise return tuint_the boundary value.
- uint8_t uint8_clamp (uint8_t min, uint8_t max, uint8_t number)
  Ensure a number is between the min and max values, otherwise return the boundary value.
- bool_t double_conv (stringer_t *s, double_t *number)

numbers.c

- bool_t float_conv (stringer_t *s, float_t *number)
  Convert a managed string to a float.
- bool_t int16_conv_bl (void *block, size_t length, int16_t *number)
  Convert a numerical string into a signed 16-bit integer.
- bool_t int16_conv_ns (char *string, int16_t *number)
  Convert a null-terminated string into a signed 16-bit integer.
- bool_t int16_conv_st (stringer_t *string, int16_t *number)
  Convert a managed string into a signed 16-bit integer.
- bool_t int32_conv_bl (void *block, size_t length, int32_t *number)
  Convert a numerical string into a signed 32-bit integer.
- bool_t int32_conv_ns (char *string, int32_t *number)
  Convert a null-terminated string into a signed 32-bit integer.
- bool_t int32_conv_st (stringer_t *string, int32_t *number)
  Convert a managed string into a signed 32-bit integer.
- bool_t int64_conv_bl (void *block, size_t length, int64_t *number)
  Convert a numerical string into a signed 64-bit integer.
- bool_t int64_conv_ns (char *string, int64_t *number)
  Convert a null-terminated string into a signed 64-bit integer.
- bool_t int64_conv_st (stringer_t *string, int64_t *number)
  Convert a managed string into a signed 64-bit integer.
- bool_t int8_conv_bl (void *block, size_t length, int8_t *number)
  Convert a numerical string into a signed 8-bit integer.
- bool_t int8_conv_ns (char *string, int8_t *number)
  Convert a null-terminated string into a signed 8-bit integer.
- bool_t int8_conv_st (stringer_t *string, int8_t *number)
  Convert a managed string into a signed 8-bit integer.
- bool_t size_conv_bl (void *block, size_t length, size_t *number)
  Convert a numerical string into a size_t value.
- bool_t ssize_conv_bl (void *block, size_t length, ssize_t *number)
  Convert a numerical string into an ssize_t value.
- bool_t uint16_conv_bl (void *block, size_t length, uint16_t *number)
  Convert a numerical string to a 16-bit unsigned integer.
- bool_t uint16_conv_ns (char *string, uint16_t *number)
  Convert a numerical string to a 16-bit unsigned integer.

- bool_t uint16_conv_st (stringer_t *string, uint16_t *number)

  Convert a numerical string to a 16-bit unsigned integer.

- bool_t uint32_conv_bl (void *block, size_t length, uint32_t *number)

  Convert a numerical string into an unsigned 32-bit integer.

- bool_t uint32_conv_ns (char *string, uint32_t *number)

  Convert a null-terminated string into an unsigned 32-bit integer.

- bool_t uint32_conv_st (stringer_t *string, uint32_t *number)

  Convert a managed string into an unsigned 32-bit integer.

- bool_t uint64_conv_bl (void *block, size_t length, uint64_t *number)

  Convert a numerical string into an unsigned 64-bit integer.

- bool_t uint64_conv_ns (char *string, uint64_t *number)

  Convert a null-terminated string into an unsigned 64-bit integer.

- bool_t uint64_conv_pl (placer_t string, uint64_t *number)

  Convert a placer into an unsigned 64-bit integer.

- bool_t uint64_conv_st (stringer_t *string, uint64_t *number)

  Convert a managed string into an unsigned 64-bit integer.

- bool_t uint8_conv_bl (void *block, size_t length, uint8_t *number)

  Convert a numerical string to an unsigned 8-bit unsigned integer.

- bool_t uint8_conv_ns (char *string, uint8_t *number)

  Convert a numerical string to an 8-bit unsigned integer.

- bool_t uint8_conv_st (stringer_t *string, uint8_t *number)

  Convert a numerical string to an 8-bit unsigned integer.

- stringer_t * uint32_put_no (uint32_t val)

  Create a stringer, storing a 4-byte value in network byte order.

- stringer_t * uint24_put_no (uint32_t val)

  Create a stringer, storing a 3-byte value in network byte order.

- stringer_t * uint16_put_no (uint16_t val)

  Create a stringer, storing a 2-byte value in network byte order.

- uint32_t uint32_get_no (stringer_t *s)

  Fetch a 4 byte network order value from a stringer and return it in host byte order.

- uint32_t uint24_get_no (stringer_t *s)

  Fetch a 3 byte network order value from a stringer and return it in host byte order.

- uint16_t uint16_get_no (stringer_t *s)

  Fetch a 2 byte network order value from a stringer and return it in host byte order.

5.57.1 Function Documentation

5.57.1.1 bool_t double_conv (stringer_t * *s*, double_t * *number*)

numbers.c numbers.c

Parameters:

s the managed string to be converted.

number a pointer to a double where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 48 of file numbers.c.

References log_pedantic, st_char_get(), st_empty, st_length_get(), and st_length_int().

5.57.1.2 bool_t float_conv (stringer_t * *s*, float_t * *number*)

Convert a managed string to a float.

Parameters:

s the managed string to be converted.

number a pointer to a float where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 16 of file numbers.c.

References log_pedantic, st_char_get(), st_empty, st_length_get(), and st_length_int().

5.57.1.3 int16_t int16_clamp (int16_t *min*, int16_t *max*, int16_t *number*)

clamp.c clamp.c

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 125 of file clamp.c.

References log_pedantic.

5.57.1.4 bool_t int16_conv_bl (void * *block*, size_t *length*, int16_t * *number*)

Convert a numerical string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 559 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int16(), int16_conv_ns(), and int16_conv_st().

5.57.1.5 bool_t int16_conv_ns (char * *string*, int16_t * *number*)

Convert a null-terminated string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 615 of file numbers.c.

References int16_conv_bl(), and ns_length_get().

5.57.1.6 bool_t int16_conv_st (stringer_t * *string*, int16_t * *number*)

Convert a managed string into a signed 16-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 16-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 626 of file numbers.c.

References int16_conv_bl(), st_data_get(), and st_length_get().

Referenced by xml_get_xpath_int16().

5.57.1.7 size_t int16_digits (int16_t *number*)

digits.c digits.c

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 112 of file digits.c.

References length.

Referenced by serialize_int16().

5.57.1.8 int32_t int32_clamp (int32_t *min*, int32_t *max*, int32_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 146 of file clamp.c.

References log_pedantic.

5.57.1.9 bool_t int32_conv_bl (void * *block*, size_t *length*, int32_t * *number*)

Convert a numerical string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 480 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int32(), http_parse_header(), imap_fetch_parse_partial(), int32_conv_ns(), and int32_conv_st().

5.57.1.10 bool_t int32_conv_ns (char * *string*, int32_t * *number*)

Convert a null-terminated string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 536 of file numbers.c.

References int32_conv_bl(), and ns_length_get().

Referenced by process_find_pid(), and process_kill().

5.57.1.11 bool_t int32_conv_st (stringer_t * *string*, int32_t * *number*)

Convert a managed string into a signed 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 547 of file numbers.c.

References int32_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int32().

5.57.1.12 size_t int32_digits (int32_t *number*)

Count the number of digits needed to represent a base-10 32-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 93 of file digits.c.

References length.

Referenced by serialize_int32().

5.57.1.13 int64_t int64_clamp (int64_t *min*, int64_t *max*, int64_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 167 of file clamp.c.

References log_pedantic.

5.57.1.14 bool_t int64_conv_bl (void * *block*, size_t *length*, int64_t * *number*)

Convert a numerical string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.
length the length, in bytes, of the numerical data.
number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 401 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_int64(), int64_conv_ns(), int64_conv_st(), and ssize_conv_bl().

5.57.1.15 bool_t int64_conv_ns (char * *string*, int64_t * *number*)

Convert a null-terminated string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.
number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 457 of file numbers.c.

References int64_conv_bl(), and ns_length_get().

5.57.1.16 bool_t int64_conv_st (stringer_t * *string*, int64_t * *number*)

Convert a managed string into a signed 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 468 of file numbers.c.

References int64_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int64().

5.57.1.17 size_t int64_digits (int64_t *number*)

Count the number of digits needed to represent a base-10 64-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 74 of file digits.c.

References length.

Referenced by serialize_int64().

5.57.1.18 int8_t int8_clamp (int8_t *min*, int8_t *max*, int8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 104 of file clamp.c.

References log_pedantic.

5.57.1.19 bool_t int8_conv_bl (void * *block*, size_t *length*, int8_t * *number*)

Convert a numerical string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 638 of file numbers.c.

References data, and log_pedantic.

Referenced by int8_conv_ns(), and int8_conv_st().

5.57.1.20 bool_t int8_conv_ns (char * *string*, int8_t * *number*)

Convert a null-terminated string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 694 of file numbers.c.

References int8_conv_bl(), and ns_length_get().

5.57.1.21 bool_t int8_conv_st (stringer_t * *string*, int8_t * *number*)

Convert a managed string into a signed 8-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to a signed 8-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 705 of file numbers.c.

References int8_conv_bl(), st_data_get(), and st_length_get().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_int8().

5.57.1.22 size_t int8_digits (int8_t *number*)

Count the number of digits needed to represent a base-10 8-bit signed integer.

Returns:

the number of digits needed to represent the specified integer, including a negative sign.

Definition at line 131 of file digits.c.

References length.

5.57.1.23 bool_t size_conv_bl (void ∗ *block*, size_t *length*, size_t ∗ *number*)

Convert a numerical string into a size_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.
length the length, in bytes, of the numerical data.
number a pointer to an size_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 82 of file numbers.c.

References uint64_conv_bl().

Referenced by http_body().

5.57.1.24 bool_t ssize_conv_bl (void ∗ *block*, size_t *length*, ssize_t ∗ *number*)

Convert a numerical string into an ssize_t value.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.
length the length, in bytes, of the numerical data.
number a pointer to an ssize_t value where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 94 of file numbers.c.

References int64_conv_bl().

5.57.1.25 uint16_t uint16_clamp (uint16_t *min*, uint16_t *max*, uint16_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 41 of file clamp.c.

References log_pedantic.

5.57.1.26 bool_t uint16_conv_bl (void ∗ *block*, size_t *length*, uint16_t ∗ *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.
length the length, in bytes, of the numerical string.
number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 259 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint16(), uint16_conv_ns(), and uint16_conv_st().

5.57.1.27 bool_t uint16_conv_ns (char ∗ *string*, uint16_t ∗ *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.
number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 307 of file numbers.c.

References ns_length_get(), and uint16_conv_bl().

5.57.1.28 bool_t uint16_conv_st (stringer_t * *string*, uint16_t * *number*)

Convert a numerical string to a 16-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 16-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 318 of file numbers.c.

References st_data_get(), st_length_get(), and uint16_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint16().

5.57.1.29 size_t uint16_digits (uint16_t *number*)

Count the number of digits needed to represent a base-10 16-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 44 of file digits.c.

References length.

Referenced by serialize_uint16().

5.57.1.30 uint16_t uint16_get_no (stringer_t * *s*)

Fetch a 2 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 2 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 852 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.57.1.31 stringer_t* uint16_put_no (uint16_t *val*)

Create a stringer, storing a 2-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 2 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 774 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.57.1.32 uint32_t uint24_get_no (stringer_t ∗ *s*)

Fetch a 3 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 3 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 827 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.57.1.33 stringer_t∗ uint24_put_no (uint32_t *val*)

Create a stringer, storing a 3-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 3 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 745 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.57.1.34 uint32_t uint32_clamp (uint32_t *min*, uint32_t *max*, uint32_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 62 of file clamp.c.

References log_pedantic.

5.57.1.35 bool_t uint32_conv_bl (void * *block*, size_t *length*, uint32_t * *number*)

Convert a numerical string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 188 of file numbers.c.

References data, and log_pedantic.

Referenced by cache_config(), deserialize_uint32(), relay_config(), servers_config(), uint32_conv_ns(), and uint32_conv_st().

5.57.1.36 bool_t uint32_conv_ns (char * *string*, uint32_t * *number*)

Convert a null-terminated string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 236 of file numbers.c.

References ns_length_get(), and uint32_conv_bl().

5.57.1.37 bool_t uint32_conv_st (stringer_t * *string*, uint32_t * *number*)

Convert a managed string into an unsigned 32-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 32-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 247 of file numbers.c.

References st_data_get(), st_length_get(), and uint32_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_fetch_body_part(), imap_search_messages_date_compare(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint32().

5.57.1.38 size_t uint32_digits (uint32_t *number*)

Count the number of digits needed to represent a base-10 32-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 29 of file digits.c.

References length.

Referenced by serialize_uint32().

5.57.1.39 uint32_t uint32_get_no (stringer_t ∗ *s*)

Fetch a 4 byte network order value from a stringer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 4 network order bytes in the buffer in host byte order. 0 on failure.

Definition at line 801 of file numbers.c.

References data, log_pedantic, st_data_get(), st_empty, and st_length_get().

5.57.1.40 stringer_t∗ uint32_put_no (uint32_t *val*)

Create a stringer, storing a 4-byte value in network byte order.

Parameters:

s a pointer to the data buffer where the value will be inserted.

val the 4 byte value to be placed in the specified buffer, in network byte order.

Returns:

Pointer to stringer on success, NULL on failure.

Definition at line 715 of file numbers.c.

References data, log_pedantic, st_alloc(), st_data_get(), and st_length_set().

5.57.1.41 uint64_t uint64_clamp (uint64_t *min*, uint64_t *max*, uint64_t *number*)

Ensure a number is between the min and max values, otherwise return tuint_the boundary value.

Parameters:

min minimum value for the clamp

max maximum value for the clamp

number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 83 of file clamp.c.

References log_pedantic.

Referenced by stacie_derive_rounds(), and stmt_exec_affected_conn().

5.57.1.42 bool_t uint64_conv_bl (void ∗ *block*, size_t *length*, uint64_t ∗ *number*)

Convert a numerical string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the numerical string to be converted.

length the length, in bytes, of the numerical data.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 106 of file numbers.c.

References data, and log_pedantic.

Referenced by deserialize_uint64(), imap_parse_literal(), pop_num_parse(), pop_top_parse(), size_conv_bl(), smtp_check_receive_quota(), uint64_conv_ns(), uint64_conv_pl(), and uint64_conv_st().

5.57.1.43 bool_t uint64_conv_ns (char ∗ *string*, uint64_t ∗ *number*)

Convert a null-terminated string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the null-terminated string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 154 of file numbers.c.

References ns_length_get(), and uint64_conv_bl().

Referenced by json_api_dispatch(), lib_load_xml(), and portal_endpoint().

5.57.1.44 bool_t uint64_conv_pl (placer_t *string*, uint64_t * *number*)

Convert a placer into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the placer to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 176 of file numbers.c.

References pl_data_get(), pl_length_get(), and uint64_conv_bl().

Referenced by smtp_parse_mail_from_path(), and stamp_counter_check().

5.57.1.45 bool_t uint64_conv_st (stringer_t * *string*, uint64_t * *number*)

Convert a managed string into an unsigned 64-bit integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to the managed string to be converted.

number a pointer to an unsigned 64-bit number where the result of the conversion will be stored.

Returns:

true on success or false on failure.

Definition at line 165 of file numbers.c.

References st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by cache_set_value(), config_value_set(), imap_narrow_messages(), imap_search_messages_range(), imap_search_messages_size(), portal_get_upload_attachment(), relay_set_value(), servers_set_value(), teacher_process(), and xml_get_xpath_uint64().

5.57.1.46 size_t uint64_digits (uint64_t *number*)

Count the number of digits needed to represent a base-10 64-bit unsigned integer.

Returns:

the number of digits needed to represent specified integer.

Definition at line 14 of file digits.c.

References length.

Referenced by mail_build_signature(), serialize_uint64(), sess_key(), and smtp_store_spamsig().

5.57.1.47 uint8_t uint8_clamp (uint8_t *min*, uint8_t *max*, uint8_t *number*)

Ensure a number is between the min and max values, otherwise return the boundary value.

Parameters:

min minimum value for the clamp
max maximum value for the clamp
number number to be clamped

Returns:

returns the min value if number is less than min, and returns max if number was greater than the max value, otherwise the number value is returned without any modifications. The original value for number is also returned if min is greater than max or max is less than min.

Definition at line 20 of file clamp.c.

References log_pedantic.

5.57.1.48 bool_t uint8_conv_bl (void ∗ *block*, size_t *length*, uint8_t ∗ *number*)

Convert a numerical string to an unsigned 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

block a pointer to the block of memory to be converted.
length the length, in bytes, of the numerical string.
number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 330 of file numbers.c.

References data, and log_pedantic.

Referenced by ip_subnet_st(), uint8_conv_ns(), and uint8_conv_st().

5.57.1.49 bool_t uint8_conv_ns (char ∗ *string*, uint8_t ∗ *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a null-terminated string containing the data to be converted.
number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 378 of file numbers.c.

References ns_length_get(), and uint8_conv_bl().

5.57.1.50 bool_t uint8_conv_st (stringer_t * *string*, uint8_t * *number*)

Convert a numerical string to an 8-bit unsigned integer.

Note:

This function checks for both numeric underflows and overflows.

Parameters:

string a pointer to a managed string containing the data to be converted.

number a pointer to an unsigned 8-bit integer that will hold the result of the conversion.

Returns:

true on success, or false on failure.

Definition at line 389 of file numbers.c.

References st_data_get(), st_length_get(), and uint8_conv_bl().

Referenced by cache_set_value(), config_value_set(), relay_set_value(), servers_set_value(), and xml_get_xpath_uint8().

5.57.1.51 size_t uint8_digits (uint8_t *number*)

Count the number of digits needed to represent a base-10 8-bit unsigned integer.

Returns:

the number of digits needed to represent the specified integer.

Definition at line 59 of file digits.c.

References length.

Data Structures

- struct tok_state_t

Functions

- uint64_t time_datestamp (void)
  time.c
- stringer_t * time_print_gmt (stringer_t *s, chr_t *format, time_t moment)
  Get a specified time as a formatted string converted to GMT.
- stringer_t * time_print_local (stringer_t *s, chr_t *format, time_t moment)
  Get a specified time as a formatted string.
- uint64_t time_till_midnight (void)
  Get the number of seconds until midnight.
- uchr_t lower_chr (uchr_t c)
  Return the lowercase representation of a character.
- stringer_t * lower_st (stringer_t *s)
  Transform a managed string (in-place) into lowercase.
- uchr_t upper_chr (uchr_t c)
  Return the uppercase representation of a character.
- stringer_t * upper_st (stringer_t *s)
  Transform a managed string (in-place) into uppercase.
- uint64_t tok_get_count_st (stringer_t *string, char token)
  Count the number of times a token is found in a managed string.
- uint64_t tok_get_count_bl (void *block, size_t length, char token)
  Count the number of times a token is found in a specified block of memory.
- uint64_t str_tok_get_count_bl (void *block, size_t length, chr_t *token, size_t toklen)
  Count the number of times a string token is found in a specified block of memory.
- int tok_get_pl (placer_t string, char token, uint64_t fragment, placer_t *value)
  Retrieve a specified token from a placer.
- int tok_get_st (stringer_t *string, char token, uint64_t fragment, placer_t *value)
  Retrieve a specified token from a managed string.

- int tok_get_bl (void *block, size_t length, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a block of data.

- int tok_get_ns (char *string, size_t length, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a null-terminated string.

- int str_tok_get_bl (char *block, size_t length, chr_t *token, size_t toklen, uint64_t fragment, placer_t *value)

  Retrieve a specified string-split token from a null-terminated string.

- int tok_pop (tok_state_t *state, placer_t *value)
- void tok_pop_init_st (tok_state_t *state, stringer_t *string, char token)
- void tok_pop_init_bl (tok_state_t *state, void *block, size_t length, char token)
- bool_t pl_skip_characters (placer_t *place, char *skipchars, size_t nchars)

  Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

- bool_t pl_skip_to_characters (placer_t *place, char *skiptochars, size_t nchars)

  Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

- bool_t pl_shrink_before_characters (placer_t *place, char *shrinkchars, size_t nchars)

  Truncate a placer to start before any of the specified characters, and update the placer accordingly.

- bool_t pl_get_embraced (placer_t str, placer_t *out, unsigned char opening, unsigned char closing, bool_t required)

  Get a placer pointing to the text contained within a specified pair of opening and closing braces.

- bool_t pl_update_start (placer_t *place, size_t nchars, bool_t more)

  Ensure that a placer contains at least a certain amount of data, and update it accordingly.

- placer_t line_pl_ns (char *string, uint64_t number)

  *Get a placer pointing to the specified line ('
  ' delimited) of a null-terminated string.*

- placer_t line_pl_pl (placer_t string, uint64_t number)

  *Get a placer pointing to the specified line ('
  ' delimited) of another placer.*

- placer_t line_pl_st (stringer_t *string, uint64_t number)

  *Get a placer pointing to the specified line ('
  ' delimited) of a managed string.*

- placer_t line_pl_bl (char *block, size_t length, uint64_t number)

  *Get a placer pointing to the specified line ('
  ' delimited) of content in a data buffer.*

- placer_t pl_trim (placer_t place)

  trim.c

- placer_t pl_trim_end (placer_t place)
- placer_t pl_trim_start (placer_t place)

  Trim the leading whitespace from a placer.

- void st_trim (stringer_t *string)
- stringer_t * st_xor (stringer_t *a, stringer_t *b, stringer_t *outcome)

  bitwise.c

- stringer_t * st_and (stringer_t *a, stringer_t *b, stringer_t *outcome)

  Perform bitwise AND operation between two input strings.

- stringer_t * st_or (stringer_t *a, stringer_t *b, stringer_t *outcome)

  Perform bitwise OR operation between two input strings.

- stringer_t * st_not (stringer_t *s, stringer_t *outcome)

  Perform bitwise NOT operation on a managed string.

5.58.1 Function Documentation

5.58.1.1 placer_t line_pl_bl (char * *block*, size_t *length*, uint64_t *number*)

Get a placer pointing to the specified line ('
' delimited) of content in a data buffer.

Parameters:

block a pointer to the block of data to be scanned.

length the length, in bytes, of the specified data buffer.

number the zero-based index of the line to be retrieved from the buffer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 17 of file line.c.

References log_pedantic, mm_empty(), pl_init(), and pl_null().

Referenced by line_pl_ns(), line_pl_pl(), and line_pl_st().

5.58.1.2 placer_t line_pl_ns (char * *string*, uint64_t *number*)

Get a placer pointing to the specified line ('
' delimited) of a null-terminated string.

See also:

line_pl_bl()

Parameters:

string a pointer to a null-terminated string to be scanned.

number the zero-based index of the line to be retrieved from the string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 60 of file line.c.

References line_pl_bl(), and ns_length_get().

5.58.1.3 placer_t line_pl_pl (placer_t *string*, uint64_t *number*)

Get a placer pointing to the specified line ('

' delimited) of another placer.

Parameters:

string a pointer to the placer to be scanned.

number the zero-based index of the line to be retrieved from the placer.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 82 of file line.c.

References line_pl_bl(), pl_char_get(), and pl_length_get().

5.58.1.4 placer_t line_pl_st (stringer_t * *string*, uint64_t *number*)

Get a placer pointing to the specified line ('

' delimited) of a managed string.

Parameters:

string a pointer to the managed string to be scanned.

number the zero-based index of the line to be retrieved from the managed string.

Returns:

a null placer on failure, or a placer pointing to the specified line on success.

Definition at line 71 of file line.c.

References line_pl_bl(), st_char_get(), and st_length_get().

Referenced by client_read_line(), con_read_line(), and imap_parse_literal().

5.58.1.5 uchr_t lower_chr (uchr_t *c*)

Return the lowercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in lowercase.

Definition at line 25 of file case.c.

Referenced by auth_sanitize_address(), hex_decode_chr(), mm_cmp_ci_eq(), pop_user_parse(), smtp_parse_helo_domain(), smtp_parse_-mail_from_path(), smtp_parse_rcpt_to(), st_cmp_ci_ends(), st_cmp_ci_eq(), st_cmp_ci_starts(), and st_search_ci().

5.58.1.6 stringer_t* lower_st (stringer_t * *s*)

Transform a managed string (in-place) into lowercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in lowercase.

Definition at line 58 of file case.c.

References log_pedantic, and st_empty_out().

Referenced by api_endpoint_register(), contact_business_valid_email(), http_parse_header(), register_business_step1(), and smtp_rcpt_to().

5.58.1.7 bool_t pl_get_embraced (placer_t *str*, placer_t * *out*, unsigned char *opening*, unsigned char *closing*, bool_t *required*)

Get a placer pointing to the text contained within a specified pair of opening and closing braces.

Parameters:

str a placer pointing to the string to be parsed.

out a pointer to a placer that will store the string between the braces on success.

opening the character to be the opening brace of the sequence.

closing the character to be the closing brace of the sequence.

required if true, fail if no data was found between the pair of braces.

Returns:

true if the brace sequence was complete, or false if either component could not be located.

Definition at line 442 of file token.c.

References pl_char_get(), and pl_empty().

5.58.1.8 bool_t pl_shrink_before_characters (placer_t * *place*, char * *shrinkchars*, size_t *nchars*)

Truncate a placer to start before any of the specified characters, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to be truncated before any of the specified characters.

shrinkchars a pointer to a buffer containing bytes that will be skipped when they are found at the end of the placer.

nchars the number of characters to be tested in the collection in shrinkchars.

Returns:

true if the shrink operation completed before the end of the placer was reached, or false otherwise.

Definition at line 405 of file token.c.

References pl_char_get(), pl_empty(), and pl_length_get().

Referenced by portal_upload().

5.58.1.9 bool_t pl_skip_characters (placer_t * *place*, char * *skipchars*, size_t *nchars*)

Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip past any of the specified characters.

skipchars a pointer to a buffer containing bytes that will be skipped at the beginning of the placer.

nchars the number of characters to be tested in the collection in skipchars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 336 of file token.c.

References pl_char_get(), and pl_empty().

Referenced by portal_upload().

5.58.1.10 bool_t pl_skip_to_characters (placer_t * *place*, char * *skiptochars*, size_t *nchars*)

Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip to any of the specified characters.

skiptochars a pointer to a buffer containing bytes that will be skipped to when they are first found in the placer.

nchars the number of characters to be tested in the collection in skiptochars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 372 of file token.c.

References pl_char_get(), and pl_empty().

Referenced by portal_upload().

5.58.1.11 placer_t pl_trim (placer_t *place*)

trim.c

Definition at line 42 of file trim.c.

References pl_char_get(), pl_init(), pl_length_get(), and pl_null().

Referenced by nvp_parse(), prime_pem_unwrap(), and smtp_parse_mail_from_path().

5.58.1.12 placer_t pl_trim_end (placer_t *place*)

Definition at line 84 of file trim.c.

References pl_char_get(), pl_init(), pl_length_get(), and pl_null().

Referenced by smtp_parse_helo_domain(), smtp_parse_mail_from_path(), and smtp_parse_rcpt_to().

5.58.1.13 placer_t pl_trim_start (placer_t *place*)

Trim the leading whitespace from a placer.

Parameters:

place a placer containing the string to have its leading whitespace trimmed.

Returns:

a placer pointing to the trimmed value inside the originally specified input string.

Definition at line 67 of file trim.c.

References pl_char_get(), pl_init(), pl_length_get(), and pl_null().

Referenced by get_header_opt().

5.58.1.14 bool_t pl_update_start (placer_t ∗ *place*, size_t *nchars*, bool_t *more*)

Ensure that a placer contains at least a certain amount of data, and update it accordingly.

Parameters:

place a pointer to the placer containing the original data, which will be updated on success.

nchars the minimum number of characters that the placer needs to contain to pass the test.

more if true, more characters following the minimum buffer size are necessary.

Returns:

true if the placer meets the minimum size check, or false if it does not.

Definition at line 485 of file token.c.

5.58.1.15 stringer_t∗ st_and (stringer_t ∗ *a*, stringer_t ∗ *b*, stringer_t ∗ *output*)

Perform bitwise AND operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 149 of file bitwise.c.

References bitwise_and(), and st_bitwise().

5.58.1.16 stringer_t∗ st_not (stringer_t ∗ *s*, stringer_t ∗ *output*)

Perform bitwise NOT operation on a managed string.

Parameters:

s Stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 75 of file bitwise.c.

References data, log_pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), and st_valid_destination().

5.58.1.17 stringer_t* st_or (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

Perform bitwise OR operation between two input strings.

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, Pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 123 of file bitwise.c.

References bitwise_or(), and st_bitwise().

5.58.1.18 void st_trim (stringer_t * *string*)

Definition at line 15 of file trim.c.

References mm_move(), mm_wipe(), st_avail_get(), st_char_get(), st_length_get(), and st_length_set().

Referenced by mail_header_fetch_cleaned(), and process_find_pid().

5.58.1.19 stringer_t* st_xor (stringer_t * *a*, stringer_t * *b*, stringer_t * *output*)

bitwise.c bitwise.c

Parameters:

a First stringer input.

b Second stringer input.

output Stringer in which the result is stored, if no stringer is provided (output = NULL) then a new stringer will be allocated for the result.

Returns:

Pointer to output if a valid output stringer was provided, or a pointer to a newly allocated stringer if no stringer was specified for the output, NULL on error.

Definition at line 136 of file bitwise.c.

References bitwise_xor(), and st_bitwise().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), signature_full_get(), signature_full_verify(), signature_tree_get(), signature_tree_verify(), slots_key(), slots_set(), stacie_decrypt(), stacie_encrypt(), and stacie_realm_key().

5.58.1.20 int str_tok_get_bl (char * *block*, size_t *length*, chr_t * *token*, size_t *toklen*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified string-split token from a null-terminated string.

Parameters:

block a pointer to the block of memory to be tokenized.

length the maximum number of characters to be scanned from the input data.

token the token string that will be used to split the data.

toklen the length, in bytes, of the token string.

fragment the zero-indexed token number to be extracted from the data.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 290 of file token.c.

References mm_empty(), pl_char_get(), pl_init(), pl_length_get(), pl_null(), placer_t, and st_search_cs().

Referenced by portal_upload().

5.58.1.21 uint64_t str_tok_get_count_bl (void * *block*, size_t *length*, chr_t * *token*, size_t *toklen*)

Count the number of times a string token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a pointer to the string token being used to split the input data.

toklen the length, in bytes, of the specified token.

Returns:

the number of times the string token was found in the block of memory, or 0 on failure.

Definition at line 257 of file token.c.

References count, mm_empty(), pl_init(), pl_length_get(), placer_t, and st_search_cs().

Referenced by portal_upload().

5.58.1.22 uint64_t time_datestamp (void)

time.c time.c

Returns:

0 on failure or a 64-bit unsigned integer containing the formatted current date on success.

Definition at line 36 of file time.c.

Referenced by api_endpoint_auth(), imap_login(), log_rotate(), log_start(), pattern_update(), pop_pass(), portal_endpoint_auth(), process_maint(), smtp_auth_login(), and smtp_auth_plain().

5.58.1.23 stringer_t* time_print_gmt (stringer_t * *s*, chr_t * *format*, time_t *moment*)

Get a specified time as a formatted string converted to GMT.

Parameters:

s a managed string where the formatted time is to be stored.

format a null-terminated string containing the format of the time string.

moment the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 92 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by http_response_cookie(), http_response_header(), and http_response_options().

5.58.1.24 stringer_t* time_print_local (stringer_t * *s*, chr_t * *format*, time_t *moment*)

Get a specified time as a formatted string.

Parameters:

s a managed string where the formatted time is to be stored.

format a null-terminated string containing the format of the time string.

moment the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 61 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by imap_id().

5.58.1.25 uint64_t time_till_midnight (void)

Get the number of seconds until midnight.

Returns:

an unsigned 64-bit integer containing the number of seconds until midnight, or 86400 on failure.

Definition at line 14 of file time.c.

Referenced by process_maint().

5.58.1.26 int tok_get_bl (void * *block*, size_t *length*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a block of data.

See also:

tok_get_ns()

Parameters:

block a pointer to the memory block to be tokenized.

length the maximum number of characters to be scanned at the input data block.

token the token character that will be used to split the data block.

fragment the zero-indexed token number to be extracted from the data block.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the data block.

Definition at line 128 of file token.c.

References tok_get_ns().

Referenced by nvp_parse(), smtp_parse_mail_from_path(), tok_get_pl(), and tok_get_st().

5.58.1.27 uint64_t tok_get_count_bl (void * *block*, size_t *length*, char *token*)

Count the number of times a token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the block of memory, or 0 on failure.

Definition at line 17 of file token.c.

References count, log_pedantic, and mm_empty().

Referenced by smtp_parse_mail_from_path(), and tok_get_count_st().

5.58.1.28 uint64_t tok_get_count_st (stringer_t * *string*, char *token*)

Count the number of times a token is found in a managed string.

See also:

tok_get_count_bl()

Parameters:

string a pointer to the managed string to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the managed string, or 0 on failure.

Definition at line 49 of file token.c.

References st_data_get(), st_length_get(), and tok_get_count_bl().

Referenced by get_header_opt(), get_header_value_noopt(), http_parse_method(), http_parse_pairs(), imap_fetch_body_part(), imap_narrow_messages(), imap_search_messages_date(), imap_search_messages_date_compare(), imap_search_messages_range(), ip_subnet_st(), mail_domain_get(), mail_mime_type_parameters(), portal_get_upload_attachment(), and stamp_counter_check().

5.58.1.29 int tok_get_ns (char * *string*, size_t *length*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a null-terminated string.

Parameters:

string a pointer to the null-terminated string to be tokenized.

length the maximum number of characters to be scanned from the input string.

token the token character that will be used to split the string.

fragment the zero-indexed token number to be extracted from the string.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 63 of file token.c.

References log_pedantic, mm_empty(), pl_init(), and pl_null().

Referenced by ip_subnet_st(), lib_load_openssl(), and tok_get_bl().

5.58.1.30 int tok_get_pl (placer_t *string*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a placer.

See also:

token_get_ns()

Parameters:

string a pointer to the placer to be tokenized.

token the token character that will be used to split the placer.

fragment the zero-indexed token number to be extracted from the placer.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the placer.

Definition at line 156 of file token.c.

References pl_data_get(), pl_length_get(), and tok_get_bl().

Referenced by http_data_value_parse(), http_parse_context(), http_parse_method(), and smtp_parse_mail_from_path().

5.58.1.31 int tok_get_st (stringer_t * *string*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a managed string.

See also:

tok_get_ns()

Parameters:

string a pointer to the managed string to be tokenized.

token the token character that will be used to split the managed string.

fragment the zero-indexed token number to be extracted from the managed string.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the managed string.

Definition at line 142 of file token.c.

References st_data_get(), st_length_get(), and tok_get_bl().

Referenced by get_header_opt(), get_header_value_noopt(), http_parse_context(), http_parse_pairs(), imap_fetch_body_part(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_narrow_messages(), imap_parse_address_part(), imap_search_messages_date(), imap_search_messages_date_compare(), imap_search_messages_range(), mail_domain_get(), mail_mime_type_parameters(), portal_get_upload_attachment(), smtp_auth_plain(), and stamp_counter_check().

5.58.1.32 int tok_pop (tok_state_t * *state*, placer_t * *value*)

on error the function returns -1 and sets value to EMPTY_PLACER on success the function returns 0 and stores the token in the placer pointed at by value if the end is hit, then the function returns 1, and places any remaining data in value

Definition at line 188 of file token.c.

References pl_init(), pl_null(), tok_state_t::position, tok_state_t::remaining, and tok_state_t::token.

Referenced by nvp_parse(), and prime_pem_unwrap().

5.58.1.33 void tok_pop_init_bl (tok_state_t * *state*, void * *block*, size_t *length*, char *token*)

Definition at line 161 of file token.c.

References tok_state_t::block, tok_state_t::length, tok_state_t::position, tok_state_t::remaining, and tok_state_t::token.

5.58.1.34 void tok_pop_init_st (tok_state_t * *state*, stringer_t * *string*, char *token*)

Definition at line 172 of file token.c.

References tok_state_t::block, tok_state_t::length, tok_state_t::position, tok_state_t::remaining, st_char_get(), st_length_get(), and tok_state_t::token.

Referenced by nvp_parse(), and prime_pem_unwrap().

5.58.1.35 uchr_t upper_chr (uchr_t *c*)

Return the uppercase representation of a character.

Parameters:

c the character to be transformed.

Returns:

the input character, in uppercase.

Definition at line 15 of file case.c.

5.58.1.36 stringer_t* upper_st (stringer_t * *s*)

Transform a managed string (in-place) into uppercase.

Parameters:

s the managed string to be modified.

Returns:

NULL on error, or a pointer to the input managed string, in uppercase.

Definition at line 35 of file case.c.

References log_pedantic, and st_empty_out().

Referenced by http_response_allow_cross(), imap_fetch_body_tag(), imap_fetch_bodystructure(), and mail_mime_type_parameters().

5.59 src/providers/parsers/parsers.h File Reference

Functions

- bool_t lib_load_jansson (void)
  json.c
- chr_t ∗ lib_version_jansson (void)
  Return the version string for libjansson.
- bool_t lib_load_xml (void)
  xml.c
- bool_t xml_start (void)
  Initialize the xml parser library.
- chr_t ∗ xml_get_xpath_ns (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the content of an evaluated xpath expression as a null-terminated string.
- const chr_t ∗ lib_version_xml (void)
  Return the version string of libxml.
- int16_t xml_get_xpath_int16 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.
- int32_t xml_get_xpath_int32 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.
- int64_t xml_get_xpath_int64 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.
- int8_t xml_get_xpath_int8 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.
- int_t xml_xpath_set_namespace (xmlXPathContextPtr ctxt, xmlChar ∗prefix, xmlChar ∗ns_uri)
  Set the namespace for an xpath context.
- size_t xml_get_xpath_node_count (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  This function is not currently being called by any other part of the code.
- stringer_t ∗ xml_dump_doc (xmlDocPtr doc)
  Get an xml document object as a string.
- stringer_t ∗ xml_get_xpath_st (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a managed string.
- stringer_t ∗ xml_node_get_content_st (xmlNodePtr node)
  Get the content of an xml node as a managed string.
- uint16_t xml_get_xpath_uint16 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.
- uint32_t xml_get_xpath_uint32 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.

- uint64_t xml_get_xpath_uint64 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)

  Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.

- uint8_t xml_get_xpath_uint8 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)

  Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.

- bool_t xml_set_xpath_uint64 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uint64_t val)

  Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.

- bool_t xml_set_xpath_ns (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uchr_t *val)

  Set the value of a node element selected by an xpath expression, as a null-terminated string.

- bool_t xml_set_xpath_property (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uchr_t *name, uchr_t *val)

  Set the value of a specified property of a node element selected by an xpath expression.

- void xml_error (void *ctx, const chr_t *format,...)

  A function handler for displaying xml parser error messages to the user.

- void xml_free_doc (xmlDocPtr doc)

  Free an xml document.

- void xml_free_parser_ctx (xmlParserCtxtPtr ctx)

  Destroy an xml parser context.

- void xml_free_xpath_ctx (xmlXPathContextPtr ctx)

  Free an xml xpath context.

- void xml_free_xpath_obj (xmlXPathObjectPtr obj)

  Free an xml xpath object.

- void xml_node_free (xmlNodePtr node)

  Free an xml node.

- void xml_node_set_content (xmlNodePtr node, uchr_t *content)

  Set the content of an xml node.

- void xml_stop (void)

  Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.

- xmlAttrPtr xml_node_set_property (xmlNodePtr node, uchr_t *name, uchr_t *value)

  Set an attribute of an xml node.

- xmlChar * xml_encode (xmlDocPtr doc, stringer_t *string)

  Encode an xml string, performing proper replacement of defined entities and non-ASCII values.

- xmlDocPtr xml_create_doc (xmlParserCtxtPtr ctx, const chr_t *buffer, int_t size, const chr_t *url, const chr_t *encoding, int_t options)

  Create a new xml document object from specified user data.

- xmlNodePtr xml_node_add_sibling (xmlNodePtr current, xmlNodePtr element)

  Add an xml node to the list of siblings of another xml node.

- xmlNodePtr xml_node_new (uchr_t *name)
  Create an xml node.
- xmlParserCtxtPtr xml_create_parser_ctx (void)
  Create and initialize a new xml parser context.
- xmlXPathContextPtr xml_create_xpath_ctx (xmlDocPtr doc)
  Create an xpath context for an xml document.
- xmlXPathObjectPtr xml_xpath_eval (const uchr_t *xpath, xmlXPathContextPtr ctx)
  Evaluate an xml xpath expression.
- bool_t lib_load_utf8proc (void)
  utf.c
- chr_t * lib_version_utf8proc (void)
  Return the shared library version string for libutf8proc.
- bool_t utf8_valid_st (stringer_t *s)
  Determine whether a managed string is a properly formatted UTF8 string.
- size_t utf8_length_st (stringer_t *s)
  Determine how many valid Unicode characters the string has.
- const chr_t * utf8_error_string (ssize_t error_code)
  Exchange an error code for a string explaining the nature of the UTF8 error.

5.59.1 Function Documentation

5.59.1.1 bool_t lib_load_jansson (void)

json.c json.c

Returns:

true on success or false on failure.

Definition at line 22 of file json.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.59.1.2 bool_t lib_load_utf8proc (void)

utf.c utf.c

Returns:

true on success or false on failure.

Definition at line 23 of file utf8.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.59.1.3 bool_t lib_load_xml (void)

xml.c xml.c

Returns:

true on success or false on failure.

Definition at line 26 of file xml.c.

References lib_symbols(), M_BIND, uint64_conv_ns(), xml_version_string, and xmlParserVersion_d.

Referenced by lib_load().

5.59.1.4 chr_t* lib_version_jansson (void)

Return the version string for libjansson.

Returns:

a pointer to a character string containing the libjansson version information.

Definition at line 14 of file json.c.

References jansson_version_d.

Referenced by lib_load().

5.59.1.5 chr_t* lib_version_utf8proc (void)

Return the shared library version string for libutf8proc.

Returns:

a pointer to a character string containing the libutf8proc version information.

Definition at line 15 of file utf8.c.

References utf8proc_version_d.

Referenced by lib_load().

5.59.1.6 const chr_t* lib_version_xml (void)

Return the version string of libxml.

Returns:

a pointer to a character string containing the libxml version information.

Definition at line 17 of file xml.c.

References xml_version_string.

Referenced by lib_load().

5.59.1.7 const chr_t* utf8_error_string (ssize_t *error_code*)

Exchange an error code for a string explaining the nature of the UTF8 error.

Parameters:

error_code the numeric error returned by the internal UTF8 mapping logic.

Returns:

A string constant with the error message. If the code goes unrecognized, then a generic message is returned.

Definition at line 42 of file utf8.c.

References utf8proc_errmsg_d.

Referenced by utf8_length_st().

5.59.1.8 size_t utf8_length_st (stringer_t * *s*)

Determine how many valid Unicode characters the string has.

Parameters:

s the managed string to be tested.

Returns:

The number of codepoints found if the string is valid, otherwise 0.

Definition at line 51 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), utf8_error_string(), utf8proc_get_property_d, and utf8proc_iterate_d.

Referenced by stacie_derive_rounds().

5.59.1.9 bool_t utf8_valid_st (stringer_t * *s*)

Determine whether a managed string is a properly formatted UTF8 string.

Parameters:

s the managed string to be tested.

Returns:

Valid strings return true, while invalid strings return false.

Definition at line 90 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), and utf8proc_iterate_d.

5.59.1.10 xmlDocPtr xml_create_doc (xmlParserCtxtPtr *ctx*, const chr_t * *buffer*, int_t *size*, const chr_t * *url*, const chr_t * *encoding*, int_t *options*)

Create a new xml document object from specified user data.

See also:

xmlCtxtReadMemory()

Parameters:

ctx a pointer to the xml context to be used for the parsing operation.

buffer a null-terminated string containing the xml data to be parsed.

size the length, in bytes, of the xml data buffer to be parsed.

url a null-terminated string containing the base url to be used for the document.

encoding a null-terminated string specifying the document encoding type, or NULL for default.

options a value containing a mask of xml parser options of type xmlParserOption.

Returns:

NULL on failure, or a pointer to the xml document tree of the parsed xml text on success.

Definition at line 1051 of file xml.c.

References log_pedantic, and xmlCtxtReadMemory_d.

Referenced by http_page_get().

5.59.1.11 xmlParserCtxtPtr xml_create_parser_ctx (void)

Create and initialize a new xml parser context.

Returns:

NULL on failure, or a newly initialized xml parser context on success.

Definition at line 961 of file xml.c.

References log_pedantic, xml_error(), and xmlNewParserCtxt_d.

Referenced by http_page_get().

5.59.1.12 xmlXPathContextPtr xml_create_xpath_ctx (xmlDocPtr *doc*)

Create an xpath context for an xml document.

Parameters:

doc a pointer to the input xml document object.

Returns:

NULL on failure, or a pointer to the new xpath context on success.

Definition at line 917 of file xml.c.

References log_pedantic, and xmlXPathNewContext_d.

Referenced by http_page_get().

5.59.1.13 stringer_t* xml_dump_doc (xmlDocPtr *doc*)

Get an xml document object as a string.

Parameters:

doc a pointer to the xml document object to be serialized.

Returns:

NULL on failure or a pointer to a managed string containing the specified xml document's serialized data on success.

Definition at line 1018 of file xml.c.

References mm_free(), st_import(), and xmlDocDumpFormatMemory_d.

Referenced by contact_print_form(), contact_print_message(), portal_print_login(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.59.1.14 xmlChar* xml_encode (xmlDocPtr *doc*, stringer_t * *string*)

Encode an xml string, performing proper replacement of defined entities and non-ASCII values.

Parameters:

doc a pointer to the xml document containing the DTD to be used for the encoding process.

string a managed string containing the xml data to be encoded.

NULL on failure, or a newly allocated null-terminated string containing the encoded xml data on success.

Definition at line 69 of file xml.c.

References st_data_get(), and xmlEncodeEntitiesReentrant_d.

Referenced by contact_print_form().

5.59.1.15 void xml_error (void * *ctx*, const chr_t * *format*, ...)

A function handler for displaying xml parser error messages to the user.

Parameters:

ctx a placeholder; ignored.

format a null-terminated string containing a format string for the error message to be displayed.

... a variable argument list containing the parameters to the format string.

Returns:

This function returns no value.

Definition at line 854 of file xml.c.

References log_internal(), M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, and M_LOG_TIME_DISABLE.

Referenced by xml_create_parser_ctx().

5.59.1.16 void xml_free_doc (xmlDocPtr *doc*)

Free an xml document.

Parameters:

doc a pointer to the xml document to be freed.

Returns:

This function returns no value.

Definition at line 1001 of file xml.c.

References log_pedantic, and xmlFreeDoc_d.

Referenced by http_page_free().

5.59.1.17 void xml_free_parser_ctx (xmlParserCtxtPtr *ctx*)

Destroy an xml parser context.

Parameters:

ctx a pointer to the xml parser context to be freed.

Returns:

This function returns no value.

Definition at line 984 of file xml.c.

References log_pedantic, and xmlFreeParserCtxt_d.

Referenced by http_page_free().

5.59.1.18 void xml_free_xpath_ctx (xmlXPathContextPtr *ctx*)

Free an xml xpath context.

Parameters:

ctx a pointer to the xml xpath context to be freed.

Returns:

This function returns no value.

Definition at line 883 of file xml.c.

References log_pedantic, and xmlXPathFreeContext_d.

Referenced by http_page_free().

5.59.1.19 void xml_free_xpath_obj (xmlXPathObjectPtr *obj*)

Free an xml xpath object.

Parameters:

obj a pointer to the xml xpath object to be freed.

Returns:

This function returns no value.

Definition at line 900 of file xml.c.

References log_pedantic, and xmlXPathFreeObject_d.

Referenced by xml_set_xpath_ns(), xml_set_xpath_property(), and xml_set_xpath_uint64().

5.59.1.20 int16_t xml_get_xpath_int16 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 16-bit integer.

Definition at line 503 of file xml.c.

References int16_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.21 int32_t xml_get_xpath_int32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 32-bit integer.

Definition at line 448 of file xml.c.

References int32_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.22 int64_t xml_get_xpath_int64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 64-bit integer.

Definition at line 393 of file xml.c.

References int64_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.23 int8_t xml_get_xpath_int8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 8-bit integer.

Definition at line 558 of file xml.c.

References int8_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.24 size_t xml_get_xpath_node_count (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

This function is not currently being called by any other part of the code.

Definition at line 817 of file xml.c.

References log_pedantic, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.25 chr_t* xml_get_xpath_ns (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the content of an evaluated xpath expression as a null-terminated string.

Parameters:

ctx a pointer to the xpath context to be used for the evaluation.

xpath_query a null-terminated string containing the xpath expression to be evaluated.

Returns:

NULL on failure, or a null-terminated string containing the value of the xpath expression's specified node on success.

Definition at line 766 of file xml.c.

References log_pedantic, ns_dupe(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.26 stringer_t* xml_get_xpath_st (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a managed string.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a managed string.

Definition at line 613 of file xml.c.

References log_pedantic, ns_length_get(), st_import(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.27 uint16_t xml_get_xpath_uint16 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 16-bit integer.

Definition at line 283 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint16_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.28 uint32_t xml_get_xpath_uint32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 32-bit integer.

Definition at line 229 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint32_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.29 uint64_t xml_get_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 64-bit integer.

Definition at line 174 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint64_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.30 uint8_t xml_get_xpath_uint8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 8-bit integer.

Definition at line 338 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint8_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.59.1.31 xmlNodePtr xml_node_add_sibling (xmlNodePtr *current*, xmlNodePtr *element*)

Add an xml node to the list of siblings of another xml node.

Note:

If the sibling node was already inserted into a document it will first be unlinked.

Parameters:

current a pointer to the xml node to which the sibling node will be added.

element a pointer to the sibling node to be added to the target node.

Returns:

NULL on failure, or a pointer to the sibling node on success.

Definition at line 94 of file xml.c.

References xmlAddSibling_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.59.1.32 void xml_node_free (xmlNodePtr *node*)

Free an xml node.

Parameters:

node a pointer to the xml node to be freed.

Returns:

This function returns no value.

Definition at line 57 of file xml.c.

References xmlFreeNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.59.1.33 stringer_t∗ xml_node_get_content_st (xmlNodePtr *node*)

Get the content of an xml node as a managed string.

Parameters:

node a pointer to the xml node to be queried.

Returns:

NULL on failure, or a pointer to a managed string

Definition at line 114 of file xml.c.

References log_pedantic, st_import(), xmlBufferContent_d, xmlBufferCreate_d, xmlBufferFree_d, xmlBufferLength_d, and xmlNodeBufGetContent_d.

5.59.1.34 xmlNodePtr xml_node_new (uchr_t ∗ *name*)

Create an xml node.

Parameters:

name the name of the new xml node.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized xml node on success.

Definition at line 104 of file xml.c.

References xmlNewNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.59.1.35 void xml_node_set_content (xmlNodePtr *node*, uchr_t * *content*)

Set the content of an xml node.

Parameters:

node a pointer to the xml node to be set.
content a null-terminated string containing the new content of the xml node.

Returns:

This function returns no value.

Definition at line 150 of file xml.c.

References xmlNodeSetContent_d.

Referenced by contact_business_add_error(), portal_print_login(), teacher_add_error(), xml_set_xpath_ns(), and xml_set_xpath_uint64().

5.59.1.36 xmlAttrPtr xml_node_set_property (xmlNodePtr *node*, uchr_t * *name*, uchr_t * *value*)

Set an attribute of an xml node.

Parameters:

node a pointer to the xml node to be set.
name a null-terminated string containing the name of the node attribute to be set.
value a null-terminated string containing the new value of the specified xml node's attribute.

Returns:

NULL on failure, or a pointer to node's attribute on success.

Definition at line 163 of file xml.c.

References xmlSetProp_d.

Referenced by contact_business_add_error(), teacher_add_error(), and xml_set_xpath_property().

5.59.1.37 bool_t xml_set_xpath_ns (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *val*)

Set the value of a node element selected by an xpath expression, as a null-terminated string.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.
val the new value of the selected node, as a null-terminated string.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 702 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.59.1.38 bool_t xml_set_xpath_property (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *name*, uchr_t * *val*)

Set the value of a specified property of a node element selected by an xpath expression.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

name a null-terminated string containing the name of the node's property to be set.

val the new value of the selected node's property, as a null-terminated string.

Returns:

true if the selected node's value was set successfully, or false on failure.

Definition at line 735 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_property(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), and teacher_print_form().

5.59.1.39 bool_t xml_set_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uint64_t *val*)

Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

val the new value of the selected node, as a 64-bit unsigned integer.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 668 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by statistics_process().

5.59.1.40 bool_t xml_start (void)

Initialize the xml parser library.

Returns:

This function returns no value.

Definition at line 1079 of file xml.c.

References xmlInitParser_d.

Referenced by process_start().

5.59.1.41 void xml_stop (void)

Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.

Returns:

This function returns no value.

Definition at line 1066 of file xml.c.

References xmlCleanupGlobals_d, xmlCleanupParser_d, and xmlMemoryDump_d.

Referenced by process_stop().

5.59.1.42 xmlXPathObjectPtr xml_xpath_eval (const uchr_t * *xpath*, xmlXPathContextPtr *ctx*)

Evaluate an xml xpath expression.

Parameters:

a null-terminated string containing the xpath expression to be evaluated.

a pointer to the xpath context in which to perform the evaluation. NULL on failure, or a pointer to the xml path object of the evaluation on success.

Definition at line 941 of file xml.c.

References log_pedantic, and xmlXPathEvalExpression_d.

Referenced by contact_business_add_error(), portal_print_login(), teacher_add_error(), xml_set_xpath_ns(), xml_set_xpath_property(), and xml_set_xpath_uint64().

5.59.1.43 int_t xml_xpath_set_namespace (xmlXPathContextPtr *ctxt*, xmlChar * *prefix*, xmlChar * *ns_uri*)

Set the namespace for an xpath context.

See also:

xmlXPathRegisterNs()

Parameters:

ctxt a pointer to the specified xpath context.

prefix a pointer to the prefix of the namespace as a string.

ns_uri a pointer to the uri of the namespace as a string.

Returns:

-1 on failure or 0 on success.

Definition at line 82 of file xml.c.

References xmlXPathRegisterNs_d.

Referenced by http_page_get().

```
#include "magma.h"
```

Functions

- placer_t bracket_extract_pl (void *block, size_t length)
  Get a pointer to a block of data between a pair of brackets.

5.60.1 Function Documentation

5.60.1.1 placer_t bracket_extract_pl (void * *block*, size_t *length*)

Get a pointer to a block of data between a pair of brackets.

Note:

The data is of format "[_data_]"

Parameters:

block a buffer containing the bracketed data.

length the length, in bytes, of the data buffer to be parsed.

Returns:

a null placer on failure, or a placer pointing to the data between the brackets on success.

Definition at line 17 of file bracket.c.

References data, log_pedantic, pl_init(), and pl_null().

Referenced by cache_config(), relay_config(), and servers_config().

5.61 src/core/parsers/special/special.h File Reference

Functions

- placer_t bracket_extract_pl (void *block, size_t length)
  Get a pointer to a block of data between a pair of brackets.

5.61.1 Function Documentation

5.61.1.1 placer_t bracket_extract_pl (void * *block*, size_t *length*)

Get a pointer to a block of data between a pair of brackets.

Note:

The data is of format "[_data_]"

Parameters:

block a buffer containing the bracketed data.

length the length, in bytes, of the data buffer to be parsed.

Returns:

a null placer on failure, or a placer pointing to the data between the brackets on success.

Definition at line 17 of file bracket.c.

References data, log_pedantic, pl_init(), and pl_null().

Referenced by cache_config(), relay_config(), and servers_config().

5.62 src/core/parsers/time.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t time_till_midnight (void)

  Get the number of seconds until midnight.

- uint64_t time_datestamp (void)

  Get the current date as an integer of the form YYYYMMDD.

- stringer_t ∗ time_print_local (stringer_t ∗s, chr_t ∗format, time_t moment)

  Get a specified time as a formatted string.

- stringer_t ∗ time_print_gmt (stringer_t ∗s, chr_t ∗format, time_t moment)

  Get a specified time as a formatted string converted to GMT.

5.62.1 Function Documentation

5.62.1.1 uint64_t time_datestamp (void)

Get the current date as an integer of the form YYYYMMDD. time.c

Returns:

0 on failure or a 64-bit unsigned integer containing the formatted current date on success.

Definition at line 36 of file time.c.

Referenced by api_endpoint_auth(), imap_login(), log_rotate(), log_start(), pattern_update(), pop_pass(), portal_endpoint_auth(), process_-maint(), smtp_auth_login(), and smtp_auth_plain().

5.62.1.2 stringer_t∗ time_print_gmt (stringer_t ∗ *s*, chr_t ∗ *format*, time_t *moment*)

Get a specified time as a formatted string converted to GMT.

Parameters:

s a managed string where the formatted time is to be stored.

format a null-terminated string containing the format of the time string.

moment the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 92 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by http_response_cookie(), http_response_header(), and http_response_options().

5.62.1.3 stringer_t* time_print_local (stringer_t * *s*, chr_t * *format*, time_t *moment*)

Get a specified time as a formatted string.

Parameters:

s a managed string where the formatted time is to be stored.

format a null-terminated string containing the format of the time string.

moment the specified time to be formatted, as a UNIX time value.

Returns:

NULL on failure, or a pointer to the managed string containing the result on success.

Definition at line 61 of file time.c.

References log_pedantic, mm_wipe(), st_avail_get(), st_char_get(), and st_length_set().

Referenced by imap_id().

5.62.1.4 uint64_t time_till_midnight (void)

Get the number of seconds until midnight.

Returns:

an unsigned 64-bit integer containing the number of seconds until midnight, or 86400 on failure.

Definition at line 14 of file time.c.

Functions

- uint64_t tok_get_count_bl (void *block, size_t length, char token)

  Count the number of times a token is found in a specified block of memory.

- uint64_t tok_get_count_st (stringer_t *string, char token)

  Count the number of times a token is found in a managed string.

- int tok_get_ns (char *string, size_t length, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a null-terminated string.

- int tok_get_bl (void *block, size_t length, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a block of data.

- int tok_get_st (stringer_t *string, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a managed string.

- int tok_get_pl (placer_t string, char token, uint64_t fragment, placer_t *value)

  Retrieve a specified token from a placer.

- void tok_pop_init_bl (tok_state_t *state, void *block, size_t length, char token)
- void tok_pop_init_st (tok_state_t *state, stringer_t *string, char token)
- int tok_pop (tok_state_t *state, placer_t *value)
- uint64_t str_tok_get_count_bl (void *block, size_t length, chr_t *token, size_t toklen)

  Count the number of times a string token is found in a specified block of memory.

- int str_tok_get_bl (char *block, size_t length, chr_t *token, size_t toklen, uint64_t fragment, placer_t *value)

  Retrieve a specified string-split token from a null-terminated string.

- bool_t pl_skip_characters (placer_t *place, char *skipchars, size_t nchars)

  Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

- bool_t pl_skip_to_characters (placer_t *place, char *skiptochars, size_t nchars)

  Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

- bool_t pl_shrink_before_characters (placer_t *place, char *shrinkchars, size_t nchars)

  Truncate a placer to start before any of the specified characters, and update the placer accordingly.

- bool_t pl_get_embraced (placer_t str, placer_t *out, unsigned char opening, unsigned char closing, bool_t required)

  Get a placer pointing to the text contained within a specified pair of opening and closing braces.

- bool_t pl_update_start (placer_t *place, size_t nchars, bool_t more)

  Ensure that a placer contains at least a certain amount of data, and update it accordingly.

5.63.1 Function Documentation

5.63.1.1 bool_t pl_get_embraced (placer_t *str*, placer_t * *out*, unsigned char *opening*, unsigned char *closing*, bool_t *required*)

Get a placer pointing to the text contained within a specified pair of opening and closing braces.

Parameters:

str a placer pointing to the string to be parsed.
out a pointer to a placer that will store the string between the braces on success.
opening the character to be the opening brace of the sequence.
closing the character to be the closing brace of the sequence.
required if true, fail if no data was found between the pair of braces.

Returns:

true if the brace sequence was complete, or false if either component could not be located.

Definition at line 442 of file token.c.

References pl_char_get(), and pl_empty().

5.63.1.2 bool_t pl_shrink_before_characters (placer_t * *place*, char * *shrinkchars*, size_t *nchars*)

Truncate a placer to start before any of the specified characters, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to be truncated before any of the specified characters.
shrinkchars a pointer to a buffer containing bytes that will be skipped when they are found at the end of the placer.
nchars the number of characters to be tested in the collection in shrinkchars.

Returns:

true if the shrink operation completed before the end of the placer was reached, or false otherwise.

Definition at line 405 of file token.c.

References pl_char_get(), pl_empty(), and pl_length_get().

Referenced by portal_upload().

5.63.1.3 bool_t pl_skip_characters (placer_t * *place*, char * *skipchars*, size_t *nchars*)

Skip past any of the specified characters found at the beginning of the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip past any of the specified characters.
skipchars a pointer to a buffer containing bytes that will be skipped at the beginning of the placer.
nchars the number of characters to be tested in the collection in skipchars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 336 of file token.c.

References pl_char_get(), and pl_empty().

Referenced by portal_upload().

5.63.1.4 bool_t pl_skip_to_characters (placer_t * *place*, char * *skiptochars*, size_t *nchars*)

Skip to the first instance of any of the specified characters in the placer, and update the placer accordingly.

Parameters:

place a pointer to a placer that will be updated to skip to any of the specified characters.
skiptochars a pointer to a buffer containing bytes that will be skipped to when they are first found in the placer.
nchars the number of characters to be tested in the collection in skiptochars.

Returns:

true if the skip operation completed before the end of the placer was reached, or false otherwise.

Definition at line 372 of file token.c.

References pl_char_get(), and pl_empty().

Referenced by portal_upload().

5.63.1.5 bool_t pl_update_start (placer_t * *place*, size_t *nchars*, bool_t *more*)

Ensure that a placer contains at least a certain amount of data, and update it accordingly.

Parameters:

place a pointer to the placer containing the original data, which will be updated on success.
nchars the minimum number of characters that the placer needs to contain to pass the test.
more if true, more characters following the minimum buffer size are necessary.

Returns:

true if the placer meets the minimum size check, or false if it does not.

Definition at line 485 of file token.c.

5.63.1.6 int str_tok_get_bl (char * *block*, size_t *length*, chr_t * *token*, size_t *toklen*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified string-split token from a null-terminated string.

Parameters:

block a pointer to the block of memory to be tokenized.
length the maximum number of characters to be scanned from the input data.
token the token string that will be used to split the data.
toklen the length, in bytes, of the token string.
fragment the zero-indexed token number to be extracted from the data.
value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 290 of file token.c.

References mm_empty(), pl_char_get(), pl_init(), pl_length_get(), pl_null(), placer_t, and st_search_cs().

Referenced by portal_upload().

5.63.1.7 uint64_t str_tok_get_count_bl (void * *block*, size_t *length*, chr_t * *token*, size_t *toklen*)

Count the number of times a string token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a pointer to the string token being used to split the input data.

toklen the length, in bytes, of the specified token.

Returns:

the number of times the string token was found in the block of memory, or 0 on failure.

Definition at line 257 of file token.c.

References count, mm_empty(), pl_init(), pl_length_get(), placer_t, and st_search_cs().

Referenced by portal_upload().

5.63.1.8 int tok_get_bl (void * *block*, size_t *length*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a block of data.

See also:

tok_get_ns()

Parameters:

block a pointer to the memory block to be tokenized.

length the maximum number of characters to be scanned at the input data block.

token the token character that will be used to split the data block.

fragment the zero-indexed token number to be extracted from the data block.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the data block.

Definition at line 128 of file token.c.

References tok_get_ns().

Referenced by nvp_parse(), smtp_parse_mail_from_path(), tok_get_pl(), and tok_get_st().

5.63.1.9 uint64_t tok_get_count_bl (void * *block*, size_t *length*, char *token*)

Count the number of times a token is found in a specified block of memory.

Parameters:

block a pointer to a block of memory to be scanned.

length the length, in bytes, of the block of memory to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the block of memory, or 0 on failure.

Definition at line 17 of file token.c.

References count, log_pedantic, and mm_empty().

Referenced by smtp_parse_mail_from_path(), and tok_get_count_st().

5.63.1.10 uint64_t tok_get_count_st (stringer_t * *string*, char *token*)

Count the number of times a token is found in a managed string.

See also:

tok_get_count_bl()

Parameters:

string a pointer to the managed string to be scanned.

token a character specifying the token to be searched.

Returns:

the number of times the token was found in the managed string, or 0 on failure.

Definition at line 49 of file token.c.

References st_data_get(), st_length_get(), and tok_get_count_bl().

Referenced by get_header_opt(), get_header_value_noopt(), http_parse_method(), http_parse_pairs(), imap_fetch_body_part(), imap_narrow_messages(), imap_search_messages_date(), imap_search_messages_date_compare(), imap_search_messages_range(), ip_subnet_st(), mail_domain_get(), mail_mime_type_parameters(), portal_get_upload_attachment(), and stamp_counter_check().

5.63.1.11 int tok_get_ns (char * *string*, size_t *length*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a null-terminated string.

Parameters:

string a pointer to the null-terminated string to be tokenized.

length the maximum number of characters to be scanned from the input string.

token the token character that will be used to split the string.

fragment the zero-indexed token number to be extracted from the string.

value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one in the string.

Definition at line 63 of file token.c.

References log_pedantic, mm_empty(), pl_init(), and pl_null().

Referenced by ip_subnet_st(), lib_load_openssl(), and tok_get_bl().

5.63.1.12 int tok_get_pl (placer_t *string*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a placer.

See also:

token_get_ns()

Parameters:

string a pointer to the placer to be tokenized.
token the token character that will be used to split the placer.
fragment the zero-indexed token number to be extracted from the placer.
value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the placer.

Definition at line 156 of file token.c.

References pl_data_get(), pl_length_get(), and tok_get_bl().

Referenced by http_data_value_parse(), http_parse_context(), http_parse_method(), and smtp_parse_mail_from_path().

5.63.1.13 int tok_get_st (stringer_t * *string*, char *token*, uint64_t *fragment*, placer_t * *value*)

Retrieve a specified token from a managed string.

See also:

tok_get_ns()

Parameters:

string a pointer to the managed string to be tokenized.
token the token character that will be used to split the managed string.
fragment the zero-indexed token number to be extracted from the managed string.
value a pointer to a placer that will receive the value of the extracted token on success, or pl_null() on failure.

Returns:

-1 on failure, 0 on success, or 1 if the token was extracted successfully, but was the last one found in the managed string.

Definition at line 142 of file token.c.

References st_data_get(), st_length_get(), and tok_get_bl().

Referenced by get_header_opt(), get_header_value_noopt(), http_parse_context(), http_parse_pairs(), imap_fetch_body_part(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_narrow_messages(), imap_parse_address_part(), imap_search_messages_date(), imap_search_messages_date_compare(), imap_search_messages_range(), mail_domain_get(), mail_mime_type_parameters(), portal_get_upload_attachment(), smtp_auth_plain(), and stamp_counter_check().

5.63.1.14 int tok_pop (tok_state_t * *state*, placer_t * *value*)

on error the function returns -1 and sets value to EMPTY_PLACER on success the function returns 0 and stores the token in the placer pointed at by value if the end is hit, then the function returns 1, and places any remaining data in value

Definition at line 188 of file token.c.

```

Functions

- void st_free (stringer_t *s)

  Free a managed string.

- void st_cleanup_variadic (ssize_t len,...)

  A checked cleanup function which can be used free a variable number managed strings.

- stringer_t * st_merge_opts (uint32_t opts, chr_t *format,...)

  Concatenate a variable number of user-supplied multi-type strings.

- stringer_t * st_import_opts (uint32_t opts, const void *s, size_t len)

  Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

- stringer_t * st_import (const void *s, size_t len)

  Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

- stringer_t * st_copy_in (stringer_t *s, void *buf, size_t len)

  Copy data into a managed string.

- stringer_t * st_dupe_opts (uint32_t opts, stringer_t *s)

  Create a duplicate copy of a managed string with a specified set of allocation options.

- stringer_t * st_dupe (stringer_t *s)

  Duplicate a managed string.

- stringer_t * st_append_opts (size_t align, stringer_t *s, stringer_t *append)

  Append one managed string to another, with aligned memory boundaries.

- int_t st_append_out (size_t align, stringer_t **s, stringer_t *append)
- stringer_t * st_alloc_opts (uint32_t opts, size_t len)

  Allocate a managed string with a specified options mask.

- stringer_t * st_alloc (size_t len)

  Allocate a managed string with a specified options mask.

- stringer_t * st_realloc (stringer_t *s, size_t len)

  Reallocate a managed string to a specified size.

- stringer_t * st_output (stringer_t *output, size_t len)

  Return a suitable managed string to store data of a specified length.

- stringer_t * st_nullify (chr_t *input, size_t len)

  Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

5.65.1 Function Documentation

5.65.1.1 stringer_t* st_alloc (size_t *len*)

Allocate a managed string with a specified options mask.

See also:

st_alloc_opts()

Parameters:

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 617 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_alloc_opts().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), auth_legacy(), auth_sanitize_address(), base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), client_connect(), con_init_network_buffer(), decompress_block_lzo(), decompress_bzip(), decompress_lzo(), decompress_zlib(), deprecated_hmac_digest(), deprecated_symmetric_decrypt(), deprecated_symmetric_encrypt(), deserialize_st(), ed25519_private_get(), ed25519_public_get(), ed25519_sign(), encrypted_chunk_set(), file_load(), hash_digest(), hex_decode_st(), hex_encode_st(), hex_encode_st_debug(), hmac_digest(), http_load_file(), imap_build_array(), imap_parse_address_part(), imap_parse_literal(), imap_parse_qstring(), ip_presentation(), ip_reversed(), ip_standard(), ip_subnet(), mail_add_required_headers(), mail_build_signature(), mail_extract_address(), mail_extract_tag(), mail_header_fetch_cleaned(), mail_load_message(), mail_mime_generate_boundary(), org_key_get(), org_signet_get(), portal_smtp_merge_headers(), qp_decode(), rand_choices(), sanity_check(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), serialize_int16(), serialize_int32(), serialize_int64(), serialize_uint16(), serialize_uint32(), serialize_uint64(), signature_full_get(), signature_tree_get(), st_bitwise(), st_not(), st_output(), st_replace(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), stacie_decrypt(), stacie_encrypt(), symmetric_decrypt(), symmetric_encrypt(), uint16_put_no(), uint24_put_no(), uint32_put_no(), url_decode(), user_key_get(), user_request_get(), user_signet_get(), zbase32_decode(), and zbase32_encode().

5.65.1.2 stringer_t* st_alloc_opts (uint32_t *opts*, size_t *len*)

Allocate a managed string with a specified options mask.

See also:

st_valid_options()

Note:

All requested allocation masks should conform to the validation imposed by st_valid_opts(). The supported types are: placer, nuller, block, managed, and mapped. The following logic is applied to requested string allocation options: 1. Any allocation options specified for strings to be allocated on the stack are IGNORED. 2. All jointed strings allocate memory for the header and data separately and then link them EXCEPT: Jointed placers only allocate space for a header. Jointed mapped strings allocate the data with an aligned mmap() operation. 3. Contiguous strings allocate space for the header and data together in a single contiguous block. 4. After allocation, the length field is set for block strings. 5. After allocation, the available field is set for managed strings. 6. Placers can only be jointed; mapped strings can only be contiguous.

Parameters:

opts the allocation options mask to be used by the newly allocated string.

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 484 of file allocation.c.

References align(), block_t, BLOCK_T, CONTIGUOUS, HEAP, JOINTED, log_pedantic, magma, MAGMA_SPOOL_DATA, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, mm_alloc(), mm_free(), mm_sec_alloc(), mm_sec_free(), mm_set(), nuller_t, NULLER_T, magma_t::page_length, placer_t, PLACER_T, SECURE, spool_mktemp(), st_info_opts(), st_valid_opts(), and STACK.

5.65.1.3 stringer_t* st_append_opts (size_t *align*, stringer_t * *s*, stringer_t * *append*)

Append one managed string to another, with aligned memory boundaries.

Parameters:

align an alignment value to be used for managed string (re)allocation. This only works for powers of 2.

s the managed string to be extended, which will be allocated for the caller if passed as NULL.

append the managed string to be appended to s.

Returns:

NULL on failure, or a pointer to the appended result on success.

Definition at line 393 of file allocation.c.

References HEAP, JOINTED, log_pedantic, MANAGED_T, mm_copy(), st_alloc_opts(), st_avail_get(), st_data_get(), st_length_get(), st_length_set(), st_realloc(), and st_valid_append().

Referenced by encrypted_chunk_set().

5.65.1.5 void st_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number managed strings.

See also:

st_free()

Parameters:

va_list a list of managed strings to be freed.

Returns:

This function returns no value.

Definition at line 96 of file allocation.c.

References st_free().

5.65.1.6 stringer_t* st_copy_in (stringer_t * *s*, void * *buf*, size_t *len*)

Copy data into a managed string.

Parameters:

s the managed string to store the copied contents of the data.

buf a pointer to the buffer containing the data to be copied.

len the length of the data to be copied.

Returns:

NULL on failure, or a pointer to the managed string on success.

Definition at line 265 of file allocation.c.

References log_pedantic, mm_copy(), st_avail_get(), st_data_get(), and st_length_set().

Referenced by pop_pass_parse().

5.65.1.7 stringer_t* st_dupe (stringer_t * *s*)

Duplicate a managed string.

See also:

st_dupe_opts()

Note:

The allocation options of the duplicated string will be the same as that of the source string.

Parameters:

s the managed string to be duplicated.

Returns:

NULL on failure, or a copy of the input managed string on success.

Definition at line 379 of file allocation.c.

References st_dupe_opts().

Referenced by ar_dupe(), auth_login(), auth_response(), contact_folder_rename(), file_temp_handle(), http_load_file(), http_print_301(), imap_folder_create(), imap_folder_rename(), imap_login(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_cache_get(), pop_pass(), prime_get(), prime_key_encrypt(), prime_pem_wrap(), register_business_step1(), register_business_step2(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), register_session_get(), smtp_add_recipient(), smtp_data_outbound(), smtp_fetch_inbound(), teacher_process(), and user_request_sign().

5.65.1.8 stringer_t* st_dupe_opts (uint32_t *opts*, stringer_t * *s*)

Create a duplicate copy of a managed string with a specified set of allocation options.

See also:

st_valid_opts()

Note:

Both the source and destination managed strings must have option values that pass st_valid_opts(). The following procedure occurs when creating the duplicate managed string: If the destination is a placer, 0 bytes are allocated for the duplicate's underlying data. If the destination is a constant, nuller, or block, its underlying data buffer will be of equal size to the source's data length. If the destination is managed or mapped, and so is the source, its underlying data buffer will be of equal size to the source's available size; but if the source is neither, the underlying data buffer of the destination managed or mapped string will equal the size of the source's data length. A deep copy will be made of the source data to the destination if the destination is NOT a placer.

Parameters:

opts the allocation options mask to be used for the newly created managed string.

s the target managed string to be duplicated.

Returns:

NULL on failure or a pointer to a copy of the duplicated managed string on success.

Definition at line 305 of file allocation.c.

References BLOCK_T, CONSTANT_T, log_pedantic, MANAGED_T, MAPPED_T, MEMORYBUF, mm_copy(), NULLER_T, PLACER_T, st_alloc_opts(), st_avail_get(), st_data_get(), st_data_set(), st_info_opts(), st_length_get(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.65.1.9 void st_free (stringer_t ∗ *s*)

Free a managed string.

See also:

st_valid_free(), st_valid_opts()

Note:

Any managed string to be freed should conform with the validity checks enforced by st_valid_free()/st_valid_opts() ∗NO∗ managed string should be passed to st_free() if it was allocated on the stack, or contains foreign data. The following logic is carried out depending on the allocation options of the string to be freed: Jointed placer: Free header, if secure or on heap Free underlying data if it is not foreign Jointed nuller: Free header and underlying data Jointed block: Free header and underlying data Jointed managed: Free header and underlying data Jointed mapped: Free the header and (munmap) underlying data Contiguous nuller: Free header (this includes the underlying data because they are already merged) Contiguous block: Free header (this includes the underlying data because they are already merged) Contiguous managed: Free header (this includes the underlying data because they are already merged)

Parameters:

s the managed string to be freed.

Returns:

This function returns no value.

HIGH: Finish this logic out. Stack allocations are skipped, unless they are jointed. In that case the data is freed unless it carries a foreigner flag. Note its possible for a jointed string to have a NULL data reference. We should be picking up on that too. Contiguous heap buffers are just destroyed.

Do we need to differentiate between stack structures, and heap data blocks needing to be freed, or not?

Definition at line 29 of file allocation.c.

5.65.1.10 stringer_t* st_import (const void * *s*, size_t *len*)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

See also:

st_import_opts()

Parameters:

s the address of the buffer to be duplicated.

len the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 253 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_import_opts().

Referenced by cache_get(), con_reverse_lookup(), deprecated_ecies_key_public_hex(), dspam_check(), ecies_key_public_hex(), file_temp_handle(), http_data_header_parse_line(), http_load_file(), imap_fetch_body(), imap_fetch_body_tag(), imap_fetch_bodystructure(), imap_fetch_message(), imap_fetch_return_header(), imap_parse_astring(), imap_parse_nstring(), imap_search_messages_date(), mail_add_outbound_headers(), mail_add_required_headers(), mail_header_fetch_all(), mail_load_header(), mail_mime_content_encoding(), mail_mime_content_id(), mail_mime_type_group(), mail_mime_type_parameters_key(), mail_mime_type_parameters_value(), mail_mime_type_sub(), meta_folders_name(), nvp_parse(), org_signet_set(), pop_user_parse(), portal_endpoint_attachments_add(), portal_endpoint_folders_add(), portal_endpoint_folders_rename(), portal_endpoint_messages_list(), portal_parse_json_str_array(), portal_upload(), register_captcha_generate(), res_field_string(), servers_network_start(), smtp_parse_auth(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), tank_load(), teacher_add_cookie(), user_request_set(), user_signet_set(), xml_dump_doc(), xml_get_xpath_st(), and xml_node_get_content_st().

5.65.1.11 stringer_t* st_import_opts (uint32_t *opts*, const void * *s*, size_t *len*)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

s the address of the buffer to be duplicated.

len the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 222 of file allocation.c.

References log_pedantic, MEMORYBUF, mm_copy(), st_alloc_opts(), st_data_get(), st_info_opts(), st_length_set(), and st_valid_destination().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and st_import().

5.65.1.12 stringer_t* st_merge_opts (uint32_t *opts*, chr_t * *format*, ...)

Concatenate a variable number of user-supplied multi-type strings.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

format a format string consisting of the characters 's' for specifying that the next variable argument will be a managed string or 'n' if it is a null-terminated string.

... a variable argument list containing the strings to be concatenated to one another.

Returns:

a newly allocated string containing the concatenations of all specified managed and null-terminated strings.

Definition at line 120 of file allocation.c.

References length, log_pedantic, MEMORYBUF, mm_copy(), ns_empty(), ns_length_get(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty, st_info_opts(), st_length_get(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by mail_add_forward_headers(), mail_add_inbound_headers(), mail_add_outbound_headers(), mail_add_required_headers(), and spool_path().

5.65.1.13 stringer_t* st_nullify (chr_t * *input*, size_t *len*)

Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

Parameters:

input a pointer to the data block to be copied.

len the size, in bytes, of the data block to be copied before being terminated with a null byte.

Returns:

NULL on failure, or a pointer to the new null-terminated string on success.

Definition at line 827 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, mm_copy(), st_alloc_opts(), st_data_get(), and st_length_set().

Referenced by portal_message_body().

5.65.1.14 stringer_t* st_output (stringer_t * *output*, size_t *len*)

Return a suitable managed string to store data of a specified length.

Note:

If a NULL output string is specified, one will be allocated for the caller.

Parameters:

output the input managed string (can be NULL).

len the size, in bytes, of the requested data buffer.

Returns:

NULL on failure or if input was not large enough or a pointer to a validated output managed string.

Definition at line 798 of file allocation.c.

References log_pedantic, st_alloc(), st_avail_get(), and st_valid_destination().

Referenced by chunk_header_write(), deprecated_symmetric_key(), deprecated_symmetric_vector(), encrypted_chunk_get(), prime_field_-write(), prime_header_write(), prime_pem_wrap(), slots_key(), symmetric_key(), symmetric_vector(), tls_cipher(), and tls_error().

5.65.1.15 stringer_t* st_realloc (stringer_t * *s*, size_t *len*)

Reallocate a managed string to a specified size.

Note:

The caller can request a new size that is either smaller (truncated) or larger than the original string. Only these types of strings can be reallocated: nuller, block, managed, and mapped. The following logic is applied to string reallocation requests: For jointed strings, a new data buffer is allocated of the requested length, the original contents copied in, the data field of the new string is set, and the original data buffer freed. The stringer header returned to the caller resides at the same address as the original. For contiguous strings, a new data buffer is allocated for both the requested length and the new stringer header, and the data of both parts are copied from the original string to the resulting one. For block strings, the length field of the resulting string is set to the requested length. For managed strings, the length field of the resulting string is set to the original length, but the available field is adjusted accordingly. For mapped strings, an aligned mremap() call is made, and both the length and available fields are set to the new length.

Parameters:

s the managed string to have its size reallocated.

len the new size, in bytes, of the resulting managed string.

Returns:

NULL on failure or a pointer to the newly reallocated managed string on success.

Definition at line 642 of file allocation.c.

Functions

- bool_t st_populated_variadic (ssize_t len,...)

  A simple method for checking multiple managed strings to see if all of them contain data.

- bool_t st_empty_variadic (ssize_t len,...)

  A simple method for checking multiple managed strings to see if any are empty.

- bool_t st_empty_out (stringer_t *s, uchr_t **ptr, size_t *len)

  Determine whether the specified managed string is empty or not, and store its underlying data and data length.

- void st_data_set (stringer_t *s, void *data)

  Set the underlying data of a jointed managed string.

- void * st_data_get (stringer_t *s)

  Retrieve the data associated with a managed string.

- chr_t * st_char_get (stringer_t *s)

  Retrieve a character pointer to a managed string's data buffer.

- uchr_t * st_uchar_get (stringer_t *s)

  Retrieve an unsigned character pointer to a managed string's data buffer.

- void st_wipe (stringer_t *s)

  Wipe all of a managed string's allocated memory and if applicable, reset its length.

- stringer_t * st_set (stringer_t *s, uint8_t set, size_t len)

  Sets a block of memory to a specified value.

5.66.1 Function Documentation

5.66.1.1 chr_t* st_char_get (stringer_t * *s*)

Retrieve a character pointer to a managed string's data buffer. data.c

See also:

st_data_get()

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 195 of file data.c.

5.66.1.2 void* st_data_get (stringer_t * *s*)

Retrieve the data associated with a managed string.

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 148 of file data.c.

5.66.1.3 void st_data_set (stringer_t * *s*, void * *data*)

Set the underlying data of a jointed managed string.

Parameters:

s the managed string to be adjusted.

data the data buffer to be attached to the input managed string.

Note:

The underlying data of s will be released, unless it contains foreign data.

Returns:

This function does not return a value.

Definition at line 91 of file data.c.

References block_t, BLOCK_T, FOREIGNDATA, JOINTED, log_pedantic, managed_t, MANAGED_T, MAPPED_T, MEMORYBUF, mm_free(), mm_sec_free(), mm_sec_secured(), nuller_t, NULLER_T, placer_t, PLACER_T, SECURE, st_info_opts(), and st_valid_jointed().

5.66.1.4 bool_t st_empty_out (stringer_t * *s*, uchr_t ** *ptr*, size_t * *len*)

Determine whether the specified managed string is empty or not, and store its underlying data and data length.

Parameters:

s the input managed string.

ptr a pointer to a null-terminated string that will receive the address of the managed string's underlying data.

len a pointer to store the size of the managed string's underlying data buffer.

Returns:

true if string is NULL or uninitialized or empty; false otherwise.

Definition at line 75 of file data.c.

References st_data_get(), and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), auth_sanitize_address(), base64_decode(), base64_decode_mod(), base64_decode_opts(), base64_encode(), base64_encode_mod(), base64_encode_opts(), base64_encode_wrap(), chunk_buffer_size(), chunk_header_size(), chunk_header_type(), client_write(), contact_name(), contact_validate_detail(), contact_validate_name(), deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_symmetric_decrypt(), deprecated_symmetric_encrypt(), ecies_decrypt(), ecies_encrypt(), ephemeral_chunk_set(), hex_count_st(), hex_decode_st(), hex_encode_st(), hex_valid_st(), http_parse_origin(), imap_command_log_safe(), imap_count_folder_levels(), imap_fetch_body_portion(), imap_valid_folder_name(), imap_valid_sequence(), lower_st(), mail_count_received(), mail_extract_address(), mail_mime_encode_part(), naked_message_get(), part_decrypt(), part_encrypt(), prime_field_write(), prime_header_read(), qp_decode(), qp_encode(), smtp_parse_auth(), st_cmp_ci_ends(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_cmp_cs_starts(), st_replace(), st_search_chr(), st_search_ci(), st_search_cs(), st_swap(), st_write_variadic(), stacie_decrypt(), stacie_derive_key(), stacie_derive_seed(), stacie_derive_token(), stacie_encrypt(), stacie_realm_key(), symmetric_decrypt(), symmetric_encrypt(), upper_st(), url_decode(), url_encode(), url_valid_st(), utf8_length_st(), utf8_valid_st(), zbase32_decode(), and zbase32_encode().

5.66.1.5 bool_t st_empty_variadic (ssize_t *len*, ...)

A simple method for checking multiple managed strings to see if any are empty.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to check for emptiness

Returns:

true if any of the strings are NULL, uninitialized or empty; false if every string has at least one byte of data.

Definition at line 47 of file data.c.

References st_data_get(), and st_length_get().

5.66.1.6 bool_t st_populated_variadic (ssize_t *len*, ...)

A simple method for checking multiple managed strings to see if all of them contain data.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to be freed.

Returns:

true if all of the strings are populated with at least one byte of data, otherwise false.

Definition at line 18 of file data.c.

References st_data_get(), and st_length_get().

5.66.1.7 stringer_t* st_set (stringer_t * *s*, uint8_t *set*, size_t *len*)

Sets a block of memory to a specified value.

Parameters:

s the managed string to be overwritten with the value of set.

set the byte value to be write into the string.

len the number of bytes to set to the provided value.

Returns:

a pointer to the block of memory passed to the function.

Definition at line 245 of file data.c.

References log_pedantic, MEMORYBUF, mm_set(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

Referenced by encrypted_chunk_get(), encrypted_chunk_set(), and slots_key().

5.66.1.8 uchr_t* st_uchar_get (stringer_t * *s*)

Retrieve an unsigned character pointer to a managed string's data buffer.

See also:

st_data_get()

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 205 of file data.c.

References st_data_get().

Referenced by dkim_signature_create(), http_parse_origin(), and prime_pem_unwrap().

5.66.1.9 void st_wipe (stringer_t * *s*)

Wipe all of a managed string's allocated memory and if applicable, reset its length.

Parameters:

s the managed string to be wiped.

Returns:

This function returns no value.

Definition at line 215 of file data.c.

References log_pedantic, MEMORYBUF, mm_wipe(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

Functions

- uint64_t tank_insert_object (int64_t transaction, uint64_t hnum, uint64_t tnum, uint64_t unum, uint64_t size, uint64_t flags)
  Insert a tank object into the mysql database.
- bool_t tank_delete_object (int64_t transaction, uint64_t hnum, uint64_t tnum, uint64_t unum, uint64_t onum)
  Delete a tank object from the mysql database.

5.67.1 Function Documentation

5.67.1.1 bool_t tank_delete_object (int64_t *transaction*, uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Delete a tank object from the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.
hnum the host number.
tnum the storage tank number.
unum the usernum of the user that owns the object.
onum the stored object id.

Returns:

false on failure, or true on success.

Definition at line 67 of file data.c.

References log_pedantic, mm_wipe(), and stmt_exec_affected_conn().

Referenced by tank_delete().

5.67.1.2 uint64_t tank_insert_object (int64_t *transaction*, uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *size*, uint64_t *flags*)

Insert a tank object into the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.
hnum the host number.
tnum the storage tank number.
unum the usernum of the user that owns the object.
size the length, in bytes, of the object to be stored.
flags 0 on failure, or the objectnum field for the newly inserted object.

Definition at line 19 of file data.c.

References mm_wipe(), and stmt_insert_conn().

Referenced by tank_store().

#include "magma.h"
```

Functions

- void http_data_free (http_data_t *data)
  Free an http data object.
- http_data_t * http_data_get (connection_t *con, HTTP_DATA source, chr_t *name)
  Get a name/value pair associated with an http connection, by name.
- void http_data_value_decode (stringer_t *string)
  Decode an escaped URI component into its original data.
- int_t http_data_value_parse (connection_t *con, HTTP_DATA source, placer_t pair)
  Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.
- http_data_t * http_data_header_parse_line (chr_t *buf, size_t len)
  Parse a data buffer into a http header name/value pair.
- http_data_t * http_data_header_parse (connection_t *con)
  Parse the current line of input from an http client connection into a http header name/value pair.

5.68.1 Function Documentation

5.68.1.1 void http_data_free (http_data_t * *data*)

Free an http data object. data.c

Parameters:

data the http data object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file data.c.

References mm_free(), http_data_t::name, st_cleanup, and http_data_t::value.

Referenced by http_data_value_parse(), http_parse_header(), http_parse_pairs(), and portal_upload().

5.68.1.2 http_data_t* http_data_get (connection_t * *con*, HTTP_DATA *source*, chr_t * *name*)

Get a name/value pair associated with an http connection, by name.

Note:

The name/value pairs searched can be supplied by a client through http request headers, or through GET or POST data.

Parameters:

con the connection object to be queried.

source the source of the client supplied value pair: HTTP_DATA_GET, HTTP_DATA_POST or HTTP_DATA_ANY.

name the name associated with the name/value pair to be retrieved.

Returns:

NULL on failure, or a pointer to the http name/value data pair requested on success.

TODO: We could just use the index find function.

Definition at line 34 of file data.c.

References data, connection_t::http, HTTP_DATA_ANY, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), http_data_t::name, NULLER, http_data_t::source, and st_cmp_ci_eq().

Referenced by contact_business(), contact_print_form(), contact_process(), http_body(), http_response_allow_cross(), multipart_get_boundary(), register_business_step1(), register_business_step2(), register_process(), and teacher_process().

5.68.1.3 http_data_t* http_data_header_parse (connection_t * *con*)

Parse the current line of input from an http client connection into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 226 of file data.c.

References http_data_header_parse_line(), connection_t::line, connection_t::network, st_char_get(), and st_length_get().

Referenced by http_parse_header().

5.68.1.4 http_data_t* http_data_header_parse_line (chr_t * *buf*, size_t *len*)

Parse a data buffer into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 163 of file data.c.

References HTTP_DATA_HEADER, mm_alloc(), http_data_t::name, http_data_t::source, st_free(), st_import(), and http_data_t::value.

Referenced by http_data_header_parse(), and portal_upload().

5.68.1.5 void http_data_value_decode (stringer_t * *string*)

Decode an escaped URI component into its original data.

Note:

Since the un-escaped string will always be at least as small as the encoded value, the input managed string is transformed in place.

Parameters:

string a managed string containing the escaped URI data to be decoded.

Returns:

This function returns no value.

Definition at line 68 of file data.c.

References hex_decode_chr(), length, st_char_get(), st_length_get(), and st_length_set().

Referenced by http_data_value_parse().

5.68.1.6 int_t http_data_value_parse (connection_t ∗ *con*, HTTP_DATA *source*, placer_t *pair*)

Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.

Note:

Each name/value pair is assumed to be delimited with a '=' character, and each half is URI-decoded before storage.

Parameters:

con a pointer to the connection object of the http client submitting the user data to be parsed.

source an HTTP_DATA value specifying the source of the name/value pair (can be HTTP_DATA_HEADER, HTTP_DATA_GET, or HTTP_DATA_POST).

pair a placer pointing to a string containing the name/value pair to be parsed.

Returns:

0 on general or parsing failure, or 1 if the specified input buffer was successfully parsed and stored.

Definition at line 111 of file data.c.

References CONTIGUOUS, data, HEAP, connection_t::http, magma_t::http, http_data_free(), http_data_value_decode(), inx_insert(), magma_t::log, log_pedantic, M_TYPE_STRINGER, magma, MANAGED_T, mm_alloc(), http_data_t::name, pl_empty(), placer_t, http_-data_t::source, multi_t::st, st_char_get(), st_dupe_opts(), st_free(), st_length_int(), tok_get_pl(), multi_t::val, and http_data_t::value.

Referenced by http_parse_pairs().

- chr_t ∗ st_option_allocators [ ]

5.69.1 Function Documentation

5.69.1.1 const chr_t∗ st_info_allocator (uint32_t *opts*)

Get a readable description of a managed string's allocator type.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's allocator type.

Definition at line 96 of file info.c.

References HEAP, SECURE, st_option_allocators, and STACK.

Referenced by st_info_opts().

5.69.1.2 const chr_t∗ st_info_layout (uint32_t *opts*)

Get a readable description of a managed string's data layout.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data layout.

Definition at line 75 of file info.c.

References CONTIGUOUS, JOINTED, and st_option_layouts.

Referenced by st_info_opts().

5.69.1.3 chr_t* st_info_opts (uint32_t *opts*, chr_t * *s*, size_t *len*)

Get a readable description of all of a managed string's option flags.

Parameters:

opts a value containing the managed string's option mask.

s a pointer to a null-terminated string to receive the options description.

len the length, in bytes, of the description output buffer.

Returns:

NULL on failure, or a pointer to the output buffer containing the managed string's options description on success.

LOW: Turn this into a loop.

Definition at line 122 of file info.c.

Functions

- size_t st_length_get (stringer_t *s)
  Return the length of the data in a managed string.
- int_t st_length_int (stringer_t *s)
  Length.
- size_t st_length_set (stringer_t *s, size_t len)
  Set the data length for a managed string that supports data length tracking.
- size_t st_avail_get (stringer_t *s)
  Return the total data buffer size allocated for a managed string.
- size_t st_avail_set (stringer_t *s, size_t avail)
  Set the total data buffer size allocated for a managed string.

5.70.1 Function Documentation

5.70.1.1 size_t st_avail_get (stringer_t * *s*)

Return the total data buffer size allocated for a managed string.

Parameters:

s the input managed string.

Returns:

0 on failure, or the total buffer size in bytes on success.

Definition at line 146 of file length.c.

References log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, st_info_opts(), st_length_get(), and st_valid_opts().

5.70.1.2 size_t st_avail_set (stringer_t * *s*, size_t *avail*)

Set the total data buffer size allocated for a managed string.

Parameters:

s the input managed string.

avail the new buffer size for the managed string.

Returns:

0 on failure, or the managed string's new buffer size in bytes on success.

Definition at line 183 of file length.c.

References log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, st_info_opts(), and st_valid_avail().

5.70.1.3 size_t st_length_get (stringer_t * *s*)

Return the length of the data in a managed string.

Parameters:

s the input managed string.

Returns:

0 on failure, or the length of the managed string's data in bytes.

Definition at line 15 of file length.c.

5.70.1.4 int_t st_length_int (stringer_t ∗ *s*)

Length. Return the length of a managed string as an integer.

Parameters:

s the managed string as type stringer_t ∗.

Returns:

the string length as an integer, capped at INT_MAX.

Definition at line 70 of file length.c.

References log_pedantic, st_length_get(), and st_valid_opts().

5.70.1.5 size_t st_length_set (stringer_t * *s*, size_t *len*)

Set the data length for a managed string that supports data length tracking.

Parameters:

s the input managed string.

len the new value of the managed string's data length.

Returns:

0 on error, or the new data length on success.

Definition at line 99 of file length.c.

Functions

- multi_t mt_get_null (void)
  Return an empty multi-type object.
- bool_t mt_is_empty (multi_t multi)
  Determine whether a multi-type object is empty.
- bool_t mt_is_number (multi_t multi)
  Determine whether a multi-type object is a number.
- uint64_t mt_get_number (multi_t multi)
  Get the value of a numerical multi-type object.
- char * mt_get_char (const multi_t *multi)
  Get a character pointer to the value of a multi-type object.
- size_t mt_get_length (multi_t multi)
  Get the length of the data associated with a multi-type object.
- M_TYPE mt_get_type (multi_t multi)
  Get the data type associated with a multi-type object.
- multi_t mt_set_type (multi_t multi, M_TYPE target)
  Set the data type of a multi-type data object.
- void mt_free (multi_t multi)
  Free the data underlying a multi-type data object (for managed and null-terminated strings).
- multi_t mt_dupe (multi_t multi)
  Duplicate a multi-type object.
- bool_t ident_mt_mt (multi_t one, multi_t two)
  Check to see if the values of two multi-type objects are identical.
- int32_t cmp_mt_mt (multi_t one, multi_t two)
  Compare the values of two multi-type objects of the same data type.

5.71.1 Function Documentation

5.71.1.1 int32_t cmp_mt_mt (multi_t *one*, multi_t *two*)

Compare the values of two multi-type objects of the same data type. multi.c

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

one the first multi-type object to be compared.

two the second multi-type object to be compared.

Returns:

Definition at line 682 of file multi.c.

References multi_t::binary, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, log_pedantic, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, mt_get_type(), multi_t::ns, NULLER, multi_t::st, st_cmp_cs_eq(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by tree_cmp().

5.71.1.2 bool_t ident_mt_mt (multi_t *one*, multi_t *two*)

Check to see if the values of two multi-type objects are identical.

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

one the first multi-type object to be compared.

two the second multi-type object to be compared.

Returns:

true if the two objects have identical values; false if they don't, or on failure.

Definition at line 567 of file multi.c.

References multi_t::binary, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, log_pedantic, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, mt_get_type(), multi_t::ns, ns_length_get(), PLACER, multi_t::st, st_cmp_cs_eq(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket_find_key(), hashed_delete(), linked_delete(), and linked_find().

5.71.1.3 multi_t mt_dupe (multi_t *multi*)

Duplicate a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

a copy of the input object (a deep copy for managed strings and null-terminated strings).

Definition at line 484 of file multi.c.

References multi_t::binary, CONTIGUOUS, multi_t::dbl, multi_t::fl, HEAP, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, mt_get_null(), multi_t::ns, ns_dupe(), multi_t::st, st_dupe_opts(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket_alloc(), linked_record_alloc(), and tree_insert().

5.71.1.4 void mt_free (multi_t *multi*)

Free the data underlying a multi-type data object (for managed and null-terminated strings).

Parameters:

multi the multi-type object to be freed.

Returns:

This function returns no value.

Definition at line 462 of file multi.c.

References M_TYPE_NULLER, M_TYPE_STRINGER, multi_t::ns, ns_free(), multi_t::st, st_free(), multi_t::type, and multi_t::val.

Referenced by hashed_delete(), hashed_free(), hashed_truncate(), linked_record_free(), tree_delete(), tree_insert(), and tree_truncate().

5.71.1.5 char∗ mt_get_char (const multi_t ∗ *multi*)

Get a character pointer to the value of a multi-type object.

Parameters:

multi a pointer to the multi-type object to be examined.

a pointer to the value of the input object, or NULL on failure.

Returns:

null on error

Definition at line 172 of file multi.c.

References multi_t::binary, multi_t::bl, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_INFO, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, multi_t::st, st_char_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.71.1.6 size_t mt_get_length (multi_t *multi*)

Get the length of the data associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the length in bytes of the data associated with the input object, or 0 on failure.

Definition at line 249 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_-FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_-UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_length_get(), multi_t::st, st_length_get(), type(), multi_t::type, and multi_t::val.

Referenced by hashed_bucket().

5.71.1.7 multi_t mt_get_null (void)

Return an empty multi-type object.

Returns:

an empty multi-type object.

Definition at line 17 of file multi.c.

References EMPTY, and multi_t::type.

Referenced by hashed_cursor_key_active(), hashed_cursor_key_next(), inx_cursor_key_active(), inx_cursor_key_next(), linked_cursor_-key_active(), linked_cursor_key_next(), linked_record_get_key(), mt_dupe(), tree_cursor_key_next(), and tree_cursor_next().

5.71.1.8 uint64_t mt_get_number (multi_t *multi*)

Get the value of a numerical multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the numerical value of the input object, or 0 on failure.

Definition at line 116 of file multi.c.

References multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_PEDANTIC, M_LOG_-STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_-INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_-TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.71.1.9 M_TYPE mt_get_type (multi_t *multi*)

Get the data type associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the data type of the input object, or EMPTY on failure.

Definition at line 318 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by cmp_mt_mt(), and ident_mt_mt().

5.71.1.10 bool_t mt_is_empty (multi_t *multi*)

Determine whether a multi-type object is empty.

Note:

All numeric (including boolean and floating point) types will always return false.

Parameters:

multi the multi-type object to be examined.

Returns:

true if the object is empty (by type or value), or false otherwise.

Definition at line 31 of file multi.c.

References multi_t::bl, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_empty(), multi_t::st, st_empty, type(), multi_t::type, and multi_t::val.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), and tree_insert().

5.71.1.11 bool_t mt_is_number (multi_t *multi*)

Determine whether a multi-type object is a number.

Parameters:

multi the multi-type object to be examined. return true if the input object is any integer, boolean, or floating point; false otherwise.

Definition at line 80 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by hashed_bucket().

5.71.1.12 multi_t mt_set_type (multi_t *multi*, M_TYPE *target*)

Set the data type of a multi-type data object.

Parameters:

multi the multi-type object to be adjusted.

target the value of the new data type for the input object.

Returns:

a copy of the modified multi-type data object.

Definition at line 391 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Functions

- size_t ns_length_get (const chr_t *s)
  Return the length of a null-terminated string.
- bool_t ns_empty (chr_t *s)
  Return whether a null-terminated string is empty or not.
- bool_t ns_empty_out (chr_t *s, chr_t **ptr, size_t *len)
  Return whether a null-terminated string is empty or not, while storing its address and length.
- int ns_length_int (chr_t *s)
  Return the length of a null-terminated string as an int, capped at INT_MAX.
- chr_t * ns_alloc (size_t len)
  Allocate (and wipe) a buffer for a null-terminated string.
- void ns_free (chr_t *s)
  Free a null-terminated string.
- void ns_cleanup_variadic (ssize_t len,...)
  A checked cleanup function which can be used free a variable number of null-terminated strings.
- chr_t * ns_dupe (chr_t *s)
  Duplicate a null-terminated string.
- chr_t * ns_import (void *block, size_t len)
  Get a block of memory as a null-terminated string.
- chr_t * ns_append (chr_t *s, chr_t *append)
  Append one string to another and return the result.
- void ns_wipe (chr_t *s, size_t len)
  Zero out a null-terminated string.

5.72.1 Function Documentation

5.72.1.1 chr_t* ns_alloc (size_t *len*)

Allocate (and wipe) a buffer for a null-terminated string. nuller.c

Parameters:

len the length of the buffer to be allocated.

Returns:

NULL on failure or if len was 0; a pointer to the newly allocated memory otherwise.

Definition at line 68 of file nuller.c.

References log_pedantic, mm_alloc(), and ns_wipe().

Referenced by deserialize_ns(), mail_message_path(), and ns_append().

5.72.1.2 chr_t* ns_append (chr_t * *s*, chr_t * *append*)

Append one string to another and return the result.

Parameters:

s a pointer to a leading null-terminated string to to which the other string will be appended.

append a pointer to a null-terminated string to be appended to the leading string.

Returns:

NULL if a memory allocation failure occurred, or a pointer to the resulting string on success.

Definition at line 179 of file nuller.c.

References log_pedantic, mm_copy(), ns_alloc(), ns_dupe(), ns_free(), and ns_length_get().

Referenced by api_response(), portal_endpoint_error(), and portal_endpoint_response().

5.72.1.3 void ns_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number of null-terminated strings.

See also:

ns_free()

Parameters:

va_list a list of null-terminated strings to be freed.

Returns:

This function returns no value.

Definition at line 114 of file nuller.c.

References ns_free().

5.72.1.4 chr_t* ns_dupe (chr_t * *s*)

Duplicate a null-terminated string.

Parameters:

s the null-terminated string to be duplicated.

Returns:

NULL on failure, or a pointer to a copy of the input string.

Definition at line 135 of file nuller.c.

References length, log_info, log_pedantic, mm_alloc(), mm_copy(), and ns_length_get().

Referenced by cache_set_value(), config_value_set(), mt_dupe(), ns_append(), relay_set_value(), servers_set_value(), and xml_get_xpath_-ns().

5.72.1.5 bool_t ns_empty (chr_t * *s*)

Return whether a null-terminated string is empty or not.

Parameters:

s the input as a null-terminated string.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 29 of file nuller.c.

References ns_length_get().

Referenced by cache_free(), cache_output_settings(), cache_set_value(), cache_validate(), config_output_value(), config_output_value_generic(), config_value_set(), mail_mime_get_media_type(), mt_is_empty(), relay_free(), relay_output_settings(), relay_set_value(), relay_validate(), servers_free(), servers_output_settings(), servers_set_value(), servers_validate(), sql_start(), and st_merge_opts().

5.72.1.6 bool_t ns_empty_out (chr_t * *s*, chr_t ** *ptr*, size_t * *len*)

Return whether a null-terminated string is empty or not, while storing its address and length.

Parameters:

s the input as a null-terminated string.

ptr a pointer address to receive a copy of the string's location.

len a pointer to a variable to receive the length of the string, in bytes.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 41 of file nuller.c.

References ns_length_get().

5.72.1.7 void ns_free (chr_t * *s*)

Free a null-terminated string.

Parameters:

s the string to be freed.

Returns:

This function returns no value.

Definition at line 95 of file nuller.c.

References log_pedantic, and mm_free().

Referenced by api_response(), cache_free(), cache_set_value(), config_free(), config_value_set(), ip_subnet_st(), mail_copy_message(), mail_load_message(), mail_message_path(), mail_remove_message(), mail_store_message(), mail_store_message_data(), mt_free(), ns_append(), ns_cleanup_variadic(), portal_endpoint_error(), portal_endpoint_response(), relay_free(), relay_set_value(), servers_free(), and servers_set_value().

5.72.1.8 chr_t* ns_import (void * *block*, size_t *len*)

Get a block of memory as a null-terminated string.

Parameters:

block a pointer to the buffer containing the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

NULL on failure, or a pointer to the newly allocated null-terminated string on success.

Definition at line 160 of file nuller.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by cache_set_value(), config_value_set(), ip_subnet_st(), relay_set_value(), and servers_set_value().

5.72.1.9 size_t ns_length_get (const chr_t * *s*)

Return the length of a null-terminated string. LOW: The ns_ functions are designed to work with NULL terminated strings. They shouldn't require a length. If the length needs to be provided, then the equivalent mm_ function should be used.

Parameters:

s the input as a null-terminatd string.

Returns:

the length in bytes of the string.

Definition at line 18 of file nuller.c.

Referenced by api_endpoint_delete_user(), api_response(), con_reverse_lookup(), con_write_ns(), config_fetch_host_number(), config_fetch_settings(), deprecated_ecies_key_private_hex(), deprecated_ecies_key_public_hex(), ecies_key_private_hex(), ecies_key_public_hex(), file_temp_handle(), host_platform(), host_version(), http_load_file(), ident_mt_mt(), imap_build_array(), imap_fetch_bodystructure(), imap_fetch_message(), imap_search_messages_date(), int16_conv_ns(), int32_conv_ns(), int64_conv_ns(), int8_conv_ns(), ip_addr_st(), ip_presentation(), ip_subnet_st(), lib_load_openssl(), line_pl_ns(), log_rotate(), log_start(), mail_mime_get_media_type(), mail_path_finder(), meta_folders_name(), mt_get_length(), ns_append(), ns_dupe(), ns_empty(), ns_empty_out(), ns_length_int(), portal_endpoint(), portal_endpoint_attachments_add(), portal_endpoint_error(), portal_endpoint_folders_add(), portal_endpoint_folders_rename(), portal_endpoint_response(), portal_parse_json_str_array(), rand_choices(), register_data_insert_user(), register_print_step1(), register_print_step2(), servers_network_start(), smtp_client_send_helo(), spool_path(), st_merge_opts(), stmt_rebuild(), stmt_start(), tank_start(), teacher_add_cookie(), uint16_conv_ns(), uint32_conv_ns(), uint64_conv_ns(), uint8_conv_ns(), virus_check(), xml_get_xpath_int16(), xml_get_xpath_int32(), xml_get_xpath_int64(), xml_get_xpath_int8(), xml_get_xpath_st(), xml_get_xpath_uint16(), xml_get_xpath_uint32(), xml_get_xpath_uint64(), and xml_get_xpath_uint8().

5.72.1.10 int ns_length_int (chr_t * *s*)

Return the length of a null-terminated string as an int, capped at INT_MAX.

Parameters:

s the null-terminated string to be evaluated.

Returns:

the length of the string.

Definition at line 51 of file nuller.c.

References log_pedantic, and ns_length_get().

Referenced by lib_load_bzip().

5.72.1.11 void ns_wipe (chr_t * *s*, size_t *len*)

Zero out a null-terminated string.

Parameters:

s the string to be wiped.

len the number of bytes to be wiped at the start of the string.

Returns:

This function returns no parameters.

Definition at line 214 of file nuller.c.

References log_pedantic, and mm_set().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and ns_alloc().

```

Functions

- uint32_t st_opt_get (stringer_t *s)

  Returns the options variable from a string to the caller. Is intended for use by functions outside of string library.

- int_t st_opt_set (stringer_t *s, uint32_t opt, bool_t enabled)

  Enable or disable a set of option(s) for a managed string, with validity testing.

- bool_t st_opt_test (stringer_t *s, uint32_t opt)

  Check to see if the managed string has the specified option enabled.

5.73.1 Function Documentation

5.73.1.1 uint32_t st_opt_get (stringer_t * *s*)

Returns the options variable from a string to the caller. Is intended for use by functions outside of string library. opts.c

Parameters:

s the input string.

Returns:

the options in use by the provided string.

Definition at line 15 of file opts.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), chunk_header_write(), ed25519_private_get(), ed25519_public_get(), ed25519_sign(), meta_data_fetch_shard(), org_key_get(), org_signet_get(), prime_field_write(), prime_header_write(), rand_choices(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_write_variadic(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), user_key_get(), user_request_get(), and user_signet_get().

5.73.1.2 int_t st_opt_set (stringer_t * *s*, uint32_t *opt*, bool_t *enabled*)

Enable or disable a set of option(s) for a managed string, with validity testing.

Parameters:

s the input managed string.

opt the bitmask of option(s) to be enabled or disabled for the managed string.

enabled if true, set the option(s); if false, disable them.

Returns:

-1 on error, 0 if successfully disabled, or 1 if successfully enabled.

Definition at line 33 of file opts.c.

References log_pedantic, MEMORYBUF, st_info_opts(), and st_valid_opts().

Referenced by contact_name().

5.73.1.3 bool_t st_opt_test (stringer_t * *s*, uint32_t *opt*)

Check to see if the managed string has the specified option enabled.

Parameters:

s the managed string to be checked. opt a bitmask of the managed string options to be tested.

Returns:

-1 on error, 0 if opt is not set, and 1 if opt is set.

Definition at line 64 of file opts.c.

References log_pedantic, MEMORYBUF, st_info_opts(), and st_valid_opts().

Referenced by contact_free(), and contact_name().

5.74 src/core/strings/print.c File Reference

```
#include "magma.h"
```

Functions

- size_t st_vsprint (stringer_t *s, chr_t *format, va_list args)

  Print to a managed string and return the number of bytes written.

- size_t st_sprint (stringer_t *s, chr_t *format,...)

  Print to a managed string and return the number of bytes written.

- stringer_t * st_quick (stringer_t *s, chr_t *format,...)

  Print to a managed string and return a pointer to the result.

- stringer_t * st_vaprint_opts (uint32_t opts, chr_t *format, va_list args)

  Return a managed string containing sprintf()-style formatted data.

- stringer_t * st_aprint (chr_t *format,...)

  Return a managed string containing sprintf()-style formatted data.

- stringer_t * st_aprint_opts (uint32_t opts, chr_t *format,...)

  Return a managed string containing sprintf()-style formatted data, with custom allocation options.

- int_t st_write_variadic (stringer_t *output, ssize_t count,...)

  Write a variable number of user-supplied strings into a buffer.

5.74.1 Function Documentation

5.74.1.1 stringer_t* st_aprint (chr_t * *format*, ...)

Return a managed string containing sprintf()-style formatted data.

See also:

st_vaprint_opts()

Parameters:

format a format string for the output string data.

... a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 145 of file print.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_vaprint_opts().

Referenced by portal_endpoint_attachments_progress(), portal_endpoint_search(), portal_message_attachments(), register_captcha_random_font(), serial_get(), serial_increment(), serial_reset(), and spool_mktemp().

5.74.1.2 stringer_t* st_aprint_opts (uint32_t *opts*, chr_t * *format*, ...)

Return a managed string containing sprintf()-style formatted data, with custom allocation options.

Parameters:

opts the option value of the newly allocated managed string that will contain the result.

format a format string for the output string data.

... a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string of the specified allocation options containing the final formatted data on success.

Definition at line 164 of file print.c.

References st_vaprint_opts().

Referenced by http_response_cookie(), imap_fetch_message(), and imap_search().

5.74.1.3 stringer_t* st_quick (stringer_t * *s*, chr_t * *format*, ...)

Print to a managed string and return a pointer to the result.

See also:

st_print()

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

... a variable argument list containing the parameters to the print format string.

Returns:

a pointer to the managed string that received the printed output.

Definition at line 82 of file print.c.

References st_vsprint().

Referenced by api_endpoint_auth(), http_response_allow_cross(), http_response_cookie(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and smtp_client_send_data().

5.74.1.4 size_t st_sprint (stringer_t * *s*, chr_t * *format*, ...)

Print to a managed string and return the number of bytes written.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

... a variable argument list containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 62 of file print.c.

References st_vsprint().

Referenced by contact_abuse_checks(), contact_abuse_increment_history(), host_platform(), host_version(), imap_id(), imap_search(), ip_reversed(), ip_standard(), ip_subnet(), lock_get(), lock_release(), mail_build_signature(), smtp_bounce(), smtp_check_greylist(), smtp_reply(), tls_cipher(), tls_error(), user_lock(), and user_unlock().

5.74.1.5 stringer_t* st_vaprint_opts (uint32_t *opts*, chr_t * *format*, va_list *args*)

Return a managed string containing sprintf()-style formatted data.

Parameters:

opts an options value to be passed to the allocation of the resulting managed string.

format a format string for the output string data.

args a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 100 of file print.c.

References length, log_pedantic, MEMORYBUF, st_alloc_opts(), st_data_get(), st_free(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_aprint(), and st_aprint_opts().

5.74.1.6 size_t st_vsprint (stringer_t * *s*, chr_t * *format*, va_list *args*)

Print to a managed string and return the number of bytes written.

See also:

vsnprintf()

Note:

If the destination string pointer is NULL the function will simply return how much room would have been necessary.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

args a va_list containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 19 of file print.c.

References length, log_pedantic, MEMORYBUF, st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_quick(), and st_sprint().

5.74.1.7 int_t st_write_variadic (stringer_t * *output*, ssize_t *count*, ...)

Write a variable number of user-supplied strings into a buffer.

Parameters:

... a variable argument list containing the strings to be written one after the other.

Returns:

the number of bytes written into the buffer.

Definition at line 182 of file print.c.

References data, mm_copy(), st_avail_get(), st_data_get(), st_empty_out(), st_length_set(), st_opt_get(), and st_valid_tracked().

5.75.1.2 stringer_t* st_swap (stringer_t * *target*, uchr_t *pattern*, uchr_t *replacement*)

Replace all instances of one character in a managed string with another.

Parameters:

target the input string which will be transformed by the character replacement.

pattern the character to be searched and replaced in the target string.

replacement the character to be substituted for the pattern character in the target string.

Returns:

a pointer to the target managed string.

Definition at line 109 of file replace.c.

Functions

- placer_t pl_null (void)

  Return a zero-length placer pointing to NULL data.

- placer_t ∗ pl_init_by_addr (placer_t ∗result, void ∗data, size_t len)

  Initialize an existing placer that wraps a data buffer of given size.

- placer_t pl_init (void ∗data, size_t len)

  Return a placer wrapping a data buffer of given size.

- placer_t pl_clone (placer_t place)
- placer_t pl_set (placer_t place, placer_t set)
- void ∗ pl_data_get (placer_t place)

  Get a pointer to the data referenced by a placer.

- chr_t ∗ pl_char_get (placer_t place)

  Get a character pointer to the data referenced by a placer.

- int_t pl_length_int (placer_t place)

  Get the length, in bytes, of a placer as an integer.

- size_t pl_length_get (placer_t place)

  Get the length, in bytes, of a placer.

- bool_t pl_empty (placer_t place)

  Determine whether or not the specified placer is empty.

- bool_t pl_starts_with_char (placer_t place, chr_t c)

  Determine if a placer begins with a specified character.

- bool_t pl_inc (placer_t ∗place, bool_t more)

  Advance the placer one character forward beyond an expected character.

5.76.1 Function Documentation

5.76.1.1 chr_t∗ pl_char_get (placer_t *place*)

Get a character pointer to the data referenced by a placer.

Parameters:

place the input placer.

Returns:

NULL on failure or a a character pointer to the block of data associated with the specified placer on success.

Definition at line 82 of file shortcuts.c.

References st_char_get().

5.76.1.5 bool_t pl_inc (placer_t * *place*, bool_t *more*)

Advance the placer one character forward beyond an expected character.

Parameters:

place the input placer.

more if true, the placer must contain more data, and vice versa.

Returns:

true if more was true and the placer contains more data, or if more was false and the placer ended; false otherwise.

Definition at line 142 of file shortcuts.c.

References pl_empty().

5.76.1.6 placer_t pl_init (void * *data*, size_t *len*)

Return a placer wrapping a data buffer of given size.

Parameters:

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

a placer pointing to the specified data.

Definition at line 53 of file shortcuts.c.

5.76.1.7 placer_t* pl_init_by_addr (placer_t * *result*, void * *data*, size_t *len*)

Initialize an existing placer that wraps a data buffer of given size. shortcuts.c

Parameters:

result a non-null pointer to the placer that will store the result

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

NULL on error or a pointer to a placer referencing the specified data.

Definition at line 28 of file shortcuts.c.

References FOREIGNDATA, JOINTED, log_error, PLACER_T, and STACK.

Referenced by mail_get_chunk().

5.76.1.8 size_t pl_length_get (placer_t *place*)

Get the length, in bytes, of a placer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 102 of file shortcuts.c.

References st_length_get().

5.76.1.9 int_t pl_length_int (placer_t *place*)

Get the length, in bytes, of a placer as an integer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 92 of file shortcuts.c.

References st_length_int().

Referenced by lib_load_openssl(), smtp_client_send_data(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), and smtp_parse_-rcpt_to().

5.76.1.10 placer_t pl_null (void)

Return a zero-length placer pointing to NULL data.

Returns:

a zero-length placer pointing to NULL data.

Definition at line 14 of file shortcuts.c.

References FOREIGNDATA, JOINTED, PLACER_T, placer_t, and STACK.

5.76.1.11 placer_t pl_set (placer_t *place*, placer_t *set*)

Definition at line 62 of file shortcuts.c.

References placer_t.

Referenced by mail_mime_split().

5.76.1.12 bool_t pl_starts_with_char (placer_t *place*, chr_t *c*)

Determine if a placer begins with a specified character.

Parameters:

place the input placer.

c the character to be compared with the first byte of the placer's data.

Returns:

true if the placer begins with the given character or false otherwise.

Definition at line 123 of file shortcuts.c.

References pl_char_get(), and pl_empty().

Referenced by nvp_parse(), prime_pem_unwrap(), and smtp_client_send_data().

Enumerations

- enum {
  CONSTANT_T = 1, PLACER_T = 2, NULLER_T = 4, BLOCK_T = 8,
  MANAGED_T = 16, MAPPED_T = 32, CONTIGUOUS = 64, JOINTED = 128,
  STACK = 256, HEAP = 512, SECURE = 1024, FOREIGNDATA = 4096 }

Functions

- struct __attribute__ ((packed))
- chr_t * ns_alloc (size_t len)

  nuller.c

- chr_t * ns_append (chr_t *s, chr_t *append)
  Append one string to another and return the result.
- chr_t * ns_dupe (chr_t *s)
  Duplicate a null-terminated string.
- bool_t ns_empty (chr_t *s)
  Return whether a null-terminated string is empty or not.
- bool_t ns_empty_out (chr_t *s, chr_t **ptr, size_t *len)
  Return whether a null-terminated string is empty or not, while storing its address and length.
- void ns_free (chr_t *s)
  Free a null-terminated string.
- void ns_cleanup_variadic (ssize_t len,...)
  A checked cleanup function which can be used free a variable number of null-terminated strings.
- chr_t * ns_import (void *block, size_t len)
  Get a block of memory as a null-terminated string.
- size_t ns_length_get (const chr_t *s)
  Return the length of a null-terminated string.
- int ns_length_int (chr_t *s)
  Return the length of a null-terminated string as an int, capped at INT_MAX.
- void ns_wipe (chr_t *s, size_t len)
  Zero out a null-terminated string.
- const chr_t * st_info_type (uint32_t opts)
  Get a readable description of a managed string's data type.
- const chr_t * st_info_layout (uint32_t opts)
  Get a readable description of a managed string's data layout.
- const chr_t * st_info_allocator (uint32_t opts)
  Get a readable description of a managed string's allocator type.
- chr_t * st_info_opts (uint32_t opts, chr_t *s, size_t len)
  Get a readable description of all of a managed string's option flags.
- bool_t st_valid_free (uint32_t opts)
  Determine whether a managed string is allowed to be freed.
- bool_t st_valid_opts (uint32_t opts)
  Check to see that a managed string has a valid combination of allocation options.
- bool_t st_valid_avail (uint32_t opts)
  Determine whether a managed string tracks the total allocated buffer size.
- bool_t st_valid_append (uint32_t opts)
  Determine whether the managed string options allow for data appending.

- bool_t st_valid_placer (uint32_t opts)

  A sanity check to determine whether the managed string is a valid placer.

- bool_t st_valid_jointed (uint32_t opts)

  Determine whether the managed string options are a validly jointed.

- bool_t st_valid_tracked (uint32_t opts)

  Determine whether a managed string provides for data length tracking.

- bool_t st_valid_destination (uint32_t opts)

  Determine whether the managed string options allow for a data store operation.

- int_t st_length_int (stringer_t *s)

  Length.

- size_t st_avail_get (stringer_t *s)

  Return the total data buffer size allocated for a managed string.

- size_t st_length_get (stringer_t *s)

  Return the length of the data in a managed string.

- size_t st_avail_set (stringer_t *s, size_t avail)

  Set the total data buffer size allocated for a managed string.

- size_t st_length_set (stringer_t *s, size_t len)

  Set the data length for a managed string that supports data length tracking.

- chr_t * st_char_get (stringer_t *s)

  data.c

- void * st_data_get (stringer_t *s)

  Retrieve the data associated with a managed string.

- void st_data_set (stringer_t *s, void *data)

  Set the underlying data of a jointed managed string.

- bool_t st_empty_out (stringer_t *s, uchr_t **ptr, size_t *len)

  Determine whether the specified managed string is empty or not, and store its underlying data and data length.

- bool_t st_empty_variadic (ssize_t len,...)

  A simple method for checking multiple managed strings to see if any are empty.

- bool_t st_populated_variadic (ssize_t len,...)

  A simple method for checking multiple managed strings to see if all of them contain data.

- bool_t st_used_variadic (ssize_t len,...)
- uchr_t * st_uchar_get (stringer_t *s)

  Retrieve an unsigned character pointer to a managed string's data buffer.

- void st_wipe (stringer_t *s)

  Wipe all of a managed string's allocated memory and if applicable, reset its length.

- stringer_t * st_set (stringer_t *s, uint8_t set, size_t len)
  Sets a block of memory to a specified value.

- void st_free (stringer_t *s)
  Free a managed string.

- void st_cleanup_variadic (ssize_t len,...)
  A checked cleanup function which can be used free a variable number managed strings.

- stringer_t * st_alloc (size_t len)
  Allocate a managed string with a specified options mask.

- stringer_t * st_dupe (stringer_t *s)
  Duplicate a managed string.

- stringer_t * st_import (const void *s, size_t len)
  Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

- stringer_t * st_copy_in (stringer_t *s, void *buf, size_t len)
  Copy data into a managed string.

- stringer_t * st_realloc (stringer_t *s, size_t len)
  Reallocate a managed string to a specified size.

- stringer_t * st_output (stringer_t *output, size_t len)
  Return a suitable managed string to store data of a specified length.

- stringer_t * st_nullify (chr_t *input, size_t len)
  Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

- stringer_t * st_import_opts (uint32_t opts, const void *s, size_t len)
  Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

- stringer_t * st_alloc_opts (uint32_t opts, size_t len)
  Allocate a managed string with a specified options mask.

- stringer_t * st_dupe_opts (uint32_t opts, stringer_t *s)
  Create a duplicate copy of a managed string with a specified set of allocation options.

- stringer_t * st_merge_opts (uint32_t opts, chr_t *format,...)
  Concatenate a variable number of user-supplied multi-type strings.

- stringer_t * st_append_opts (size_t align, stringer_t *s, stringer_t *append)
  Append one managed string to another, with aligned memory boundaries.

- int_t st_append_out (size_t align, stringer_t **s, stringer_t *append)
- placer_t * pl_init_by_addr (placer_t *result, void *data, size_t len)
  shortcuts.c

- chr_t * pl_char_get (placer_t place)
  Get a character pointer to the data referenced by a placer.

- void * pl_data_get (placer_t place)

Get a pointer to the data referenced by a placer.

- bool_t pl_empty (placer_t place)

  Determine whether or not the specified placer is empty.

- placer_t pl_init (void *data, size_t len)

  Return a placer wrapping a data buffer of given size.

- placer_t pl_clone (placer_t place)
- size_t pl_length_get (placer_t place)

  Get the length, in bytes, of a placer.

- int_t pl_length_int (placer_t place)

  Get the length, in bytes, of a placer as an integer.

- placer_t pl_null (void)

  Return a zero-length placer pointing to NULL data.

- placer_t pl_set (placer_t place, placer_t set)
- bool_t pl_starts_with_char (placer_t place, chr_t c)

  Determine if a placer begins with a specified character.

- bool_t pl_inc (placer_t *place, bool_t more)

  Advance the placer one character forward beyond an expected character.

- uint32_t st_opt_get (stringer_t *s)

  opts.c

- bool_t st_opt_test (stringer_t *s, uint32_t opt)

  Check to see if the managed string has the specified option enabled.

- int_t st_opt_set (stringer_t *s, uint32_t opt, bool_t enabled)

  Enable or disable a set of option(s) for a managed string, with validity testing.

- stringer_t * st_aprint (chr_t *format,...) __attribute__((format(printf

  print.c

- stringer_t stringer_t * st_aprint_opts (uint32_t opts, chr_t *format,...) __attribute__((format(printf
- stringer_t stringer_t stringer_t * st_quick (stringer_t *s, chr_t *format,...) __attribute__((format(printf
- stringer_t stringer_t stringer_t size_t st_sprint (stringer_t *s, chr_t *format,...) __attribute__((format(printf
- stringer_t stringer_t stringer_t size_t stringer_t * st_vaprint_opts (uint32_t opts, chr_t *format, va_list args)

  Return a managed string containing sprintf()-style formatted data.

- size_t st_vsprint (stringer_t *s, chr_t *format, va_list args)

  Print to a managed string and return the number of bytes written.

- int_t st_write_variadic (stringer_t *output, ssize_t count,...)

  Write a variable number of user-supplied strings into a buffer.

- int_t st_replace (stringer_t **target, stringer_t *pattern, stringer_t *replacement)

  replace.c

- stringer_t * st_swap (stringer_t *target, uchr_t pattern, uchr_t replacement)

Replace all instances of one character in a managed string with another.

- int32_t cmp_mt_mt (multi_t one, multi_t two)
  multi.c
- bool_t ident_mt_mt (multi_t one, multi_t two)
  Check to see if the values of two multi-type objects are identical.
- multi_t mt_dupe (multi_t multi)
  Duplicate a multi-type object.
- void mt_free (multi_t multi)
  Free the data underlying a multi-type data object (for managed and null-terminated strings).
- char * mt_get_char (const multi_t *multi)
  Get a character pointer to the value of a multi-type object.
- size_t mt_get_length (multi_t multi)
  Get the length of the data associated with a multi-type object.
- multi_t mt_get_null (void)
  Return an empty multi-type object.
- uint64_t mt_get_number (multi_t multi)
  Get the value of a numerical multi-type object.
- M_TYPE mt_get_type (multi_t multi)
  Get the data type associated with a multi-type object.
- bool_t mt_is_empty (multi_t multi)
  Determine whether a multi-type object is empty.
- bool_t mt_is_number (multi_t multi)
  Determine whether a multi-type object is a number.
- multi_t mt_set_type (multi_t multi, M_TYPE target)
  Set the data type of a multi-type data object.

Definition at line 68 of file strings.h.

References data, and length.

5.77.4.2 int32_t cmp_mt_mt (multi_t *one*, multi_t *two*)

multi.c multi.c

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

one the first multi-type object to be compared.

two the second multi-type object to be compared.

Returns:

Definition at line 682 of file multi.c.

References multi_t::binary, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, log_pedantic, M_LOG_-PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_-INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_-TYPE_UINT64, M_TYPE_UINT8, mt_get_type(), multi_t::ns, NULLER, multi_t::st, st_cmp_cs_eq(), multi_t::type, multi_t::u16, multi_-t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by tree_cmp().

5.77.4.3 bool_t ident_mt_mt (multi_t *one*, multi_t *two*)

Check to see if the values of two multi-type objects are identical.

Note:

The types of the two input objects must match, or be a comparison between a managed string and null-terminated string.

Parameters:

one the first multi-type object to be compared.

two the second multi-type object to be compared.

Returns:

true if the two objects have identical values; false if they don't, or on failure.

Definition at line 567 of file multi.c.

References multi_t::binary, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, log_pedantic, M_LOG_-PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_-INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_-TYPE_UINT64, M_TYPE_UINT8, mt_get_type(), multi_t::ns, ns_length_get(), PLACER, multi_t::st, st_cmp_cs_eq(), multi_t::type, multi_-t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket_find_key(), hashed_delete(), linked_delete(), and linked_find().

5.77.4.4 multi_t mt_dupe (multi_t *multi*)

Duplicate a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

a copy of the input object (a deep copy for managed strings and null-terminated strings).

Definition at line 484 of file multi.c.

References multi_t::binary, CONTIGUOUS, multi_t::dbl, multi_t::fl, HEAP, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_-pedantic, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_-TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, mt_get_null(), multi_t::ns, ns_dupe(), multi_t::st, st_dupe_opts(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_-t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket_alloc(), linked_record_alloc(), and tree_insert().

5.77.4.5 void mt_free (multi_t *multi*)

Free the data underlying a multi-type data object (for managed and null-terminated strings).

Parameters:

multi the multi-type object to be freed.

Returns:

This function returns no value.

Definition at line 462 of file multi.c.

References M_TYPE_NULLER, M_TYPE_STRINGER, multi_t::ns, ns_free(), multi_t::st, st_free(), multi_t::type, and multi_t::val.

Referenced by hashed_delete(), hashed_free(), hashed_truncate(), linked_record_free(), tree_delete(), tree_insert(), and tree_truncate().

5.77.4.6 char∗ mt_get_char (const multi_t ∗ *multi*)

Get a character pointer to the value of a multi-type object.

Parameters:

multi a pointer to the multi-type object to be examined.

a pointer to the value of the input object, or NULL on failure.

Returns:

null on error

Definition at line 172 of file multi.c.

References multi_t::binary, multi_t::bl, multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_INFO, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, multi_t::st, st_char_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.77.4.7 size_t mt_get_length (multi_t *multi*)

Get the length of the data associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the length in bytes of the data associated with the input object, or 0 on failure.

Definition at line 249 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_length_get(), multi_t::st, st_length_get(), type(), multi_t::type, and multi_t::val.

Referenced by hashed_bucket().

5.77.4.8 multi_t mt_get_null (void)

Return an empty multi-type object.

Returns:

an empty multi-type object.

Definition at line 17 of file multi.c.

References EMPTY, and multi_t::type.

Referenced by hashed_cursor_key_active(), hashed_cursor_key_next(), inx_cursor_key_active(), inx_cursor_key_next(), linked_cursor_key_active(), linked_cursor_key_next(), linked_record_get_key(), mt_dupe(), tree_cursor_key_next(), and tree_cursor_next().

5.77.4.9 uint64_t mt_get_number (multi_t *multi*)

Get the value of a numerical multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the numerical value of the input object, or 0 on failure.

Definition at line 116 of file multi.c.

References multi_t::dbl, multi_t::fl, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by hashed_bucket().

5.77.4.10 M_TYPE mt_get_type (multi_t *multi*)

Get the data type associated with a multi-type object.

Parameters:

multi the multi-type object to be examined.

Returns:

the data type of the input object, or EMPTY on failure.

Definition at line 318 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by cmp_mt_mt(), and ident_mt_mt().

5.77.4.11 bool_t mt_is_empty (multi_t *multi*)

Determine whether a multi-type object is empty.

Note:

All numeric (including boolean and floating point) types will always return false.

Parameters:

multi the multi-type object to be examined.

Returns:

true if the object is empty (by type or value), or false otherwise.

Definition at line 31 of file multi.c.

References multi_t::bl, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, multi_t::ns, ns_empty(), multi_t::st, st_empty, type(), multi_t::type, and multi_t::val.

Referenced by config_load_cmdline_settings(), config_load_file_settings(), and tree_insert().

5.77.4.12 bool_t mt_is_number (multi_t *multi*)

Determine whether a multi-type object is a number.

Parameters:

multi the multi-type object to be examined. return true if the input object is any integer, boolean, or floating point; false otherwise.

Definition at line 80 of file multi.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_EMPTY, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by hashed_bucket().

5.77.4.13 multi_t mt_set_type (multi_t *multi*, M_TYPE *target*)

Set the data type of a multi-type data object.

Parameters:

multi the multi-type object to be adjusted.

target the value of the new data type for the input object.

Returns:

a copy of the modified multi-type data object.

Definition at line 391 of file multi.c.

References EMPTY, log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, type(), and multi_t::type.

Referenced by nvp_parse().

5.77.4.14 chr_t* ns_alloc (size_t *len*)

nuller.c nuller.c

Parameters:

len the length of the buffer to be allocated.

Returns:

NULL on failure or if len was 0; a pointer to the newly allocated memory otherwise.

Definition at line 68 of file nuller.c.

References log_pedantic, mm_alloc(), and ns_wipe().

Referenced by deserialize_ns(), mail_message_path(), and ns_append().

5.77.4.15 chr_t* ns_append (chr_t * *s*, chr_t * *append*)

Append one string to another and return the result.

Parameters:

s a pointer to a leading null-terminated string to to which the other string will be appended.

append a pointer to a null-terminated string to be appended to the leading string.

Returns:

NULL if a memory allocation failure occurred, or a pointer to the resulting string on success.

Definition at line 179 of file nuller.c.

References log_pedantic, mm_copy(), ns_alloc(), ns_dupe(), ns_free(), and ns_length_get().

Referenced by api_response(), portal_endpoint_error(), and portal_endpoint_response().

5.77.4.16 void ns_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number of null-terminated strings.

See also:

ns_free()

Parameters:

va_list a list of null-terminated strings to be freed.

Returns:

This function returns no value.

Definition at line 114 of file nuller.c.

References ns_free().

5.77.4.17 chr_t* ns_dupe (chr_t * *s*)

Duplicate a null-terminated string.

Parameters:

s the null-terminated string to be duplicated.

Returns:

NULL on failure, or a pointer to a copy of the input string.

Definition at line 135 of file nuller.c.

References length, log_info, log_pedantic, mm_alloc(), mm_copy(), and ns_length_get().

Referenced by cache_set_value(), config_value_set(), mt_dupe(), ns_append(), relay_set_value(), servers_set_value(), and xml_get_xpath_ns().

5.77.4.18 bool_t ns_empty (chr_t * *s*)

Return whether a null-terminated string is empty or not.

Parameters:

s the input as a null-terminated string.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 29 of file nuller.c.

References ns_length_get().

Referenced by cache_free(), cache_output_settings(), cache_set_value(), cache_validate(), config_output_value(), config_output_value_generic(), config_value_set(), mail_mime_get_media_type(), mt_is_empty(), relay_free(), relay_output_settings(), relay_set_value(), relay_validate(), servers_free(), servers_output_settings(), servers_set_value(), servers_validate(), sql_start(), and st_merge_opts().

5.77.4.19 bool_t ns_empty_out (chr_t * *s*, chr_t ** *ptr*, size_t * *len*)

Return whether a null-terminated string is empty or not, while storing its address and length.

Parameters:

s the input as a null-terminated string.

ptr a pointer address to receive a copy of the string's location.

len a pointer to a variable to receive the length of the string, in bytes.

Returns:

true if string is NULL or zero length; false otherwise.

Definition at line 41 of file nuller.c.

References ns_length_get().

5.77.4.20 void ns_free (chr_t * s)

Free a null-terminated string.

Parameters:

s the string to be freed.

Returns:

This function returns no value.

Definition at line 95 of file nuller.c.

References log_pedantic, and mm_free().

Referenced by api_response(), cache_free(), cache_set_value(), config_free(), config_value_set(), ip_subnet_st(), mail_copy_message(), mail_load_message(), mail_message_path(), mail_remove_message(), mail_store_message(), mail_store_message_data(), mt_free(), ns_-append(), ns_cleanup_variadic(), portal_endpoint_error(), portal_endpoint_response(), relay_free(), relay_set_value(), servers_free(), and servers_set_value().

5.77.4.21 chr_t* ns_import (void * *block*, size_t *len*)

Get a block of memory as a null-terminated string.

Parameters:

block a pointer to the buffer containing the data to be copied.

len the length, in bytes, of the data buffer to be copied.

Returns:

NULL on failure, or a pointer to the newly allocated null-terminated string on success.

Definition at line 160 of file nuller.c.

References log_pedantic, mm_alloc(), and mm_copy().

Referenced by cache_set_value(), config_value_set(), ip_subnet_st(), relay_set_value(), and servers_set_value().

5.77.4.22 size_t ns_length_get (const chr_t * s)

Return the length of a null-terminated string. LOW: The ns_ functions are designed to work with NULL terminated strings. They shouldn't require a length. If the length needs to be provided, then the equivalent mm_ function should be used.

Parameters:

s the input as a null-terminatd string.

Returns:

the length in bytes of the string.

Definition at line 18 of file nuller.c.

Referenced by api_endpoint_delete_user(), api_response(), con_reverse_lookup(), con_write_ns(), config_fetch_host_number(), config_-fetch_settings(), deprecated_ecies_key_private_hex(), deprecated_ecies_key_public_hex(), ecies_key_private_hex(), ecies_key_public_-hex(), file_temp_handle(), host_platform(), host_version(), http_load_file(), ident_mt_mt(), imap_build_array(), imap_fetch_bodystructure(), imap_fetch_message(), imap_search_messages_date(), int16_conv_ns(), int32_conv_ns(), int64_conv_ns(), int8_conv_ns(), ip_addr_st(),

5.77.4.23 int ns_length_int (chr_t * *s*)

Return the length of a null-terminated string as an int, capped at INT_MAX.

Parameters:

s the null-terminated string to be evaluated.

Returns:

the length of the string.

Definition at line 51 of file nuller.c.

References log_pedantic, and ns_length_get().

Referenced by lib_load_bzip().

5.77.4.24 void ns_wipe (chr_t * *s*, size_t *len*)

Zero out a null-terminated string.

Parameters:

s the string to be wiped.

len the number of bytes to be wiped at the start of the string.

Returns:

This function returns no parameters.

Definition at line 214 of file nuller.c.

References log_pedantic, and mm_set().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and ns_alloc().

5.77.4.25 chr_t* pl_char_get (placer_t *place*)

Get a character pointer to the data referenced by a placer.

Parameters:

place the input placer.

Returns:

NULL on failure or a a character pointer to the block of data associated with the specified placer on success.

Definition at line 82 of file shortcuts.c.

References st_char_get().

Referenced by cache_config(), con_write_pl(), deprecated_ecies_key_private(), deprecated_ecies_key_public(), dmtp_process(), ecies_key_private(), ecies_key_public(), imap_fetch_body_header(), imap_narrow_messages(), imap_search_messages_range(), ip_subnet_st(), lib_load_openssl(), line_pl_pl(), molten_parse(), nvp_parse(), pl_get_embraced(), pl_shrink_before_characters(), pl_skip_characters(), pl_skip_to_characters(), pl_starts_with_char(), pl_trim(), pl_trim_end(), pl_trim_start(), pop_process(), portal_message_body(), portal_upload(), relay_config(), servers_config(), smtp_auth_login(), smtp_auth_plain(), smtp_client_send_data(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), smtp_process(), and str_tok_get_bl().

Definition at line 58 of file shortcuts.c.

References pl_init().

Referenced by prime_pem_unwrap().

5.77.4.27 void* pl_data_get (placer_t *place*)

Get a pointer to the data referenced by a placer.

Parameters:

place the input placer.

Returns:

NULL on failure or a pointer to the block of data associated with the specified placer on success.

Definition at line 72 of file shortcuts.c.

References st_data_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), deprecated_ecies_key_private(), deprecated_ecies_key_public(), ecies_key_private(), ecies_key_public(), ephemeral_chunk_set(), imap_build_array(), imap_build_array_isliteral(), imap_fetch_body(), imap_fetch_body_header(), imap_folder_create(), imap_folder_rename(), imap_parse_address_part(), nvp_parse(), org_signet_set(), prime_pem_unwrap(), smtp_check_filters(), tok_get_pl(), uint64_conv_pl(), user_request_set(), and user_signet_set().

5.77.4.28 bool_t pl_empty (placer_t *place*)

Determine whether or not the specified placer is empty.

Parameters:

place the input placer.

Returns:

true if the placer is empty or zero-length, or false otherwise.

Definition at line 112 of file shortcuts.c.

References st_empty.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), cache_config(), client_read_line(), con_read_line(), dmtp_process(), http_data_value_parse(), http_process(), imap_build_array(), imap_build_array_isliteral(), imap_fetch_body(), imap_fetch_body_header(), imap_narrow_messages(), imap_parse_address(), imap_parse_literal(), imap_process(), imap_search_messages_date(), imap_search_messages_header(), imap_search_messages_range(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_mime_child(), mail_mime_count(), mail_mod_subject(), molten_parse(), multipart_get_boundary(), nvp_parse(), pl_get_embraced(), pl_inc(), pl_shrink_before_characters(), pl_skip_characters(), pl_skip_to_characters(), pl_starts_with_char(), pop_process(),

portal_upload(), prime_pem_unwrap(), relay_config(), servers_config(), slots_key(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), and smtp_process().

5.77.4.29 bool_t pl_inc (placer_t * *place*, bool_t *more*)

Advance the placer one character forward beyond an expected character.

Parameters:

place the input placer.

more if true, the placer must contain more data, and vice versa.

Returns:

true if more was true and the placer contains more data, or if more was false and the placer ended; false otherwise.

Definition at line 142 of file shortcuts.c.

References pl_empty().

5.77.4.30 placer_t pl_init (void * *data*, size_t *len*)

Return a placer wrapping a data buffer of given size.

Parameters:

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

a placer pointing to the specified data.

Definition at line 53 of file shortcuts.c.

References FOREIGNDATA, JOINTED, PLACER_T, placer_t, and STACK.

Referenced by aes_cipher_key(), aes_tag_shard(), aes_vector_shard(), bracket_extract_pl(), chunk_header_read(), deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), ecies_decrypt(), ecies_encrypt(), ephemeral_chunk_set(), get_header_value_noopt(), http_parse_context(), http_parse_origin(), http_parse_pairs(), imap_build_array(), imap_fetch_body(), imap_fetch_body_portion(), imap_fetch_bodystructure(), imap_fetch_envelope(), imap_parse_address_breaker(), imap_search_messages_date(), imap_search_messages_header(), line_pl_bl(), mail_header_pop(), mail_mime_child(), mail_mime_header(), mail_mime_part(), mail_mime_update(), mail_store_header(), naked_message_get(), naked_message_set(), pl_clone(), pl_trim(), pl_trim_end(), pl_trim_start(), prime_pem_unwrap(), prime_reader_open(), prime_reader_payload(), signature_full_verify(), signature_tree_verify(), slots_alloc(), slots_get(), smtp_check_filters(), smtp_client_send_helo(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_ns(), and tok_pop().

5.77.4.31 placer_t* pl_init_by_addr (placer_t * *result*, void * *data*, size_t *len*)

shortcuts.c shortcuts.c

Parameters:

result a non-null pointer to the placer that will store the result

data a pointer to the data to be wrapped.

len the length, in bytes, of the data.

Returns:

NULL on error or a pointer to a placer referencing the specified data.

Definition at line 28 of file shortcuts.c.

References FOREIGNDATA, JOINTED, log_error, PLACER_T, and STACK.

Referenced by mail_get_chunk().

5.77.4.32 size_t pl_length_get (placer_t *place*)

Get the length, in bytes, of a placer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 102 of file shortcuts.c.

References st_length_get().

Referenced by cache_config(), chunk_buffer_read(), chunk_header_read(), client_read(), client_read_line(), con_read(), con_read_line(), con_write_pl(), deprecated_ecies_key_private(), deprecated_ecies_key_public(), dmtp_process(), ecies_key_private(), ecies_key_public(), imap_build_array(), imap_build_array_isliteral(), imap_fetch_body(), imap_folder_create(), imap_folder_rename(), imap_parse_address_part(), imap_parse_literal(), ip_subnet_st(), line_pl_pl(), molten_parse(), nvp_parse(), org_signet_set(), pl_shrink_before_characters(), pl_trim(), pl_trim_end(), pl_trim_start(), pop_process(), portal_message_body(), portal_upload(), prime_pem_unwrap(), relay_config(), servers_config(), slots_buffer(), smtp_auth_login(), smtp_auth_plain(), smtp_check_filters(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), smtp_parse_rcpt_to(), smtp_process(), str_tok_get_bl(), str_tok_get_count_bl(), tok_get_pl(), uint64_conv_pl(), user_request_set(), and user_signet_set().

5.77.4.33 int_t pl_length_int (placer_t *place*)

Get the length, in bytes, of a placer as an integer.

Parameters:

place the input placer.

Returns:

the size, in bytes, of the specified placer.

Definition at line 92 of file shortcuts.c.

References st_length_int().

Referenced by lib_load_openssl(), smtp_client_send_data(), smtp_parse_helo_domain(), smtp_parse_mail_from_path(), and smtp_parse_rcpt_to().

5.77.4.34 placer_t pl_null (void)

Return a zero-length placer pointing to NULL data.

Returns:

a zero-length placer pointing to NULL data.

Definition at line 14 of file shortcuts.c.

References FOREIGNDATA, JOINTED, PLACER_T, placer_t, and STACK.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), aes_cipher_key(), aes_tag_shard(), aes_vector_shard(), bracket_extract_pl(), client_read(), client_read_line(), con_init_network_buffer(), con_read(), con_read_line(), get_-header_opt(), imap_fetch_body(), imap_fetch_body_portion(), imap_fetch_envelope(), imap_narrow_messages(), imap_parse_address_-breaker(), imap_parse_literal(), imap_search_messages_date(), imap_search_messages_header(), imap_search_messages_range(), imap_-starttls(), line_pl_bl(), mail_header_pop(), mail_mime_child(), naked_message_get(), naked_message_set(), nvp_parse(), part_decrypt(), pl_trim(), pl_trim_end(), pl_trim_start(), pop_starttls(), prime_pem_unwrap(), prime_reader_payload(), slots_buffer(), smtp_check_filters(), smtp_client_send_helo(), smtp_rcpt_to(), smtp_starttls(), str_tok_get_bl(), tok_get_ns(), and tok_pop().

Definition at line 62 of file shortcuts.c.

References placer_t.

Referenced by mail_mime_split().

5.77.4.36 bool_t pl_starts_with_char (placer_t *place*, chr_t *c*)

Determine if a placer begins with a specified character.

Parameters:

place the input placer.

c the character to be compared with the first byte of the placer's data.

Returns:

true if the placer begins with the given character or false otherwise.

Definition at line 123 of file shortcuts.c.

References pl_char_get(), and pl_empty().

Referenced by nvp_parse(), prime_pem_unwrap(), and smtp_client_send_data().

5.77.4.37 stringer_t* st_alloc (size_t *len*)

Allocate a managed string with a specified options mask.

See also:

st_alloc_opts()

Parameters:

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 617 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, and st_alloc_opts().

5.77.4.38 stringer_t* st_alloc_opts (uint32_t *opts*, size_t *len*)

Allocate a managed string with a specified options mask.

See also:

st_valid_options()

Note:

All requested allocation masks should conform to the validation imposed by st_valid_opts(). The supported types are: placer, nuller, block, managed, and mapped. The following logic is applied to requested string allocation options: 1. Any allocation options specified for strings to be allocated on the stack are IGNORED. 2. All jointed strings allocate memory for the header and data separately and then link them EXCEPT: Jointed placers only allocate space for a header. Jointed mapped strings allocate the data with an aligned mmap() operation. 3. Contiguous strings allocate space for the header and data together in a single contiguous block. 4. After allocation, the length field is set for block strings. 5. After allocation, the available field is set for managed strings. 6. Placers can only be jointed; mapped strings can only be contiguous.

Parameters:

opts the allocation options mask to be used by the newly allocated string.

len the length, in bytes, of the managed string to be allocated.

Returns:

NULL on failure or a pointer to the newly allocated managed string on success.

Definition at line 484 of file allocation.c.

References align(), block_t, BLOCK_T, CONTIGUOUS, HEAP, JOINTED, log_pedantic, magma, MAGMA_SPOOL_DATA, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, mm_alloc(), mm_free(), mm_sec_alloc(), mm_sec_free(), mm_set(), nuller_t, NULLER_T, magma_t::page_length, placer_t, PLACER_T, SECURE, spool_mktemp(), st_info_opts(), st_valid_opts(), and STACK.

5.77.4.39 stringer_t* st_append_opts (size_t *align*, stringer_t * *s*, stringer_t * *append*)

Append one managed string to another, with aligned memory boundaries.

Parameters:

align an alignment value to be used for managed string (re)allocation. This only works for powers of 2.

s the managed string to be extended, which will be allocated for the caller if passed as NULL.

append the managed string to be appended to s.

Returns:

NULL on failure, or a pointer to the appended result on success.

Definition at line 393 of file allocation.c.

5.77.4.44 size_t st_avail_set (stringer_t * *s*, size_t *avail*)

Set the total data buffer size allocated for a managed string.

Parameters:

s the input managed string.

avail the new buffer size for the managed string.

Returns:

0 on failure, or the managed string's new buffer size in bytes on success.

Definition at line 183 of file length.c.

References log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, st_info_opts(), and st_valid_avail().

5.77.4.45 chr_t* st_char_get (stringer_t * s)

data.c data.c

See also:

st_data_get()

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

5.77.4.46 void st_cleanup_variadic (ssize_t *len*, ...)

A checked cleanup function which can be used free a variable number managed strings.

See also:

st_free()

Parameters:

va_list a list of managed strings to be freed.

Returns:

This function returns no value.

Definition at line 96 of file allocation.c.

References st_free().

5.77.4.47 stringer_t* st_copy_in (stringer_t * *s*, void * *buf*, size_t *len*)

Copy data into a managed string.

Parameters:

s the managed string to store the copied contents of the data.

buf a pointer to the buffer containing the data to be copied.

len the length of the data to be copied.

Returns:

NULL on failure, or a pointer to the managed string on success.

Definition at line 265 of file allocation.c.

References log_pedantic, mm_copy(), st_avail_get(), st_data_get(), and st_length_set().

Referenced by pop_pass_parse().

5.77.4.48 void∗ st_data_get (stringer_t ∗ *s*)

Retrieve the data associated with a managed string.

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 148 of file data.c.

References block_t, BLOCK_T, constant_t, CONSTANT_T, log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, nuller_t, NULLER_T, placer_t, PLACER_T, st_info_opts(), and st_valid_opts().

5.77.4.49 void st_data_set (stringer_t ∗ *s*, void ∗ *data*)

Set the underlying data of a jointed managed string.

Parameters:

s the managed string to be adjusted.

data the data buffer to be attached to the input managed string.

Note:

The underlying data of s will be released, unless it contains foreign data.

Returns:

This function does not return a value.

Definition at line 91 of file data.c.

References block_t, BLOCK_T, FOREIGNDATA, JOINTED, log_pedantic, managed_t, MANAGED_T, MAPPED_T, MEMORYBUF, mm_free(), mm_sec_free(), mm_sec_secured(), nuller_t, NULLER_T, placer_t, PLACER_T, SECURE, st_info_opts(), and st_valid_jointed().

Referenced by contact_name(), ephemeral_chunk_set(), smtp_data_finish(), smtp_data_read(), and st_dupe_opts().

5.77.4.50 stringer_t* st_dupe (stringer_t * *s*)

Duplicate a managed string.

See also:

st_dupe_opts()

Note:

The allocation options of the duplicated string will be the same as that of the source string.

Parameters:

s the managed string to be duplicated.

Returns:

NULL on failure, or a copy of the input managed string on success.

Definition at line 379 of file allocation.c.

References st_dupe_opts().

Referenced by ar_dupe(), auth_login(), auth_response(), contact_folder_rename(), file_temp_handle(), http_load_file(), http_print_301(), imap_folder_create(), imap_folder_rename(), imap_login(), mail_add_forward_headers(), mail_add_outbound_headers(), mail_cache_get(), pop_pass(), prime_get(), prime_key_encrypt(), prime_pem_wrap(), register_business_step1(), register_business_step2(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), register_session_get(), smtp_add_recipient(), smtp_data_outbound(), smtp_fetch_inbound(), teacher_process(), and user_request_sign().

5.77.4.51 stringer_t* st_dupe_opts (uint32_t *opts*, stringer_t * *s*)

Create a duplicate copy of a managed string with a specified set of allocation options.

See also:

st_valid_opts()

Note:

Both the source and destination managed strings must have option values that pass st_valid_opts(). The following procedure occurs when creating the duplicate managed string: If the destination is a placer, 0 bytes are allocated for the duplicate's underlying data. If the destination is a constant, nuller, or block, its underlying data buffer will be of equal size to the source's data length. If the destination is managed or mapped, and so is the source, its underlying data buffer will be of equal size to the source's available size; but if the source is neither, the underlying data buffer of the destination managed or mapped string will equal the size of the source's data length. A deep copy will be made of the source data to the destination if the destination is NOT a placer.

Parameters:

opts the allocation options mask to be used for the newly created managed string.

s the target managed string to be duplicated.

Returns:

NULL on failure or a pointer to a copy of the duplicated managed string on success.

Definition at line 305 of file allocation.c.

References BLOCK_T, CONSTANT_T, log_pedantic, MANAGED_T, MAPPED_T, MEMORYBUF, mm_copy(), NULLER_T, PLACER_T, st_alloc_opts(), st_avail_get(), st_data_get(), st_data_set(), st_info_opts(), st_length_get(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.77.4.52 bool_t st_empty_out (stringer_t * *s*, uchr_t ** *ptr*, size_t * *len*)

Determine whether the specified managed string is empty or not, and store its underlying data and data length.

Parameters:

s the input managed string.

ptr a pointer to a null-terminated string that will receive the address of the managed string's underlying data.

len a pointer to store the size of the managed string's underlying data buffer.

Returns:

true if string is NULL or uninitialized or empty; false otherwise.

Definition at line 75 of file data.c.

References st_data_get(), and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), auth_sanitize_address(), base64_decode(), base64_decode_mod(), base64_decode_opts(), base64_encode(), base64_encode_mod(), base64_encode_opts(), base64_encode_wrap(), chunk_buffer_size(), chunk_header_size(), chunk_header_type(), client_write(), contact_name(), contact_validate_detail(), contact_validate_name(), deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_symmetric_decrypt(), deprecated_symmetric_encrypt(), ecies_decrypt(), ecies_encrypt(), ephemeral_chunk_set(), hex_count_st(), hex_decode_st(), hex_encode_st(), hex_valid_st(), http_parse_origin(), imap_command_log_safe(), imap_count_folder_levels(), imap_fetch_body_portion(), imap_valid_folder_name(), imap_valid_sequence(), lower_st(), mail_count_received(), mail_extract_address(), mail_mime_encode_part(), naked_message_get(), part_decrypt(), part_encrypt(), prime_field_write(), prime_header_read(), qp_decode(), qp_encode(), smtp_parse_auth(), st_cmp_ci_ends(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_cmp_cs_starts(), st_replace(), st_search_chr(), st_search_ci(), st_search_cs(), st_swap(), st_write_variadic(), stacie_decrypt(), stacie_derive_key(), stacie_derive_seed(), stacie_derive_token(), stacie_encrypt(), stacie_realm_key(), symmetric_decrypt(), symmetric_encrypt(), upper_st(), url_decode(), url_encode(), url_valid_st(), utf8_length_st(), utf8_valid_st(), zbase32_decode(), and zbase32_encode().

5.77.4.53 bool_t st_empty_variadic (ssize_t *len*, ...)

A simple method for checking multiple managed strings to see if any are empty.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to check for emptiness

Returns:

true if any of the strings are NULL, uninitialized or empty; false if every string has at least one byte of data.

Definition at line 47 of file data.c.

References st_data_get(), and st_length_get().

5.77.4.54 void st_free (stringer_t * *s*)

Free a managed string.

See also:

st_valid_free(), st_valid_opts()

Note:

Any managed string to be freed should conform with the validity checks enforced by st_valid_free()/st_valid_opts() *NO* managed string should be passed to st_free() if it was allocated on the stack, or contains foreign data. The following logic is carried out depending on the allocation options of the string to be freed: Jointed placer: Free header, if secure or on heap Free underlying data if it is not foreign Jointed nuller: Free header and underlying data Jointed block: Free header and underlying data Jointed managed: Free header and underlying data Jointed mapped: Free the header and (munmap) underlying data Contiguous nuller: Free header (this includes the underlying data because they are already merged) Contiguous block: Free header (this includes the underlying data because they are already merged) Contiguous managed: Free header (this includes the underlying data because they are already merged)

Parameters:

s the managed string to be freed.

Returns:

This function returns no value.

HIGH: Finish this logic out. Stack allocations are skipped, unless they are jointed. In that case the data is freed unless it carries a foreigner flag. Note its possible for a jointed string to have a NULL data reference. We should be picking up on that too. Contiguous heap buffers are just destroyed.

Do we need to differentiate between stack structures, and heap data blocks needing to be freed, or not?

Definition at line 29 of file allocation.c.

5.77.4.56 stringer_t* st_import_opts (uint32_t *opts*, const void * *s*, size_t *len*)

Create a new (contiguous managed) managed string on the heap to hold a copy of the specified data buffer.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

s the address of the buffer to be duplicated.

len the length, in bytes, of the copied buffer.

Returns:

NULL on failure, or a pointer to the newly allocated managed string on success.

Definition at line 222 of file allocation.c.

References log_pedantic, MEMORYBUF, mm_copy(), st_alloc_opts(), st_data_get(), st_info_opts(), st_length_set(), and st_valid_destination().

Referenced by deprecated_ecies_key_private_hex(), ecies_key_private_hex(), and st_import().

5.77.4.57 const chr_t* st_info_allocator (uint32_t *opts*)

Get a readable description of a managed string's allocator type.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's allocator type.

Definition at line 96 of file info.c.

References HEAP, SECURE, st_option_allocators, and STACK.

Referenced by st_info_opts().

5.77.4.58 const chr_t* st_info_layout (uint32_t *opts*)

Get a readable description of a managed string's data layout.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data layout.

Definition at line 75 of file info.c.

References CONTIGUOUS, JOINTED, and st_option_layouts.

Referenced by st_info_opts().

5.77.4.59 chr_t* st_info_opts (uint32_t *opts*, chr_t * *s*, size_t *len*)

Get a readable description of all of a managed string's option flags.

Parameters:

opts a value containing the managed string's option mask.

s a pointer to a null-terminated string to receive the options description.

len the length, in bytes, of the description output buffer.

Returns:

NULL on failure, or a pointer to the output buffer containing the managed string's options description on success.

LOW: Turn this into a loop.

Definition at line 122 of file info.c.

5.77.4.60 const chr_t* st_info_type (uint32_t *opts*)

Get a readable description of a managed string's data type.

Parameters:

opts a value containing the managed string's option mask.

Returns:

a pointer to a null-terminated string containing a description of the managed string's data type.

Definition at line 42 of file info.c.

References BLOCK_T, CONSTANT_T, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, and st_option_types.

Referenced by st_info_opts().

5.77.4.61 size_t st_length_get (stringer_t * *s*)

Return the length of the data in a managed string.

Parameters:

s the input managed string.

Returns:

0 on failure, or the length of the managed string's data in bytes.

Definition at line 15 of file length.c.

References block_t, BLOCK_T, constant_t, CONSTANT_T, data, log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, nuller_t, NULLER_T, placer_t, PLACER_T, st_info_opts(), and st_valid_opts().

5.77.4.62 int_t st_length_int (stringer_t * *s*)

Length. Return the length of a managed string as an integer.

Parameters:

s the managed string as type stringer_t *.

Returns:

the string length as an integer, capped at INT_MAX.

Definition at line 70 of file length.c.

References log_pedantic, st_length_get(), and st_valid_opts().

5.77.4.63 size_t st_length_set (stringer_t * *s*, size_t *len*)

Set the data length for a managed string that supports data length tracking.

Parameters:

s the input managed string.

len the new value of the managed string's data length.

Returns:

0 on error, or the new data length on success.

Definition at line 99 of file length.c.

References log_pedantic, managed_t, MANAGED_T, mapped_t, MAPPED_T, MEMORYBUF, placer_t, PLACER_T, st_info_opts(), and st_valid_tracked().

5.77.4.64 stringer_t* st_merge_opts (uint32_t *opts*, chr_t * *format*, ...)

Concatenate a variable number of user-supplied multi-type strings.

Parameters:

opts the options value of the resulting managed string that will be allocated for the caller.

format a format string consisting of the characters 's' for specifying that the next variable argument will be a managed string or 'n' if it is a null-terminated string.

... a variable argument list containing the strings to be concatenated to one another.

Returns:

a newly allocated string containing the concatenations of all specified managed and null-terminated strings.

Definition at line 120 of file allocation.c.

References length, log_pedantic, MEMORYBUF, mm_copy(), ns_empty(), ns_length_get(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty, st_info_opts(), st_length_get(), st_length_set(), st_valid_destination(), and st_valid_tracked().

5.77.4.65 stringer_t* st_nullify (chr_t * *input*, size_t *len*)

Create a null-terminated string out of a block of memory and return it as a newly allocated nuller.

Parameters:

input a pointer to the data block to be copied.

len the size, in bytes, of the data block to be copied before being terminated with a null byte.

Returns:

NULL on failure, or a pointer to the new null-terminated string on success.

Definition at line 827 of file allocation.c.

References CONTIGUOUS, HEAP, MANAGED_T, mm_copy(), st_alloc_opts(), st_data_get(), and st_length_set().

Referenced by portal_message_body().

5.77.4.66 uint32_t st_opt_get (stringer_t * s)

opts.c opts.c

Parameters:

s the input string.

Returns:

the options in use by the provided string.

Definition at line 15 of file opts.c.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), chunk_header_write(), ed25519_-private_get(), ed25519_public_get(), ed25519_sign(), meta_data_fetch_shard(), org_key_get(), org_signet_get(), prime_field_write(), prime_header_write(), rand_choices(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_write_variadic(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), user_key_get(), user_request_get(), and user_signet_get().

5.77.4.67 int_t st_opt_set (stringer_t * s, uint32_t opt, bool_t enabled)

Enable or disable a set of option(s) for a managed string, with validity testing.

Parameters:

s the input managed string.

opt the bitmask of option(s) to be enabled or disabled for the managed string.

enabled if true, set the option(s); if false, disable them.

Returns:

-1 on error, 0 if successfully disabled, or 1 if successfully enabled.

Definition at line 33 of file opts.c.

References log_pedantic, MEMORYBUF, st_info_opts(), and st_valid_opts().

Referenced by contact_name().

5.77.4.68 bool_t st_opt_test (stringer_t * s, uint32_t opt)

Check to see if the managed string has the specified option enabled.

Parameters:

s the managed string to be checked. opt a bitmask of the managed string options to be tested.

Returns:

-1 on error, 0 if opt is not set, and 1 if opt is set.

Definition at line 64 of file opts.c.

References log_pedantic, MEMORYBUF, st_info_opts(), and st_valid_opts().

Referenced by contact_free(), and contact_name().

5.77.4.69 stringer_t* st_output (stringer_t * *output*, size_t *len*)

Return a suitable managed string to store data of a specified length.

Note:

If a NULL output string is specified, one will be allocated for the caller.

Parameters:

output the input managed string (can be NULL).

len the size, in bytes, of the requested data buffer.

Returns:

NULL on failure or if input was not large enough or a pointer to a validated output managed string.

Definition at line 798 of file allocation.c.

References log_pedantic, st_alloc(), st_avail_get(), and st_valid_destination().

Referenced by chunk_header_write(), deprecated_symmetric_key(), deprecated_symmetric_vector(), encrypted_chunk_get(), prime_field_-write(), prime_header_write(), prime_pem_wrap(), slots_key(), symmetric_key(), symmetric_vector(), tls_cipher(), and tls_error().

5.77.4.70 bool_t st_populated_variadic (ssize_t *len*, ...)

A simple method for checking multiple managed strings to see if all of them contain data.

Parameters:

len the number of strings being passed in.

va_list a list of managed strings to be freed.

Returns:

true if all of the strings are populated with at least one byte of data, otherwise false.

Definition at line 18 of file data.c.

References st_data_get(), and st_length_get().

5.77.4.71 stringer_t stringer_t stringer_t* st_quick (stringer_t * *s*, chr_t * *format*, ...)

5.77.4.72 stringer_t* st_realloc (stringer_t * *s*, size_t *len*)

Reallocate a managed string to a specified size.

Note:

The caller can request a new size that is either smaller (truncated) or larger than the original string. Only these types of strings can be reallocated: nuller, block, managed, and mapped. The following logic is applied to string reallocation requests: For jointed strings, a new data buffer is allocated of the requested length, the original contents copied in, the data field of the new string is set, and the original data buffer freed. The stringer header returned to the caller resides at the same address as the original. For contiguous strings, a new data buffer is allocated for both the requested length and the new stringer header, and the data of both parts are copied from the original string to the resulting one. For block strings, the length field of the resulting string is set to the requested length. For managed strings, the length field of the resulting string is set to the original length, but the available field is adjusted accordingly. For mapped strings, an aligned mremap() call is made, and both the length and available fields are set to the new length.

Parameters:

s the managed string to have its size reallocated.

len the new size, in bytes, of the resulting managed string.

Returns:

NULL on failure or a pointer to the newly reallocated managed string on success.

Definition at line 642 of file allocation.c.

References align(), block_t, BLOCK_T, CONTIGUOUS, data, JOINTED, length, log_pedantic, magma, managed_t, MANAGED_T, mapped_t, MAPPED_T, magma_t::memory, MEMORYBUF, mm_alloc(), mm_copy(), mm_free(), mm_sec_alloc(), mm_sec_free(), nuller_t, NULLER_T, magma_t::page_length, magma_t::secure, SECURE, st_info_opts(), st_length_get(), st_valid_opts(), and system_ulimit_cur().

5.77.4.74 stringer_t* st_set (stringer_t * *s*, uint8_t *set*, size_t *len*)

Sets a block of memory to a specified value.

Parameters:

s the managed string to be overwritten with the value of set.

set the byte value to be write into the string.

len the number of bytes to set to the provided value.

Returns:

a pointer to the block of memory passed to the function.

Definition at line 245 of file data.c.

References log_pedantic, MEMORYBUF, mm_set(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

5.77.4.76 stringer_t* st_swap (stringer_t * *target*, uchr_t *pattern*, uchr_t *replacement*)

Replace all instances of one character in a managed string with another.

Parameters:

target the input string which will be transformed by the character replacement.

pattern the character to be searched and replaced in the target string.

replacement the character to be substituted for the pattern character in the target string.

Returns:

a pointer to the target managed string.

Definition at line 109 of file replace.c.

References log_check, log_pedantic, and st_empty_out().

Referenced by process_kill().

5.77.4.77 uchr_t* st_uchar_get (stringer_t * *s*)

Retrieve an unsigned character pointer to a managed string's data buffer.

See also:

st_data_get()

Parameters:

s the input managed string.

Returns:

NULL on failure or for an improperly constructed string; otherwise, a pointer to the string's data.

Definition at line 205 of file data.c.

References st_data_get().

Referenced by dkim_signature_create(), http_parse_origin(), and prime_pem_unwrap().

5.77.4.78 bool_t st_used_variadic (ssize_t *len*, ...)

5.77.4.79 bool_t st_valid_append (uint32_t *opts*)

Determine whether the managed string options allow for data appending.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, the string is not jointed, or either managed or mapped.

Definition at line 52 of file validate.c.

References JOINTED, MANAGED_T, MAPPED_T, and st_valid_opts().

Referenced by st_append_opts().

5.77.4.80 bool_t st_valid_avail (uint32_t *opts*)

Determine whether a managed string tracks the total allocated buffer size.

Parameters:

opts the managed string's options value.

Returns:

false if buffer size isn't tracked; true otherwise (the managed string is managed or mapped).

Definition at line 123 of file validate.c.

References MANAGED_T, MAPPED_T, and st_valid_opts().

5.77.4.81 bool_t st_valid_destination (uint32_t *opts*)

Determine whether the managed string options allow for a data store operation.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, or indicate the managed string is constant.

Definition at line 35 of file validate.c.

References CONSTANT_T, and st_valid_opts().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), base64_decode(), base64_decode_-mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), deprecated_hmac_digest(), ed25519_private_get(), ed25519_-public_get(), ed25519_sign(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_presentation(), ip_reversed(), ip_-standard(), ip_subnet(), meta_data_fetch_shard(), org_key_get(), org_signet_get(), rand_choices(), rand_write(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_append_out(), st_bitwise(), st_import_opts(), st_merge_opts(), st_not(), st_output(), st_vaprint_opts(), st_vsprint(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), user_key_get(), user_request_get(), and user_signet_get().

5.77.4.82 bool_t st_valid_free (uint32_t *opts*)

Determine whether a managed string is allowed to be freed.

Parameters:

opts the options value of the managed string to be evaluated.

Returns:

true if the managed string can be freed; false otherwise (it is allocated on the stack or contains foreign data).

Definition at line 72 of file validate.c.

References FOREIGNDATA, st_valid_opts(), and STACK.

Referenced by st_free(), and st_replace().

5.77.4.83 bool_t st_valid_jointed (uint32_t *opts*)

Determine whether the managed string options are a validly jointed.

Parameters:

opts the options value to test.

Returns:

false if the options are invalid or if the string isn't jointed; true if the string is jointed.

Definition at line 106 of file validate.c.

References JOINTED, and st_valid_opts().

Referenced by st_data_set().

5.77.4.84 bool_t st_valid_opts (uint32_t *opts*)

Check to see that a managed string has a valid combination of allocation options.

Note:

The following rules are enforced: 1. Each managed string must only be one of the following: a. constant, nuller, block, placer, managed, or mapped. b. jointed or contiguous. c. allocated on the stack, heap, or secure. 2. A placer cannot be contiguous. 3. A constant must be contiguous and be allocated on the stack. 4. Mapped strings must be contiguous and on the heap.

Parameters:

opts the managed string option mask to be validated.

Returns:

true if the options represent valid managed string allocation options, or false if they do not.

Definition at line 149 of file validate.c.

References bitwise_count(), BLOCK_T, CONSTANT_T, CONTIGUOUS, HEAP, JOINTED, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, SECURE, and STACK.

Referenced by st_alloc_opts(), st_avail_get(), st_data_get(), st_dupe_opts(), st_length_get(), st_length_int(), st_opt_set(), st_opt_test(), st_-realloc(), st_set(), st_valid_append(), st_valid_avail(), st_valid_destination(), st_valid_free(), st_valid_jointed(), st_valid_placer(), st_valid_-tracked(), and st_wipe().

5.77.4.85 bool_t st_valid_placer (uint32_t *opts*)

A sanity check to determine whether the managed string is a valid placer.

Note:

The following criteria must be satisfied: placer bit set, jointed bit set, either stack, heap, or secure set, and no other bits other than these mentioned should be set.

Parameters:

opts the managed string options value to be evaluated.

Returns:

true if the option value reflects a valid placer, or false otherwise.

Definition at line 17 of file validate.c.

References HEAP, JOINTED, PLACER_T, SECURE, st_valid_opts(), and STACK.

5.77.4.86 bool_t st_valid_tracked (uint32_t *opts*)

Determine whether a managed string provides for data length tracking.

Parameters:

opts the options value of the managed string.

Returns:

false if no length tracking is available; true if there is (string is a placer, managed, or mapped).

Definition at line 89 of file validate.c.

References MANAGED_T, MAPPED_T, PLACER_T, and st_valid_opts().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), chunk_header_write(), deprecated_hmac_digest(), deprecated_symmetric_key(), deprecated_symmetric_vector(), ed25519_private_get(), ed25519_public_get(), ed25519_sign(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_presentation(), ip_reversed(), ip_standard(), prime_field_write(), prime_header_write(), rand_choices(), rand_write(), secp256k1_compute_kek(), secp256k1_private_get(), secp256k1_public_get(), st_dupe_opts(), st_length_set(), st_merge_opts(), st_set(), st_vaprint_opts(), st_vsprint(), st_wipe(), st_write_variadic(), stacie_create_nonce(), stacie_create_salt(), stacie_create_shard(), symmetric_key(), and symmetric_vector().

5.77.4.87 stringer_t stringer_t stringer_t size_t stringer_t* st_vaprint_opts (uint32_t *opts*, chr_t * *format*, va_list *args*)

Return a managed string containing sprintf()-style formatted data.

Parameters:

opts an options value to be passed to the allocation of the resulting managed string.

format a format string for the output string data.

args a variable argument list of parameters to be formatted as output.

Returns:

NULL on failure or a managed string containing the final formatted data on success.

Definition at line 100 of file print.c.

References length, log_pedantic, MEMORYBUF, st_alloc_opts(), st_data_get(), st_free(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_aprint(), and st_aprint_opts().

5.77.4.88 size_t st_vsprint (stringer_t * *s*, chr_t * *format*, va_list *args*)

Print to a managed string and return the number of bytes written.

See also:

vsnprintf()

Note:

If the destination string pointer is NULL the function will simply return how much room would have been necessary.

Parameters:

s a pointer to the managed string that will receive the output of the print operation.

format a format string specifying the arguments of the print operation.

args a va_list containing the parameters to the print format string.

Returns:

-1 on failure, or the number of characters printed to the string, excluding the terminating null byte.

Definition at line 19 of file print.c.

References length, log_pedantic, MEMORYBUF, st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_destination(), and st_valid_tracked().

Referenced by st_quick(), and st_sprint().

5.77.4.89 void st_wipe (stringer_t * *s*)

Wipe all of a managed string's allocated memory and if applicable, reset its length.

Parameters:

s the managed string to be wiped.

Returns:

This function returns no value.

Definition at line 215 of file data.c.

References log_pedantic, MEMORYBUF, mm_wipe(), st_avail_get(), st_data_get(), st_info_opts(), st_length_set(), st_valid_opts(), and st_valid_tracked().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), ed25519_private_get(), ed25519_public_get(), ip_standard(), org_key_get(), org_signet_get(), secp256k1_private_get(), user_key_get(), user_request_get(), and user_signet_get().

5.77.4.90 int_t st_write_variadic (stringer_t * *output*, ssize_t *count*, ...)

Write a variable number of user-supplied strings into a buffer.

Parameters:

... a variable argument list containing the strings to be written one after the other.

Returns:

the number of bytes written into the buffer.

Definition at line 182 of file print.c.

References data, mm_copy(), st_avail_get(), st_data_get(), st_empty_out(), st_length_set(), st_opt_get(), and st_valid_tracked().

Functions

- bool_t st_valid_placer (uint32_t opts)

  A sanity check to determine whether the managed string is a valid placer.

- bool_t st_valid_destination (uint32_t opts)

  Determine whether the managed string options allow for a data store operation.

- bool_t st_valid_append (uint32_t opts)

  Determine whether the managed string options allow for data appending.

- bool_t st_valid_free (uint32_t opts)

  Determine whether a managed string is allowed to be freed.

- bool_t st_valid_tracked (uint32_t opts)

  Determine whether a managed string provides for data length tracking.

- bool_t st_valid_jointed (uint32_t opts)

  Determine whether the managed string options are a validly jointed.

- bool_t st_valid_avail (uint32_t opts)

  Determine whether a managed string tracks the total allocated buffer size.

- bool_t st_valid_opts (uint32_t opts)

  Check to see that a managed string has a valid combination of allocation options.

5.78.1 Function Documentation

5.78.1.1 bool_t st_valid_append (uint32_t *opts*)

Determine whether the managed string options allow for data appending.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, the string is not jointed, or either managed or mapped.

Definition at line 52 of file validate.c.

References JOINTED, MANAGED_T, MAPPED_T, and st_valid_opts().

Referenced by st_append_opts().

5.78.1.2 bool_t st_valid_avail (uint32_t *opts*)

Determine whether a managed string tracks the total allocated buffer size.

Parameters:

opts the managed string's options value.

Returns:

false if buffer size isn't tracked; true otherwise (the managed string is managed or mapped).

Definition at line 123 of file validate.c.

References MANAGED_T, MAPPED_T, and st_valid_opts().

Referenced by base64_decode(), base64_decode_mod(), base64_encode(), base64_encode_mod(), base64_encode_wrap(), deprecated_hmac_digest(), hash_digest(), hex_decode_st(), hex_encode_st(), hmac_digest(), ip_subnet(), rand_write(), st_avail_set(), st_bitwise(), and st_not().

5.78.1.3 bool_t st_valid_destination (uint32_t *opts*)

Determine whether the managed string options allow for a data store operation.

Parameters:

opts the options value for the managed string.

Returns:

true if permitted, or false if options are invalid, or indicate the managed string is constant.

Definition at line 35 of file validate.c.

References CONSTANT_T, and st_valid_opts().

5.78.1.4 bool_t st_valid_free (uint32_t *opts*)

Determine whether a managed string is allowed to be freed.

Parameters:

opts the options value of the managed string to be evaluated.

Returns:

true if the managed string can be freed; false otherwise (it is allocated on the stack or contains foreign data).

Definition at line 72 of file validate.c.

References FOREIGNDATA, st_valid_opts(), and STACK.

Referenced by st_free(), and st_replace().

5.78.1.5 bool_t st_valid_jointed (uint32_t *opts*)

Determine whether the managed string options are a validly jointed.

Parameters:

opts the options value to test.

Returns:

false if the options are invalid or if the string isn't jointed; true if the string is jointed.

Definition at line 106 of file validate.c.

References JOINTED, and st_valid_opts().

Referenced by st_data_set().

5.78.1.6 bool_t st_valid_opts (uint32_t *opts*)

Check to see that a managed string has a valid combination of allocation options.

Note:

The following rules are enforced: 1. Each managed string must only be one of the following: a. constant, nuller, block, placer, managed, or mapped. b. jointed or contiguous. c. allocated on the stack, heap, or secure. 2. A placer cannot be contiguous. 3. A constant must be contiguous and be allocated on the stack. 4. Mapped strings must be contiguous and on the heap.

Parameters:

opts the managed string option mask to be validated.

Returns:

true if the options represent valid managed string allocation options, or false if they do not.

Definition at line 149 of file validate.c.

References bitwise_count(), BLOCK_T, CONSTANT_T, CONTIGUOUS, HEAP, JOINTED, MANAGED_T, MAPPED_T, NULLER_T, PLACER_T, SECURE, and STACK.

5.78.1.7 bool_t st_valid_placer (uint32_t *opts*)

A sanity check to determine whether the managed string is a valid placer.

Note:

The following criteria must be satisfied: placer bit set, jointed bit set, either stack, heap, or secure set, and no other bits other than these mentioned should be set.

Parameters:

opts the managed string options value to be evaluated.

Returns:

true if the option value reflects a valid placer, or false otherwise.

Definition at line 17 of file validate.c.

References HEAP, JOINTED, PLACER_T, SECURE, st_valid_opts(), and STACK.

5.78.1.8 bool_t st_valid_tracked (uint32_t *opts*)

Determine whether a managed string provides for data length tracking.

Parameters:

opts the options value of the managed string.

Returns:

false if no length tracking is available; true if there is (string is a placer, managed, or mapped).

Definition at line 89 of file validate.c.

References MANAGED_T, MAPPED_T, PLACER_T, and st_valid_opts().

5.79 src/core/thread/keys.c File Reference

```
#include "magma.h"
```

Functions

- int tkey_init (pthread_key_t ∗key, void(∗destructor)(void ∗))
  Create a thread-specific data key.
- void ∗ tkey_get (pthread_key_t key)
  Get the calling thread's value for a pthread key.
- int tkey_set (pthread_key_t key, void ∗value)
  Set the calling thread's value for a pthread key.

5.79.1 Function Documentation

5.79.1.1 void∗ tkey_get (pthread_key_t *key*)

Get the calling thread's value for a pthread key. keys.c

See also:

pthread_getspecific()

Parameters:

key the pthread key to be queried.

Returns:

NULL on failure or a pointer to the key's thread-specific data value on success.

Definition at line 35 of file keys.c.

5.79.1.2 int tkey_init (pthread_key_t ∗ *key*, void(∗)(void ∗) *destructor*)

Create a thread-specific data key.

See also:

pthread_key_create()

Parameters:

key a pointer to pthread key to be initialized for thread-local storage.

destructor if not NULL, an optional function pointer to be called at thread exit to release the data.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file keys.c.

References log_pedantic.

5.79.1.3 int tkey_set (pthread_key_t *key*, void * *value*)

Set the calling thread's value for a pthread key.

See also:

pthread_setspecific()

Parameters:

key the pthread key to have its thread-local value modified.

value a pointer to the new thread-specific value of the specified key.

Returns:

0 on success, or an error number on failure.

Definition at line 46 of file keys.c.

References log_pedantic.

5.80 src/providers/dime/signet/keys.c File Reference

#include "providers/symbols.h"
```

Functions

- int dime_keys_file_create (keys_type_t type, ED25519_KEY ∗sign_key, EC_KEY ∗enc_key, const char ∗filename)
  Creates a keys file with specified signing and encryption keys.
- ED25519_KEY ∗ dime_keys_signkey_fetch (char const ∗filename)
  Retrieves the encryption key from the keys file.
- EC_KEY ∗ dime_keys_enckey_fetch (char const ∗filename)
  Retrieves the signing key from the keys file.
- int dime_keys_generate (keys_type_t type, char ∗∗signet_pem, char ∗∗key_pem)

5.80.1 Function Documentation

5.80.1.1 EC_KEY∗ dime_keys_enckey_fetch (char const ∗ *filename*)

Retrieves the signing key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the ed25519 signing key. {free_ed25519_key}

Definition at line 633 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.80.1.2 int dime_keys_file_create (keys_type_t *type*, ED25519_KEY ∗ *sign_key*, EC_KEY ∗ *enc_key*, const char ∗ *filename*)

Creates a keys file with specified signing and encryption keys.

Parameters:

type Type of keys file, whether the keys correspond to a user or organizational signet.

sign_key Pointer to the specified ed25519 key, the private portion of which will be stored in the keys file as the signing key.

enc_key Pointer to the specified elliptic curve key, the private portion of which will be stored in the keys file as the encryption key.

filename Pointer to the NULL terminated string containing the filename for the keys file.

Returns:

0 on success, -1 on failure.

Definition at line 586 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.80.1.4 ED25519_KEY* dime_keys_signkey_fetch (char const * *filename*)

Retrieves the encryption key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the elliptic curve encryption key. {free_ec_key}

Definition at line 620 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.81 src/core/thread/mutex.c File Reference

```
#include "magma.h"
```

Functions

- int mutex_init (pthread_mutex_t *lock, pthread_mutexattr_t *attr)
  Initialize a pthread mutex with the given attributes.
- int mutex_lock (pthread_mutex_t *lock)
  Acquire a pthread mutex, blocking if necessary.
- int mutex_unlock (pthread_mutex_t *lock)
  Unlock a pthread mutex.
- int mutex_destroy (pthread_mutex_t *lock)
  Free a pthread mutex.

5.81.1 Function Documentation

5.81.1.1 int mutex_destroy (pthread_mutex_t * *lock*)

Free a pthread mutex. mutex.c

See also:

pthread_mutex_destroy()

Parameters:

lock a pointer to the mutex to be freed.

Returns:

0 on success, or an error number on failure.

Definition at line 77 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_destroy(), meta_free(), pool_free(), protocol_secure(), queue_shutdown(), sess_destroy(), ssl_stop(), stacker_free(), and stats_shutdown().

5.81.1.2 int mutex_init (pthread_mutex_t * *lock*, pthread_mutexattr_t * *attr*)

Initialize a pthread mutex with the given attributes.

See also:

pthread_mutex_init()

Parameters:

lock a pointer to a mutex that will be initialized.

attr a pointer to a mutex attributes holder, or NULL to use system default values.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_init(), meta_alloc(), pool_alloc(), queue_init(), ssl_start(), stacker_alloc(), and stats_init().

5.81.1.3 int mutex_lock (pthread_mutex_t ∗ *lock*)

Acquire a pthread mutex, blocking if necessary.

See also:

pthread_mutex_lock()

Parameters:

lock a pointer to the mutex to be locked.

Returns:

0 on success, or an error number on failure.

Definition at line 37 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Functions

- int rwlock_init (pthread_rwlock_t *lock, pthread_rwlockattr_t *attr)
  Initialize a pthread read/write lock.
- int rwlock_lock_write (pthread_rwlock_t *lock)
  Attempt to acquire a pthread read/write lock for writing, blocking if necessary.
- int rwlock_lock_read (pthread_rwlock_t *lock)
  Attempt to acquire a pthread read/write lock for reading, blocking if necessary.
- int rwlock_unlock (pthread_rwlock_t *lock)
  Unlock a pthread read/write lock.
- int rwlock_destroy (pthread_rwlock_t *lock)
  Free a pthread read/write lock and free its resources.
- int rwlock_attr_init (pthread_rwlockattr_t *attr)
  Initialize a pthread read/write lock attributes object with default values.
- int rwlock_attr_destroy (pthread_rwlockattr_t *attr)
  Free a pthread read/write lock attributes object.
- int rwlock_attr_setkind (pthread_rwlockattr_t *attr, int pref)
  Set the kind of a pthread read/write lock attributes object.
- int rwlock_attr_getkind (pthread_rwlockattr_t *attr, int *pref)
  Get the kind of a pthread read/write lock attributes object.

5.82.1 Function Documentation

5.82.1.1 int rwlock_attr_destroy (pthread_rwlockattr_t * *attr*)

Free a pthread read/write lock attributes object. rwlock.c

See also:

pthread_rwlockattr_destroy()

Parameters:

attr a pointer to the read/write lock attributes object to be freed.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.82.1.2 int rwlock_attr_getkind (pthread_rwlockattr_t * *attr*, int * *pref*)

Get the kind of a pthread read/write lock attributes object.

See also:

pthread_rwlockattr_getkind_np()

Parameters:

attr a pointer to the read/write lock attributes object to be queried.

pref a pointer to an integer that will receive the kind of the read/write lock.

Returns:

0 on success or an error number on failure.

Definition at line 155 of file rwlock.c.

References log_pedantic.

5.82.1.3 int rwlock_attr_init (pthread_rwlockattr_t * *attr*)

Initialize a pthread read/write lock attributes object with default values.

See also:

pthread_rwlockattr_init()

Parameters:

attr a pointer to the read/write lock attributes object to be initialized.

Returns:

0 on success or an error number on failure.

Definition at line 105 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.82.1.4 int rwlock_attr_setkind (pthread_rwlockattr_t * *attr*, int *pref*)

Set the kind of a pthread read/write lock attributes object.

See also:

pthread_rwlockattr_setkind_np()

Parameters:

attr a pointer to the read/write lock attributes object to be adjusted.

pref the kind of the read/write lock: PTHREAD_RWLOCK_PREFER_READER_NP, PTHREAD_RWLOCK_PREFER_WRITER_NP, or PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP.

Returns:

0 on success or an error number on failure.

Definition at line 138 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.82.1.5 int rwlock_destroy (pthread_rwlock_t * *lock*)

Free a pthread read/write lock and free its resources.

See also:

pthread_rwlock_destroy()

Parameters:

lock a pointer to the read/write lock to be destroyed.

Returns:

0 on success or an error number on failure.

Definition at line 89 of file rwlock.c.

References log_pedantic.

Referenced by inx_free(), magma_folder_free(), message_free(), meta_alloc(), and meta_free().

5.82.1.6 int rwlock_init (pthread_rwlock_t * *lock*, pthread_rwlockattr_t * *attr*)

Initialize a pthread read/write lock.

See also:

pthread_rwlock_init()

Parameters:

lock a pointer to the read/write lock to be initialized.

attr an optional pointer to a set of lock attributes, or the default attributes if NULL is specified.

Returns:

0 on success or an error number on failure.

Definition at line 17 of file rwlock.c.

References log_pedantic.

Referenced by inx_alloc(), magma_folder_alloc(), message_alloc(), and meta_alloc().

5.82.1.7 int rwlock_lock_read (pthread_rwlock_t * *lock*)

Attempt to acquire a pthread read/write lock for reading, blocking if necessary.

See also:

pthread_rwlock_rdlock()

Parameters:

lock the read-write lock to be tried.

Returns:

0 on success or an error number on failure.

Definition at line 53 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_read(), inx_lock_read(), meta_user_rlock(), register_abuse_check_blocklist(), spool_mktemp(), status(), and status_get().

5.82.1.8 int rwlock_lock_write (pthread_rwlock_t * *lock*)

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

See also:

pthread_rwlock_wrlock()

Parameters:

lock a pointer to the read/write lock to be acquired.

Returns:

0 on success or an error number on failure.

Definition at line 35 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_write(), inx_lock_write(), meta_user_wlock(), register_blocklist_update(), spool_cleanup(), status_set(), and status_signal().

5.82.1.9 int rwlock_unlock (pthread_rwlock_t * *lock*)

Unlock a pthread read/write lock.

See also:

pthread_rwlock_unlock()

Parameters:

lock a pointer to the read/write lock to be unlocked.

Returns:

0 on success or an error number on failure.

Definition at line 71 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_unlock(), inx_unlock(), meta_user_unlock(), register_abuse_check_blocklist(), register_blocklist_update(), spool_cleanup(), spool_mktemp(), status(), status_get(), status_set(), and status_signal().

5.83 src/core/thread/thread.c File Reference

```
#include "magma.h"
```

Functions

- pthread_t thread_get_thread_id (void)
  Get the id of the calling thread.
- int_t thread_launch (pthread_t *thread, void *function, void *data)
  Launch a thread to execute a specified function.
- pthread_t * thread_alloc (void *function, void *data)
  Launch a function in a freshly created thread.
- int_t thread_join (pthread_t thread)
  Block until a specified thread finishes execution.
- int_t thread_result (pthread_t thread, void **result)
  Block until a specified thread finishes execution and store its exit value.
- int_t thread_signal (pthread_t thread, int_t signal)
  Send a specified signal to a thread.
- int_t thread_cancel (pthread_t thread)
  Send a cancellation request to a thread.
- void thread_cancel_enable (void)
  Set the calling thread to be cancelable.
- void thread_cancel_disable (void)
  Set the calling thread to be not cancelable.

5.83.1 Function Documentation

5.83.1.1 pthread_t* thread_alloc (void * *function*, void * *data*)

Launch a function in a freshly created thread. thread.c

See also:

pthread_create_new()

Parameters:

function a pointer to the function to be executed.
data a pointer to data to be passed to the executed function.

Returns:

NULL on failure, or a pointer to the newly created pthread on success.

Definition at line 62 of file thread.c.

References log_pedantic, mm_alloc(), mm_free(), and thread_launch().

Referenced by net_listen().

5.83.1.2 int_t thread_cancel (pthread_t *thread*)

Send a cancellation request to a thread.

Parameters:

thread the pthread id of the thread to be cancele.d.

Returns:

0 on success or a non-zero error number on failure.

Definition at line 131 of file thread.c.

References log_pedantic.

5.83.1.3 void thread_cancel_disable (void)

Set the calling thread to be not cancelable.

Returns:

This function returns no value.

Definition at line 162 of file thread.c.

Referenced by process_maint().

5.83.1.4 void thread_cancel_enable (void)

Set the calling thread to be cancelable.

Returns:

This function returns no value.

Definition at line 153 of file thread.c.

Referenced by process_maint().

5.83.1.5 pthread_t thread_get_thread_id (void)

Get the id of the calling thread.

Returns:

the id of the calling thread.

Definition at line 14 of file thread.c.

Referenced by rand_start(), rand_thread_start(), spool_mktemp(), and ssl_thread_id_callback().

5.83.1.6 int_t thread_join (pthread_t *thread*)

Block until a specified thread finishes execution.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

Returns:

0 on success, or an error number on failure.

Definition at line 86 of file thread.c.

References log_pedantic.

Referenced by net_listen(), process_stop(), queue_shutdown(), and signal_shutdown().

5.83.1.7 int_t thread_launch (pthread_t * *thread*, void * *function*, void * *data*)

Launch a thread to execute a specified function.

See also:

pthread_create()

Parameters:

thread a pointer to a pthread object to receive the new thread id.

function a pointer to a function to be executed inside the new thread.

data a pointer to be data to be passed in as input to the called function.

Returns:

0 on success, or a non-zero error code on failure.

Definition at line 27 of file thread.c.

References log_pedantic, magma, magma_t::system, and magma_t::thread_stack_size.

Referenced by process_start(), queue_init(), signal_shutdown(), and thread_alloc().

5.83.1.8 int_t thread_result (pthread_t *thread*, void ** *result*)

Block until a specified thread finishes execution and store its exit value.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

result a pointer to a block of memory to receive the target thread exit value.

Returns:

0 on success, or an error number on failure.

Definition at line 104 of file thread.c.

References log_pedantic.

5.83.1.9 int_t thread_signal (pthread_t *thread*, int_t *signal*)

Send a specified signal to a thread.

Parameters:

thread the target thread id.

signal the number of the signal to be delivered.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file thread.c.

Referenced by process_stop(), and queue_signal().

5.84 src/engine/context/thread.c File Reference

```
#include "magma.h"
```

Functions

- void thread_stop (void)

  Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

- bool_t thread_start (void)

  Setup a new thread by registering the signal handlers and preparing the MySQL thread specific storage.

5.84.1 Function Documentation

5.84.1.1 bool_t thread_start (void)

Setup a new thread by registering the signal handlers and preparing the MySQL thread specific storage. thread.c

Returns:

true on success or false on failure.

Definition at line 27 of file thread.c.

References signal_thread_start(), and sql_thread_start().

Referenced by dequeue(), net_accept(), and process_maint().

5.84.1.2 void thread_stop (void)

Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

Returns:

This function returns no value.

Definition at line 14 of file thread.c.

References mail_cache_thread_stop(), sql_thread_stop(), and ssl_thread_stop().

Referenced by dequeue(), net_accept(), and process_maint().

5.85 src/core/thread/thread.h File Reference

Functions

- pthread_t * thread_alloc (void *function, void *data)
  thread.c
- int_t thread_cancel (pthread_t thread)
  Send a cancellation request to a thread.
- void thread_cancel_disable (void)
  Set the calling thread to be not cancelable.
- void thread_cancel_enable (void)
  Set the calling thread to be cancelable.
- pthread_t thread_get_thread_id (void)
  Get the id of the calling thread.
- int_t thread_join (pthread_t thread)
  Block until a specified thread finishes execution.
- int_t thread_launch (pthread_t *thread, void *function, void *data)
  Launch a thread to execute a specified function.
- int_t thread_result (pthread_t thread, void **result)
  Block until a specified thread finishes execution and store its exit value.
- int_t thread_signal (pthread_t thread, int_t signal)
  Send a specified signal to a thread.
- int rwlock_attr_destroy (pthread_rwlockattr_t *attr)
  rwlock.c
- int rwlock_attr_getkind (pthread_rwlockattr_t *attr, int *pref)
  Get the kind of a pthread read/write lock attributes object.
- int rwlock_attr_init (pthread_rwlockattr_t *attr)
  Initialize a pthread read/write lock attributes object with default values.
- int rwlock_attr_setkind (pthread_rwlockattr_t *attr, int pref)
  Set the kind of a pthread read/write lock attributes object.
- int rwlock_destroy (pthread_rwlock_t *lock)
  Free a pthread read/write lock and free its resources.
- int rwlock_init (pthread_rwlock_t *lock, pthread_rwlockattr_t *attr)
  Initialize a pthread read/write lock.
- int rwlock_lock_read (pthread_rwlock_t *lock)
  Attempt to acquire a pthread read/write lock for reading, blocking if necessary.
- int rwlock_lock_write (pthread_rwlock_t *lock)

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

- int rwlock_unlock (pthread_rwlock_t *lock)

  Unlock a pthread read/write lock.

- void * tkey_get (pthread_key_t key)

  keys.c

- int tkey_init (pthread_key_t *key, void(*destructor)(void *))

  Create a thread-specific data key.

- int tkey_set (pthread_key_t key, void *value)

  Set the calling thread's value for a pthread key.

- int mutex_destroy (pthread_mutex_t *lock)

  mutex.c

- int mutex_init (pthread_mutex_t *lock, pthread_mutexattr_t *attr)

  Initialize a pthread mutex with the given attributes.

- int mutex_lock (pthread_mutex_t *lock)

  Acquire a pthread mutex, blocking if necessary.

- int mutex_unlock (pthread_mutex_t *lock)

  Unlock a pthread mutex.

5.85.1 Function Documentation

5.85.1.1 int mutex_destroy (pthread_mutex_t * *lock*)

mutex.c mutex.c

See also:

pthread_mutex_destroy()

Parameters:

lock a pointer to the mutex to be freed.

Returns:

0 on success, or an error number on failure.

Definition at line 77 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_destroy(), meta_free(), pool_free(), protocol_secure(), queue_shutdown(), sess_destroy(), ssl_stop(), stacker_free(), and stats_shutdown().

5.85.1.2 int mutex_init (pthread_mutex_t * *lock*, pthread_mutexattr_t * *attr*)

Initialize a pthread mutex with the given attributes.

See also:

pthread_mutex_init()

Parameters:

lock a pointer to a mutex that will be initialized.

attr a pointer to a mutex attributes holder, or NULL to use system default values.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file mutex.c.

References log_pedantic, and MEMORYBUF.

Referenced by con_init(), meta_alloc(), pool_alloc(), queue_init(), ssl_start(), stacker_alloc(), and stats_init().

5.85.1.3 int mutex_lock (pthread_mutex_t * *lock*)

Acquire a pthread mutex, blocking if necessary.

See also:

pthread_mutex_lock()

Parameters:

lock a pointer to the mutex to be locked.

Returns:

0 on success, or an error number on failure.

Definition at line 37 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Referenced by con_decrement_refs(), con_increment_refs(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_status(), dequeue(), dh_exchange_2048(), dh_exchange_4096(), dh_params_generate(), log_disable(), log_enable(), log_internal(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_stamp(), meta_user_ref_total(), mm_sec_alloc(), mm_sec_free(), mm_sec_stats(), pattern_check(), pattern_stop(), pattern_update(), pool_get_failures(), pool_get_obj(), pool_pull(), pool_release(), pool_set_obj(), pool_swap_obj(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_send(), portal_get_upload_attachment(), requeue(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_ref_stamp(), sess_ref_total(), sess_refresh_check(), sess_refresh_flush(), sess_refresh_stamp(), sess_trigger(), signal_refresh(), spool_check(), spool_check_file(), spool_error_stats(), spool_mktemp(), spool_start(), ssl_locking_callback(), stacker_nodes(), stacker_pop(), stacker_push(), statistics_refresh(), stats_adjust_by_name(), stats_adjust_by_num(), stats_decrement_by_name(), stats_decrement_by_num(), stats_get_name(), stats_get_name_pos(), stats_get_value_by_name(), stats_get_value_by_num(), stats_increment_by_name(), stats_increment_by_num(), stats_set_by_name(), stats_set_by_num(), and tank_cycle().

5.85.1.4 int mutex_unlock (pthread_mutex_t * *lock*)

Unlock a pthread mutex.

See also:

pthread_mutex_unlock()

Parameters:

lock a pointer to the mutex to be unlocked.

Returns:

0 on success, or an error number on failure.

Definition at line 57 of file mutex.c.

References log_options, M_LOG_PEDANTIC, M_LOG_STACK_TRACE, and MEMORYBUF.

Referenced by con_decrement_refs(), con_increment_refs(), con_reverse_check(), con_reverse_domain(), con_reverse_enqueue(), con_reverse_status(), dequeue(), dh_exchange_2048(), dh_exchange_4096(), dh_params_generate(), log_disable(), log_enable(), log_internal(), meta_user_ref_add(), meta_user_ref_dec(), meta_user_ref_protocol_total(), meta_user_ref_stamp(), meta_user_ref_total(), mm_sec_alloc(), mm_sec_free(), mm_sec_stats(), pattern_check(), pattern_stop(), pattern_update(), pool_get_failures(), pool_get_obj(), pool_pull(), pool_release(), pool_set_obj(), pool_swap_obj(), portal_endpoint_attachments_add(), portal_endpoint_attachments_remove(), portal_endpoint_messages_compose(), portal_endpoint_messages_send(), portal_get_upload_attachment(), requeue(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_ref_stamp(), sess_ref_total(), sess_refresh_check(), sess_refresh_flush(), sess_refresh_stamp(), sess_trigger(), signal_refresh(), spool_check(), spool_check_file(), spool_error_stats(), spool_mktemp(), spool_start(), ssl_locking_callback(), stacker_nodes(), stacker_pop(), stacker_push(), statistics_refresh(), stats_adjust_by_name(), stats_adjust_by_num(), stats_decrement_by_name(), stats_decrement_by_num(), stats_get_name(), stats_get_name_pos(), stats_get_value_by_name(), stats_get_value_by_num(), stats_increment_by_name(), stats_increment_by_num(), stats_set_by_name(), stats_set_by_num(), and tank_cycle().

5.85.1.5 int rwlock_attr_destroy (pthread_rwlockattr_t ∗ *attr*)

rwlock.c rwlock.c

See also:

pthread_rwlockattr_destroy()

Parameters:

attr a pointer to the read/write lock attributes object to be freed.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.85.1.6 int rwlock_attr_getkind (pthread_rwlockattr_t ∗ *attr*, int ∗ *pref*)

Get the kind of a pthread read/write lock attributes object.

See also:

pthread_rwlockattr_getkind_np()

Parameters:

attr a pointer to the read/write lock attributes object to be queried.

pref a pointer to an integer that will receive the kind of the read/write lock.

Returns:

0 on success or an error number on failure.

Definition at line 155 of file rwlock.c.

References log_pedantic.

5.85.1.7 int rwlock_attr_init (pthread_rwlockattr_t ∗ *attr*)

Initialize a pthread read/write lock attributes object with default values.

See also:

pthread_rwlockattr_init()

Parameters:

attr a pointer to the read/write lock attributes object to be initialized.

Returns:

0 on success or an error number on failure.

Definition at line 105 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.85.1.8 int rwlock_attr_setkind (pthread_rwlockattr_t ∗ *attr*, int *pref*)

Set the kind of a pthread read/write lock attributes object.

See also:

pthread_rwlockattr_setkind_np()

Parameters:

attr a pointer to the read/write lock attributes object to be adjusted.

pref the kind of the read/write lock: PTHREAD_RWLOCK_PREFER_READER_NP, PTHREAD_RWLOCK_PREFER_WRITER_NP, or PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP.

Returns:

0 on success or an error number on failure.

Definition at line 138 of file rwlock.c.

References log_pedantic.

Referenced by meta_alloc().

5.85.1.9 int rwlock_destroy (pthread_rwlock_t ∗ *lock*)

Free a pthread read/write lock and free its resources.

See also:

pthread_rwlock_destroy()

Parameters:

lock a pointer to the read/write lock to be destroyed.

Returns:

0 on success or an error number on failure.

Definition at line 89 of file rwlock.c.

References log_pedantic.

Referenced by inx_free(), magma_folder_free(), message_free(), meta_alloc(), and meta_free().

5.85.1.10 int rwlock_init (pthread_rwlock_t * *lock*, pthread_rwlockattr_t * *attr*)

Initialize a pthread read/write lock.

See also:

pthread_rwlock_init()

Parameters:

lock a pointer to the read/write lock to be initialized.

attr an optional pointer to a set of lock attributes, or the default attributes if NULL is specified.

Returns:

0 on success or an error number on failure.

Definition at line 17 of file rwlock.c.

References log_pedantic.

Referenced by inx_alloc(), magma_folder_alloc(), message_alloc(), and meta_alloc().

5.85.1.11 int rwlock_lock_read (pthread_rwlock_t * *lock*)

Attempt to acquire a pthread read/write lock for reading, blocking if necessary.

See also:

pthread_rwlock_rdlock()

Parameters:

lock the read-write lock to be tried.

Returns:

0 on success or an error number on failure.

Definition at line 53 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_read(), inx_lock_read(), meta_user_rlock(), register_abuse_check_blocklist(), spool_mktemp(), status(), and status_-get().

5.85.1.12 int rwlock_lock_write (pthread_rwlock_t * *lock*)

Attempt to acquire a pthread read/write lock for writing, blocking if necessary.

See also:

pthread_rwlock_wrlock()

Parameters:

lock a pointer to the read/write lock to be acquired.

Returns:

0 on success or an error number on failure.

Definition at line 35 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_write(), inx_lock_write(), meta_user_wlock(), register_blocklist_update(), spool_cleanup(), status_set(), and status_signal().

5.85.1.13 int rwlock_unlock (pthread_rwlock_t * *lock*)

Unlock a pthread read/write lock.

See also:

pthread_rwlock_unlock()

Parameters:

lock a pointer to the read/write lock to be unlocked.

Returns:

0 on success or an error number on failure.

Definition at line 71 of file rwlock.c.

References log_pedantic.

Referenced by inx_auto_unlock(), inx_unlock(), meta_user_unlock(), register_abuse_check_blocklist(), register_blocklist_update(), spool_cleanup(), spool_mktemp(), status(), status_get(), status_set(), and status_signal().

5.85.1.14 pthread_t* thread_alloc (void * *function*, void * *data*)

thread.c thread.c

See also:

pthread_create_new()

Parameters:

function a pointer to the function to be executed.

data a pointer to data to be passed to the executed function.

Returns:

NULL on failure, or a pointer to the newly created pthread on success.

Definition at line 62 of file thread.c.

References log_pedantic, mm_alloc(), mm_free(), and thread_launch().

Referenced by net_listen().

5.85.1.15 int_t thread_cancel (pthread_t *thread*)

Send a cancellation request to a thread.

Parameters:

thread the pthread id of the thread to be cancele.d.

Returns:

0 on success or a non-zero error number on failure.

Definition at line 131 of file thread.c.

References log_pedantic.

5.85.1.16 void thread_cancel_disable (void)

Set the calling thread to be not cancelable.

Returns:

This function returns no value.

Definition at line 162 of file thread.c.

Referenced by process_maint().

5.85.1.17 void thread_cancel_enable (void)

Set the calling thread to be cancelable.

Returns:

This function returns no value.

Definition at line 153 of file thread.c.

Referenced by process_maint().

5.85.1.18 pthread_t thread_get_thread_id (void)

Get the id of the calling thread.

Returns:

the id of the calling thread.

Definition at line 14 of file thread.c.

Referenced by rand_start(), rand_thread_start(), spool_mktemp(), and ssl_thread_id_callback().

5.85.1.19 int_t thread_join (pthread_t *thread*)

Block until a specified thread finishes execution.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

Returns:

0 on success, or an error number on failure.

Definition at line 86 of file thread.c.

References log_pedantic.

Referenced by net_listen(), process_stop(), queue_shutdown(), and signal_shutdown().

5.85.1.20 int_t thread_launch (pthread_t ∗ *thread*, void ∗ *function*, void ∗ *data*)

Launch a thread to execute a specified function.

See also:

pthread_create()

Parameters:

thread a pointer to a pthread object to receive the new thread id.

function a pointer to a function to be executed inside the new thread.

data a pointer to be data to be passed in as input to the called function.

Returns:

0 on success, or a non-zero error code on failure.

Definition at line 27 of file thread.c.

References log_pedantic, magma, magma_t::system, and magma_t::thread_stack_size.

Referenced by process_start(), queue_init(), signal_shutdown(), and thread_alloc().

5.85.1.21 int_t thread_result (pthread_t *thread*, void ∗∗ *result*)

Block until a specified thread finishes execution and store its exit value.

Note:

pthread_join()

Parameters:

thread the thread to wait upon.

result a pointer to a block of memory to receive the target thread exit value.

Returns:

0 on success, or an error number on failure.

Definition at line 104 of file thread.c.

References log_pedantic.

5.85.1.22 int_t thread_signal (pthread_t *thread*, int_t *signal*)

Send a specified signal to a thread.

Parameters:

thread the target thread id.
signal the number of the signal to be delivered.

Returns:

0 on success or an error number on failure.

Definition at line 121 of file thread.c.

Referenced by process_stop(), and queue_signal().

5.85.1.23 void∗ tkey_get (pthread_key_t *key*)

keys.c keys.c

See also:

pthread_getspecific()

Parameters:

key the pthread key to be queried.

Returns:

NULL on failure or a pointer to the key's thread-specific data value on success.

Definition at line 35 of file keys.c.

5.85.1.24 int tkey_init (pthread_key_t ∗ *key*, void(∗)(void ∗) *destructor*)

Create a thread-specific data key.

See also:

pthread_key_create()

Parameters:

key a pointer to pthread key to be initialized for thread-local storage.
destructor if not NULL, an optional function pointer to be called at thread exit to release the data.

Returns:

0 on success, or an error number on failure.

Definition at line 17 of file keys.c.

References log_pedantic.

5.85.1.25 int tkey_set (pthread_key_t *key*, void * *value*)

Set the calling thread's value for a pthread key.

See also:

pthread_setspecific()

Parameters:

key the pthread key to have its thread-local value modified.

value a pointer to the new thread-specific value of the specified key.

Returns:

0 on success, or an error number on failure.

Definition at line 46 of file keys.c.

References log_pedantic.

5.86 src/core/type.c File Reference

```
#include "magma.h"
```

Functions

- char ∗ type (M_TYPE type)

5.86.1 Function Documentation

5.86.1.1 char∗ type (M_TYPE *type*)

Takes a type code and returns the fully enumerated string associated with that type.

Parameters:

type The type code to evaluate.

Returns:

Null terminated string containing type name. String is stored in static buffer and returned as a pointer.

Definition at line 17 of file type.c.

References M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_MULTI, M_TYPE_NULLER, M_TYPE_PLACER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, and M_TYPE_UINT8.

```
#include "magma.h"
#include "keys.h"
```

Functions

- void cache_free (void)

  Free magma's cache server configuration options.

- cache_t ∗ cache_alloc (uint32_t number)

  Allocate a new cache server configuration entry and initialize it to its default values.

- bool_t cache_validate (void)

  Validate all of the configured magma cache server instances.

- void cache_output_settings (void)

  Log the full contents of the magma cache configuration settings.

- bool_t cache_set_value (cache_keys_t ∗setting, cache_t ∗cache, stringer_t ∗value)

  Set the value of a key for a specified cache server configuration entry.

- bool_t cache_config (stringer_t ∗name, stringer_t ∗value)

  Set the value of a cache server configuration entry by name.

- void cache_output_help (void)

  Log all cache key information to be returned via "magma -h".

5.87.1 Function Documentation

5.87.1.1 cache_t∗ cache_alloc (uint32_t *number*)

Allocate a new cache server configuration entry and initialize it to its default values.

Parameters:

number the index of the cache server instance in the global cache server array.

Returns:

NULL on failure, or a pointer to the requested cache server configuration entry on success.

Definition at line 64 of file cache.c.

References magma_t::cache, cache_keys, cache_set_value(), magma_t::iface, log_critical, magma, and mm_alloc().

Referenced by cache_config().

5.87.1.2 bool_t cache_config (stringer_t ∗ *name*, stringer_t ∗ *value*)

Set the value of a cache server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new cache server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable cache server configuration parameter to be set.

value a managed string containing the new value of the cache server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 425 of file cache.c.

References bracket_extract_pl(), cache_alloc(), cache_keys, cache_set_value(), CONSTANT, log_critical, MAGMA_CACHE_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.87.1.3 void cache_free (void)

Free magma's cache server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 17 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_-INSTANCES, mm_free(), cache_keys_t::norm, ns_empty(), ns_free(), cache_keys_t::offset, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.87.1.4 void cache_output_help (void)

Log all cache key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 484 of file cache.c.

References multi_t::bl, cache_keys, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_-FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_-TIME_DISABLE, cache_keys_t::norm, cache_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.87.1.5 void cache_output_settings (void)

Log the full contents of the magma cache configuration settings.

Note:

This logs all the details of each memcached instance configured to work with magma.

Returns:

This function returns no value.

Definition at line 207 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.87.1.6 bool_t cache_set_value (cache_keys_t * *setting*, cache_t * *cache*, stringer_t * *value*)

Set the value of a key for a specified cache server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the cache server key to be set.

cache a pointer to the cache server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 282 of file cache.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, cache_keys_t::name, cache_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), cache_keys_t::offset, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by cache_alloc(), and cache_config().

5.87.1.7 bool_t cache_validate (void)

Validate all of the configured magma cache server instances.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all cache servers have been validated, or false on failure.

Definition at line 93 of file cache.c.

References magma_t::cache, cache_keys, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, magma_t::iface, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_empty, multi_t::type, type(), multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by config_validate_settings().

```
#include "magma.h"
```

Functions

- void mail_cache_destroy (void *holder)
  Free a cached mail message.
- bool_t mail_cache_start (void)
  Initialize the thread-specific data key used for the mail message cache.
- void mail_cache_stop (void)
  Destroy the thread-specific data key used for the mail message cache.
- void mail_cache_thread_stop (void)
  Free the thread-specific data for the mail message cache.
- stringer_t * mail_cache_get (uint64_t messagenum)
  Attempt to retrieve the contents of a message from the thread's cached data.
- void mail_cache_reset (void)
  Reset the thread's mail cache and free any held message.
- void mail_cache_set (uint64_t messagenum, stringer_t *text)
  Set the contents of the thread's mail cache.

5.88.1 Function Documentation

5.88.1.1 void mail_cache_destroy (void * *holder*)

Free a cached mail message. cache.c

Parameters:

holder a pointer to the cached mail message object to be freed.

Returns:

This function returns no value.

Definition at line 17 of file cache.c.

References mm_free(), st_cleanup, and mail_cache_t::text.

Referenced by mail_cache_start(), and mail_cache_thread_stop().

5.88.1.2 stringer_t* mail_cache_get (uint64_t *messagenum*)

Attempt to retrieve the contents of a message from the thread's cached data.

Note:

The thread's cache only has the capacity to store a single message.

Parameters:

messagenum the id of the message to be retrieved.

Returns:

NULL on failure or a managed string containing the message data on success.

Definition at line 78 of file cache.c.

References mail_cache_t::messagenum, st_dupe(), and mail_cache_t::text.

Referenced by mail_load_message().

5.88.1.3 void mail_cache_reset (void)

Reset the thread's mail cache and free any held message.

Returns:

This function returns no value.

Definition at line 97 of file cache.c.

References mail_cache_t::messagenum, mm_free(), st_cleanup, and mail_cache_t::text.

Referenced by imap_session_destroy(), and pop_session_destroy().

5.88.1.4 void mail_cache_set (uint64_t *messagenum*, stringer_t ∗ *text*)

Set the contents of the thread's mail cache.

Parameters:

messagenum the numerical id of the message to be cached. a managed string containing the contents of the specified message to be cached.

Returns:

This function returns no value.

Definition at line 118 of file cache.c.

References CONTIGUOUS, HEAP, log_pedantic, MANAGED_T, mail_cache_t::messagenum, mm_alloc(), mm_free(), st_cleanup, st_dupe_opts(), and mail_cache_t::text.

Referenced by mail_load_message().

5.88.1.5 bool_t mail_cache_start (void)

Initialize the thread-specific data key used for the mail message cache.

Returns:

true on success or false on failure.

Definition at line 33 of file cache.c.

References log_pedantic, and mail_cache_destroy().

Referenced by process_start().

5.88.1.6 void mail_cache_stop (void)

Destroy the thread-specific data key used for the mail message cache.

Returns:

This function returns no value.

Definition at line 47 of file cache.c.

References log_pedantic.

Referenced by process_stop().

5.88.1.7 void mail_cache_thread_stop (void)

Free the thread-specific data for the mail message cache.

Returns:

This function returns no value.

Definition at line 60 of file cache.c.

References mail_cache_destroy().

Referenced by thread_stop().

5.89 src/providers/consumers/cache.c File Reference

```
#include "magma.h"
```

Functions

- bool_t lib_load_cache (void)

  Initialize the memcached library and bind dynamically to the exported functions that are required.

- const char * lib_version_cache (void)

  Return the version string of the memcached library.

- bool_t cache_start (void)
- void cache_stop (void)

  Destroy the memcached client pool and all active connections.

- void cache_flush (void)
- stringer_t * cache_get (stringer_t *key)

  Retrieve data from memcached by key.

- uint64_t cache_get_u64 (stringer_t *key)

  Retrieve a 64 bit value from memcached by key.

- int_t cache_set (stringer_t *key, stringer_t *object, time_t expiration)

  Set a value in memcached by key.

- int_t cache_set_u64 (stringer_t *key, uint64_t value, time_t expiration)

  Set a 64 bit value in memcached by key.

- int_t cache_add (stringer_t *key, stringer_t *object, time_t expiration)

  Add a new key/value pair to the memcached server.

- int_t cache_silent_add (stringer_t *key, stringer_t *object, time_t expiration)

  Add a new key/value pair to the memcached server, but suppress any error messages.

- int_t cache_append (stringer_t *key, stringer_t *object, time_t expiration)

  Append data to the value of a cached keye on a memcached server.

- int_t cache_delete (stringer_t *key)

  Delete a key from memcached immediately.

- uint64_t cache_increment (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)

  Increment the value stored with a key by memcached by a specified offset.

- uint64_t cache_decrement (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)

  Decrement the value stored with a key inside memcached, using the specified offset.

Variables

- pool_t * cache_pool = NULL

5.89.1 Function Documentation

5.89.1.1 int_t cache_add (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Add a new key/value pair to the memcached server. cache.c

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 278 of file cache.c.

References log_info, memcached_add_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_-get(), st_empty, st_length_get(), and st_length_int().

5.89.1.2 int_t cache_append (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Append data to the value of a cached keye on a memcached server.

Parameters:

key a managed string with the name of the target memcached key.

object a managed string containing the value of the data being appended to the original key.

expiration an expiration time, in seconds, for the modified cached data.

Definition at line 323 of file cache.c.

References log_info, memcached_add_d, memcached_append_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by stamp_counter_increment().

5.89.1.3 uint64_t cache_decrement (stringer_t * *key*, uint64_t *offset*, uint64_t *initial*, time_t *expiration*)

Decrement the value stored with a key inside memcached, using the specified offset.

See also:

memcached_decrement_with_initial()

Note:

If the expiration valuse is MEMCACHED_EXPIRATION_NOT_ADD the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be decremented.

initial the initial value to seed the key with it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly decremented value associated with the key, or the initial value, on success.

Definition at line 415 of file cache.c.

References log_pedantic, memcached_decrement_with_initial_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by imap_login(), pop_pass(), smtp_auth_login(), and smtp_auth_plain().

5.89.1.4 int_t cache_delete (stringer_t ∗ *key*)

Delete a key from memcached immediately.

Note:

memcached_delete()

Parameters:

key the name of the key to be deleted from the memcached server.

Returns:

0 on failure, or MEMCACHED_SUCCESS on success.

Definition at line 353 of file cache.c.

References log_info, memcached_delete_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_-get(), st_empty, st_length_get(), and st_length_int().

Referenced by lock_release().

5.89.1.5 void cache_flush (void)

Definition at line 124 of file cache.c.

References log_info, memcached_flush_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), and pool_release().

5.89.1.6 stringer_t∗ cache_get (stringer_t ∗ *key*)

Retrieve data from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or a pointer to a managed string containing the cached data on success.

Definition at line 145 of file cache.c.

References data, length, log_info, memcached_get_d, memcached_strerror_d, mm_free(), PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_import(), st_length_get(), and st_length_int().

Referenced by register_session_get(), smtp_check_greylist(), smtp_fetch_autoreply(), stamp_counter_check(), and teacher_data_get().

5.89.1.7 uint64_t cache_get_u64 (stringer_t ∗ *key*)

Retrieve a 64 bit value from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or the 64 bit value cached data on success.

Definition at line 185 of file cache.c.

References data, length, log_info, memcached_get_d, memcached_strerror_d, mm_free(), PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by contact_abuse_checks(), register_abuse_checks(), and smtp_reply().

5.89.1.8 uint64_t cache_increment (stringer_t * *key*, uint64_t *offset*, uint64_t *initial*, time_t *expiration*)

Increment the value stored with a key by memcached by a specified offset.

See also:

memcached_increment_with_initial()

Note:

If the expiration valuse is MEMCACHED_EXPIRATION_NOT_ADD the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be incremented.

initial the initial value to seed the key if it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly incremented value associated with the key, or the initial value, on success.

Definition at line 381 of file cache.c.

References log_pedantic, memcached_increment_with_initial_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by api_endpoint_auth(), contact_abuse_increment_history(), imap_login(), pop_pass(), portal_endpoint_auth(), register_abuse_-increment_history(), serial_get(), serial_increment(), smtp_auth_login(), and smtp_auth_plain().

5.89.1.9 int_t cache_set (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Set a value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

object a managed string containing the new data to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

0 on failure, or 1 on success.

Definition at line 231 of file cache.c.

References log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by register_session_cache(), serial_reset(), smtp_check_greylist(), smtp_fetch_autoreply(), and teacher_data_save().

5.89.1.10 int_t cache_set_u64 (stringer_t * *key*, uint64_t *value*, time_t *expiration*)

Set a 64 bit value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

value the new value to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

NULL on failure, or the retrieved unsigned 64 bit cached data on success.

Definition at line 255 of file cache.c.

References log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by smtp_reply().

5.89.1.11 int_t cache_silent_add (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Add a new key/value pair to the memcached server, but suppress any error messages.

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 301 of file cache.c.

References memcached_add_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, and st_length_get().

Referenced by lock_get().

5.89.1.12 bool_t cache_start (void)

Definition at line 45 of file cache.c.

References magma_t::cache, magma_t::iface, log_critical, magma, MAGMA_CACHE_INSTANCES, memcached_behavior_set_d, memcached_create_d, memcached_free_d, memcached_server_add_with_weight_d, memcached_strerror_d, pool_alloc(), and pool_set_-obj().

Referenced by process_start().

5.89.1.13 void cache_stop (void)

Destroy the memcached client pool and all active connections.

Returns:

This function returns no value.

Definition at line 104 of file cache.c.

References magma_t::cache, magma_t::iface, magma, memcached_free_d, pool_free(), and pool_get_obj().

Referenced by process_stop().

5.89.1.14 bool_t lib_load_cache (void)

Initialize the memcached library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 16 of file cache.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.89.1.15 const char* lib_version_cache (void)

Return the version string of the memcached library.

Returns:

a pointer to a character string containing the memcached library version information.

Definition at line 37 of file cache.c.

References memcached_lib_version_d.

Referenced by lib_load().

Functions

- cached_store_t * _get_cached_store_by_type (cached_data_type_t dtype)

  Get a pointer to a cached object store by its type.

- char * _get_dime_dir_location (const char *suffix)

  Get the full pathname of the DIME base directory.

- char * _get_cache_location (void)

  Get the full pathname of the DIME cache file.

- int _set_cache_location (const char *path)

  Set the pathname of the DIME management record cache file.

- cached_object_t * _create_cached_object (cached_data_type_t dtype, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)

  Allocate and initialize a new cached object.

- void * _get_cache_obj_data (cached_object_t *object)

  Get the data associated with a cached object, freeing the parent cached object.

- void _destroy_cache_entry (cached_object_t *entry)

  Destroy a cached object.

- cached_object_t * _find_cached_object (const char *oid, cached_store_t *store)

  Find a cached object in a cached store.

- cached_object_t * _find_cached_object_cmp (const void *key, cached_store_t *store, cached_store_comparator_t cmpfn)

  Find a cached object in a cached store using a custom comparator.

- int _cached_object_exists (const unsigned char *hashid, cached_store_t *store)

  Check by a cached object's hashed id to see if it already exists in a cached object store.

- int _cached_object_exists_cmp (const void *key, cached_store_t *store, cached_store_comparator_t cmpfn)

  Check to see if an object exists in a cached store by using a custom comparator function.

- cached_object_t * _add_cached_object (const char *id, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)

  Create and add a cached object to a cached store.

- cached_object_t * _add_cached_object_forced (const char *id, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)

  Create and add an object to the cache, forcing the removal of any existing object with a clashing id.

- cached_object_t * _add_cached_object_cmp (const char *id, const void *key, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, cached_store_comparator_t cmpfn)

  Create and add a cached object to a cached store using a custom comparator check for collisions.

- cached_object_t * _add_cached_object_cmp_forced (const char *id, const void *key, cached_store_t *store, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed, cached_store_comparator_t cmpfn)

  Create and add an object to the cache, forcing the removal of any existing object that matches the result of a custom comparison function.

- int _remove_cached_object (const char *oid, cached_store_t *store)

  Remove an object from a cached store by name.

- int _remove_cached_object_cmp (const void *key, cached_store_t *store, cached_store_comparator_t cmpfn)

  Remove an object from a cached store using a custom comparator function.

- cached_object_t * _clone_cached_object (const cached_object_t *obj)

  Clone a deep copy of a cached object for user-safe retrieval.

- void _dump_cache (cached_data_type_t dtype, int do_data, int ephemeral)

  Dump the content of the specified data cached store(s) to the console.

- void _dump_cache_data (FILE *fp, const cached_object_t *obj, int brief)

  Dump information about a specified cached object to a file stream.

- int _load_cache_contents (void)

  Persist the entire contents of the cache to local storage.

- int _save_cache_contents (void)

  Persist the entire contents of the cache to local storage.

- int _set_cache_permissions (unsigned long flags)

  Set the permissions flags for the object cache.

- size_t _mem_append_serialized (unsigned char **buf, size_t *blen, const unsigned char *data, size_t dlen)

  Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_string (unsigned char **buf, size_t *blen, const char *string)

  Apped a null-terminated string to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_array (unsigned char **buf, size_t *blen, const unsigned char **array, size_t itemsize)

  Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_str_array (unsigned char **buf, size_t *blen, const char **array)
  Append an array of null-terminated strings to a dynamically allocated buffer for serialization.
- size_t _mem_append_serialized_array_cb (unsigned char **buf, size_t *blen, const char **array, custom_serializer_t sfn)
  Append an array of custom-formatted data to a dynamically allocated buffer for serialization.
- unsigned int _deserialize_data (unsigned char *dst, unsigned char **bufptr, const unsigned char *bufend, size_t len)
  Deserialize a fixed-sized chunk of data from an input buffer.
- unsigned char * _deserialize_vardata (unsigned char **bufptr, const unsigned char *bufend, size_t *olen)
  Deserialize a variable-length chunk of data from an input buffer.
- unsigned int _deserialize_string (char **dst, unsigned char **bufptr, const unsigned char *bufend)
  Deserialize a null-terminated string from an input buffer.
- unsigned int _deserialize_array (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, size_t itemsize)
  Deserialize an array of fixed-size objects from an input buffer.
- unsigned int _deserialize_str_array (char ***dst, unsigned char **bufptr, const unsigned char *bufend)
  Deserialize an array of null-terminated string from an input buffer.
- unsigned int _deserialize_array_cb (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, custom_deserializer_t dfn)
  Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.
- int _is_object_expired (cached_object_t *obj, int *refresh)
  Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.
- cached_object_t * _unlink_object (cached_object_t *object, int destroy, int stale)
  Unlink a cached object from its doubly linked list.
- cached_object_t * _replace_object (cached_object_t *oobj, cached_object_t *nobj, int shadow)
  Replace one object in the cache with another.
- void _lock_cache_store (cached_store_t *store)
  Lock a cached store for thread-safe processing.
- void _unlock_cache_store (cached_store_t *store)
  Unlock a cached storea for use by other callers.
- unsigned int _evict_if_stale (cached_object_t **objptr)
  Evict an item from the object cache if it is stale (has expired).
- void * _deserialize_signet_cb (void *data, size_t len)
  Deserializes signet from a void pointer.
- void * _serialize_signet_cb (void *record, size_t *outlen)
  Serializes a signet_t structure into a binary string.
- void _dump_signet_cb (FILE *fp, void *record, int brief)
  Dumps a signet from a signet_t structure.
- void _destroy_signet_cb (void *record)
  Destroys a signet_t structure.

Variables

- cached_store_t cached_stores [cached_data_signet+1]

5.90.1 Function Documentation

5.90.1.1 cached_object_t* _add_cached_object (const char * *id*, cached_store_t * *store*, unsigned long *ttl*, time_t *expiration*, void * *data*, int *persists*, int *relaxed*)

Create and add a cached object to a cached store.

Parameters:

id a unique identifier to be associated with the cached object in the store.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 556 of file cache.c.

References _clone_cached_object(), _compute_sha_hash(), _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_-ADD, cached_object::data, cached_store_t::dtype, cached_object::dtype, ERR_BAD_PARAM, ERR_NOMEM, ERR_PERM, ERR_-UNSPEC, cached_object::expiration, cached_store_t::head, cached_object::id, cached_object::next, cached_object::persists, cached_-object::prev, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_PTR, RET_ERROR_PTR_FMT, SHA_256_SIZE, cached_object::timestamp, and cached_object::ttl.

Referenced by _add_cached_object_forced(), _do_ocsp_validation(), _get_dime_record(), and _get_signet().

5.90.1.2 cached_object_t* _add_cached_object_cmp (const char * *id*, const void * *key*, cached_store_t * *store*, unsigned long *ttl*, time_t *expiration*, void * *data*, int *persists*, int *relaxed*, cached_store_comparator_t *cmpfn*)

Create and add a cached object to a cached store using a custom comparator check for collisions.

Parameters:

id a unique identifier to be associated with the cached object in the store.

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cache dstore and determine whether the two objects match one another.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 741 of file cache.c.

References _clone_cached_object(), _compute_sha_hash(), _create_cached_object(), _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_ADD, cached_object::data, cached_store_t::dtype, ERR_BAD_PARAM, ERR_PERM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, cached_object::prev, RET_ERROR_PTR, and SHA_256_SIZE.

Referenced by _add_cached_object_cmp_forced(), _add_dnskey_entry_rsa(), and _add_ds_entry().

5.90.1.3 cached_object_t* _add_cached_object_cmp_forced (const char * *id*, const void * *key*, cached_store_t * *store*, unsigned long *ttl*, time_t *expiration*, void * *data*, int *persists*, int *relaxed*, cached_store_comparator_t *cmpfn*)

Create and add an object to the cache, forcing the removal of any existing object that matches the result of a custom comparison function.

Parameters:

id a unique identifier to be associated with the cached object in the store.

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cache dstore and determine whether the two objects match one another.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 835 of file cache.c.

References _add_cached_object_cmp(), _clone_cached_object(), _create_cached_object(), _dbgprint(), _destroy_cache_entry(), _dump_cache_data(), _find_cached_object(), _find_cached_object_cmp(), _replace_object(), _verbose, CACHE_PERM_ADD, cached_object::data, cached_store_t::dtype, ERR_BAD_PARAM, ERR_PERM, ERR_UNSPEC, and RET_ERROR_PTR.

Referenced by _add_dnskey_entry_rsa().

5.90.1.4 cached_object_t* _add_cached_object_forced (const char * *id*, cached_store_t * *store*, unsigned long *ttl*, time_t *expiration*, void * *data*, int *persists*, int *relaxed*)

Create and add an object to the cache, forcing the removal of any existing object with a clashing id.

Note:

If an object with the same identifier already exists, it will be stored as the "shadow" data of the newly created cached entry. This allows for shadowed data to be saved to disk on a cache save, even if the over-shadowing data is not marked as persistent.

Parameters:

id a unique identifier to be associated with the cached object in the store.

store a pointer to the cached store that will hold the new cached object.

ttl an optional time-to-live value for the cached object, in seconds.

expiration an optional expiration date for the cached object, as a UTC time.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy; this ensures that even if the entry's TTL has expired, if its absolute (UTC) expiration has not been reached, it will not be evicted from the cache, but will delivery a refresh notification to the caller.

Returns:

a pointer to the newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 662 of file cache.c.

References _add_cached_object(), _clone_cached_object(), _create_cached_object(), _dbgprint(), _destroy_cache_entry(), _dump_cache_-data(), _find_cached_object(), _replace_object(), _verbose, CACHE_PERM_ADD, cached_object::data, cached_store_t::dtype, ERR_BAD_-PARAM, ERR_PERM, ERR_UNSPEC, and RET_ERROR_PTR.

Referenced by _get_dime_record_from_file().

5.90.1.5 int _cached_object_exists (const unsigned char ∗ *hashid*, cached_store_t ∗ *store*)

Check by a cached object's hashed id to see if it already exists in a cached object store.

Parameters:

store a pointer to the cached store in which to search for the cached object.

hashid the (already) hashed unique id of the object to be located in the cache.

Returns:

1 if the object described was present in the cache, 0 if it was not, or -1 on error.

Definition at line 460 of file cache.c.

References _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_READ, ERR_BAD_PARAM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, RET_ERROR_INT, and SHA_256_SIZE.

Referenced by _load_cache_contents().

5.90.1.6 int _cached_object_exists_cmp (const void ∗ *key*, cached_store_t ∗ *store*, cached_store_comparator_t *cmpfn*)

Check to see if an object exists in a cached store by using a custom comparator function.

Note:

This function is used when the simple unique object ID is not enough to identify an object.

Parameters:

key a pointer to an object-specific key that will be passed to the comparison function.

store a pointer to the cached store in which to search for the cached object.

cmpfn a comparison function that will compare the key value to the objects in the specified cached store, and determine whether the two objects match one another.

Returns:

1 if the object described was present in the cache, 0 if it was not, or -1 on error.

Definition at line 506 of file cache.c.

References _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_READ, cached_object::data, ERR_BAD_-PARAM, ERR_UNSPEC, cached_store_t::head, cached_object::next, and RET_ERROR_INT.

5.90.1.7 cached_object_t* _clone_cached_object (const cached_object_t * *obj*)

Clone a deep copy of a cached object for user-safe retrieval.

Definition at line 994 of file cache.c.

References _get_cached_store_by_type(), cached_store_t::clone, cached_object::data, data, cached_store_t::deserialize, cached_object::dtype, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, cached_object::expiration, cached_object::id, cached_store_t::internal, cached_object::persists, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_PTR, cached_store_t::serialize, store, cached_object::timestamp, and cached_object::ttl.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), _find_cached_object(), and _find_cached_object_cmp().

5.90.1.8 cached_object_t* _create_cached_object (cached_data_type_t *dtype*, unsigned long *ttl*, time_t *expiration*, void * *data*, int *persists*, int *relaxed*)

Allocate and initialize a new cached object.

See also:

_add_cached_object()

Note:

The data parameter specifies an object-specific value that will be passed to other parts of the cache management subsystem, such as functions for deletion, destruction, search, etc.

Parameters:

dtype the data type identifying the cached store to which this cached object will belong.

ttl if not 0, an optional time-to-live value in seconds specifying in how many seconds from now the cached object will reach expiration.

expiration if not 0, an optional UTC time value specifying the exact time at which this cached object will reach expiration.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy. A relaxed cache policy ensures that even if the entry's ttl has expired, if its absolute (UTC) expiration time has not been reached, it will not be evicted from the cache, but will allow for a notification to the caller that it is time for the cached entry to be refreshed.

Returns:

a pointer to a newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 244 of file cache.c.

References cached_object::data, cached_object::dtype, ERR_NOMEM, ERR_UNSPEC, cached_object::expiration, cached_object::persists, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_PTR, cached_object::timestamp, and cached_object::ttl.

Referenced by _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _get_dime_record().

5.90.1.9 unsigned int _deserialize_array (unsigned char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t *itemsize*)

Deserialize an array of fixed-size objects from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_array().

Parameters:

dst a pointer to the address of an array of objects that will receive a copy of the deserialized data as an array of (NULL pointer terminated) fixed-size objects on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

itemsize the size, in bytes, of the fixed-sized objects to be deserialized.

Returns:

1 on success or 0 on failure.

Definition at line 1876 of file cache.c.

References _deserialize_data(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_-ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb().

5.90.1.10 unsigned int _deserialize_array_cb (unsigned char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, custom_deserializer_t *dfn*)

Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.

Note:

This is the inverse function of _mem_append_serialized_array_cb().

Parameters:

dst a pointer to the address of an array of data buffers that will receive a copy of the deserialized data as an array of (NULL pointer terminated) data buffers on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

dfn a custom deserialization function that will be used to deserialize the user data from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 2025 of file cache.c.

References _deserialize_data(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_UINT.

5.90.1.11 unsigned int _deserialize_data (unsigned char * *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t *len*)

Deserialize a fixed-sized chunk of data from an input buffer.

Note:

This is the inverse function of _mem_append(); dst must be at least len bytes long.

Parameters:

dst a pointer to the output buffer that will receive the deserialized data.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

len the size of the data chunk to be deserialized from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 1755 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_UINT, and RET_ERROR_UINT_FMT.

Referenced by _deserialize_array(), _deserialize_array_cb(), _deserialize_dime_record_cb(), _deserialize_dnskey_record_cb(), _deserialize_ds_record_cb(), _deserialize_str_array(), and _deserialize_vardata().

5.90.1.12 void* _deserialize_signet_cb (void * *data*, size_t *len*)

Deserializes signet from a void pointer.

Parameters:

data Pointer to serial signet data.

len Length of serial signet data.

Returns:

Void pointer to a signet_t structure.

Definition at line 2321 of file cache.c.

References dime_sgnt_signet_binary_deserialize(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_PTR.

5.90.1.13 unsigned int _deserialize_str_array (char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize an array of null-terminated string from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_str_array().

Parameters:

dst a pointer to the address of an array of strings that will receive a copy of the deserialized data as an array of (NULL pointer terminated) null-terminated strings on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1955 of file cache.c.

References _deserialize_data(), _deserialize_string(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb().

5.90.1.14 unsigned int _deserialize_string (char ** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize a null-terminated string from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_string().

Parameters:

dst a pointer to the address of a string that will receive a copy of the deserialized data as a null-terminated string on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1826 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb(), _deserialize_dnskey_record_cb(), _deserialize_ds_record_cb(), and _deserialize_str_array().

5.90.1.15 unsigned char* _deserialize_vardata (unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t * *olen*)

Deserialize a variable-length chunk of data from an input buffer.

Note:

This is the inverse function of _mem_append_serialized.

Parameters:

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

olen an optional pointer to receive the size of the deserialized data on success.

Returns:

a pointer to a newly allocated buffer containing the deserialized data on success, or NULL on failure.

Definition at line 1784 of file cache.c.

References _deserialize_data(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_UINT.

Referenced by _deserialize_dnskey_record_cb(), and _deserialize_ds_record_cb().

5.90.1.16 void _destroy_cache_entry (cached_object_t * *entry*)

Destroy a cached object.

Parameters:

entry a pointer to the cached object to be destroyed.

Definition at line 316 of file cache.c.

References _clear_error_stack(), _get_cached_store_by_type(), cached_object::data, cached_store_t::destructor, cached_object::dtype, dump_error_stack(), get_last_error(), and store.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), _get_cache_obj_data(), _get_dime_record(), _load_-cache_contents(), and _replace_object().

5.90.1.17 void _destroy_signet_cb (void * *record*)

Destroys a signet_t structure.

Parameters:

record Void pointer to a signet_t structure to be destroyed.

Definition at line 2399 of file cache.c.

References dime_sgnt_signet_destroy().

5.90.1.18 void _dump_cache (cached_data_type_t *dtype*, int *do_data*, int *ephemeral*)

Dump the content of the specified data cached store(s) to the console.

Parameters:

dtype the type of the object cached store to be dumped, or cached_data_unknown for all stores.

do_data if non-zero, dump the type-specific data associated with the cached object.

ephemeral if non-zero, print out ephemeral as well as persistent cache data.

Definition at line 1068 of file cache.c.

References _dump_cache_data(), _get_chr_date(), _lock_cache_store(), _unlock_cache_store(), cached_data_unknown, cached_-object::data, cached_store_t::dtype, cached_object::expiration, cached_object::next, cached_object::persists, cached_object::relaxed, cached_object::shadow, cached_object::timestamp, and cached_object::ttl.

5.90.1.19 void _dump_cache_data (FILE * *fp*, const cached_object_t * *obj*, int *brief*)

Dump information about a specified cached object to a file stream.

Parameters:

fp a pointer to the file stream across which the data should be dumped.

obj a pointer to the cached object to have its details dumped.

brief if true, print a brief one-line description of the object; otherwise, dump full object information.

Definition at line 1163 of file cache.c.

References _clear_error_stack(), _get_cached_store_by_type(), cached_object::data, cached_object::dtype, cached_store_t::dump, dump_-error_stack(), get_last_error(), and store.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), _dump_cache(), _load_cache_contents(), and _unlink_-object().

5.90.1.20 void _dump_signet_cb (FILE * *fp*, void * *record*, int *brief*)

Dumps a signet from a signet_t structure.

Parameters:

fp File descriptor that specifies the output destination.

record Void pointer to a signet_t structure.

brief TODO

Definition at line 2377 of file cache.c.

References dime_sgnt_signet_dump().

5.90.1.21 unsigned int _evict_if_stale (cached_object_t ** *objptr*)

Evict an item from the object cache if it is stale (has expired).

Returns:

1 if the object was evicted for being stale or 0 if it was not.

Definition at line 2287 of file cache.c.

References _clear_error_stack(), _is_object_expired(), _unlink_object(), dump_error_stack(), and get_last_error().

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _find_cached_object(), _find_cached_object_cmp(), _remove_cached_object(), and _remove_cached_object_cmp().

5.90.1.22 cached_object_t* _find_cached_object (const char * *oid*, cached_store_t * *store*)

Find a cached object in a cached store.

Parameters:

oid a null-terminated string containing the unique name or identifier of the cached object.

store a pointer to the cached store to be searched for the target object.

Returns:

a pointer to the specified cached object, if found, or NULL on failure.

Definition at line 355 of file cache.c.

References _clone_cached_object(), _compute_sha_hash(), _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_READ, ERR_BAD_PARAM, ERR_PERM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, RET_ERROR_PTR, and SHA_256_SIZE.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), _do_ocsp_validation(), _get_dime_record(), and _get_signet().

5.90.1.23 cached_object_t* _find_cached_object_cmp (const void * *key*, cached_store_t * *store*, cached_store_comparator_t *cmpfn*)

Find a cached object in a cached store using a custom comparator.

Note:

This function is used when the simple unique object ID is not sufficient to identify an object.

Parameters:

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store in which to search for the cached object.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cached store and determine whether the two objects match one another.

Returns:

a pointer to the found cached object on success, or NULL on failure.

Definition at line 412 of file cache.c.

References _clone_cached_object(), _evict_if_stale(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_READ, cached_object::data, ERR_BAD_PARAM, ERR_PERM, ERR_UNSPEC, cached_store_t::head, cached_object::next, and RET_ERROR_PTR.

Referenced by _add_cached_object_cmp_forced(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), and _load_dnskey_file().

5.90.1.24 char∗ _get_cache_location (void)

Get the full pathname of the DIME cache file.

Note:

The default location returned by this function can be overridden by setting the DIME_CACHE_FILE environment variable.

Returns:

NULL on failure, or a null-terminated string containing the filename of the DIME object cache file on success. {free}

Definition at line 154 of file cache.c.

References _dbgprint(), _get_dime_dir_location(), ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _load_cache_contents(), and _save_cache_contents().

5.90.1.25 void∗ _get_cache_obj_data (cached_object_t ∗ *object*)

Get the data associated with a cached object, freeing the parent cached object.

Note:

This function is useful as a wrapper for returning cached data without returning the meta-information associated with the same data that is stored inside its cached_object_t holder. If the object belongs to an internal store, no memory will be freed.

Parameters:

object a pointer to the cached object to have its opaque data returned, and enclosing structure freed.

Returns:

NULL on failure, or a pointer to the cached object's data on success.

Definition at line 281 of file cache.c.

References _destroy_cache_entry(), _get_cached_store_by_type(), cached_object::data, cached_object::dtype, ERR_UNSPEC, cached_store_t::internal, RET_ERROR_PTR, and store.

Referenced by _add_dnskey_entry_rsa(), _add_ds_entry(), _get_dime_record(), _get_dime_record_from_file(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), and _get_signet().

5.90.1.26 cached_store_t* _get_cached_store_by_type (cached_data_type_t *dtype*)

Get a pointer to a cached object store by its type.

Parameters:

dtype the numerical identifier of the cached data type.

Returns:

a pointer to the requested cached object store on success, or NULL on failure.

Definition at line 46 of file cache.c.

Referenced by _clone_cached_object(), _destroy_cache_entry(), _dump_cache_data(), _get_cache_obj_data(), _load_cache_contents(), _replace_object(), and _unlink_object().

5.90.1.27 char* _get_dime_dir_location (const char * *suffix*)

Get the full pathname of the DIME base directory.

Parameters:

suffix if not NULL, an optional suffix containing a filename or path to be appended to the end of the DIME directory name.

Returns:

NULL on failure, or a null-terminated string containing the requested DIME directory pathname on success.

Definition at line 61 of file cache.c.

References ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and str_printf().

Referenced by _get_cache_location(), _initialize_resolver(), and _ssl_initialize().

5.90.1.28 int _is_object_expired (cached_object_t * *obj*, int * *refresh*)

Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.

Note:

An object has "expired" and needs to be evicted from the cache if it has a non-zero TTL from its cache date that has been reached, or a non-zero absolute expiration date that has been exceeded. If the object's cache policy is relaxed, a TTL expiration advises a "refresh" if no absolute expiration has occurred.

Parameters:

obj a pointer to the cached object to have its age examined.

refresh an optional pointer to a value that, if the cached object has a relaxed expiration policy, will be set to 1 if it needs to be refreshed or 0 if it does not.

Returns:

1 if the object has expired or 0 if it has not; -1 if a general error has occurred.

Definition at line 2093 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, cached_object::expiration, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_INT, cached_object::timestamp, and cached_object::ttl.

Referenced by _evict_if_stale(), and _get_dime_record().

5.90.1.29 int _load_cache_contents (void)

Persist the entire contents of the cache to local storage.

Returns:

1 if the cache was loaded successfully, 0 if it was created, or -1 on general failure.

Definition at line 1196 of file cache.c.

References _cached_object_exists(), _clear_error_stack(), _dbgprint(), _destroy_cache_entry(), _dump_cache_data(), _get_cache_location(), _get_cached_store_by_type(), _get_chr_date(), _lock_cache_store(), _unlock_cache_store(), _verbose, CACHE_PERM_LOAD, cached_object::data, cached_store_t::deserialize, cached_object::dtype, dump_error_stack(), ERR_NOMEM, ERR_PERM, ERR_UNSPEC, cached_object::expiration, cached_store_t::head, cached_object::id, cached_object::next, cached_object::persists, PUSH_ERROR_SYSCALL, RET_ERROR_INT, store, cached_object::timestamp, and cached_object::ttl.

5.90.1.30 void _lock_cache_store (cached_store_t * *store*)

Lock a cached store for thread-safe processing.

Parameters:

store a pointer to the cached store to be locked.

Definition at line 2261 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), and _save_cache_contents().

5.90.1.31 size_t _mem_append_serialized (unsigned char ** *buf*, size_t * *blen*, const unsigned char * *data*, size_t *dlen*)

Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

data a pointer to a buffer holding the data that will be appended to the end of the output buffer.

dlen the size, in bytes, of the data buffer to be appended to the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1524 of file cache.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _mem_append_serialized_array(), _mem_append_serialized_array_cb(), _mem_append_serialized_str_array(), _serialize_dnskey_record_cb(), and _serialize_ds_record_cb().

5.90.1.32 size_t _mem_append_serialized_array (unsigned char ** *buf*, size_t * *blen*, const unsigned char ** *array*, size_t *itemsize*)

Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to fixed-size objects (ending with a NULL pointer) to be appended to the end of the output buffer.

itemsize the size, in bytes, of the array elements to be deserialized.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1585 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb().

5.90.1.33 size_t _mem_append_serialized_array_cb (unsigned char ∗∗ *buf*, size_t ∗ *blen*, const char ∗∗ *array*, custom_serializer_t *sfn*)

Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

Note:

This function uses a custom serialization function in order to output the user data properly.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to custom-formatted data buffers (ending with a NULL pointer) to be appended to the end of the output buffer using a custom serialization function.

sfn a custom serialization function that will be used to serialize the user data into the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1698 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

5.90.1.34 size_t _mem_append_serialized_str_array (unsigned char ∗∗ *buf*, size_t ∗ *blen*, const char ∗∗ *array*)

Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to null-terminated strings (ending with a NULL pointer) to be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1640 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb().

5.90.1.35 size_t _mem_append_serialized_string (unsigned char ** *buf*, size_t * *blen*, const char * *string*)

Apped a null-terminated string to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

string a null-terminated string that will be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1552 of file cache.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb(), _serialize_dnskey_record_cb(), and _serialize_ds_record_cb().

5.90.1.36 int _remove_cached_object (const char * *oid*, cached_store_t * *store*)

Remove an object from a cached store by name.

Note:

The caller is still responsible for freeing the cached object and its underlying data.

Parameters:

oid the unique identifier of the cached object to be removed.

store a pointer to the cached store from which the specified object will be removed.

Returns:

1 if the object was successfully removed or 0 if it couldn't be found; -1 on general error.

Definition at line 903 of file cache.c.

References _compute_sha_hash(), _evict_if_stale(), _lock_cache_store(), _unlink_object(), _unlock_cache_store(), CACHE_PERM_-DELETE, ERR_BAD_PARAM, ERR_PERM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, RET_-ERROR_INT, and SHA_256_SIZE.

5.90.1.37 int _remove_cached_object_cmp (const void * *key*, cached_store_t * *store*, cached_store_comparator_t *cmpfn*)

Remove an object from a cached store using a custom comparator function.

Note:

The caller is still responsible for freeing the cached object and its underlying data.

Parameters:

key a pointer to an object-specific key that will be passed to the custom comparison function.

store a pointer to the cached store from which the specified object will be removed.

cmpfn a custom comparison function that will compare the key value to the objects in the specified cached store and determine whether the two objects match one another.

Returns:

1 if the object was successfully removed or 0 if it couldn't be found; -1 on general error.

Definition at line 953 of file cache.c.

References _evict_if_stale(), _lock_cache_store(), _unlink_object(), _unlock_cache_store(), CACHE_PERM_DELETE, cached_object::data, ERR_BAD_PARAM, ERR_PERM, cached_store_t::head, cached_object::next, and RET_ERROR_INT.

5.90.1.38 cached_object_t* _replace_object (cached_object_t * *oobj*, cached_object_t * *nobj*, int *shadow*)

Replace one object in the cache with another.

Note:

If shadow is not set, then the old cached object will be automatically destroyed. Otherwise this function also makes the old cached object the new cached object's "shadow" data.

Parameters:

oobj a pointer to the old cached object to be replaced in its cached store with the new object.

nobj a pointer to the new cached object that will replace the old object in the cached store.

shadow if set, preserve the old object as the "shadow" value of the new object.

Returns:

NULL on failure, or a pointer to the new cached object on success.

Definition at line 2208 of file cache.c.

References _destroy_cache_entry(), _get_cached_store_by_type(), cached_object::dtype, ERR_BAD_PARAM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, cached_object::prev, RET_ERROR_PTR, SHA_256_SIZE, cached_object::shadow, and store.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _get_dime_record().

5.90.1.39 int _save_cache_contents (void)

Persist the entire contents of the cache to local storage.

Returns:

0 on success or -1 on failure.

Definition at line 1414 of file cache.c.

References _clear_error_stack(), _dbgprint(), _get_cache_location(), _lock_cache_store(), _unlock_cache_store(), CACHE_PERM_LOAD, cached_object::data, dump_error_stack(), ERR_PERM, ERR_UNSPEC, cached_store_t::head, cached_object::next, cached_object::persists, PUSH_ERROR_FMT, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and cached_object::shadow.

Referenced by _do_ocsp_validation(), and _get_signet().

5.90.1.40 void* _serialize_signet_cb (void * *record*, size_t * *outlen*)

Serializes a signet_t structure into a binary string.

Parameters:

record Void pointer to a signet_t structure to be serialized.

outlen Pointer to the length of the returned string.

Returns:

Pointer to a serialized signet.

Definition at line 2343 of file cache.c.

References dime_sgnt_signet_binary_serialize(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.90.1.41 int _set_cache_location (const char * *path*)

Set the pathname of the DIME management record cache file.

Parameters:

path a null-terminated string containing the fully qualified path of the cache file to be used.

Returns:

0 on success or -1 on failure.

Definition at line 199 of file cache.c.

References _dbgprint(), ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

5.90.1.42 int _set_cache_permissions (unsigned long *flags*)

Set the permissions flags for the object cache.

Parameters:

flags

Returns:

-1 on error or 0 if the permissions were set successfully.

Definition at line 1503 of file cache.c.

References CACHE_PERM_ALL_FLAGS, ERR_BAD_PARAM, and RET_ERROR_INT.

5.90.1.43 cached_object_t* _unlink_object (cached_object_t * *object*, int *destroy*, int *stale*)

Unlink a cached object from its doubly linked list.

Parameters:

object a pointer to the cached object to be delinked.

destroy if set, deallocate the specified cached object after unlinking.

stale if set, the cache removal was performed because of a stale entry.

Returns:

a pointer to the next cached object in the store, or NULL if at the end of the store.

Definition at line 2140 of file cache.c.

References _clear_error_stack(), _dbgprint(), _dump_cache_data(), _get_cached_store_by_type(), _verbose, cached_object::data, cached_store_t::destructor, cached_object::dtype, cached_store_t::dump, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, get_last_error(), cached_store_t::head, cached_object::next, cached_object::prev, RET_ERROR_PTR, and store.

Referenced by _do_ocsp_validation(), _evict_if_stale(), _remove_cached_object(), and _remove_cached_object_cmp().

5.90.1.44 void _unlock_cache_store (cached_store_t * *store*)

Unlock a cached storea for use by other callers.

Parameters:

store a pointer to the cached store to be unlocked.

Definition at line 2274 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), and _save_cache_contents().

Data Structures

- struct cache_keys_t
- struct cache_t

Functions

- void cache_free (void)

  Free magma's cache server configuration options.

- bool_t cache_validate (void)

  Validate all of the configured magma cache server instances.

- void cache_output_settings (void)

  Log the full contents of the magma cache configuration settings.

- cache_t ∗ cache_alloc (uint32_t number)

  Allocate a new cache server configuration entry and initialize it to its default values.

- bool_t cache_config (stringer_t ∗name, stringer_t ∗value)

  Set the value of a cache server configuration entry by name.

- bool_t cache_set_value (cache_keys_t ∗setting, cache_t ∗cache, stringer_t ∗value)

  Set the value of a key for a specified cache server configuration entry.

- void cache_output_help (void)

  Log all cache key information to be returned via "magma -h".

5.91.1 Function Documentation

5.91.1.1 cache_t∗ cache_alloc (uint32_t *number*)

Allocate a new cache server configuration entry and initialize it to its default values.

Parameters:

number the index of the cache server instance in the global cache server array.

Returns:

NULL on failure, or a pointer to the requested cache server configuration entry on success.

Definition at line 64 of file cache.c.

References magma_t::cache, cache_keys, cache_set_value(), magma_t::iface, log_critical, magma, and mm_alloc().

Referenced by cache_config().

5.91.1.2 bool_t cache_config (stringer_t * *name*, stringer_t * *value*)

Set the value of a cache server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new cache server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable cache server configuration parameter to be set.

value a managed string containing the new value of the cache server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 425 of file cache.c.

References bracket_extract_pl(), cache_alloc(), cache_keys, cache_set_value(), CONSTANT, log_critical, MAGMA_CACHE_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.91.1.3 void cache_free (void)

Free magma's cache server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 17 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_-INSTANCES, mm_free(), cache_keys_t::norm, ns_empty(), ns_free(), cache_keys_t::offset, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.91.1.4 void cache_output_help (void)

Log all cache key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 484 of file cache.c.

References multi_t::bl, cache_keys, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_-FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_-TIME_DISABLE, cache_keys_t::norm, cache_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.91.1.5 void cache_output_settings (void)

Log the full contents of the magma cache configuration settings.

Note:

This logs all the details of each memcached instance configured to work with magma.

Returns:

This function returns no value.

Definition at line 207 of file cache.c.

References magma_t::cache, cache_keys, magma_t::iface, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_CACHE_INSTANCES, cache_keys_t::norm, ns_empty(), cache_keys_t::offset, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.91.1.6 bool_t cache_set_value (cache_keys_t * *setting*, cache_t * *cache*, stringer_t * *value*)

Set the value of a key for a specified cache server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the cache server key to be set.

cache a pointer to the cache server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 282 of file cache.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, cache_keys_t::name, cache_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), cache_keys_t::offset, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by cache_alloc(), and cache_config().

5.91.1.7 bool_t cache_validate (void)

Validate all of the configured magma cache server instances.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all cache servers have been validated, or false on failure.

Definition at line 93 of file cache.c.

- cached_object_t * _create_cached_object (cached_data_type_t dtype, unsigned long ttl, time_t expiration, void *data, int persists, int relaxed)

  Allocate and initialize a new cached object.

- cached_store_t * _get_cached_store_by_type (cached_data_type_t dtype)

  Get a pointer to a cached object store by its type.

- void _dump_cache (cached_data_type_t dtype, int do_data, int ephemeral)

  Dump the content of the specified data cached store(s) to the console.

- void _dump_cache_data (FILE *fp, const cached_object_t *obj, int brief)

  Dump information about a specified cached object to a file stream.

- cached_object_t * _clone_cached_object (const cached_object_t *obj)

  Clone a deep copy of a cached object for user-safe retrieval.

- size_t _mem_append_serialized (unsigned char **buf, size_t *blen, const unsigned char *data, size_t dlen)

  Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_string (unsigned char **buf, size_t *blen, const char *string)

  Apped a null-terminated string to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_array (unsigned char **buf, size_t *blen, const unsigned char **array, size_t itemsize)

  Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_str_array (unsigned char **buf, size_t *blen, const char **array)

  Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

- size_t _mem_append_serialized_array_cb (unsigned char **buf, size_t *blen, const char **array, custom_serializer_t sfn)

  Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

- unsigned int _deserialize_data (unsigned char *dst, unsigned char **bufptr, const unsigned char *bufend, size_t len)

  Deserialize a fixed-sized chunk of data from an input buffer.

- unsigned char * _deserialize_vardata (unsigned char **bufptr, const unsigned char *bufend, size_t *outlen)

  Deserialize a variable-length chunk of data from an input buffer.

- unsigned int _deserialize_string (char **dst, unsigned char **bufptr, const unsigned char *bufend)

  Deserialize a null-terminated string from an input buffer.

- unsigned int _deserialize_array (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, size_t itemsize)

  Deserialize an array of fixed-size objects from an input buffer.

- unsigned int _deserialize_str_array (char ***dst, unsigned char **bufptr, const unsigned char *bufend)

  Deserialize an array of null-terminated string from an input buffer.

- unsigned int _deserialize_array_cb (unsigned char ***dst, unsigned char **bufptr, const unsigned char *bufend, custom_deserializer_t dfn)

  Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.

- int _is_object_expired (cached_object_t *obj, int *refresh)

  Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.

- cached_object_t * _unlink_object (cached_object_t *object, int destroy, int stale)

  Unlink a cached object from its doubly linked list.

- cached_object_t * _replace_object (cached_object_t *oobj, cached_object_t *nobj, int shadow)

  Replace one object in the cache with another.

- unsigned int _evict_if_stale (cached_object_t **objptr)

  Evict an item from the object cache if it is stale (has expired).

- void _lock_cache_store (cached_store_t *store)

  Lock a cached store for thread-safe processing.

- void _unlock_cache_store (cached_store_t *store)

  Unlock a cached storea for use by other callers.

- void * _deserialize_signet_cb (void *data, size_t len)

  Deserializes signet from a void pointer.

- void * _serialize_signet_cb (void *record, size_t *outlen)

  Serializes a signet_t structure into a binary string.

- void _destroy_signet_cb (void *record)

  Destroys a signet_t structure.

- void _dump_signet_cb (FILE *fp, void *record, int brief)

  Dumps a signet from a signet_t structure.

Definition at line 69 of file cache.h.

5.92.3 Enumeration Type Documentation

5.92.3.1 enum cached_data_type_t

Enumerator:

cached_data_unknown
cached_data_drec
cached_data_dnskey
cached_data_ds
cached_data_ocsp
cached_data_signet

Definition at line 25 of file cache.h.

5.92.4 Function Documentation

5.92.4.1 cached_object_t∗ _clone_cached_object (const cached_object_t ∗ *obj*)

Clone a deep copy of a cached object for user-safe retrieval.

Definition at line 994 of file cache.c.

References _get_cached_store_by_type(), cached_store_t::clone, cached_object::data, data, cached_store_t::deserialize, cached_object::dtype, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, cached_object::expiration, cached_object::id, cached_store_t::internal, cached_object::persists, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_PTR, cached_store_t::serialize, store, cached_object::timestamp, and cached_object::ttl.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), _find_cached_object(), and _find_cached_object_cmp().

5.92.4.2 cached_object_t∗ _create_cached_object (cached_data_type_t *dtype*, unsigned long *ttl*, time_t *expiration*, void ∗ *data*, int *persists*, int *relaxed*)

Allocate and initialize a new cached object.

See also:

_add_cached_object()

Note:

The data parameter specifies an object-specific value that will be passed to other parts of the cache management subsystem, such as functions for deletion, destruction, search, etc.

Parameters:

dtype the data type identifying the cached store to which this cached object will belong.

ttl if not 0, an optional time-to-live value in seconds specifying in how many seconds from now the cached object will reach expiration.

expiration if not 0, an optional UTC time value specifying the exact time at which this cached object will reach expiration.

data a pointer to the object-specific data to be associated with the cache entry.

persists if set, the cached object will be persisted to disk when the cache is saved.

relaxed if set, use a relaxed cache policy. A relaxed cache policy ensures that even if the entry's ttl has expired, if its absolute (UTC) expiration time has not been reached, it will not be evicted from the cache, but will allow for a notification to the caller that it is time for the cached entry to be refreshed.

Returns:

a pointer to a newly allocated cached object for the specified data on success, or NULL on failure.

Definition at line 244 of file cache.c.

References cached_object::data, cached_object::dtype, ERR_NOMEM, ERR_UNSPEC, cached_object::expiration, cached_object::persists, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_ERROR_PTR, cached_object::timestamp, and cached_object::ttl.

Referenced by _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _get_dime_record().

5.92.4.3 unsigned int _deserialize_array (unsigned char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t *itemsize*)

Deserialize an array of fixed-size objects from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_array().

Parameters:

dst a pointer to the address of an array of objects that will receive a copy of the deserialized data as an array of (NULL pointer terminated) fixed-size objects on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

itemsize the size, in bytes, of the fixed-sized objects to be deserialized.

Returns:

1 on success or 0 on failure.

Definition at line 1876 of file cache.c.

References _deserialize_data(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_-ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb().

5.92.4.4 unsigned int _deserialize_array_cb (unsigned char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, custom_deserializer_t *dfn*)

Deserialize an array of custom-formatted data objects from an input buffer using a deserialization function.

Note:

This is the inverse function of _mem_append_serialized_array_cb().

Parameters:

dst a pointer to the address of an array of data buffers that will receive a copy of the deserialized data as an array of (NULL pointer terminated) data buffers on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

dfn a custom deserialization function that will be used to deserialize the user data from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 2025 of file cache.c.

References _deserialize_data(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_UINT.

5.92.4.5 unsigned int _deserialize_data (unsigned char * *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t *len*)

Deserialize a fixed-sized chunk of data from an input buffer.

Note:

This is the inverse function of _mem_append(); dst must be at least len bytes long.

Parameters:

dst a pointer to the output buffer that will receive the deserialized data.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

len the size of the data chunk to be deserialized from the input buffer.

Returns:

1 on success or 0 on failure.

Definition at line 1755 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_UINT, and RET_ERROR_UINT_FMT.

Referenced by _deserialize_array(), _deserialize_array_cb(), _deserialize_dime_record_cb(), _deserialize_dnskey_record_cb(), _deserialize_ds_record_cb(), _deserialize_str_array(), and _deserialize_vardata().

5.92.4.6 void* _deserialize_signet_cb (void * *data*, size_t *len*)

Deserializes signet from a void pointer.

Parameters:

data Pointer to serial signet data.

len Length of serial signet data.

Returns:

Void pointer to a signet_t structure.

Definition at line 2321 of file cache.c.

References dime_sgnt_signet_binary_deserialize(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_PTR.

5.92.4.7 unsigned int _deserialize_str_array (char *** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize an array of null-terminated string from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_str_array().

Parameters:

dst a pointer to the address of an array of strings that will receive a copy of the deserialized data as an array of (NULL pointer terminated) null-terminated strings on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1955 of file cache.c.

References _deserialize_data(), _deserialize_string(), _ptr_chain_add(), _ptr_chain_free(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_-ERROR_UINT.

Referenced by _deserialize_dime_record_cb().

5.92.4.8 unsigned int _deserialize_string (char ** *dst*, unsigned char ** *bufptr*, const unsigned char * *bufend*)

Deserialize a null-terminated string from an input buffer.

Note:

This is the inverse function of _mem_append_serialized_string().

Parameters:

dst a pointer to the address of a string that will receive a copy of the deserialized data as a null-terminated string on success.

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

Returns:

1 on success or 0 on failure.

Definition at line 1826 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _deserialize_dime_record_cb(), _deserialize_dnskey_record_cb(), _deserialize_ds_record_cb(), and _deserialize_str_array().

5.92.4.9 unsigned char* _deserialize_vardata (unsigned char ** *bufptr*, const unsigned char * *bufend*, size_t * *olen*)

Deserialize a variable-length chunk of data from an input buffer.

Note:

This is the inverse function of _mem_append_serialized.

Parameters:

bufptr a pointer to the address of the input buffer holding the data to be deserialized, which will be updated after the operation to point to the next available data.

bufend a pointer to the end of the input buffer for validation purposes.

olen an optional pointer to receive the size of the deserialized data on success.

Returns:

a pointer to a newly allocated buffer containing the deserialized data on success, or NULL on failure.

Definition at line 1784 of file cache.c.

References _deserialize_data(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_UINT.

Referenced by _deserialize_dnskey_record_cb(), and _deserialize_ds_record_cb().

5.92.4.10 void _destroy_signet_cb (void * *record*)

Destroys a signet_t structure.

Parameters:

record Void pointer to a signet_t structure to be destroyed.

Definition at line 2399 of file cache.c.

References dime_sgnt_signet_destroy().

5.92.4.11 void _dump_cache (cached_data_type_t *dtype*, int *do_data*, int *ephemeral*)

Dump the content of the specified data cached store(s) to the console.

Parameters:

dtype the type of the object cached store to be dumped, or cached_data_unknown for all stores.

do_data if non-zero, dump the type-specific data associated with the cached object.

ephemeral if non-zero, print out ephemeral as well as persistent cache data.

Definition at line 1068 of file cache.c.

References _dump_cache_data(), _get_chr_date(), _lock_cache_store(), _unlock_cache_store(), cached_data_unknown, cached_object::data, cached_store_t::dtype, cached_object::expiration, cached_object::next, cached_object::persists, cached_object::relaxed, cached_object::shadow, cached_object::timestamp, and cached_object::ttl.

5.92.4.12 void _dump_cache_data (FILE * *fp*, const cached_object_t * *obj*, int *brief*)

Dump information about a specified cached object to a file stream.

Parameters:

fp a pointer to the file stream across which the data should be dumped.

obj a pointer to the cached object to have its details dumped.

brief if true, print a brief one-line description of the object; otherwise, dump full object information.

Definition at line 1163 of file cache.c.

References _clear_error_stack(), _get_cached_store_by_type(), cached_object::data, cached_object::dtype, cached_store_t::dump, dump_error_stack(), get_last_error(), and store.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), _dump_cache(), _load_cache_contents(), and _unlink_object().

5.92.4.13 void _dump_signet_cb (FILE * *fp*, void * *record*, int *brief*)

Dumps a signet from a signet_t structure.

Parameters:

fp File descriptor that specifies the output destination.

record Void pointer to a signet_t structure.

brief TODO

Definition at line 2377 of file cache.c.

References dime_sgnt_signet_dump().

5.92.4.14 unsigned int _evict_if_stale (cached_object_t ** *objptr*)

Evict an item from the object cache if it is stale (has expired).

Returns:

1 if the object was evicted for being stale or 0 if it was not.

Definition at line 2287 of file cache.c.

References _clear_error_stack(), _is_object_expired(), _unlink_object(), dump_error_stack(), and get_last_error().

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _find_cached_object(), _find_cached_object_cmp(), _remove_cached_object(), and _remove_cached_object_cmp().

5.92.4.15 cached_store_t* _get_cached_store_by_type (cached_data_type_t *dtype*)

Get a pointer to a cached object store by its type.

Parameters:

dtype the numerical identifier of the cached data type.

Returns:

a pointer to the requested cached object store on success, or NULL on failure.

Definition at line 46 of file cache.c.

Referenced by _clone_cached_object(), _destroy_cache_entry(), _dump_cache_data(), _get_cache_obj_data(), _load_cache_contents(), _replace_object(), and _unlink_object().

5.92.4.16 int _is_object_expired (cached_object_t * *obj*, int * *refresh*)

Check to see if a cached object needs to be evicted for exceeding its TTL or expiration.

Note:

An object has "expired" and needs to be evicted from the cache if it has a non-zero TTL from its cache date that has been reached, or a non-zero absolute expiration date that has been exceeded. If the object's cache policy is relaxed, a TTL expiration advises a "refresh" if no absolute expiration has occurred.

Parameters:

obj a pointer to the cached object to have its age examined.

refresh an optional pointer to a value that, if the cached object has a relaxed expiration policy, will be set to 1 if it needs to be refreshed or 0 if it does not.

Returns:

1 if the object has expired or 0 if it has not; -1 if a general error has occurred.

Definition at line 2093 of file cache.c.

References ERR_BAD_PARAM, ERR_UNSPEC, cached_object::expiration, PUSH_ERROR_SYSCALL, cached_object::relaxed, RET_-ERROR_INT, cached_object::timestamp, and cached_object::ttl.

Referenced by _evict_if_stale(), and _get_dime_record().

5.92.4.17 void _lock_cache_store (cached_store_t * *store*)

Lock a cached store for thread-safe processing.

Parameters:

store a pointer to the cached store to be locked.

Definition at line 2261 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _-remove_cached_object_cmp(), and _save_cache_contents().

5.92.4.18 size_t _mem_append_serialized (unsigned char ** *buf*, size_t * *blen*, const unsigned char * *data*, size_t *dlen*)

Append a variable-length chunk of data to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

data a pointer to a buffer holding the data that will be appended to the end of the output buffer.

dlen the size, in bytes, of the data buffer to be appended to the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1524 of file cache.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _mem_append_serialized_array(), _mem_append_serialized_array_cb(), _mem_append_serialized_str_array(), _serialize_-dnskey_record_cb(), and _serialize_ds_record_cb().

5.92.4.19 size_t _mem_append_serialized_array (unsigned char ** *buf*, size_t * *blen*, const unsigned char ** *array*, size_t *itemsize*)

Append an array of fixed-size objects to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to fixed-size objects (ending with a NULL pointer) to be appended to the end of the output buffer.

itemsize the size, in bytes, of the array elements to be deserialized.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1585 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb().

5.92.4.20 size_t _mem_append_serialized_array_cb (unsigned char ** *buf*, size_t * *blen*, const char ** *array*, custom_serializer_t *sfn*)

Append an array of custom-formatted data to a dynamically allocated buffer for serialization.

Note:

This function uses a custom serialization function in order to output the user data properly.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to custom-formatted data buffers (ending with a NULL pointer) to be appended to the end of the output buffer using a custom serialization function.

sfn a custom serialization function that will be used to serialize the user data into the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1698 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

5.92.4.21 size_t _mem_append_serialized_str_array (unsigned char ** *buf*, size_t * *blen*, const char ** *array*)

Append an array of null-terminated strings to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

array an array of pointers to null-terminated strings (ending with a NULL pointer) to be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1640 of file cache.c.

References _mem_append(), _mem_append_serialized(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb().

5.92.4.22 size_t _mem_append_serialized_string (unsigned char ** *buf*, size_t * *blen*, const char * *string*)

Apped a null-terminated string to a dynamically allocated buffer for serialization.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

string a null-terminated string that will be appended to the end of the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 1552 of file cache.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, and RET_ERROR_UINT.

Referenced by _serialize_dime_record_cb(), _serialize_dnskey_record_cb(), and _serialize_ds_record_cb().

5.92.4.23 cached_object_t* _replace_object (cached_object_t * *oobj*, cached_object_t * *nobj*, int *shadow*)

Replace one object in the cache with another.

Note:

If shadow is not set, then the old cached object will be automatically destroyed. Otherwise this function also makes the old cached object the new cached object's "shadow" data.

Parameters:

oobj a pointer to the old cached object to be replaced in its cached store with the new object.

nobj a pointer to the new cached object that will replace the old object in the cached store.

shadow if set, preserve the old object as the "shadow" value of the new object.

Returns:

NULL on failure, or a pointer to the new cached object on success.

Definition at line 2208 of file cache.c.

References _destroy_cache_entry(), _get_cached_store_by_type(), cached_object::dtype, ERR_BAD_PARAM, ERR_UNSPEC, cached_store_t::head, cached_object::id, cached_object::next, cached_object::prev, RET_ERROR_PTR, SHA_256_SIZE, cached_object::shadow, and store.

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), and _get_dime_record().

5.92.4.24 void* _serialize_signet_cb (void * *record*, size_t * *outlen*)

Serializes a signet_t structure into a binary string.

Parameters:

record Void pointer to a signet_t structure to be serialized.

outlen Pointer to the length of the returned string.

Returns:

Pointer to a serialized signet.

Definition at line 2343 of file cache.c.

References dime_sgnt_signet_binary_serialize(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.92.4.25 cached_object_t* _unlink_object (cached_object_t * *object*, int *destroy*, int *stale*)

Unlink a cached object from its doubly linked list.

Parameters:

object a pointer to the cached object to be delinked.

destroy if set, deallocate the specified cached object after unlinking.

stale if set, the cache removal was performed because of a stale entry.

Returns:

a pointer to the next cached object in the store, or NULL if at the end of the store.

Definition at line 2140 of file cache.c.

References _clear_error_stack(), _dbgprint(), _dump_cache_data(), _get_cached_store_by_type(), _verbose, cached_object::data, cached_store_t::destructor, cached_object::dtype, cached_store_t::dump, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, get_last_error(), cached_store_t::head, cached_object::next, cached_object::prev, RET_ERROR_PTR, and store.

Referenced by _do_ocsp_validation(), _evict_if_stale(), _remove_cached_object(), and _remove_cached_object_cmp().

5.92.4.26 void _unlock_cache_store (cached_store_t * *store*)

Unlock a cached storea for use by other callers.

Parameters:

store a pointer to the cached store to be unlocked.

Definition at line 2274 of file cache.c.

References cached_store_t::lock.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _cached_object_exists(), _cached_object_exists_cmp(), _dump_cache(), _find_cached_object(), _find_cached_object_cmp(), _fixup_dnskey_validation(), _load_cache_contents(), _remove_cached_object(), _remove_cached_object_cmp(), and _save_cache_contents().

KEYS_TYPE_USER

Definition at line 6 of file keys.h.

5.97.2 Function Documentation

5.97.2.1 EC_KEY* dime_keys_enckey_fetch (char const * *filename*)

Retrieves the signing key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the ed25519 signing key. {free_ed25519_key}

Definition at line 633 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.97.2.2 int dime_keys_file_create (keys_type_t *type*, ED25519_KEY * *sign_key*, EC_KEY * *enc_key*, const char * *filename*)

Creates a keys file with specified signing and encryption keys.

Parameters:

type Type of keys file, whether the keys correspond to a user or organizational signet.

sign_key Pointer to the specified ed25519 key, the private portion of which will be stored in the keys file as the signing key.

enc_key Pointer to the specified elliptic curve key, the private portion of which will be stored in the keys file as the encryption key.

filename Pointer to the NULL terminated string containing the filename for the keys file.

Returns:

0 on success, -1 on failure.

Definition at line 586 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.97.2.3 int dime_keys_generate (keys_type_t *type*, char ** *signet_pem*, char ** *key_pem*)

Definition at line 637 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.97.2.4 ED25519_KEY* dime_keys_signkey_fetch (char const * *filename*)

Retrieves the encryption key from the keys file.

Parameters:

filename Null terminated filename string.

Returns:

Pointer to the elliptic curve encryption key. {free_ec_key}

Definition at line 620 of file keys.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Enumerations

- enum { USER_CONF_STATUS_NONE = 0, USER_CONF_STATUS_CRITICAL = 1 }

Functions

- struct __attribute__ ((packed))
- user_config_t * user_config_alloc (uint64_t usernum)

  config.c

- user_config_t * user_config_create (uint64_t usernum)

  Create a new user config collection object for the specified user and populate it with config entries from the database.

- int_t user_config_edit (user_config_t *collection, stringer_t *key, stringer_t *value)

  Change the value of, or delete a key from a user's config collection.

- user_config_entry_t * user_config_entry_alloc (stringer_t *key, stringer_t *value, uint64_t flags)

  Create and initialize new user config entry object.

- void user_config_entry_free (user_config_entry_t *entry)

  Destroy a user config entry.

- void user_config_free (user_config_t *collection)

  Free a user config collection object.

- int_t user_config_update (user_config_t *collection)

  Update a collection of user config options from the database, if necessary.

- int_t user_config_delete (uint64_t usernum, stringer_t *key)

  datatier.c

- bool_t user_config_fetch (user_config_t *collection)

  Fetch a user's config collection from the database.

- int_t user_config_upsert (uint64_t usernum, stringer_t *key, stringer_t *value, uint64_t flags)

  Update a user config entry in the database, or insert it if it does not already exist.

Variables

- user_config_entry_t
- user_config_t

5.100.1 Enumeration Type Documentation

5.100.1.1 anonymous enum

Enumerator:

USER_CONF_STATUS_NONE

USER_CONF_STATUS_CRITICAL

Definition at line 17 of file config.h.

5.100.2 Function Documentation

5.100.2.1 struct __attribute__ ((packed)) [read]

Definition at line 22 of file config.h.

References __attribute__::usernum.

5.100.2.2 user_config_t* user_config_alloc (uint64_t *usernum*)

config.c config.c

Parameters:

usernum the numerical user id for the requested user.

Returns:

NULL on failure or a pointer to the newly allocated user config collection object on success.

Definition at line 44 of file config.c.

References align(), inx_alloc(), log_pedantic, M_INX_TREE, mm_alloc(), mm_free(), user_config_entry_free(), and user_config_t.

Referenced by user_config_create().

5.100.2.3 user_config_t* user_config_create (uint64_t *usernum*)

Create a new user config collection object for the specified user and populate it with config entries from the database.

Parameters:

usernum the numerical user id for the user to be queried.

Returns:

NULL on failure, or a pointer to the newly created user config collection object on success.

Definition at line 106 of file config.c.

References log_pedantic, OBJECT_CONFIG, serial_get(), user_config_alloc(), user_config_fetch(), user_config_free(), and user_config_t.

Referenced by portal_endpoint_config_edit(), and portal_endpoint_config_load().

5.100.2.4 int_t user_config_delete (uint64_t *usernum*, stringer_t * *key*)

datatier.c datatier.c

Parameters:

usernum the numerical userid of the user to whom the requested config key belongs.

key a managed string containing the name of the config key to be deleted.

Returns:

1 if the config option was successfully deleted, 0 if the config key couldn't be found in the database, or -1 on general failure.

Definition at line 16 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by user_config_edit().

5.100.2.5 int_t user_config_edit (user_config_t ∗ *collection*, stringer_t ∗ *key*, stringer_t ∗ *value*)

Change the value of, or delete a key from a user's config collection.

Parameters:

collection a pointer to a collection of user's config entries.

key a pointer to a managed string containing the name of the user config key to be modified.

value a pointer to a managed string containing the name of the new value of the key, or NULL if it is to be deleted.

Returns:

-1 on error or 1 on success.

Definition at line 160 of file config.c.

References inx_delete(), inx_find(), inx_replace(), log_pedantic, M_TYPE_STRINGER, OBJECT_CONFIG, serial_increment(), multi_t::st, st_cmp_cs_eq(), st_empty, user_config_delete(), user_config_entry_alloc(), user_config_entry_free(), user_config_entry_t, user_config_upsert(), and multi_t::val.

Referenced by portal_endpoint_config_edit().

5.100.2.6 user_config_entry_t∗ user_config_entry_alloc (stringer_t ∗ *key*, stringer_t ∗ *value*, uint64_t *flags*)

Create and initialize new user config entry object.

Parameters:

key a managed string containing the key of the config entry object.

value a managed string containing the value of the config entry object.

flags a bitmask reflecting the flags of the config entry object.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized user config entry object on success.

Definition at line 70 of file config.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), STACK, and user_config_entry_t.

Referenced by user_config_edit(), and user_config_fetch().

5.100.2.7 void user_config_entry_free (user_config_entry_t ∗ *entry*)

Destroy a user config entry.

Parameters:

entry a pointer to the user config entry object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file config.c.

References mm_free().

Referenced by user_config_alloc(), user_config_edit(), and user_config_fetch().

5.100.2.8 bool_t user_config_fetch (user_config_t ∗ *collection*)

Fetch a user's config collection from the database.

Parameters:

collection a pointer to the specified user config collection object (with usernum field set by the caller) to be populated from the database.

Returns:

true on success or false on failure.

Definition at line 96 of file datatier.c.

References inx_insert(), log_info, log_pedantic, M_TYPE_STRINGER, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), user_config_entry_alloc(), user_config_entry_free(), user_config_entry_t, and multi_t::val.

Referenced by user_config_create(), and user_config_update().

5.100.2.9 void user_config_free (user_config_t ∗ *collection*)

Free a user config collection object.

Parameters:

collection a pointer to the user config collection object to be freed.

Returns:

This function returns no value.

Definition at line 29 of file config.c.

References inx_cleanup(), and mm_free().

Referenced by portal_endpoint_config_edit(), portal_endpoint_config_load(), and user_config_create().

5.100.2.10 int_t user_config_update (user_config_t ∗ *collection*)

Update a collection of user config options from the database, if necessary.

Note:

This function is not currently being used anywhere. If this function returns -1, the config entries are left in an undefined state and should not be relied upon.

Parameters:

collection a pointer to a collection of user config entries to be checked for updates.

Returns:

1 if the collection is up-to-date, 0 if it was refreshed to update changes, or -1 if the refresh operation failed.

Definition at line 132 of file config.c.

References inx_truncate(), OBJECT_CONFIG, serial_get(), and user_config_fetch().

5.100.2.11 int_t user_config_upsert (uint64_t *usernum*, stringer_t * *key*, stringer_t * *value*, uint64_t *flags*)

Update a user config entry in the database, or insert it if it does not already exist.

Parameters:

usernum the numerical id of the user to whom the specified config entry belongs.

key a pointer to a managed string containing the name of the config entry to be updated or inserted.

value a pointer to a managed string containing the value of the specified config entry key.

flags a bitmask of flags for the config entry (USER_CONF_STATUS_CRITICAL is supported).

Returns:

2 if the config entry was updated, 1 if a new config key was inserted into the database, 0 if no update was necessary, or -1 on general failure.

Definition at line 52 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by user_config_edit().

5.100.3 Variable Documentation

5.100.3.1 user_config_entry_t

Definition at line 14 of file config.h.

Referenced by portal_config_collection(), user_config_edit(), user_config_entry_alloc(), and user_config_fetch().

5.100.3.2 user_config_t

Definition at line 25 of file config.h.

Referenced by portal_endpoint_config_edit(), portal_endpoint_config_load(), user_config_alloc(), and user_config_create().

5.101 src/engine/config/global/datatier.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t config_fetch_host_number (void)

  Retrieve this computer's host number from the database.

- table_t * config_fetch_settings (void)

  Retrieve the entire collection of configuration key/value pairs from the database.

5.101.1 Function Documentation

5.101.1.1 uint64_t config_fetch_host_number (void)

Retrieve this computer's host number from the database. datatier.c

Returns:

this host's numerical identifier, or 0 on failure.

Definition at line 14 of file datatier.c.

References magma_t::host, log_error, magma, mm_wipe(), magma_t::name, ns_length_get(), res_field_uint64(), res_row_next(), res_table_-free(), and stmt_get_result().

Referenced by config_load_database_settings().

5.101.1.2 table_t* config_fetch_settings (void)

Retrieve the entire collection of configuration key/value pairs from the database.

Parameters:

none This function accepts no parameters.

Returns:

NULL on failure, or a database table of configuration key/value pairs on success.

Definition at line 40 of file datatier.c.

References magma_t::host, magma, mm_wipe(), magma_t::name, ns_length_get(), and stmt_get_result().

Referenced by config_load_database_settings().

5.102 src/objects/auth/datatier.c File Reference

```
#include "magma.h"
```

Functions

- int_t auth_data_update_legacy (uint64_t usernum, stringer_t *legacy, stringer_t *salt, stringer_t *verification, uint32_t bonus)

  Replaces legacy auth tokens with STACIE compatible tokens.

- int_t auth_data_fetch (auth_t *auth)

  Fetches the authentication information based on the provided username.

5.102.1 Function Documentation

5.102.1.1 int_t auth_data_fetch (auth_t * *auth*)

Fetches the authentication information based on the provided username. datatier.c

Note:

This function searches the Users table first, and the Mailboxes table second. This way if someone sneaks a username into the Mailboxes table, they won't override the Users table.

Parameters:

auth The authentication object providing the username, and used to store the result.

Returns:

0 if the user information is pulled correctly, 1 if the user isn't found, and -1 if an error occurs.

Definition at line 91 of file datatier.c.

References base64_decode_mod(), auth_t::bonus, hex_decode_st(), auth_t::legacy, auth_t::locked, log_error, log_pedantic, mm_wipe(), PLACER, res_field_block(), res_field_int8(), res_field_length(), res_field_string(), res_field_uint32(), res_field_uint64(), res_row_count(), res_row_next(), res_table_free(), auth_t::salt, auth_t::seasoning, st_char_get(), st_cmp_cs_eq(), st_empty, st_free(), st_length_get(), st_length_int(), st_search_chr(), STACIE_KEY_ROUNDS_MAX, STACIE_SALT_LENGTH, STACIE_TOKEN_LENGTH, auth_t::status, stmt_get_result(), auth_t::token, auth_t::tokens, auth_t::username, auth_t::usernum, and auth_t::verification.

Referenced by auth_challenge().

5.102.1.2 int_t auth_data_update_legacy (uint64_t *usernum*, stringer_t * *legacy*, stringer_t * *salt*, stringer_t * *verification*, uint32_t *bonus*)

Replaces legacy auth tokens with STACIE compatible tokens.

Parameters:

usernum The user account number.

legacy The legacy auth token, encoded as a hexadecimal string.

salt The user specific salt value, encoded as a hexadecimal string.

verification The STACIE verification token, encoded as a hexadecimal string.

bonus The number of bonus hash rounds.

Returns:

0 if the user information was updated correctly, or -1 if an error occurs.

Definition at line 22 of file datatier.c.

References log_error, log_pedantic, mm_wipe(), st_char_get(), st_empty, st_length_get(), STACIE_KEY_ROUNDS_MAX, and stmt_exec_-affected().

Referenced by auth_login().

```
#include "magma.h"
```

Functions

- int_t user_config_delete (uint64_t usernum, stringer_t *key)
  Delete a user config entry from the database by key.
- int_t user_config_upsert (uint64_t usernum, stringer_t *key, stringer_t *value, uint64_t flags)
  Update a user config entry in the database, or insert it if it does not already exist.
- bool_t user_config_fetch (user_config_t *collection)
  Fetch a user's config collection from the database.

5.103.1 Function Documentation

5.103.1.1 int_t user_config_delete (uint64_t *usernum*, stringer_t * *key*)

Delete a user config entry from the database by key. datatier.c

Parameters:

usernum the numerical userid of the user to whom the requested config key belongs.

key a managed string containing the name of the config key to be deleted.

Returns:

1 if the config option was successfully deleted, 0 if the config key couldn't be found in the database, or -1 on general failure.

Definition at line 16 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by user_config_edit().

5.103.1.2 bool_t user_config_fetch (user_config_t * *collection*)

Fetch a user's config collection from the database.

Parameters:

collection a pointer to the specified user config collection object (with usernum field set by the caller) to be populated from the database.

Returns:

true on success or false on failure.

Definition at line 96 of file datatier.c.

References inx_insert(), log_info, log_pedantic, M_TYPE_STRINGER, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), user_config_entry_alloc(), user_config_entry_free(), user_config_entry_t, and multi_t::val.

Referenced by user_config_create(), and user_config_update().

5.103.1.3 int_t user_config_upsert (uint64_t *usernum*, stringer_t * *key*, stringer_t * *value*, uint64_t *flags*)

Update a user config entry in the database, or insert it if it does not already exist.

Parameters:

usernum the numerical id of the user to whom the specified config entry belongs.

key a pointer to a managed string containing the name of the config entry to be updated or inserted.

value a pointer to a managed string containing the value of the specified config entry key.

flags a bitmask of flags for the config entry (USER_CONF_STATUS_CRITICAL is supported).

Returns:

2 if the config entry was updated, 1 if a new config key was inserted into the database, 0 if no update was necessary, or -1 on general failure.

Definition at line 52 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by user_config_edit().

5.104 src/objects/contacts/datatier.c File Reference

```
#include "magma.h"
```

Functions

- int_t contact_update_stamp (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

  Touch the last updated time stamp of a contact entry in the database.

- int_t contact_delete (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

  Delete a user's contact entry and its associated details from the database.

- int_t contact_update (uint64_t contactnum, uint64_t usernum, uint64_t cur_folder, uint64_t target_folder, stringer_t *name)

  Update a user contact entry in the database.

- uint64_t contact_insert (uint64_t usernum, uint64_t foldernum, stringer_t *name)

  Insert a new contact entry into the database.

- int_t contact_detail_delete (uint64_t contactnum, stringer_t *key)

  Delete the specified contact detail of a contact entry from the database.

- int_t contact_detail_upsert (uint64_t contactnum, stringer_t *key, stringer_t *value, uint64_t flags)

  Update a specified contact detail in the database, or insert it if it does not exist.

- int_t contact_details_fetch (contact_t *contact)

  Populate a contact entry with its details from the database.

- int_t contacts_fetch (uint64_t usernum, contact_folder_t *folder)

  Retrieve all of a user's contact entries in a specified contacts folder from the database.

5.104.1 Function Documentation

5.104.1.1 int_t contact_delete (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *foldernum*)

Delete a user's contact entry and its associated details from the database. datatier.c

Parameters:

contactnum the numerical id of the contact entry to be deleted.

usernum the numerical id of the user to whom the specified contact entry belongs.

foldernum the numerical id of the parent contact folder containing the contact entry.

Returns:

1 if the specified contact was deleted successfully, 0 if no matching contact was found in the database, or -1 on general failure.

Definition at line 61 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by contact_remove(), and portal_endpoint_contacts_remove().

5.104.1.2 int_t contact_detail_delete (uint64_t *contactnum*, stringer_t * *key*)

Delete the specified contact detail of a contact entry from the database.

Parameters:

contactnum the numerical id of the contact entry to have the specified detail removed.

key a managed string containing the name of the contact detail to be removed from the entry.

Returns:

-1 on error, 0 if no matching detail was found in the database, or 1 if the delete operation was successful.

Definition at line 204 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by contact_edit().

5.104.1.3 int_t contact_detail_upsert (uint64_t *contactnum*, stringer_t * *key*, stringer_t * *value*, uint64_t *flags*)

Update a specified contact detail in the database, or insert it if it does not exist.

Parameters:

contactnum the numerical id of the contact entry to be modified.

key a managed string containing the name of the contact detail to be updated.

value a managed string containing the new value of the specified contact detail.

flags a bitmask of flags to be associated with the specified contact entry detail.

Returns:

-1 on error, 0 if no update was necessary, 1 if a new contact detail was inserted into the database, or 2 if the specified contact detail was updated successfully.

Definition at line 241 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by contact_edit().

5.104.1.4 int_t contact_details_fetch (contact_t * *contact*)

Populate a contact entry with its details from the database.

Parameters:

contact a pointer to the contact entry object that will be updated.

Returns:

-1 on failure or 1 on success.

Definition at line 285 of file datatier.c.

References contact_detail_alloc(), contact_detail_free(), contact_detail_t, inx_insert(), log_info, log_pedantic, M_TYPE_STRINGER, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), and multi_t::val.

5.104.1.5 uint64_t contact_insert (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *name*)

Insert a new contact entry into the database.

Parameters:

usernum the numerical id of the user to whom the contact entry belongs.
foldernum the numerical id of the parent folder to contain the contact entry.
name a pointer to a managed string containing the name of the new contact entry.

Returns:

-1 on failure, 0 if no item was inserted into the database, or the id of the newly inserted contact entry in the database on success.

Definition at line 172 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_insert().

Referenced by contact_create().

5.104.1.6 int_t contact_update (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *cur_folder*, uint64_t *target_folder*, stringer_t * *name*)

Update a user contact entry in the database.

Parameters:

contactnum the numerical id of the contact entry to be modified.
usernum the numerical id of the user to whom the specified contact entry belongs.
cur_folder the numerical id of the parent contact containing the specified contact entry.
target_folder if not 0, sets the new parent contact folder to which the specified contact entry will belong.
name if not NULL, sets the new name of the specified contact entry.

Returns:

-1 on error, 0 if the specified contact entry was not found in the database, or 1 if the contact entry was successfully updated.

Definition at line 106 of file datatier.c.

References ISNULL, log_check, log_pedantic, mm_wipe(), st_char_get(), st_empty, st_length_get(), and stmt_exec_affected().

Referenced by contact_edit(), and contact_move().

5.104.1.7 int_t contact_update_stamp (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *foldernum*)

Touch the last updated time stamp of a contact entry in the database.

Parameters:

contactnum the numerical id of the contact entry to have its time stamp updated.
usernum the numerical id of the user to whom the contact entry belongs.
foldernum the numerical id of the parent folder containing the contact entry.

Returns:

1 if the contact time stamp was updated successfully, 0 if the specified contact was not found, or -1 on general failure.

Definition at line 17 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by contact_edit().

5.104.1.8 int_t contacts_fetch (uint64_t *usernum*, contact_folder_t * *folder*)

Retrieve all of a user's contact entries in a specified contacts folder from the database.

Parameters:

usernum the numerical id of the user whose contacts will be retrieved.

folder a pointer to the contact folder which will have its contents listed.

Returns:

-1 on failure or 1 on success.

LOW: Should we bother with error checking?

Definition at line 339 of file datatier.c.

References contact_alloc(), contact_details_fetch(), contact_free(), contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_-cursor_value_next(), inx_insert(), log_info, log_pedantic, M_TYPE_UINT64, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

```

Functions

- inx_t * magma_folder_fetch (uint64_t usernum, uint_t type)

  Fetch all of a user's folders of a specified type from the database.

- uint64_t magma_folder_insert (uint64_t usernum, stringer_t *name, uint64_t parent, uint32_t order, uint_t type)

  Insert a new folder into the database.

- bool_t magma_folder_delete (uint64_t usernum, uint64_t foldernum, uint_t type)

  Delete a folder from the database.

- bool_t magma_folder_rename (uint64_t usernum, uint64_t foldernum, uint_t type, stringer_t *rename)

  Rename a folder in the database.

5.105.1 Function Documentation

5.105.1.1 bool_t magma_folder_delete (uint64_t *usernum*, uint64_t *foldernum*, uint_t *type*)

Delete a folder from the database. datatier.c

Parameters:

usernum the numerical id of the user requesting the folder removal.

foldernum the numerical id of the folder to be removed.

type the type of the folder to be deleted (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

true on success or false on failure.

Definition at line 136 of file datatier.c.

References mm_wipe(), and stmt_exec_affected().

Referenced by contact_folder_remove(), and message_folder_remove().

5.105.1.2 inx_t* magma_folder_fetch (uint64_t *usernum*, uint_t *type*)

Fetch all of a user's folders of a specified type from the database.

Parameters:

usernum the numerical id of the requested user.

type the folder class of the folders to be retrieved (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

NULL on failure, or an inx object holding all of the requested folders on success.

Definition at line 16 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_info, log_pedantic, M_INX_TREE, M_TYPE_UINT64, magma_folder_funcs(), magma_folder_t, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by contacts_update(), and messages_update().

5.105.1.3 uint64_t magma_folder_insert (uint64_t *usernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*, uint_t *type*)

Insert a new folder into the database.

Parameters:

usernum the numerical id of the user to whom the new folder belongs.

name a managed string containing the name of the new folder.

parent the numerical id of the mail folder to be the parent of the new mail folder.

order the order number of this folder in its parent folder.

type the type of the new folder (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

0 on failure, or the numerical id of the newly inserted folder in the database on success.

Definition at line 91 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_insert().

Referenced by contact_folder_create(), and message_folder_create().

5.105.1.4 bool_t magma_folder_rename (uint64_t *usernum*, uint64_t *foldernum*, uint_t *type*, stringer_t * *rename*)

Rename a folder in the database.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

foldernum the numerical id of the folder to be renamed.

type the type of the folder to be renamed (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

rename a managed string containing the new name of the specified folder.

Returns:

true on success or false on failure.

Definition at line 176 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by contact_folder_rename().

```
#include "magma.h"
```

Functions

- void mail_db_hide_message (uint64_t messagenum)

  Set a message invisible in the database.

- bool_t mail_db_delete_message (uint64_t usernum, uint64_t messagenum, uint32_t size, int_t transaction)

  Delete a mail message from the mysql database and adjust the owner's quota.

- int_t mail_db_update_message_folder (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target, int64_t transaction)

  Update a mail message's parent folder in the database.

- uint64_t mail_db_insert_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, int_t transaction)

  Insert a mail message into the database.

- uint64_t mail_db_insert_duplicate_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, uint64_t created, int_t transaction)

  Insert a duplicate entry for a message in the database.

5.106.1 Function Documentation

5.106.1.1 bool_t mail_db_delete_message (uint64_t *usernum*, uint64_t *messagenum*, uint32_t *size*, int_t *transaction*)

Delete a mail message from the mysql database and adjust the owner's quota. datatier.c

Parameters:

usernum the user id to whom the target mail message belongs.

messagenum the message id of the mail message to be deleted.

size the storage size, in bytes, of the message to be deleted.

transaction the mysql connection id on which to execute the statements.

Returns:

0 on failure or 1 on success.

Definition at line 41 of file datatier.c.

References log_error, mm_wipe(), and stmt_exec_affected_conn().

Referenced by mail_remove_message().

5.106.1.2 void mail_db_hide_message (uint64_t *messagenum*)

Set a message invisible in the database.

Parameters:

messagenum the message id of the mail message to be hidden.

Returns:

This function returns no value.

Definition at line 15 of file datatier.c.

References mm_wipe(), and stmt_exec().

Referenced by mail_load_message().

5.106.1.3 uint64_t mail_db_insert_duplicate_message (uint64_t *usernum*, uint64_t *foldernum*, uint32_t *status*, uint32_t *size*, uint64_t *signum*, uint64_t *sigkey*, uint64_t *created*, int_t *transaction*)

Insert a duplicate entry for a message in the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id ot eh user that owns the message.

foldernum the numerical id of the parent folder containing the message.

status the status flags value for the message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

created the UNIX timestamp of when the message was created.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

NULL on failure, or the ID of the newly inserted message on success.

Definition at line 304 of file datatier.c.

References magma_t::active, ISNULL, log_pedantic, magma, MAIL_MARK_JUNK, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_conn(), stmt_insert_conn(), and magma_t::storage.

Referenced by mail_copy_message().

5.106.1.4 uint64_t mail_db_insert_message (uint64_t *usernum*, uint64_t *foldernum*, uint32_t *status*, uint32_t *size*, uint64_t *signum*, uint64_t *sigkey*, int_t *transaction*)

Insert a mail message into the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id of the user to whom the mail message will belong.

foldernum the numerical id of the folder that will be the parent folder of the message.

status the status flags of the mail message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

0 on failure or the id of the newly inserted mail message on success.

Definition at line 172 of file datatier.c.

References magma_t::active, ISNULL, log_pedantic, magma, MAIL_MARK_JUNK, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_conn(), stmt_insert_conn(), and magma_t::storage.

Referenced by mail_store_message().

5.106.1.5 int_t mail_db_update_message_folder (uint64_t *usernum*, uint64_t *messagenum*, uint64_t *source*, uint64_t *target*, int64_t *transaction*)

Update a mail message's parent folder in the database. usernum the numerical id of the user to whom the mail message belongs. messagenum the numerical id of the target mail message of the operation. source the numerical id of the parent folder in which the mail message currently resides. target the numerical id of the destination folder which is to be the new parent of the mail message. transaction a transaction id for the database operation, in case the caller needs to roll back changes on failure.

Returns:

-1 on failure, 0 if the target message could not be located in the database, or 1 on success.

Definition at line 100 of file datatier.c.

References log_pedantic, mm_wipe(), mysql_stmt_errno_d, mysql_stmt_error_d, pool_get_obj(), sql_pool, and stmt_exec_affected_conn().

Referenced by mail_move_message().

5.107 src/objects/messages/datatier.c File Reference

```
#include "magma.h"
```

Functions

- bool_t meta_data_fetch_folder_messages (uint64_t usernum, message_folder_t *folder)

  Populate a message folder with all of its child messages from the database.

- void meta_data_fetch_message_tags (meta_message_t *message)

  Fetch the tags for a specified message from the database.

- bool_t meta_data_fetch_messages (meta_user_t *user)

  Fetch all of a user's stored messages from the database and attach them to the meta user object.

5.107.1 Function Documentation

5.107.1.1 bool_t meta_data_fetch_folder_messages (uint64_t *usernum*, message_folder_t * *folder*)

Populate a message folder with all of its child messages from the database. datatier.c

Parameters:

usernum the numerical id of the user that owns the folder.

folder a pointer to the message folder object to be populated.

Returns:

true on success or false on failure.

Definition at line 16 of file datatier.c.

References inx_append(), log_error, log_pedantic, M_TYPE_UINT64, message_alloc(), message_free(), message_t, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by messages_update().

5.107.1.2 void meta_data_fetch_message_tags (meta_message_t * *message*)

Fetch the tags for a specified message from the database.

Note:

The results of the operation will be stored in the specified meta message object's "tags" member.

Parameters:

message the meta message object for which the tags will be looked up.

Returns:

This function returns no value.

Definition at line 77 of file datatier.c.

References ar_alloc(), ar_append(), ARRAY_TYPE_STRINGER, meta_message_t::messagenum, mm_wipe(), res_field_string(), res_row_count(), res_row_next(), res_table_free(), stmt_get_result(), and meta_message_t::tags.

Referenced by meta_data_fetch_messages(), and portal_endpoint_messages_tag().

5.107.1.3 bool_t meta_data_fetch_messages (meta_user_t * *user*)

Fetch all of a user's stored messages from the database and attach them to the meta user object.

Note:

Any of the user's existing messages will be destroyed first to allow for updates.

Parameters:

user the meta user object whose mail messages will be retrieved.

Returns:

true on success or false on failure.

TODO: Do we still need this once the refactorization is complete?

Definition at line 115 of file datatier.c.

5.108 src/objects/meta/datatier.c File Reference

```
#include "magma.h"
```

Functions

- void meta_data_update_log (meta_user_t *user, META_PROTOCOL prot)

  Update the per-user entry in the Log table for the specified protocol.

- void meta_data_update_lock (uint64_t usernum, uint8_t lock)

  Update a user's lock in the database.

- bool_t meta_data_fetch_folders (meta_user_t *user)

  Retrieve all of a user's message folders from the database.

- int_t meta_data_fetch_mailbox_aliases (meta_user_t *user)

  Get all the mailbox aliases for a specified user.

- int_t meta_data_fetch_user (meta_user_t *user)

  Build a meta user object by username, hashed password, and hashed key storage password.

- int_t meta_data_fetch_keys (meta_user_t *user, key_pair_t *output, int64_t transaction)

  Retrieve the encryption keys for a user account.

- int_t meta_data_insert_keys (uint64_t usernum, stringer_t *username, key_pair_t *input, int64_t transaction)

  Store the encryption keys for a user account.

- int_t meta_data_fetch_shard (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *output, uint_t *rotated, int64_t transaction)

  Retrieve a shard value for user account.

- int_t meta_data_insert_shard (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *shard, int64_t transaction)

  Store the user realm shard value.

- bool_t meta_data_acknowledge_alert (uint64_t alertnum, uint64_t usernum, uint32_t transaction)

  Mark a user alert message as acknowledged in the database.

- inx_t * meta_data_fetch_alerts (uint64_t usernum)

  Get all unacknowledged alert messages for a user.

- bool_t meta_data_flags_replace (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

- bool_t meta_data_flags_remove (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Remove the specified flags mask from a collection of mail messages.

- bool_t meta_data_flags_add (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Add the specified flags mask to a collection of mail messages.

- uint64_t meta_data_delete_folder (uint64_t usernum, uint64_t foldernum)

  Delete a message folder from the database.

- uint64_t meta_data_update_folder_name (uint64_t usernum, uint64_t foldernum, stringer_t *name, uint64_t parent, uint32_t order)

  Update the record for a message folder in the database.

- uint64_t meta_data_insert_folder (uint64_t usernum, stringer_t *name, uint64_t parent, uint32_t order)

  Insert a new mail folder into the database.

- int_t meta_data_insert_tag (meta_message_t *message, stringer_t *tag)

  Insert a tag for a message into the database.

- int_t meta_data_truncate_tags (meta_message_t *message)

  Remove all tags associated with a message in the database.

- int_t meta_data_delete_tag (meta_message_t *message, stringer_t *tag)

  Remove a tag from a message in the database.

- inx_t * meta_data_fetch_all_tags (uint64_t usernum)

  Fetch all the tags attached to messages of a specified user from the database.

5.108.1 Function Documentation

5.108.1.1 bool_t meta_data_acknowledge_alert (uint64_t *alertnum*, uint64_t *usernum*, uint32_t *transaction*)

Mark a user alert message as acknowledged in the database. datatier.c

Note:

If the table is not updated immediately, another check is made to see if the alert is still pending. If so, false is returned.

Parameters:

alertnum the numerical id of the alert message to be acknowledged.

usernum the numerical id of the user to whom the alert message belongs.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

true if the alert was acknowledged successfully, or false on failure.

Definition at line 623 of file datatier.c.

References log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), stmt_exec_affected_conn(), and stmt_get_result_-conn().

Referenced by portal_endpoint_alert_acknowledge().

5.108.1.2 uint64_t meta_data_delete_folder (uint64_t *usernum*, uint64_t *foldernum*)

Delete a message folder from the database.

Parameters:

usernum the numerical id of the user that owns the folder to be deleted.

foldernum the folder id of the message folder to be deleted.

Returns:

1 if the message folder was successfully, or <= 0 if there was an error.

Definition at line 971 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), stmt_exec_affected(), and type().

Referenced by imap_folder_remove().

5.108.1.3 int_t meta_data_delete_tag (meta_message_t * *message*, stringer_t * *tag*)

Remove a tag from a message in the database.

Parameters:

message a pointer to the meta message object of the message to have the tag stripped.

tag a managed string containing the name of the tag to be deleted.

Returns:

0 on success or -1 on failure.

Definition at line 1176 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.108.1.4 inx_t* meta_data_fetch_alerts (uint64_t *usernum*)

Get all unacknowledged alert messages for a user.

Parameters:

usernum the numerical id of the user for whom the alert messages will be fetched.

Returns:

NULL on failure, or a pointer to an inx holder containing all of the user's alert messages on success.

Definition at line 688 of file datatier.c.

References alert_alloc(), inx_alloc(), inx_free(), inx_insert(), log_error, log_info, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_alert_t, mm_free(), mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_alert_list().

5.108.1.5 inx_t* meta_data_fetch_all_tags (uint64_t *usernum*)

Fetch all the tags attached to messages of a specified user from the database.

Parameters:

usernum the numerical id of the user for whom the message tags will be fetched.

Returns:

NULL on failure, or an inx holder containing a list of all the user's messages' tags as managed strings on success.

Definition at line 1209 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, res_field_string(), res_row_next(), res_table_free(), st_free(), stmt_get_result(), multi_t::type, multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_messages_tags().

5.108.1.6 bool_t meta_data_fetch_folders (meta_user_t * *user*)

Retrieve all of a user's message folders from the database.

Note:

If the user already had a working set of message folders they will be deleted first.

Parameters:

user a pointer to the meta user object of the user making the request, which will be updated on success.

Returns:

-1 on failure or 1 on success.

Definition at line 97 of file datatier.c.

References meta_folder_t::foldernum, meta_user_t::folders, inx_alloc(), inx_cleanup(), inx_insert(), log_error, log_pedantic, M_FOLDER_MESSAGES, M_INX_LINKED, M_TYPE_UINT64, mm_alloc(), mm_copy(), mm_free(), mm_wipe(), meta_folder_t::name, meta_folder_t::order, meta_folder_t::parent, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::type, type(), multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by meta_update_folders().

5.108.1.7 int_t meta_data_fetch_keys (meta_user_t * *user*, key_pair_t * *output*, int64_t *transaction*)

Retrieve the encryption keys for a user account.

Parameters:

user a meta object with the user number field populated.

output a key pair object to hold the results.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 346 of file datatier.c.

References base64_decode_mod(), log_pedantic, mm_wipe(), PLACER, key_pair_t::private, key_pair_t::public, res_field_block(), res_field_length(), res_row_next(), res_table_free(), st_char_get(), st_empty, st_free(), st_length_int(), stmt_get_result_conn(), meta_user_t::username, and meta_user_t::usernum.

Referenced by meta_update_keys().

5.108.1.8 int_t meta_data_fetch_mailbox_aliases (meta_user_t * *user*)

Get all the mailbox aliases for a specified user.

Parameters:

user a pointer to the partially populated meta user object to be queried, with its usernum field set.

Returns:

true on success or false on failure.

Definition at line 198 of file datatier.c.

References alias_alloc(), meta_user_t::aliases, inx_alloc(), inx_cleanup(), inx_insert(), log_error, log_info, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_alias_t, mm_free(), mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_field_uint8(), res_row_next(), res_table_free(), st_char_get(), st_length_int(), stmt_get_result(), multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by meta_update_aliases().

5.108.1.9 int_t meta_data_fetch_shard (uint64_t *usernum*, uint16_t *serial*, stringer_t * *label*, stringer_t * *output*, uint_t * *rotated*, int64_t *transaction*)

Retrieve a shard value for user account.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the serial number associated with the shard value.

label the textual label associated with the shard value.

output the buffer where the binary output should be stored.

rotated the buffer where the rotated variable is stored.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 479 of file datatier.c.

References base64_decode_mod(), log_pedantic, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint8(), res_row_next(), res_table_free(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_opt_get(), st_valid_destination(), STACIE_SHARD_LENGTH, and stmt_get_result_conn().

Referenced by meta_update_realms().

5.108.1.10 int_t meta_data_fetch_user (meta_user_t * *user*)

Build a meta user object by username, hashed password, and hashed key storage password.

Parameters:

user a meta object with the user number field populated.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 263 of file datatier.c.

References base64_decode_mod(), meta_user_t::flags, log_pedantic, META_USER_ENCRYPT_DATA, META_USER_OVERQUOTA, META_USER_TLS, mm_wipe(), PLACER, res_field_block(), res_field_int8(), res_field_length(), res_field_string(), res_row_next(), res_table_free(), st_cleanup, st_empty, stmt_get_result(), meta_user_t::username, meta_user_t::usernum, and meta_user_t::verification.

Referenced by meta_update_user().

5.108.1.11 bool_t meta_data_flags_add (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Add the specified flags mask to a collection of mail messages.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 908 of file datatier.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, meta_message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_fetch(), imap_update_flags(), portal_endpoint_messages_flag(), and portal_endpoint_messages_tag().

5.108.1.12 bool_t meta_data_flags_remove (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Remove the specified flags mask from a collection of mail messages.

Parameters:

messages an inx holder containing the collection of messages to have their flags removed.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be stripped from any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 834 of file datatier.c.

References meta_message_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, meta_-message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_select(), imap_update_flags(), portal_endpoint_messages_flag(), and portal_endpoint_messages_tag().

5.108.1.13 bool_t meta_data_flags_replace (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

Note:

The new mask can contain both user and system flags, but only user flags will be stripped from each message initially.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.

usernum the numerical of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 752 of file datatier.c.

References meta_message_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, MAIL_STATUS_USER_FLAGS, meta_message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_update_flags(), and portal_endpoint_messages_flag().

5.108.1.14 uint64_t meta_data_insert_folder (uint64_t *usernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*)

Insert a new mail folder into the database.

Parameters:

usernum the numerical id of the user to whom the new folder belongs.

name a managed string containing the name of the new mail folder.

parent the numerical id of the mail folder to be the parent of the new mail folder.

order the order number of this folder in its parent folder.

Returns:

0 on failure, or the numerical id of the newly inserted mail folder in the database on success.

Definition at line 1067 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), st_char_get(), st_length_get(), stmt_insert(), and type().

Referenced by imap_folder_create(), and imap_folder_rename().

5.108.1.15 int_t meta_data_insert_keys (uint64_t *usernum*, stringer_t * *username*, key_pair_t * *input*, int64_t *transaction*)

Store the encryption keys for a user account.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

username the plain text username.

input the public and private key pair.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 411 of file datatier.c.

References base64_encode_mod(), log_pedantic, mm_wipe(), key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_length_-get(), st_length_int(), st_populated, and stmt_exec_affected_conn().

Referenced by meta_crypto_keys_create().

5.108.1.16 int_t meta_data_insert_shard (uint64_t *usernum*, uint16_t *serial*, stringer_t * *label*, stringer_t * *shard*, int64_t *transaction*)

Store the user realm shard value.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the nummerid serial number associated with the shard value.

label the textual label associated with the shard value.

shard the binary shard value.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 547 of file datatier.c.

References base64_encode_mod(), log_pedantic, MANAGEDBUF, mm_wipe(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), STACIE_SHARD_LENGTH, and stmt_exec_affected_conn().

Referenced by meta_update_realms().

5.108.1.17 int_t meta_data_insert_tag (meta_message_t * *message*, stringer_t * *tag*)

Insert a tag for a message into the database.

Parameters:

message the meta message object of the message to be tagged.

tag a managed string containing the name of the tag.

Returns:

0 on success or -1 on failure.

Definition at line 1114 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.108.1.18 int_t meta_data_truncate_tags (meta_message_t * *message*)

Remove all tags associated with a message in the database.

Parameters:

message a pointer to the meta message object of the message to have all of its tags stripped.

Returns:

0 on success or -1 on failure.

Definition at line 1147 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.108.1.19 uint64_t meta_data_update_folder_name (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*)

Update the record for a message folder in the database.

Parameters:

usernum the numerical id of the user that owns the specified folder.

foldernum the id of the folder to have its properties adjusted.

name a managed string containing the new name of the specified folder.

parent the id of the new parent folder to be set for the specified message folder.

order the value of the order for the specified folder.

Returns:

1 on success, or <= 0 on failure.

Definition at line 1011 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_affected(), and type().

Referenced by imap_folder_rename().

5.108.1.20 void meta_data_update_lock (uint64_t *usernum*, uint8_t *lock*)

Update a user's lock in the database.

Parameters:

usernum the numerical id of the user for whom the lock will be set.

lock the new value to which the specified user's lock will be set.

Returns:

This function returns no value.

Definition at line 57 of file datatier.c.

References log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by smtp_fetch_authorization().

5.108.1.21 void meta_data_update_log (meta_user_t * *user*, META_PROTOCOL *prot*)

Update the per-user entry in the Log table for the specified protocol.

Note:

This function will set the last session timestamp for the user, and increment the sessions counter in the database.

Parameters:

user the meta user object of the user making the logging request.

prot the protocol associated with the log request: META_PROT_POP, META_PROT_IMAP, or META_PROT_WEB.

Returns:

This function returns no value.

Definition at line 20 of file datatier.c.

References log_pedantic, META_PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_WEB, mm_wipe(), stmt_exec_affected(), and meta_user_t::usernum.

Referenced by imap_login(), and pop_pass().

```

Functions

- inx_t ∗ warehouse_fetch_domains (void)

  Fetch the list of configured domains from the database.

- inx_t ∗ warehouse_fetch_patterns (void)

  Fetch the pattern list from the database.

5.109.1 Function Documentation

5.109.1.1 inx_t∗ warehouse_fetch_domains (void)

Fetch the list of configured domains from the database. datatier.c

Returns:

NULL on failure, or an inx object holding all the configured domains on success.

Definition at line 14 of file datatier.c.

References domain_alloc(), domain_t, inx_alloc(), inx_free(), inx_insert(), log_check, log_info, log_pedantic, M_INX_TREE, M_TYPE_-STRINGER, MAGMA_HOSTNAME_MAX, mm_free(), PLACER, res_field_block(), res_field_int8(), res_field_length(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), and multi_t::val.

Referenced by domain_start().

5.109.1.2 inx_t∗ warehouse_fetch_patterns (void)

Fetch the pattern list from the database.

Returns:

NULL on failure or a pointer to an inx holder containing a collection of managed strings with the patterns on success.

Definition at line 64 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_UINT64, res_field_string(), res_row_next(), res_table_free(), st_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

#include "magma.h"
```

Functions

- int_t smtp_get_action (chr_t *string, size_t length)
  Parse an smtp event action string from the Dispatch table.
- stringer_t * smtp_fetch_autoreply (uint64_t autoreply, uint64_t usernum)
  Fetch a specified auto-reply message for a user.
- int_t smtp_fetch_inbound (stringer_t *address, smtp_inbound_prefs_t **output)
  Fetch a user's smtp inbound preferences from the database.
- table_t * smtp_fetch_rollmessages (uint64_t usernum)
  Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.
- void smtp_update_receive_stats (connection_t *con, smtp_inbound_prefs_t *prefs)
  Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.
- uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t *prefs, uint64_t key, int_t code)
  Store a spam signature in the database.
- void smtp_update_transmission_stats (connection_t *con)
  Update the transmission and per-user log tables in the database for a successfully sent smtp message.
- int_t smtp_check_transmit_quota (uint64_t usernum, size_t num_recipients, smtp_outbound_prefs_t *prefs)
  Check to see if a user's current mail send request would push them over their daily transmission quota.
- int_t smtp_fetch_authorization (stringer_t *username, stringer_t *verification, smtp_outbound_prefs_t **output)
  Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.
- int_t smtp_check_receive_quota (connection_t *con, smtp_inbound_prefs_t *prefs)
  Check the user's received statistics from the database to see if receiving a message would result in a quota overage.
- int_t smtp_check_authorized_from (uint64_t usernum, stringer_t *address)
  Check to see if a user is permitted to send email originating from a specified email address.

5.110.1 Function Documentation

5.110.1.1 int_t smtp_check_authorized_from (uint64_t *usernum*, stringer_t * *address*)

Check to see if a user is permitted to send email originating from a specified email address. datatier.c

Note:

The authorization attempt first checks against the specified email address, and if unsuccessful, upon the domain component of the email address if wildcards are enabled for that domain.

Parameters:

usernum the numerical id of the user attempting to send the mail message.

address a pointer to a managed string containing the From address value of the mail message to be sent.

Returns:

1 if the user is authorized to send email from the specified address, or 0 otherwise.

Definition at line 782 of file datatier.c.

References domain_wildcard(), mail_domain_get(), mm_wipe(), placer_t, res_row_count(), res_table_free(), st_char_get(), st_length_get(), and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.110.1.2 int_t smtp_check_receive_quota (connection_t * *con*, smtp_inbound_prefs_t * *prefs*)

Check the user's received statistics from the database to see if receiving a message would result in a quota overage.

Note:

The sum total of all emails received by the user over the past 24 hours is calculated from the database, and these checks are made: 1. The amount of mail messages received in the past 24 hours by the user does not exceed their daily mail received quota. 2. The messages received in the past 24 hours by the user from this subnet does not exceed the user's daily per-subnet received quota.

Parameters:

con a pointer to the connection object over which the smtp message was received.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

0 if message receipt is permitted, 1 if the general daily receiving limit was exceeded, 2 if the sending subnet's transmission limit was exceeded, or -1 if there was a general error.

Definition at line 717 of file datatier.c.

References con_addr_subnet(), smtp_inbound_prefs_t::daily_recv_limit, smtp_inbound_prefs_t::daily_recv_limit_ip, log_pedantic, mm_wipe(), number, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), st_char_get(), st_free(), st_length_get(), stmt_get_result(), uint64_conv_bl(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_rcpt_to().

5.110.1.3 int_t smtp_check_transmit_quota (uint64_t *usernum*, size_t *num_recipients*, smtp_outbound_prefs_t * *prefs*)

Check to see if a user's current mail send request would push them over their daily transmission quota.

Note:

This check is performed by querying the database to see how many messages a user has sent in the past 24 hour period, and by adding the current number of recipients of the pending email request to that number to see if their quota would be exceeded.

Parameters:

con a pointer to the connection object of the user attempting to send mail.

Returns:

-1 on error, 0 if the send operation is permitted, or 1 if the send operation would result in a daily send quota overage.

Definition at line 542 of file datatier.c.

References smtp_outbound_prefs_t::daily_send_limit, log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), smtp_outbound_prefs_t::sent_today, and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.110.1.4 int_t smtp_fetch_authorization (stringer_t * *username*, stringer_t * *verification*, smtp_outbound_prefs_t ** *output*)

Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.

Note:

This function first checks if the account is locked in the Users table; next it populates the user's outbound mail preferences with a combination of data from the Users and Dispatch tables. The number of messages the user has sent in the past 24 hours is also computed from the Transmitting table.

Parameters:

cred a pointer to a credential object for the user, which must be of type CREDENTIAL_AUTH.

output a pointer to the address of an outbound smtp preferences object to receive the value of the lookup.

Returns:

1 on success or <= 0 on failure. 0: authentication failure (invalid username/password combination). -1: general or database failure. -2: the account is subject to an administrative lock. -3: the account is locked due to suspicion of abuse violations. -4: the account has been locked at the request of the user.

Definition at line 594 of file datatier.c.

References base64_encode_mod(), smtp_outbound_prefs_t::daily_send_limit, smtp_outbound_prefs_t::domain, smtp_outbound_prefs_t::importance, log_error, log_pedantic, meta_data_update_lock(), mm_alloc(), mm_free(), mm_wipe(), res_field_int8(), res_field_string(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), smtp_outbound_prefs_t::send_size_limit, smtp_outbound_prefs_t::sent_today, st_char_get(), st_free(), st_length_get(), st_length_int(), st_populated, stmt_get_result(), smtp_outbound_prefs_t::tls, and smtp_outbound_prefs_t::usernum.

Referenced by portal_outbound_checks(), smtp_auth_login(), and smtp_auth_plain().

5.110.1.5 stringer_t* smtp_fetch_autoreply (uint64_t *autoreply*, uint64_t *usernum*)

Fetch a specified auto-reply message for a user.

Note:

This function first checks the cache, and falls back to the database.

Parameters:

autoreply the numerical id of the auto-reply message in the database.

usernum the numerical id of the user to whom the auto-reply message belongs.

Returns:

NULL on failure, or a pointer to a managed string containing the user's auto-reply on success.

Definition at line 51 of file datatier.c.

References cache_get(), cache_set(), log_pedantic, mm_wipe(), PLACER, res_field_string(), res_row_next(), res_table_free(), and stmt_get_result().

Referenced by smtp_reply().

5.110.1.6 int_t smtp_fetch_inbound (stringer_t * *address*, smtp_inbound_prefs_t ** *output*)

Fetch a user's smtp inbound preferences from the database.

Parameters:

cred a pointer to the credential object of a user with

address Returns -1 for errors, -2 for an admin lock, -3 for an inactivity lock, -4 for a user lock, -5 for an abuse lock, -6 if the domain isn't local and 0 if the domain is local but the address wasn't found. If everything works, return 1 to indicate success.

Definition at line 111 of file datatier.c.

References smtp_inbound_filter_t::action, smtp_inbound_prefs_t::address, smtp_inbound_prefs_t::autoreply, base64_decode_mod(), BINARY, smtp_inbound_prefs_t::bounces, CONTIGUOUS, smtp_inbound_prefs_t::daily_recv_limit, smtp_inbound_prefs_t::daily_recv_limit_ip, smtp_inbound_prefs_t::dkim, smtp_inbound_prefs_t::dkimaction, smtp_inbound_prefs_t::domain, domain_wildcard(), smtp_inbound_filter_t::expression, smtp_inbound_filter_t::field, smtp_inbound_prefs_t::filters, smtp_inbound_filter_t::foldernum, smtp_inbound_prefs_t::forwarded, smtp_inbound_prefs_t::greylist, smtp_inbound_prefs_t::greytime, HEAP, smtp_inbound_prefs_t::inbox, inx_alloc(), inx_insert(), smtp_inbound_filter_t::label, smtp_inbound_filter_t::location, log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, mail_domain_get(), MANAGED_T, mm_alloc(), mm_free(), mm_wipe(), NONE, smtp_inbound_prefs_t::overquota, smtp_inbound_prefs_t::phish, smtp_inbound_prefs_t::phishaction, PLACER, placer_t, prime_set(), smtp_inbound_prefs_t::quota, smtp_inbound_prefs_t::rbl, smtp_inbound_prefs_t::rblaction, smtp_inbound_prefs_t::rcptto, smtp_inbound_prefs_t::recv_size_limit, res_field_block(), res_field_int8(), res_field_length(), res_field_string(), res_field_uint32(), res_field_uint64(), res_row_count(), res_row_next(), res_table_free(), smtp_inbound_prefs_t::rollout, smtp_inbound_filter_t::rulenum, smtp_inbound_prefs_t::secure, smtp_inbound_prefs_t::signet, SMTP_FILTER_ACTION_LABEL, SMTP_FILTER_ACTION_MOVE, SMTP_FILTER_LOCATION_FIELD, smtp_free_inbound(), smtp_get_action(), smtp_list_free_filter(), smtp_inbound_prefs_t::spam, smtp_inbound_prefs_t::spamaction, smtp_inbound_prefs_t::spf, smtp_inbound_prefs_t::spfaction, st_char_get(), st_cleanup, st_dupe(), st_dupe_opts(), st_empty, st_length_get(), st_length_int(), stmt_get_result(), smtp_inbound_prefs_t::stor_size, smtp_inbound_filter_t::type, multi_t::u64, smtp_inbound_prefs_t::usernum, multi_t::val, smtp_inbound_prefs_t::virus, and smtp_inbound_prefs_t::virusaction.

Referenced by smtp_rcpt_to().

5.110.1.7 table_t* smtp_fetch_rollmessages (uint64_t *usernum*)

Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.

Parameters:

usernum the numerical id of the user whose messages are to be queried.

Returns:

NULL on failure, or a pointer to a sql results set containing the user's oldest messages on success.

Definition at line 344 of file datatier.c.

References log_pedantic, mm_wipe(), and stmt_get_result().

Referenced by smtp_rollout().

5.110.1.8 int_t smtp_get_action (chr_t * *string*, size_t *length*)

Parse an smtp event action string from the Dispatch table.

Note:

These values describe user-specified actions for events related to the spam filter, virus scanner, phishing detection, SPF, DKIM, and RBL checks.

Parameters:

string a pointer to a null-terminated string containing the name of the action.

length the length, in bytes, of the action string.

Returns:

the code of the corresponding smtp event action, SMTP_ACTION_UNDEFINED if the action is not known, or SMTP_ACTION_ERROR on failure.

Definition at line 19 of file datatier.c.

References log_error, PLACER, SMTP_ACTION_BOUNCE, SMTP_ACTION_DELETE, SMTP_ACTION_ERROR, SMTP_ACTION_-MARK, SMTP_ACTION_MARK_READ, SMTP_ACTION_REJECT, SMTP_ACTION_UNDEFINED, and st_cmp_cs_eq().

Referenced by smtp_fetch_inbound().

5.110.1.9 uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t * *prefs*, uint64_t *key*, int_t *code*)

Store a spam signature in the database.

See also:

dspam_process()

Parameters:

prefs a pointer to the specified user's inbound mail preferences data.

key a randomly chosen authentication key for the signature.

code the dspam return code for the message from dspam_process()

Returns:

0 on failure, or the number of the newly inserted spam signature on success.

Definition at line 445 of file datatier.c.

References log_pedantic, mm_wipe(), smtp_inbound_prefs_t::spamsig, st_char_get(), st_length_get(), stmt_insert(), and smtp_inbound_-prefs_t::usernum.

Referenced by smtp_store_spamsig().

5.110.1.10 void smtp_update_receive_stats (connection_t * *con*, smtp_inbound_prefs_t * *prefs*)

Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.

Note:

The Receiving table is updated with the subnet address from which the message was received; the Log table for the user is updated to reflect the newly calculated totals of bounces or messages received.

Parameters:

con the connection across which the smtp message was received.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 373 of file datatier.c.

References smtp_inbound_prefs_t::bounces, con_addr_subnet(), log_pedantic, smtp_session_t::mailfrom, mm_wipe(), PLACER, connection_t::smtp, st_char_get(), st_cmp_cs_eq(), st_free(), st_length_get(), stmt_exec(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.110.1.11 void smtp_update_transmission_stats (connection_t * *con*)

Update the transmission and per-user log tables in the database for a successfully sent smtp message.

Note:

The Transmitting table is updated with the timestamp of this transaction; the Log table for the user is updated to reflect the newly calculated total for messages sent.

Parameters:

con a pointer to the connection object across which the smtp message was sent.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 497 of file datatier.c.

References log_pedantic, mm_wipe(), smtp_session_t::num_recipients, smtp_session_t::out_prefs, connection_t::smtp, stmt_exec(), and smtp_outbound_prefs_t::usernum.

Referenced by smtp_data_outbound().

```
#include "magma.h"
```

Functions

- inx_t ∗ register_data_fetch_blocklist (void)

  Fetch the blocklist for new user registration from the database.

- bool_t register_data_check_username (stringer_t ∗username)

  Check to see if a username requested by a registration attempt has already been taken.

- bool_t register_data_insert_user (connection_t ∗con, uint16_t plan, stringer_t ∗username, stringer_t ∗password, int64_t transaction, uint64_t ∗outuser)

  Insert a newly registered user into the database using information gathered by registration step #2.

5.111.1 Function Documentation

5.111.1.1 bool_t register_data_check_username (stringer_t ∗ *username*)

Check to see if a username requested by a registration attempt has already been taken. datatier.c

Parameters:

username the username to be checked against the database.

Returns:

true if the username is taken or false if it is not.

Definition at line 67 of file datatier.c.

References mm_wipe(), res_row_next(), res_table_free(), st_char_get(), st_length_get(), and stmt_get_result().

Referenced by register_business_step1().

5.111.1.2 inx_t∗ register_data_fetch_blocklist (void)

Fetch the blocklist for new user registration from the database. HIGH: The prepared statements being used aren't valid. The queries need to be copied over and created. register_fetch_blocklist still needs to be defined.

Returns:

an inx holder containing the registration blocklist as a collection of managed strings.

Definition at line 18 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_UINT64, res_field_string(), res_row_next(), res_table_free(), st_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by register_blocklist_update().

5.111.1.3 bool_t register_data_insert_user (connection_t * *con*, uint16_t *plan*, stringer_t * *username*, stringer_t * *password*, int64_t *transaction*, uint64_t * *outuser*)

Insert a newly registered user into the database using information gathered by registration step #2.

Note:

The following steps occur: 1. Insert a new user into the Users table, supplying username, hashed password, plan info, and quota. 2. Insert a random shard value into the User_Realms table. 3. Insert a blank entry into the Profile table for the user. 4. Insert an entry into the Folders table for the user's "Inbox" folder. 5. Insert a new entry into the Log table containing the usernum and IP address of the client request. 6. Insert a new entry into the Dispatch table for the user, configuring the spam folder, inbox, send/receive/daily send/daily receive limits, etc. 7. Insert a new entry into the Mailboxes table for the user.

Parameters:

con a pointer to the connection object of the client making the registration request.

reg the current registration session of the user to be added.

transaction a mysql transaction id for all database operations, since they all need to be committed atomically or rolled back.

outuser a pointer to a numerical id to receive the newly generated and inserted user id.

Returns:

true if the new user account was successfully created, or false on failure.

LOW: This function should be passed a number of days (or years) to use for any of the pre-paid account plans. LOW: The IP address could be passed in as an ip_t or as a string to avoid the need for the entire connection object.

Functions

- void teacher_data_free (teacher_data_t *teach)

  Free a spam signature object.

- void teacher_data_delete (teacher_data_t *teach)

  Delete spam signature information from the database.

- teacher_data_t * teacher_data_fetch (uint64_t signum)

  Fetch information about a spam signature from the database.

- void teacher_data_save (teacher_data_t *teach)

  Save spam signature information to the cache.

- teacher_data_t * teacher_data_get (uint64_t signum)

  Get information about a spam signature from the cache, or fall back to the database.

5.113.1 Function Documentation

5.113.1.1 void teacher_data_delete (teacher_data_t * *teach*)

Delete spam signature information from the database. datatier.c

HIGH: After training a signature, we should search the messages table for references to the signature being trained and update the message status flags. The UPDATE_SIGNATURE_FLAGS_ADD/UPDATE_SIGNATURE_FLAGS_REMOVE queries were created for that purpose but aren't being used right now. Note to self: retroactively brand messages as junk accordingly.

Note:

If the signature matched junk, all matching messages in the database belonging to the user will have their junk flag cleared. But if the signature didn't match junk, all matching messages in the database belonging to the user will have the junk flag added.

Parameters:

teach the spam signature to be removed from the database.

Returns:

This function returns no value.

Definition at line 38 of file datatier.c.

References teacher_data_t::completed, teacher_data_t::disposition, log_pedantic, MAIL_MARK_JUNK, mm_wipe(), teacher_data_t::password, teacher_data_t::signature, teacher_data_t::signum, st_cleanup, stmt_exec(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.113.1.2 teacher_data_t* teacher_data_fetch (uint64_t *signum*)

Fetch information about a spam signature from the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 137 of file datatier.c.

References teacher_data_t::disposition, teacher_data_t::keynum, mm_alloc(), mm_wipe(), teacher_data_t::password, res_field_int8(), res_field_string(), res_field_uint64(), res_row_next(), res_table_free(), teacher_data_t::signature, teacher_data_t::signum, stmt_get_result(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_data_get().

5.113.1.3 void teacher_data_free (teacher_data_t * *teach*)

Free a spam signature object.

Parameters:

teach the spam signature object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file datatier.c.

References mm_free(), teacher_data_t::password, teacher_data_t::signature, st_cleanup, and teacher_data_t::username.

Referenced by teacher_data_fetch(), teacher_data_get(), and teacher_process().

5.113.1.4 teacher_data_t* teacher_data_get (uint64_t *signum*)

Get information about a spam signature from the cache, or fall back to the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 229 of file datatier.c.

References cache_get(), teacher_data_t::completed, serialization_t::data, data, deserialize_int32(), deserialize_st(), deserialize_uint64(), teacher_data_t::disposition, teacher_data_t::keynum, log_pedantic, mm_alloc(), mm_wipe(), teacher_data_t::password, PLACER, teacher_data_t::signature, teacher_data_t::signum, st_free(), teacher_data_fetch(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.113.1.5 void teacher_data_save (teacher_data_t * *teach*)

Save spam signature information to the cache.

Note:

The information will be cached for 2 hours.

Parameters:

teach the spam signature to be cached.

Returns:

This function returns no value.

Definition at line 189 of file datatier.c.

References cache_set(), teacher_data_t::completed, data, teacher_data_t::disposition, teacher_data_t::keynum, log_pedantic, teacher_data_t::password, PLACER, serialize_int32(), serialize_st(), serialize_uint64(), teacher_data_t::signature, teacher_data_t::signum, st_free(), teacher_data_t::username, and teacher_data_t::usernum.

- stringer_t * cmdline_config_data = NULL

5.114.1 Function Documentation

5.114.1.1 void config_free (void)

LOW: We should use use basename() and dirname() to cleanup path strings. global.c

Free all loaded magma configuration options.

Note:

First all magma config keys will be freed, then the cache servers, relay servers, and magma servers.

Returns:

This function returns no value.

Definition at line 23 of file global.c.

References magma_t::blacklists, cache_free(), log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma_keys, mm_free(), magma_keys_t::norm, ns_free(), NULLER, PLACER, relay_free(), servers_free(), magma_t::smtp, st_cmp_cs_eq(), st_free(), store, type(), and multi_t::type.

Referenced by config_load_defaults(), and process_stop().

5.114.1.2 magma_keys_t∗ config_key_lookup (stringer_t ∗ *name*)

Get a magma config key by name.

Parameters:

name a managed string with the name of the magma config option to be looked up.

Returns:

NULL on failure or a pointer to the found magma key object on success.

Definition at line 711 of file global.c.

References magma_keys, NULLER, and st_cmp_ci_eq().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), and config_validate_settings().

5.114.1.3 bool_t config_load_cmdline_settings (void)

Load all magma configuration options specified by the user on the command line.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 923 of file global.c.

References cache_config(), cmdline_config_data, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, inx_cursor_-alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, mt_is_empty(), magma_keys_-t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.114.1.4 bool_t config_load_database_settings (void)

Load all magma configuration options present in the database.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 835 of file global.c.

References cache_config(), config_fetch_host_number(), config_fetch_settings(), config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::database, magma_t::host, log_critical, magma_keys_t::name, magma_t::number, magma_keys_t::overwrite, PLACER, relay_config(), magma_keys_t::required, res_field_block(), res_field_length(), res_row_count(), res_row_get(), res_table_free(), servers_-config(), magma_keys_t::set, st_char_get(), st_cmp_ci_starts(), st_empty, and st_length_int().

Referenced by process_start().

5.114.1.5 bool_t config_load_defaults (void)

Load all the default values for non-required configuration options.

Returns:

true if all default magma config values were successfully loaded, or false on failure.

Definition at line 686 of file global.c.

References config_free(), config_value_set(), log_info, and magma_keys.

Referenced by args_parse(), and process_start().

5.114.1.6 bool_t config_load_file_settings (void)

Load the magma configuration file specified in magma.config.file, or from the command line.

Note:

Parses the config file data into a series of name/value pairs, and make sure that for each key: If a config option was loaded from the file, the key must allow it to be configurable via the file, and If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all config file options were parsed and evaluated successfully, or false on failure.

Definition at line 733 of file global.c.

References cache_config(), magma_t::config, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, magma_t::file, file_load(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, mt_is_empty(), magma_keys_t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.114.1.7 void config_output_help (void)

Log all magma config key settings, as well as server, relay server, and cache server settings.

Returns:

This function returns no value.

Definition at line 291 of file global.c.

References multi_t::bl, cache_output_help(), config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, magma_keys, magma_keys_t::norm, relay_output_help(), magma_keys_t::required, servers_output_help(), and multi_t::val.

Referenced by args_parse().

5.114.1.8 void config_output_settings (void)

Log a display of all active magma configuration settings.

Returns:

This function returns no value.

Definition at line 264 of file global.c.

References cache_output_settings(), magma_t::config, config_output_value(), magma_t::file, magma_t::host, log_info, magma_keys, magma_t::name, magma_t::number, relay_output_settings(), and servers_output_settings().

Referenced by config_validate_settings().

5.114.1.9 void config_output_value (magma_keys_t * *key*)

Log the contents of a magma configuration option.

Parameters:

key a pointer to the magma configuration key to be dumped.

Returns:

This function returns no value.

Definition at line 192 of file global.c.

References magma_t::blacklists, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma_keys_t::name, magma_keys_t::norm, ns_empty(), NULLER, PLACER, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), magma_keys_t::store, and multi_t::type.

Referenced by config_output_settings().

5.114.1.10 void config_output_value_generic (chr_t * *prefix*, chr_t * *name*, M_TYPE *type*, void * *val*, bool_t *required*)

Output a key name and value in a generic way.

Parameters:

prefix a pointer to a null-terminated string containing an optional prefix to be printed before the supplied key name.

name a pointer to a null-terminated string containing the name of the key being output.

type an M_TYPE value specifying the multi-type of the key value.

val a void pointer to the value of the specified key, which will be printed in accordance with the supplied multi-type.

required a boolean value specifying whether the specified key is a required configuration option.

Returns:

This function returns no value.

Definition at line 78 of file global.c.

References magma_t::blacklists, CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MOLTEN, ns_empty(), NULLER, PLACER, POP, SMTP, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), SUBMISSION, TCP_PORT, and TLS_PORT.

Referenced by cache_output_help(), config_output_help(), relay_output_help(), and servers_output_help().

5.114.1.11 bool_t config_validate_settings (void)

Validate all the user configuration settings.

Note:

The steps are as follows: 1. Check to see that all required keys have been set. 2. If magma.iface.virus.available is set, magma.iface.virus.signatures must be set. 3. Make sure 10 <= magma.iface.cache.retry <= 86400 4. Make sure 1 <= magma.iface.cache.timeout <= 3600 5. Make sure magma.iface.cache.retry <= magma.iface.cache.timeout 6. Make sure 40 <= magma.smtp.wrap_line_length <= 65535 7. Make sure 8 <= magma.smtp.recipient_limit <= 32768 8. Make sure 16 <= magma.smtp.relay_limit 9. Make sure 16384 <= system_ulimit_max(RLIMIT_STACK) 10. If magma.system.daemonize is set, make sure magma.output.file is not false 11. If magma.output.file is enabled, magma.output.path must be set. 12. If magma.dkim.enabled is set, then magma.dkim.domain, magma.dkim.selector, and magma.dkim.key must all be set. 13. Validate all the configured magma servers, relay servers, and cache servers. 14. Check all config key filenames and directories to ensure that they exist and are accessible. 15. Make sure magma.admin.contact and point to valid email addresses, if they are specified. 16. If magma.config.output_config is set, dump the current configuration.

Definition at line 329 of file global.c.

Referenced by process_start().

5.114.1.12 bool_t config_value_set (magma_keys_t * *setting*, stringer_t * *value*)

Set the value of a global config key.

Note:

This function will also free the value of the global config key if it has already previously been set.

Parameters:

setting a pointer to the global key to have its value adjusted.

value a managed string containing the new key value, or if NULL, the key's default value will be used.

Returns:

true if the specified key's value was set successfully, or false on failure.

LOW: Realtime blacklist domains are handled using custom code because we don't yet have a generic type to store lists.

Definition at line 500 of file global.c.

References multi_t::binary, magma_t::blacklists, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MAGMA_BLACKLIST_INSTANCES, MANAGED_T, magma_keys_t::name, magma_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), NULLER, PLACER, magma_t::smtp, smtp_add_bypass_entry(), multi_t::st, st_char_get(), st_cmp_ci_eq(), st_cmp_cs_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), magma_keys_t::store, multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Data Structures

- struct magma_keys_t
- struct magma_t

Functions

- uint64_t config_fetch_host_number (void)

  datatier.c

- table_t ∗ config_fetch_settings (void)

  Retrieve the entire collection of configuration key/value pairs from the database.

- void config_free (void)

  global.c

- magma_keys_t ∗ config_key_lookup (stringer_t ∗name)

  Get a magma config key by name.

- bool_t config_load_database_settings (void)

  Load all magma configuration options present in the database.

- bool_t config_load_cmdline_settings (void)

  Load all magma configuration options specified by the user on the command line.

- bool_t config_load_defaults (void)

  Load all the default values for non-required configuration options.

- bool_t config_load_file_settings (void)

  Load the magma configuration file specified in magma.config.file, or from the command line.

- void config_output_help (void)

  Log all magma config key settings, as well as server, relay server, and cache server settings.

- void config_output_settings (void)

  Log a display of all active magma configuration settings.

- void config_output_value_generic (chr_t ∗prefix, chr_t ∗name, M_TYPE type, void ∗val, bool_t required)

  Output a key name and value in a generic way.

- void config_output_value (magma_keys_t ∗key)

  Log the contents of a magma configuration option.

- bool_t config_validate_settings (void)

  Validate all the user configuration settings.

- bool_t config_value_set (magma_keys_t ∗setting, stringer_t ∗value)

  Set the value of a global config key.

5.115.1 Function Documentation

5.115.1.1 uint64_t config_fetch_host_number (void)

datatier.c datatier.c

Returns:

this host's numerical identifier, or 0 on failure.

Definition at line 14 of file datatier.c.

References magma_t::host, log_error, magma, mm_wipe(), magma_t::name, ns_length_get(), res_field_uint64(), res_row_next(), res_table_-free(), and stmt_get_result().

Referenced by config_load_database_settings().

5.115.1.2 table_t* config_fetch_settings (void)

Retrieve the entire collection of configuration key/value pairs from the database.

Parameters:

none This function accepts no parameters.

Returns:

NULL on failure, or a database table of configuration key/value pairs on success.

Definition at line 40 of file datatier.c.

References magma_t::host, magma, mm_wipe(), magma_t::name, ns_length_get(), and stmt_get_result().

Referenced by config_load_database_settings().

5.115.1.3 void config_free (void)

global.c global.c

Free all loaded magma configuration options.

Note:

First all magma config keys will be freed, then the cache servers, relay servers, and magma servers.

Returns:

This function returns no value.

Definition at line 23 of file global.c.

References magma_t::blacklists, cache_free(), log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_-ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_-STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma_keys, mm_free(), magma_keys_-t::norm, ns_free(), NULLER, PLACER, relay_free(), servers_free(), magma_t::smtp, st_cmp_cs_eq(), st_free(), store, type(), and multi_-t::type.

Referenced by config_load_defaults(), and process_stop().

5.115.1.4 magma_keys_t* config_key_lookup (stringer_t * *name*)

Get a magma config key by name.

Parameters:

name a managed string with the name of the magma config option to be looked up.

Returns:

NULL on failure or a pointer to the found magma key object on success.

Definition at line 711 of file global.c.

References magma_keys, NULLER, and st_cmp_ci_eq().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), config_load_file_settings(), and config_validate_settings().

5.115.1.5 bool_t config_load_cmdline_settings (void)

Load all magma configuration options specified by the user on the command line.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 923 of file global.c.

References cache_config(), cmdline_config_data, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, mt_is_empty(), magma_keys_t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.115.1.6 bool_t config_load_database_settings (void)

Load all magma configuration options present in the database.

Note:

Each key/value pair extracted from the database is submitted to the following logic: If a config option was loaded from the database, the key must allow it to be configurable via the database. Check to see that any key that has previously been set is allowed to be overwritten. If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all database config options were parsed and evaluated successfully, or false on failure.

Definition at line 835 of file global.c.

References cache_config(), config_fetch_host_number(), config_fetch_settings(), config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::database, magma_t::host, log_critical, magma_keys_t::name, magma_t::number, magma_keys_t::overwrite, PLACER,

relay_config(), magma_keys_t::required, res_field_block(), res_field_length(), res_row_count(), res_row_get(), res_table_free(), servers_-config(), magma_keys_t::set, st_char_get(), st_cmp_ci_starts(), st_empty, and st_length_int().

Referenced by process_start().

5.115.1.7 bool_t config_load_defaults (void)

Load all the default values for non-required configuration options.

Returns:

true if all default magma config values were successfully loaded, or false on failure.

Definition at line 686 of file global.c.

References config_free(), config_value_set(), log_info, and magma_keys.

Referenced by args_parse(), and process_start().

5.115.1.8 bool_t config_load_file_settings (void)

Load the magma configuration file specified in magma.config.file, or from the command line.

Note:

Parses the config file data into a series of name/value pairs, and make sure that for each key: If a config option was loaded from the file, the key must allow it to be configurable via the file, and If the key is required, it may not contain an empty value. Finally, this function sets the appropriate magma key corresponding to the config key. All leftover keys not matched to global magma keys will be configured via servers, relay, and cache server options.

Returns:

true if all config file options were parsed and evaluated successfully, or false on failure.

Definition at line 733 of file global.c.

References cache_config(), magma_t::config, config_key_lookup(), config_value_set(), CONSTANT, magma_keys_t::file, magma_t::file, file_load(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_key_next(), inx_cursor_t, inx_cursor_value_active(), log_critical, mt_is_-empty(), magma_keys_t::name, nvp_alloc(), nvp_free(), nvp_parse(), nvp_t::pairs, relay_config(), magma_keys_t::required, servers_config(), magma_keys_t::set, multi_t::st, st_char_get(), st_cmp_ci_starts(), st_empty, st_free(), st_length_int(), and multi_t::val.

Referenced by process_start().

5.115.1.9 void config_output_help (void)

Log all magma config key settings, as well as server, relay server, and cache server settings.

Returns:

This function returns no value.

Definition at line 291 of file global.c.

References multi_t::bl, cache_output_help(), config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_-FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_-TIME_DISABLE, magma_keys, magma_keys_t::norm, relay_output_help(), magma_keys_t::required, servers_output_help(), and multi_-t::val.

Referenced by args_parse().

5.115.1.10 void config_output_settings (void)

Log a display of all active magma configuration settings.

Returns:

This function returns no value.

Definition at line 264 of file global.c.

References cache_output_settings(), magma_t::config, config_output_value(), magma_t::file, magma_t::host, log_info, magma_keys, magma_t::name, magma_t::number, relay_output_settings(), and servers_output_settings().

Referenced by config_validate_settings().

5.115.1.11 void config_output_value (magma_keys_t * *key*)

Log the contents of a magma configuration option.

Parameters:

key a pointer to the magma configuration key to be dumped.

Returns:

This function returns no value.

Definition at line 192 of file global.c.

References magma_t::blacklists, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_-UINT8, magma_keys_t::name, magma_keys_t::norm, ns_empty(), NULLER, PLACER, magma_t::smtp, st_char_get(), st_cmp_cs_eq(), st_-empty, st_length_int(), magma_keys_t::store, and multi_t::type.

Referenced by config_output_settings().

5.115.1.12 void config_output_value_generic (chr_t * *prefix*, chr_t * *name*, M_TYPE *type*, void * *val*, bool_t *required*)

Output a key name and value in a generic way.

Parameters:

prefix a pointer to a null-terminated string containing an optional prefix to be printed before the supplied key name.

name a pointer to a null-terminated string containing the name of the key being output.

type an M_TYPE value specifying the multi-type of the key value.

val a void pointer to the value of the specified key, which will be printed in accordance with the supplied multi-type.

required a boolean value specifying whether the specified key is a required configuration option.

Returns:

This function returns no value.

Definition at line 78 of file global.c.

References magma_t::blacklists, CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_-ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_-UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MOLTEN, ns_empty(), NULLER, PLACER, POP, SMTP, magma_-t::smtp, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), SUBMISSION, TCP_PORT, and TLS_PORT.

Referenced by cache_output_help(), config_output_help(), relay_output_help(), and servers_output_help().

5.115.1.13 bool_t config_validate_settings (void)

Validate all the user configuration settings.

Note:

The steps are as follows: 1. Check to see that all required keys have been set. 2. If magma.iface.virus.available is set, magma.iface.virus.signatures must be set. 3. Make sure 10 <= magma.iface.cache.retry <= 86400 4. Make sure 1 <= magma.iface.cache.timeout <= 3600 5. Make sure magma.iface.cache.retry <= magma.iface.cache.timeout 6. Make sure 40 <= magma.smtp.wrap_line_length <= 65535 7. Make sure 8 <= magma.smtp.recipient_limit <= 32768 8. Make sure 16 <= magma.smtp.relay_limit 9. Make sure 16384 <= system_ulimit_max(RLIMIT_STACK) 10. If magma.system.daemonize is set, make sure magma.output.file is not false 11. If magma.output.file is enabled, magma.output.path must be set. 12. If magma.dkim.enabled is set, then magma.dkim.domain, magma.dkim.selector, and magma.dkim.key must all be set. 13. Validate all the configured magma servers, relay servers, and cache servers. 14. Check all config key filenames and directories to ensure that they exist and are accessible. 15. Make sure magma.admin.contact and point to valid email addresses, if they are specified. 16. If magma.config.output_config is set, dump the current configuration.

Definition at line 329 of file global.c.

References magma_t::abuse, magma_t::admin, magma_t::cache, cache_validate(), magma_t::config, CONFIG_CHECK_DIR_READABLE, CONFIG_CHECK_DIR_READWRITE, CONFIG_CHECK_FILE_READABLE, config_key_lookup(), config_output_settings(), magma_t::contact, contact_business_valid_email(), magma_t::daemonize, magma_t::dime, magma_t::dkim, magma_t::domain, magma_t::enabled, exit_and_dump, magma_t::file, magma_t::http, magma_t::iface, magma_t::key, magma_t::library, log_critical, magma_keys, magma_t::output, magma_t::output_config, magma_t::path, PLACER, magma_t::recipient_limit, magma_t::relay_limit, relay_validate(), magma_t::root_directory, magma_t::selector, servers_validate(), magma_keys_t::set, magma_t::signet, magma_t::smtp, magma_t::spool, st_char_get(), magma_t::system, system_ulimit_max(), magma_t::thread_stack_size, magma_t::virus, and magma_t::wrap_line_length.

Referenced by process_start().

5.115.1.14 bool_t config_value_set (magma_keys_t * *setting*, stringer_t * *value*)

Set the value of a global config key.

Note:

This function will also free the value of the global config key if it has already previously been set.

Parameters:

setting a pointer to the global key to have its value adjusted.

value a managed string containing the new key value, or if NULL, the key's default value will be used.

Returns:

true if the specified key's value was set successfully, or false on failure.

LOW: Realtime blacklist domains are handled using custom code because we don't yet have a generic type to store lists.

Definition at line 500 of file global.c.

Functions

- void relay_counter (void)

  Update the relay server counters to reflect the number of configured standard and premium relay servers.

- void relay_free (void)

  Free magma's relay server configuration options.

- relay_t ∗ relay_alloc (uint32_t number)

  Allocate and initialize a magma server relay object, or return it if it already exists.

- bool_t relay_validate (void)

  Validate all of the configured magma relay server instances.

- void relay_output_settings (void)
- bool_t relay_set_value (relay_keys_t ∗setting, relay_t ∗relay, stringer_t ∗value)

  Set a specified key for a relay server configuration entry.

- bool_t relay_config (stringer_t ∗name, stringer_t ∗value)

  Set the value of a relay server configuration entry by name.

- void relay_output_help (void)

  Log all relay key information to be returned via "magma -h".

5.116.1 Function Documentation

5.116.1.1 relay_t∗ relay_alloc (uint32_t *number*)

Allocate and initialize a magma server relay object, or return it if it already exists.

Parameters:

number a zero-based index into the global relay server table where the entry should be created and/or queried.

Returns:

NULL on failure, or a pointer to the requested relay server object on success.

Definition at line 86 of file relay.c.

References magma_t::host, log_critical, magma, mm_alloc(), magma_t::relay, relay_keys, and relay_set_value().

Referenced by relay_config().

5.116.1.2 bool_t relay_config (stringer_t ∗ *name*, stringer_t ∗ *value*)

Set the value of a relay server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new relay server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable relay server configuration parameter to be set.

value a managed string containing the new value of the relay server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 448 of file relay.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_RELAY_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, relay_alloc(), relay_keys, relay_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.116.1.3 void relay_counter (void)

Update the relay server counters to reflect the number of configured standard and premium relay servers.

Returns:

This function returns no value.

Definition at line 16 of file relay.c.

References magma_t::count, magma_t::host, magma, MAGMA_RELAY_INSTANCES, magma_t::premium, and magma_t::relay.

Referenced by relay_set_value().

5.116.1.4 void relay_free (void)

Free magma's relay server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 39 of file relay.c.

References magma_t::host, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, mm_free(), relay_keys_t::norm, ns_empty(), ns_free(), relay_keys_t::offset, magma_t::relay, relay_keys, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.116.1.5 void relay_output_help (void)

Log all relay key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 508 of file relay.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, relay_keys_t::norm, relay_keys, relay_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.116.1.6 void relay_output_settings (void)

Definition at line 228 of file relay.c.

References magma_t::host, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(), relay_keys_t::offset, magma_t::relay, relay_keys, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.116.1.7 bool_t relay_set_value (relay_keys_t * *setting*, relay_t * *relay*, stringer_t * *value*)

Set a specified key for a relay server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the relay server configuration key to be set.

relay a pointer to the relay server configuration entry to be adjusted.

value a managed string containing the new value of the config key.

Returns:

true if the value was successfully set, or false on error.

Definition at line 303 of file relay.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, relay_keys_t::name, relay_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), relay_keys_t::offset, relay_counter(), multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by relay_alloc(), and relay_config().

5.116.1.8 bool_t relay_validate (void)

Validate all of the configured magma relay server instances. Iterates through all of the server structures and verifies that each was supplied with valid values for all of its required keys. This function also applies the application specific validation rules. Specifically it verifies that only one server structure has been configured to use a given port number.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all relay servers have been validated, or false on failure.

Definition at line 115 of file relay.c.

References magma_t::host, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(), relay_keys_t::offset, magma_t::relay, relay_keys, st_empty, multi_t::type, type(), multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by config_validate_settings().

5.117 src/servers/smtp/relay.c File Reference

```
#include "magma.h"
```

Functions

- void smtp_client_close (client_t *client)
  Issue an smtp client QUIT command.
- client_t * smtp_client_connect (int_t premium)
  Connect to a randomly selected mail relay server, and wait for a successful banner message.
- int_t smtp_client_send_helo (client_t *client)
  Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.
- int_t smtp_client_send_mailfrom (client_t *client, stringer_t *mailfrom, size_t send_size)
  Issue a MAIL FROM command to an smtp server, and wait for a successful response.
- int_t smtp_client_send_nullfrom (client_t *client)
  Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.
- int_t smtp_client_send_rcptto (client_t *client, stringer_t *rcptto)
  Issue a RCPT TO command to an smtp server, and wait for a successful response.
- int_t smtp_client_send_data (client_t *client, stringer_t *message, bool_t dotstuffed)
  Issue a DATA command to an smtp server, and wait for a successful response.

5.117.1 Function Documentation

5.117.1.1 void smtp_client_close (client_t * *client*)

Issue an smtp client QUIT command. relay.c

Parameters:

client a pointer to the smtp client session to be closed.

Returns:

This function returns no value.

Definition at line 15 of file relay.c.

References client_close(), client_read_line(), client_write(), and PLACER.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

5.117.1.2 client_t* smtp_client_connect (int_t *premium*)

Connect to a randomly selected mail relay server, and wait for a successful banner message.

Parameters:

premium if set, a premium relay will be selected instead of a standard one.

Returns:

NULL on failure or a pointer to the newly established network client object connected to a mail relay on success.

Definition at line 31 of file relay.c.

References client_t::buffer, client_close(), client_connect(), client_read_line(), client_secure(), magma_t::count, magma_t::host, client_t::line, log_pedantic, magma, MAGMA_RELAY_INSTANCES, relay_t::name, net_set_timeout(), relay_t::port, magma_t::premium, rand_get_uint32(), magma_t::relay, relay_t::secure, client_t::sockd, st_char_get(), st_length_get(), st_length_int(), and magma_t::timeout.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

5.117.1.3 int_t smtp_client_send_data (client_t ∗ *client*, stringer_t ∗ *message*, bool_t *dotstuffed*)

Issue a DATA command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the DATA command.

message a pointer to a managed string containing the body of the message to be sent.

dotstuffed a boolean to where true indicates the supplied message has already been dotstuffed.

Returns:

-3 for internal errors, -2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 243 of file relay.c.

References client_read_line(), client_write(), HEAP, JOINTED, client_t::line, log_pedantic, MANAGEDBUF, MAPPED_T, pl_char_get(), pl_length_int(), pl_starts_with_char(), PLACER, st_char_get(), st_cleanup, st_cmp_cs_ends(), st_dupe_opts(), st_empty, st_length_get(), st_length_int(), st_quick(), and st_replace().

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

5.117.1.4 int_t smtp_client_send_helo (client_t ∗ *client*)

Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the remote command.

Returns:

-1 on failure or 1 on success.

Definition at line 110 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), magma_t::domain, magma_t::host, client_t::line, log_pedantic, magma, magma_t::name, ns_length_get(), pl_init(), pl_null(), placer_t, st_char_get(), st_empty, st_length_get(), and magma_t::system.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

5.117.1.5 int_t smtp_client_send_mailfrom (client_t ∗ *client*, stringer_t ∗ *mailfrom*, size_t *send_size*)

Issue a MAIL FROM command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.

mailfrom a pointer to a managed string containing the address parameter for the MAIL FROM command.

send_size if greater than 0, specify the optional SIZE parameter to the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

LOW: Technically we should only be sending the size parameter if the EHLO response indicates support.

Definition at line 168 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_forward_message(), smtp_relay_message(), and smtp_send_message().

5.117.1.6 int_t smtp_client_send_nullfrom (client_t ∗ *client*)

Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.

Note:

Null senders are used when the sender is not concerned about being notified about bounced messages.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 196 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), and st_length_int().

Referenced by smtp_bounce(), and smtp_reply().

5.117.1.7 int_t smtp_client_send_rcptto (client_t ∗ *client*, stringer_t ∗ *rcptto*)

Issue a RCPT TO command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the RCPT TO command.

rcptto a pointer to a managed string containing the recipient address parameter for the RCPT TO command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 219 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_send_message().

5.118 src/engine/config/relay/relay.h File Reference

Data Structures

- struct relay_keys_t
- struct relay_t

Functions

- void relay_free (void)

  Free magma's relay server configuration options.

- bool_t relay_validate (void)

  Validate all of the configured magma relay server instances.

- void relay_output_settings (void)
- relay_t ∗ relay_alloc (uint32_t number)

  Allocate and initialize a magma server relay object, or return it if it already exists.

- bool_t relay_config (stringer_t ∗name, stringer_t ∗value)

  Set the value of a relay server configuration entry by name.

- bool_t relay_set_value (relay_keys_t ∗setting, relay_t ∗relay, stringer_t ∗value)

  Set a specified key for a relay server configuration entry.

- void relay_output_help (void)

  Log all relay key information to be returned via "magma -h".

5.118.1 Function Documentation

5.118.1.1 relay_t∗ relay_alloc (uint32_t *number*)

Allocate and initialize a magma server relay object, or return it if it already exists.

Parameters:

number a zero-based index into the global relay server table where the entry should be created and/or queried.

Returns:

NULL on failure, or a pointer to the requested relay server object on success.

Definition at line 86 of file relay.c.

References magma_t::host, log_critical, magma, mm_alloc(), magma_t::relay, relay_keys, and relay_set_value().

Referenced by relay_config().

5.118.1.2 bool_t relay_config (stringer_t ∗ *name*, stringer_t ∗ *value*)

Set the value of a relay server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new relay server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable relay server configuration parameter to be set.

value a managed string containing the new value of the relay server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 448 of file relay.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_RELAY_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, relay_alloc(), relay_keys, relay_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.118.1.3 void relay_free (void)

Free magma's relay server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 39 of file relay.c.

References magma_t::host, log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, mm_free(), relay_keys_t::norm, ns_empty(), ns_free(), relay_keys_t::offset, magma_t::relay, relay_keys, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.118.1.4 void relay_output_help (void)

Log all relay key information to be returned via "magma -h".

Returns:

This function returns no value.

Definition at line 508 of file relay.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, relay_keys_t::norm, relay_keys, relay_keys_t::required, and multi_t::val.

Referenced by config_output_help().

5.118.1.5 void relay_output_settings (void)

Definition at line 228 of file relay.c.

References magma_t::host, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(), relay_keys_t::offset, magma_t::relay, relay_keys, st_char_get(), st_empty, st_length_int(), multi_t::type, and type().

Referenced by config_output_settings().

5.118.1.6 bool_t relay_set_value (relay_keys_t * *setting*, relay_t * *relay*, stringer_t * *value*)

Set a specified key for a relay server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the relay server configuration key to be set.

relay a pointer to the relay server configuration entry to be adjusted.

value a managed string containing the new value of the config key.

Returns:

true if the value was successfully set, or false on error.

Definition at line 303 of file relay.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, HEAP, multi_t::i32, multi_t::i64, multi_t::i8, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, relay_keys_t::name, relay_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), relay_keys_t::offset, relay_counter(), multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by relay_alloc(), and relay_config().

5.118.1.7 bool_t relay_validate (void)

Validate all of the configured magma relay server instances. Iterates through all of the server structures and verifies that each was supplied with valid values for all of its required keys. This function also applies the application specific validation rules. Specifically it verifies that only one server structure has been configured to use a given port number.

Note:

This makes set that all required config keys have been set, and that at least one host has been configured.

Returns:

true if all relay servers have been validated, or false on failure.

Definition at line 115 of file relay.c.

References magma_t::host, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_RELAY_INSTANCES, relay_keys_t::norm, ns_empty(),

```
#include "magma.h"
#include "keys.h"
```

Functions

- uint64_t servers_get_count_using_port (uint32_t port)

  Get the number of servers that are configured to use a specified port.

- server_t ∗ servers_get_by_socket (int sockd)

  Lookup the server instance associated with a socket descriptor.

- server_t ∗ servers_get_by_protocol (uint32_t protocol, bool_t tls)

  Lookup the server instance associated with a particular protocol type.

- bool_t servers_network_start (void)

  Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.

- bool_t servers_encryption_start (void)

  Create a TLS context for each TLS enabled server instance.

- void servers_network_stop (void)

  Close the listening sockets of all running servers.

- void servers_encryption_stop (void)

  Destroy the transport security context for each TLS enabled servers.

- void servers_free (void)

  Free magma's server configuration options.

- server_t ∗ servers_alloc (uint32_t number)

  Allocate a new magma server configuration entry and initialize it to the default values.

- bool_t servers_validate (void)

  Validate all of the configured magmad server instances.

- void servers_output_settings (void)

  Log the full contents of the magma server instance settings.

- bool_t servers_set_value (server_keys_t ∗setting, server_t ∗server, stringer_t ∗value)

  Set the value of a key for a specified magma server configuration entry.

- bool_t servers_config (stringer_t ∗name, stringer_t ∗value)

  Set the value of a magma server configuration entry by name.

- void servers_output_help (void)

  Log all server key information to be returned via the "magmad -h|--help" command.

5.119.1 Function Documentation

5.119.1.1 server_t∗ servers_alloc (uint32_t *number*)

Allocate a new magma server configuration entry and initialize it to the default values. servers.c

Parameters:

number the index of the magma server instance in the global magma server array.

Returns:

NULL on failure, or a pointer to the requested magma server configuration entry on success.

Definition at line 193 of file servers.c.

References log_critical, magma, mm_alloc(), server_t::network, server_keys, magma_t::servers, servers_set_value(), and server_t::sockd.

Referenced by servers_config().

5.119.1.2 bool_t servers_config (stringer_t ∗ *name*, stringer_t ∗ *value*)

Set the value of a magma server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new magma server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable magma server configuration parameter to be set.

value a managed string containing the new value of the magma server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 666 of file servers.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_SERVER_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, server_keys, servers_alloc(), servers_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.119.1.3 bool_t servers_encryption_start (void)

Create a TLS context for each TLS enabled server instance.

Returns:

true on success or false on failure.

Definition at line 101 of file servers.c.

References server_t::certificate, DMTP, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, server_t::protocol, magma_t::servers, server_t::tls, and tls_server_create().

Referenced by process_start().

5.119.1.4 void servers_encryption_stop (void)

Destroy the transport security context for each TLS enabled servers.

Returns:

This function returns no value.

Definition at line 132 of file servers.c.

References server_t::context, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, magma_t::servers, server_t::tls, and tls_server_-destroy().

Referenced by process_stop().

5.119.1.5 void servers_free (void)

Free magma's server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 146 of file servers.c.

References log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_-TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, mm_free(), server_keys_t::norm, ns_empty(), ns_free(), server_keys_t::offset, server_keys, magma_t::servers, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.119.1.6 server_t* servers_get_by_protocol (uint32_t *protocol*, bool_t *tls*)

Lookup the server instance associated with a particular protocol type.

Note:

This function doesn't allow you to specify which server instance to return, if more than one is available.

Parameters:

protocol the enumerated protocol type being looked up.

tls whether the server instance should be a TCP server, or a TLS server instance.

Returns:

NULL if no server instances are configured, or a pointer to the server structure for a protocol.

Definition at line 54 of file servers.c.

References DMTP, server_t::enabled, HTTP, IMAP, log_pedantic, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_t::network, POP, server_t::protocol, magma_t::servers, SMTP, SUBMISSION, TCP_PORT, TLS_PORT, server_t::type, and type().

5.119.1.7 server_t* servers_get_by_socket (int *sockd*)

Lookup the server instance associated with a socket descriptor.

Parameters:

sockd the socket file descriptor to be looked up.

Returns:

NULL on failure, or a pointer to the server structure for the specified file descriptor on success.

Definition at line 34 of file servers.c.

References magma, MAGMA_SERVER_INSTANCES, server_t::network, magma_t::servers, and server_t::sockd.

5.119.1.8 uint64_t servers_get_count_using_port (uint32_t *port*)

Get the number of servers that are configured to use a specified port.

Parameters:

port the port number to be matched against the server list.

Returns:

the number of servers configured to use the port.

Definition at line 17 of file servers.c.

References count, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_t::port, and magma_t::servers.

Referenced by servers_validate(), and signal_shutdown().

5.119.1.9 bool_t servers_network_start (void)

Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.

Note:

If any of the servers have an empty name or domain, the value of magma.host.name will be used instead.

Returns:

true if all server listening sockets were initialized successfully, or false on failure.

Definition at line 80 of file servers.c.

References server_t::domain, server_t::enabled, magma_t::host, magma, MAGMA_SERVER_INSTANCES, magma_t::name, server_t::name, net_init(), ns_length_get(), magma_t::servers, servers_network_stop(), st_empty, and st_import().

Referenced by process_start().

5.119.1.10 void servers_network_stop (void)

Close the listening sockets of all running servers.

Returns:

This function returns no value.

Definition at line 119 of file servers.c.

References server_t::enabled, magma, MAGMA_SERVER_INSTANCES, net_shutdown(), server_t::network, magma_t::servers, and server_t::sockd.

Referenced by process_stop(), and servers_network_start().

5.119.1.11 void servers_output_help (void)

Log all server key information to be returned via the "magmad -h|--help" command.

Returns:

This function returns no value.

Definition at line 723 of file servers.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_-DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_-DISABLE, server_keys_t::norm, server_keys_t::required, server_keys, and multi_t::val.

Referenced by config_output_help().

5.119.1.12 void servers_output_settings (void)

Log the full contents of the magma server instance settings.

Returns:

This function returns no value.

Definition at line 368 of file servers.c.

References CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_-INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_-TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_keys_t::norm, ns_-empty(), NULLER, server_keys_t::offset, POP, server_keys, magma_t::servers, SMTP, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_-int(), SUBMISSION, TCP_PORT, TLS_PORT, multi_t::type, and type().

Referenced by config_output_settings().

5.119.1.13 bool_t servers_set_value (server_keys_t * *setting*, server_t * *server*, stringer_t * *value*)

Set the value of a key for a specified magma server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the magma server key to be set.

server a pointer to the magma server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 474 of file servers.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, DMTP, HEAP, HTTP, multi_t::i32, multi_t::i64, multi_t::i8, IMAP, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, MOLTEN, server_keys_t::name, server_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), NULLER, server_keys_t::offset, POP, SMTP, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), st_length_int(), SUBMISSION, TCP_PORT, TLS_PORT, type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by servers_alloc(), and servers_config().

5.119.1.14 bool_t servers_validate (void)

Validate all of the configured magmad server instances.

Note:

This function also checks to see that no servers are binding to the same port.

Returns:

true if all servers have been validated, or false on failure.

Definition at line 220 of file servers.c.

References buflen, bufptr, server_t::certificate, CONSTANT, DMTP, file_readwritable(), file_world_accessible(), GENERIC, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_keys_t::norm, ns_empty(), NULLER, server_keys_t::offset, server_t::port, server_t::protocol, server_keys, magma_t::servers, servers_get_count_using_port(), st_cmp_ci_eq(), st_empty, server_t::tls, TLS_PORT, multi_t::type, type(), server_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

- server_t * servers_alloc (uint32_t number)
  servers.c
- bool_t servers_config (stringer_t *name, stringer_t *value)
  Set the value of a magma server configuration entry by name.
- bool_t servers_encryption_start (void)
  Create a TLS context for each TLS enabled server instance.
- void servers_encryption_stop (void)
  Destroy the transport security context for each TLS enabled servers.
- void servers_free (void)
  Free magma's server configuration options.
- server_t * servers_get_by_protocol (uint32_t protocol, bool_t tls)
  Lookup the server instance associated with a particular protocol type.
- server_t * servers_get_by_socket (int sockd)
  Lookup the server instance associated with a socket descriptor.
- uint64_t servers_get_count_using_port (uint32_t port)
  Get the number of servers that are configured to use a specified port.
- bool_t servers_network_start (void)
  Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.
- void servers_network_stop (void)
  Close the listening sockets of all running servers.
- void servers_output_help (void)
  Log all server key information to be returned via the "magmad -h|--help" command.
- void servers_output_settings (void)
  Log the full contents of the magma server instance settings.

- bool_t servers_set_value (server_keys_t *setting, server_t *server, stringer_t *value)

  Set the value of a key for a specified magma server configuration entry.

- bool_t servers_validate (void)

  Validate all of the configured magmad server instances.

5.120.1 Enumeration Type Documentation

5.120.1.1 enum M_PORT

Enumerator:

TCP_PORT

TLS_PORT

Definition at line 11 of file servers.h.

5.120.1.2 enum M_PROTOCOL

Enumerator:

GENERIC

MOLTEN

HTTP

POP

IMAP

SMTP

DMTP

SUBMISSION

Definition at line 16 of file servers.h.

5.120.2 Function Documentation

5.120.2.1 server_t* servers_alloc (uint32_t *number*)

servers.c servers.c

Parameters:

number the index of the magma server instance in the global magma server array.

Returns:

NULL on failure, or a pointer to the requested magma server configuration entry on success.

Definition at line 193 of file servers.c.

References log_critical, magma, mm_alloc(), server_t::network, server_keys, magma_t::servers, servers_set_value(), and server_t::sockd.

Referenced by servers_config().

5.120.2.2 bool_t servers_config (stringer_t * *name*, stringer_t * *value*)

Set the value of a magma server configuration entry by name.

Note:

This function is designed to operate on lines from a configuration source, like a file or database. When a named server is referenced for the first time, a new magma server configuration instance will be allocated.

Parameters:

name a managed string containing the human-readable magma server configuration parameter to be set.

value a managed string containing the new value of the magma server config key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 666 of file servers.c.

References bracket_extract_pl(), CONSTANT, log_critical, MAGMA_SERVER_INSTANCES, NULLER, pl_char_get(), pl_empty(), pl_length_get(), PLACER, placer_t, server_keys, servers_alloc(), servers_set_value(), st_char_get(), st_cmp_ci_eq(), st_cmp_ci_starts(), st_length_get(), st_length_int(), and uint32_conv_bl().

Referenced by config_load_cmdline_settings(), config_load_database_settings(), and config_load_file_settings().

5.120.2.3 bool_t servers_encryption_start (void)

Create a TLS context for each TLS enabled server instance.

Returns:

true on success or false on failure.

Definition at line 101 of file servers.c.

References server_t::certificate, DMTP, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, server_t::protocol, magma_t::servers, server_t::tls, and tls_server_create().

Referenced by process_start().

5.120.2.4 void servers_encryption_stop (void)

Destroy the transport security context for each TLS enabled servers.

Returns:

This function returns no value.

Definition at line 132 of file servers.c.

References server_t::context, server_t::enabled, magma, MAGMA_SERVER_INSTANCES, magma_t::servers, server_t::tls, and tls_server_destroy().

Referenced by process_stop().

5.120.2.5 void servers_free (void)

Free magma's server configuration options.

Note:

This function assumes all worker threads have finished, and should only be called during the normal shutdown process.

Parameters:

This function returns no value.

Definition at line 146 of file servers.c.

References log_pedantic, M_TYPE_BLOCK, M_TYPE_BOOLEAN, M_TYPE_DOUBLE, M_TYPE_ENUM, M_TYPE_FLOAT, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, mm_free(), server_keys_t::norm, ns_empty(), ns_free(), server_keys_t::offset, server_keys, magma_t::servers, st_empty, st_free(), type(), and multi_t::type.

Referenced by config_free().

5.120.2.6 server_t* servers_get_by_protocol (uint32_t *protocol*, bool_t *tls*)

Lookup the server instance associated with a particular protocol type.

Note:

This function doesn't allow you to specify which server instance to return, if more than one is available.

Parameters:

protocol the enumerated protocol type being looked up.

tls whether the server instance should be a TCP server, or a TLS server instance.

Returns:

NULL if no server instances are configured, or a pointer to the server structure for a protocol.

Definition at line 54 of file servers.c.

References DMTP, server_t::enabled, HTTP, IMAP, log_pedantic, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_t::network, POP, server_t::protocol, magma_t::servers, SMTP, SUBMISSION, TCP_PORT, TLS_PORT, server_t::type, and type().

5.120.2.7 server_t* servers_get_by_socket (int *sockd*)

Lookup the server instance associated with a socket descriptor.

Parameters:

sockd the socket file descriptor to be looked up.

Returns:

NULL on failure, or a pointer to the server structure for the specified file descriptor on success.

Definition at line 34 of file servers.c.

References magma, MAGMA_SERVER_INSTANCES, server_t::network, magma_t::servers, and server_t::sockd.

5.120.2.8 uint64_t servers_get_count_using_port (uint32_t *port*)

Get the number of servers that are configured to use a specified port.

Parameters:

port the port number to be matched against the server list.

Returns:

the number of servers configured to use the port.

Definition at line 17 of file servers.c.

References count, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_t::port, and magma_t::servers.

Referenced by servers_validate(), and signal_shutdown().

5.120.2.9 bool_t servers_network_start (void)

Setup the listening sockets for all configured servers, or shut them all down if any one of them fails.

Note:

If any of the servers have an empty name or domain, the value of magma.host.name will be used instead.

Returns:

true if all server listening sockets were initialized successfully, or false on failure.

Definition at line 80 of file servers.c.

References server_t::domain, server_t::enabled, magma_t::host, magma, MAGMA_SERVER_INSTANCES, magma_t::name, server_t::name, net_init(), ns_length_get(), magma_t::servers, servers_network_stop(), st_empty, and st_import().

Referenced by process_start().

5.120.2.10 void servers_network_stop (void)

Close the listening sockets of all running servers.

Returns:

This function returns no value.

Definition at line 119 of file servers.c.

References server_t::enabled, magma, MAGMA_SERVER_INSTANCES, net_shutdown(), server_t::network, magma_t::servers, and server_t::sockd.

Referenced by process_stop(), and servers_network_start().

5.120.2.11 void servers_output_help (void)

Log all server key information to be returned via the "magmad -h|--help" command.

Returns:

This function returns no value.

Definition at line 723 of file servers.c.

References multi_t::bl, config_output_value_generic(), log_info, log_options, M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME_DISABLE, server_keys_t::norm, server_keys_t::required, server_keys, and multi_t::val.

Referenced by config_output_help().

5.120.2.12 void servers_output_settings (void)

Log the full contents of the magma server instance settings.

Returns:

This function returns no value.

Definition at line 368 of file servers.c.

References CONSTANT, DMTP, GENERIC, HTTP, IMAP, log_info, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, MOLTEN, server_keys_t::norm, ns_empty(), NULLER, server_keys_t::offset, POP, server_keys, magma_t::servers, SMTP, st_char_get(), st_cmp_cs_eq(), st_empty, st_length_int(), SUBMISSION, TCP_PORT, TLS_PORT, multi_t::type, and type().

Referenced by config_output_settings().

5.120.2.13 bool_t servers_set_value (server_keys_t * *setting*, server_t * *server*, stringer_t * *value*)

Set the value of a key for a specified magma server configuration entry.

Note:

This function will allocate space for a copy of the key value, and return an error if it is not able to convert it to the proper key data type.

Parameters:

setting a pointer to the magma server key to be set.

server a pointer to the magma server configuration entry to be modified.

value a managed string containing the new value of the key.

Returns:

true if the value was was successfully set, or false on failure.

Definition at line 474 of file servers.c.

References multi_t::binary, CONSTANT, CONTIGUOUS, DMTP, HEAP, HTTP, multi_t::i32, multi_t::i64, multi_t::i8, IMAP, int32_conv_st(), int64_conv_st(), int8_conv_st(), log_critical, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, MANAGED_T, MOLTEN, server_keys_t::name, server_keys_t::norm, multi_t::ns, ns_dupe(), ns_empty(), ns_free(), ns_import(), NULLER, server_keys_t::offset, POP, SMTP, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_empty, st_free(), st_length_get(), st_length_int(), SUBMISSION, TCP_PORT, TLS_PORT, type(), multi_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, uint16_conv_st(), uint32_conv_st(), uint64_conv_st(), uint8_conv_st(), and multi_t::val.

Referenced by servers_alloc(), and servers_config().

5.120.2.14 bool_t servers_validate (void)

Validate all of the configured magmad server instances.

Note:

This function also checks to see that no servers are binding to the same port.

Returns:

true if all servers have been validated, or false on failure.

Definition at line 220 of file servers.c.

References buflen, bufptr, server_t::certificate, CONSTANT, DMTP, file_readwritable(), file_world_accessible(), GENERIC, multi_t::i16, multi_t::i32, multi_t::i64, multi_t::i8, log_critical, log_pedantic, M_TYPE_BOOLEAN, M_TYPE_ENUM, M_TYPE_INT16, M_TYPE_INT32, M_TYPE_INT64, M_TYPE_INT8, M_TYPE_NULLER, M_TYPE_STRINGER, M_TYPE_UINT16, M_TYPE_UINT32, M_TYPE_UINT64, M_TYPE_UINT8, magma, MAGMA_SERVER_INSTANCES, server_t::network, server_keys_t::norm, ns_empty(), NULLER, server_keys_t::offset, server_t::port, server_t::protocol, server_keys, magma_t::servers, servers_get_count_using_port(), st_cmp_ci_eq(), st_empty, server_t::tls, TLS_PORT, multi_t::type, type(), server_t::type, multi_t::u16, multi_t::u32, multi_t::u64, multi_t::u8, and multi_t::val.

Referenced by config_validate_settings().

Functions

- void display_usage (void)

  Display the magma usage info if a user requests help or invokes it with incorrect options.

- bool_t args_parse (int argc, char *argv[ ])

  Process any command line arguments supplied to magma.

Variables

- stringer_t * cmdline_config_data
- bool_t exit_and_dump

5.122.1 Function Documentation

5.122.1.1 bool_t args_parse (int *argc*, char * *argv*[ ])

Process any command line arguments supplied to magma.

Note:

A few command line options are supported: -h (--help), -d (--dump), -v (--version), and -c (--config). Otherwise, the magma config file path will be loaded from the command line. If not an option starting with "-", the final command line argument is assumed to be the path of the magma configuration file.

Returns:

true if the command line arguments were parsed successfully, or false if there was an error.

Definition at line 39 of file args.c.

References build_commit(), build_stamp(), build_version(), cmdline_config_data, magma_t::config, config_load_defaults(), config_output_help(), display_usage(), exit_and_dump, magma_t::file, HEAP, JOINTED, log_critical, log_info, magma, MAGMA_FILEPATH_MAX, MANAGED_T, mm_cmp_cs_eq(), NULLER, PLACER, st_append, st_cmp_cs_eq(), and st_dupe_opts().

Referenced by main().

5.122.1.2 void display_usage (void)

Display the magma usage info if a user requests help or invokes it with incorrect options. args.c

Returns:

This function returns no value.

Definition at line 19 of file args.c.

References log_info.

Referenced by args_parse().

Functions

- void display_usage (void)

  args.c

- bool_t args_parse (int argc, char *argv[ ])

  Process any command line arguments supplied to magma.

- bool_t sanity_check (void)

  Perform a series of system-wide sanity checks at process startup.

- void process_stop (void)

  Execute the magma shutdown routines.

- bool_t process_start (void)

  Execute the magma initializations routines, making sure they all run properly.

- bool_t signal_start (void)

  signal.c

- bool_t signal_thread_start (void)

  Bind a SIGALRM handler for the calling thread.

- void signal_segfault (int signal)

  Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

- void signal_shutdown (int signal)

  A function to handle receipt of shutdown signals and allow for graceful exits.

- void signal_status (int signal)

  A generic worker thread signal handler entry point.

- bool_t system_change_root_directory (void)

  system.c

- bool_t system_fork_daemon (void)

  Daemonize into the background, if the magma.system.daemonize config option is set.

- bool_t system_init_core_dumps (void)

  Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.

- bool_t system_init_impersonation (void)

  Set process privileges to run as a specified user if magma.system.impersonate_user is set.

- bool_t system_init_resource_limits (void)

  Increase process resource limits, if magma.system.increase_resource_limits is set.

- bool_t system_init_umask (void)

  Set the process umask for new file/dir creation to O_RDWR.

- uint64_t system_ulimit_cur (int_t resource)

Get the soft system limit for a specified resource.

- uint64_t system_ulimit_max (int_t resource)

  Get the hard system limit for a specified resource.

- bool_t thread_start (void)

  thread.c

- void thread_stop (void)

  Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

5.123.1 Function Documentation

5.123.1.1 bool_t args_parse (int *argc*, char * *argv*[ ])

Process any command line arguments supplied to magma.

Note:

A few command line options are supported: -h (--help), -d (--dump), -v (--version), and -c (--config). Otherwise, the magma config file path will be loaded from the command line. If not an option starting with "-", the final command line argument is assumed to be the path of the magma configuration file.

Returns:

true if the command line arguments were parsed successfully, or false if there was an error.

Definition at line 39 of file args.c.

References build_commit(), build_stamp(), build_version(), cmdline_config_data, magma_t::config, config_load_defaults(), config_output_help(), display_usage(), exit_and_dump, magma_t::file, HEAP, JOINTED, log_critical, log_info, magma, MAGMA_FILEPATH_MAX, MANAGED_T, mm_cmp_cs_eq(), NULLER, PLACER, st_append, st_cmp_cs_eq(), and st_dupe_opts().

Referenced by main().

5.123.1.2 void display_usage (void)

args.c args.c

Returns:

This function returns no value.

Definition at line 19 of file args.c.

References log_info.

Referenced by args_parse().

5.123.1.3 bool_t process_start (void)

Execute the magma initializations routines, making sure they all run properly.

Note:

If any of the init routines returns with failure, this function fails and logs an error message. Certain checks are made that the init routines are run in a particular order, especially in waiting for daemonization and privilege dropping before starting logging. The system maintenance thread is also launched from here.

Returns:

true if all starter functions returned true, or false if any of them failed..

Definition at line 162 of file process.c.

References cache_start(), config_load_cmdline_settings(), config_load_database_settings(), config_load_defaults(), config_load_file_-settings(), config_validate_settings(), deprecated_ecies_start(), dkim_start(), dspam_start(), exit_and_dump, magma_t::host, http_content_-start(), magma_t::init, lib_load(), log_critical, log_info, log_start(), magma, MAGMA_HOSTNAME_MAX, mail_cache_start(), maint, mm_alloc(), mm_free(), mm_sec_start(), magma_t::name, obj_cache_start(), magma_t::page_length, prime_start(), process_maint(), protocol_init(), queue_init(), rand_start(), sanity_check(), servers_encryption_start(), servers_network_start(), signal_start(), spf_start(), spool_start(), sql_start(), ssl_start(), stats_init(), status_process(), system_change_root_directory(), system_fork_daemon(), system_init_-core_dumps(), system_init_impersonation(), system_init_resource_limits(), system_init_umask(), tank_start(), thread_launch(), virus_start(), warehouse_start(), and xml_start().

Referenced by main().

5.123.1.4 void process_stop (void)

Execute the magma shutdown routines.

Note:

This function will execute a shutdown routine for each of the startup initialization routines that was performed. It will also signal and terminate the maintenance thread.

Returns:

This function returns no value.

Definition at line 66 of file process.c.

References cache_stop(), config_free(), deprecated_ecies_stop(), dkim_stop(), dspam_stop(), http_content_stop(), magma_t::init, lib_-unload(), log_critical, log_info, log_pedantic, magma, mail_cache_stop(), maint, mm_free(), mm_sec_stop(), obj_cache_stop(), prime_-stop(), queue_shutdown(), rand_stop(), servers_encryption_stop(), servers_network_stop(), spf_stop(), spool_stop(), sql_stop(), ssl_stop(), stats_shutdown(), status, tank_stop(), thread_join(), thread_signal(), virus_stop(), warehouse_stop(), and xml_stop().

Referenced by main().

5.123.1.5 bool_t sanity_check (void)

Perform a series of system-wide sanity checks at process startup.

Note:

This function ensures that the standard data types are their expected data sizes, and performs other checks, such as data primitive maximum values.

Returns:

true if the system environment passed all checks and should function correctly, or false if any checks failed.

Definition at line 15 of file sanity.c.

References CONSTANT, MAGMA_CORE_POOL_OBJECTS_LIMIT, MAGMA_CORE_POOL_TIMEOUT_LIMIT, NULLER, placer_t, queries, record_t, SELECT_DOMAINS, st_alloc(), st_avail_get(), st_cmp_cs_eq(), st_data_get(), and st_free().

Referenced by process_start().

5.123.1.6 void signal_segfault (int *signal*)

Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

Note:

The signals handled by this function are: SIGSEGV, SIGFPE, SIGBUS, SIGSYS, and SIGABRT. The handler will respond by logging a stack backtrace, and terminating the program with abort().

Parameters:

signal the number of the signal that was received.

Returns:

This function returns no value.

Definition at line 19 of file signal.c.

References log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, mm_wipe(), and signal_name().

Referenced by signal_start().

5.123.1.7 void signal_shutdown (int *signal*)

A function to handle receipt of shutdown signals and allow for graceful exits.

Note:

This function handles the following signals: SIGINT, SIGQUIT, and SIGTERM. The shutdown procedure is as follows: 1. Set status to -1 and sleep for .1 second to allow for normal daemon termination. 2. Signal all worker threads to wake up blocked threads, and sleep one more second. 3. Loop through all possible file descriptors and if the descriptor matches a socket that is bound to a magma server, close it.

Parameters:

signal the number of the signal delivered to the process.

Returns:

This function returns no value.

LOW: This only compares the port number for the sockets. We should also ensure the socket is owned by magmad, and/or that the server used INADDR_ANY or IN6ADDR_ANY_INIT, otherwise the logic below will close sockets that could be owned by other processes on the system that are using the same port number, while bound to a different IP interface.

Definition at line 52 of file signal.c.

References server_t::enabled, ip_t::family, ip_t::ip4, ip_t::ip6, ip_presentation(), log_critical, log_info, magma, MAGMA_SERVER_-INSTANCES, MEMORYBUF, mm_copy(), mm_wipe(), server_t::network, PLACER, queue_signal(), magma_t::servers, servers_get_-count_using_port(), signal_name(), server_t::sockd, st_char_get(), status_signal(), thread_join(), and thread_launch().

Referenced by signal_start().

5.123.1.8 bool_t signal_start (void)

signal.c signal.c

Note:

The following handlers are established: signal_shutdown: SIGINT, SIGQUIT, SIGTERM, SIGHUP signal_segfault: SIGSEGV, SIGFPE, SIGBUS, SIGSYS signal_refresh: SIGHUP [ignored]: SIGPIPE

Returns:

true if all siginal handlers were successfully registered, or false on failure.

Definition at line 211 of file signal.c.

References log_info, mm_wipe(), signal_refresh(), signal_segfault(), and signal_shutdown().

Referenced by process_start().

5.123.1.9 void signal_status (int *signal*)

A generic worker thread signal handler entry point.

Note:

If the target thread is not in the process of shutting down, display the name of the caught signal.

Parameters:

signal the number of the signal caught by the signal handler.

Returns:

This function returns no value.

Definition at line 150 of file signal.c.

References log_info, signal_name(), and status.

Referenced by signal_thread_start().

5.123.1.10 bool_t signal_thread_start (void)

Bind a SIGALRM handler for the calling thread.

See also:

signal_status()

Returns:

false on failure or true on success.

TODO: Disabling this signal handler to see if it fixes the shutdown issue.

Definition at line 185 of file signal.c.

References log_info, mm_wipe(), and signal_status().

Referenced by thread_start().

5.123.1.11 bool_t system_change_root_directory (void)

system.c system.c

Returns:

true on success or false on failure.

Definition at line 66 of file system.c.

References buflen, bufptr, log_info, magma, magma_t::root_directory, and magma_t::system.

Referenced by process_start().

5.123.1.12 bool_t system_fork_daemon (void)

Daemonize into the background, if the magma.system.daemonize config option is set.

Returns:

true inside the child process, or false inside the parent process or if an error occurs.

Definition at line 81 of file system.c.

References magma_t::daemonize, log_critical, log_info, magma, pid, status_process(), and magma_t::system.

Referenced by process_start().

5.123.1.13 bool_t system_init_core_dumps (void)

Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.

Returns:

true if core dumps were successfully enabled or false on failure.

Definition at line 149 of file system.c.

References buflen, bufptr, magma_t::core_dump_size_limit, magma_t::enable_core_dumps, log_info, magma, and magma_t::system.

Referenced by process_start().

5.123.1.14 bool_t system_init_impersonation (void)

Set process privileges to run as a specified user if magma.system.impersonate_user is set.

Note:

This function will set the user id and group id to the specified user, and chdir() to their home directory.

Returns:

true on success or if magma.system.impersonate_user is not set; false on failure to change privileges.

Definition at line 169 of file system.c.

References buflen, bufptr, magma_t::impersonate_user, log_critical, log_info, magma, mm_alloc(), mm_free(), mm_wipe(), status_process(), and magma_t::system.

Referenced by process_start().

5.123.1.15 bool_t system_init_resource_limits (void)

Increase process resource limits, if magma.system.increase_resource_limits is set.

Note:

Resource limits will be maximized for magma's virtual address space, data and stack segments, available file descriptors and subprocesses, and allowed file sizes. If output_resource_limits is enabled, the state of the process resource limits will be dumped to the log afterwards.

Returns:

This function always returns true (errors are logged).

Definition at line 244 of file system.c.

References magma_t::config, magma_t::increase_resource_limits, log_info, magma, MEMORYBUF, magma_t::output_resource_limits, and magma_t::system.

Referenced by process_start().

5.123.1.16 bool_t system_init_umask (void)

Set the process umask for new file/dir creation to O_RDWR.

Returns:

true if the umask was set successfully, or false on failure.

Definition at line 131 of file system.c.

References buflen, bufptr, and log_info.

Referenced by process_start().

5.123.1.17 uint64_t system_ulimit_cur (int_t *resource*)

Get the soft system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system soft limit of the specified resource identifier on success.

Definition at line 43 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by st_realloc().

5.123.1.18 uint64_t system_ulimit_max (int_t *resource*)

Get the hard system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system hard limit of the specified resource identifier on success.

Definition at line 17 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by config_validate_settings().

5.123.1.19 bool_t thread_start (void)

thread.c thread.c

Returns:

true on success or false on failure.

Definition at line 27 of file thread.c.

References signal_thread_start(), and sql_thread_start().

Referenced by dequeue(), net_accept(), and process_maint().

5.123.1.20 void thread_stop (void)

Prepare a thread to exit by destroying its MySQL and OpenSSL thread storage, and the thread specific mail cache.

Returns:

This function returns no value.

Definition at line 14 of file thread.c.

References mail_cache_thread_stop(), sql_thread_stop(), and ssl_thread_stop().

Referenced by dequeue(), net_accept(), and process_maint().

5.124 src/engine/context/sanity.c File Reference

```
#include "magma.h"
```

Functions

- bool_t sanity_check (void)

  Perform a series of system-wide sanity checks at process startup.

5.124.1 Function Documentation

5.124.1.1 bool_t sanity_check (void)

Perform a series of system-wide sanity checks at process startup.

Note:

This function ensures that the standard data types are their expected data sizes, and performs other checks, such as data primitive maximum values.

Returns:

true if the system environment passed all checks and should function correctly, or false if any checks failed.

Definition at line 15 of file sanity.c.

References CONSTANT, MAGMA_CORE_POOL_OBJECTS_LIMIT, MAGMA_CORE_POOL_TIMEOUT_LIMIT, NULLER, placer_t, queries, record_t, SELECT_DOMAINS, st_alloc(), st_avail_get(), st_cmp_cs_eq(), st_data_get(), and st_free().

Referenced by process_start().

5.125 src/engine/context/signal.c File Reference

```
#include "magma.h"
```

Functions

- void signal_segfault (int signal)

  Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

- void signal_shutdown (int signal)

  A function to handle receipt of shutdown signals and allow for graceful exits.

- void signal_status (int signal)

  A generic worker thread signal handler entry point.

- void signal_refresh (int signal)

  A function to handle receipt of SIGHUP and refresh all web server content.

- bool_t signal_thread_start (void)

  Bind a SIGALRM handler for the calling thread.

- bool_t signal_start (void)

  Setup signal masks and register signal handlers for handling shutdowns, program termination, and reloads.

Variables

- pthread_mutex_t sig_hup_mutex = PTHREAD_MUTEX_INITIALIZER

5.125.1 Function Documentation

5.125.1.1 void signal_refresh (int *signal*)

A function to handle receipt of SIGHUP and refresh all web server content.

Parameters:

signal the number of the delivered signal (should only be SIGHUP).

Returns:

This function returns no value.

Definition at line 164 of file signal.c.

References http_content_refresh(), log_error, log_info, mutex_lock(), mutex_unlock(), and sig_hup_mutex.

Referenced by signal_start().

5.125.1.2 void signal_segfault (int *signal*)

Handle signals that indicate the program was killed because of an invalid operation (including SIGSEGV).

Note:

The signals handled by this function are: SIGSEGV, SIGFPE, SIGBUS, SIGSYS, and SIGABRT. The handler will respond by logging a stack backtrace, and terminating the program with abort().

Parameters:

signal the number of the signal that was received.

Returns:

This function returns no value.

Definition at line 19 of file signal.c.

References log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, mm_wipe(), and signal_name().

Referenced by signal_start().

5.125.1.3 void signal_shutdown (int *signal*)

A function to handle receipt of shutdown signals and allow for graceful exits.

Note:

This function handles the following signals: SIGINT, SIGQUIT, and SIGTERM. The shutdown procedure is as follows: 1. Set status to -1 and sleep for .1 second to allow for normal daemon termination. 2. Signal all worker threads to wake up blocked threads, and sleep one more second. 3. Loop through all possible file descriptors and if the descriptor matches a socket that is bound to a magma server, close it.

Parameters:

signal the number of the signal delivered to the process.

Returns:

This function returns no value.

LOW: This only compares the port number for the sockets. We should also ensure the socket is owned by magmad, and/or that the server used INADDR_ANY or IN6ADDR_ANY_INIT, otherwise the logic below will close sockets that could be owned by other processes on the system that are using the same port number, while bound to a different IP interface.

Definition at line 52 of file signal.c.

References server_t::enabled, ip_t::family, ip_t::ip4, ip_t::ip6, ip_presentation(), log_critical, log_info, magma, MAGMA_SERVER_-INSTANCES, MEMORYBUF, mm_copy(), mm_wipe(), server_t::network, PLACER, queue_signal(), magma_t::servers, servers_get_-count_using_port(), signal_name(), server_t::sockd, st_char_get(), status_signal(), thread_join(), and thread_launch().

Referenced by signal_start().

5.125.1.4 bool_t signal_start (void)

Setup signal masks and register signal handlers for handling shutdowns, program termination, and reloads. signal.c

Note:

The following handlers are established: signal_shutdown: SIGINT, SIGQUIT, SIGTERM, SIGHUP signal_segfault: SIGSEGV, SIGFPE, SIGBUS, SIGSYS signal_refresh: SIGHUP [ignored]: SIGPIPE

Returns:

true if all siginal handlers were successfully registered, or false on failure.

Definition at line 211 of file signal.c.

References log_info, mm_wipe(), signal_refresh(), signal_segfault(), and signal_shutdown().

Referenced by process_start().

5.125.1.5 void signal_status (int *signal*)

A generic worker thread signal handler entry point.

Note:

If the target thread is not in the process of shutting down, display the name of the caught signal.

Parameters:

signal the number of the signal caught by the signal handler.

Returns:

This function returns no value.

Definition at line 150 of file signal.c.

References log_info, signal_name(), and status.

Referenced by signal_thread_start().

5.125.1.6 bool_t signal_thread_start (void)

Bind a SIGALRM handler for the calling thread.

See also:

signal_status()

Returns:

false on failure or true on success.

TODO: Disabling this signal handler to see if it fixes the shutdown issue.

Definition at line 185 of file signal.c.

References log_info, mm_wipe(), and signal_status().

Referenced by thread_start().

5.125.2 Variable Documentation

5.125.2.1 pthread_mutex_t sig_hup_mutex = PTHREAD_MUTEX_INITIALIZER

Definition at line 10 of file signal.c.

Referenced by signal_refresh().

5.126 src/engine/context/system.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t system_ulimit_max (int_t resource)
  Get the hard system limit for a specified resource.
- uint64_t system_ulimit_cur (int_t resource)
  Get the soft system limit for a specified resource.
- bool_t system_change_root_directory (void)
  Perform a chroot() on the directory specified in the config option magma.system.root_directory, if it is set.
- bool_t system_fork_daemon (void)
  Daemonize into the background, if the magma.system.daemonize config option is set.
- bool_t system_init_umask (void)
  Set the process umask for new file/dir creation to O_RDWR.
- bool_t system_init_core_dumps (void)
  Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.
- bool_t system_init_impersonation (void)
  Set process privileges to run as a specified user if magma.system.impersonate_user is set.
- bool_t system_init_resource_limits (void)
  Increase process resource limits, if magma.system.increase_resource_limits is set.

5.126.1 Function Documentation

5.126.1.1 bool_t system_change_root_directory (void)

Perform a chroot() on the directory specified in the config option magma.system.root_directory, if it is set. system.c

Returns:

true on success or false on failure.

Definition at line 66 of file system.c.

References buflen, bufptr, log_info, magma, magma_t::root_directory, and magma_t::system.

Referenced by process_start().

5.126.1.2 bool_t system_fork_daemon (void)

Daemonize into the background, if the magma.system.daemonize config option is set.

Returns:

true inside the child process, or false inside the parent process or if an error occurs.

Definition at line 81 of file system.c.

References magma_t::daemonize, log_critical, log_info, magma, pid, status_process(), and magma_t::system.

Referenced by process_start().

5.126.1.3 bool_t system_init_core_dumps (void)

Set the magma core dump size rlimit, if magma.system.enable_core_dumps was enabled.

Returns:

true if core dumps were successfully enabled or false on failure.

Definition at line 149 of file system.c.

References buflen, bufptr, magma_t::core_dump_size_limit, magma_t::enable_core_dumps, log_info, magma, and magma_t::system.

Referenced by process_start().

5.126.1.4 bool_t system_init_impersonation (void)

Set process privileges to run as a specified user if magma.system.impersonate_user is set.

Note:

This function will set the user id and group id to the specified user, and chdir() to their home directory.

Returns:

true on success or if magma.system.impersonate_user is not set; false on failure to change privileges.

Definition at line 169 of file system.c.

References buflen, bufptr, magma_t::impersonate_user, log_critical, log_info, magma, mm_alloc(), mm_free(), mm_wipe(), status_process(), and magma_t::system.

Referenced by process_start().

5.126.1.5 bool_t system_init_resource_limits (void)

Increase process resource limits, if magma.system.increase_resource_limits is set.

Note:

Resource limits will be maximized for magma's virtual address space, data and stack segments, available file descriptors and sub-processes, and allowed file sizes. If output_resource_limits is enabled, the state of the process resource limits will be dumped to the log afterwards.

Returns:

This function always returns true (errors are logged).

Definition at line 244 of file system.c.

References magma_t::config, magma_t::increase_resource_limits, log_info, magma, MEMORYBUF, magma_t::output_resource_limits, and magma_t::system.

Referenced by process_start().

5.126.1.6 bool_t system_init_umask (void)

Set the process umask for new file/dir creation to O_RDWR.

Returns:

true if the umask was set successfully, or false on failure.

Definition at line 131 of file system.c.

References buflen, bufptr, and log_info.

Referenced by process_start().

5.126.1.7 uint64_t system_ulimit_cur (int_t *resource*)

Get the soft system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system soft limit of the specified resource identifier on success.

Definition at line 43 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by st_realloc().

5.126.1.8 uint64_t system_ulimit_max (int_t *resource*)

Get the hard system limit for a specified resource.

Note:

This function will never return a value greater than UINT64_MAX.

See also:

getrlimit64()

Parameters:

resource the system rlimit resource identifier to be queried.

Returns:

-1 on failure, or the system hard limit of the specified resource identifier on success.

Definition at line 17 of file system.c.

References buflen, bufptr, log_info, and log_pedantic.

Referenced by config_validate_settings().

5.127 src/engine/controller/controller.h File Reference

Functions

- void dequeue (void)

  queue.c

- void enqueue (void ∗function, void ∗data)

  Push a function on the job queue to be executed asynchronously.

- bool_t queue_init (void)

  Create a queue of worker threads and set them into motion.

- void queue_shutdown (void)

  Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

- void queue_signal (void)

  Signal all worker threads with SIGALRM to force their return.

- void requeue (void ∗function, void ∗requeue, void ∗data)

  Push a function on the job queue to be executed asynchronously.

- bool_t protocol_init (void)

  protocol.c

- void protocol_process (server_t ∗server, int sockd)

  Create a connection object for an accepted connection, and enqueue it to be handled.

5.127.1 Function Documentation

5.127.1.1 void dequeue (void)

queue.c queue.c

Note:

This is the thread pool entry point called from queue_init().

Returns:

This function returns no value.

Definition at line 79 of file queue.c.

References queue_t::data, queue_t::function, log_error, mm_free(), mutex_lock(), mutex_unlock(), queue_t::next, queue, queue_t::requeue(), stats_decrement_by_name(), stats_increment_by_name(), status, thread_start(), and thread_stop().

Referenced by queue_init().

5.127.1.2 void enqueue (void ∗ *function*, void ∗ *data*)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new queue_t object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

data a pointer to an arbitrary block of data to be passed to the specified function on execution.

Returns:

This function returns no value.

Definition at line 69 of file queue.c.

References requeue().

Referenced by con_reverse_enqueue(), dmtp_process(), dmtp_requeue(), http_process(), http_requeue(), imap_process(), imap_requeue(), molten_init(), molten_invalid(), molten_parse(), molten_stats(), pop_process(), pop_requeue(), protocol_enqueue(), protocol_process(), smtp_process(), and smtp_requeue().

5.127.1.3 bool_t protocol_init (void)

protocol.c protocol.c

Returns:

This function always returns true.

Definition at line 86 of file protocol.c.

References dmtp_sort(), imap_sort(), molten_sort(), pop_sort(), portal_endpoint_sort(), and smtp_sort().

Referenced by process_start().

5.127.1.4 void protocol_process (server_t * *server*, int *sockd*)

Create a connection object for an accepted connection, and enqueue it to be handled.

See also:

protocol_secure(), protocol_enqueue()

Note:

Depending on whether the server specifies a secure transport layer, protocol_secure() or protocol_enqueue() will be dispatched.

Parameters:

server a pointer to the server object of the server handling the connection.

sockd the socket descriptor of the newly accepted connection.

Definition at line 197 of file protocol.c.

References con_init(), server_t::context, enqueue(), log_pedantic, net_set_timeout(), server_t::network, protocol_enqueue(), protocol_secure(), server_t::timeout, server_t::tls, TLS_PORT, and server_t::type.

Referenced by net_accept().

5.127.1.5 bool_t queue_init (void)

Create a queue of worker threads and set them into motion.

Note:

Up to magma.system.worker_threads number of threads will be created.

Returns:

false on failure or true on success.

Definition at line 153 of file queue.c.

References dequeue(), log_error, magma, mm_alloc(), mutex_init(), queue, queue_shutdown(), stats_increment_by_name(), magma_t::system, thread_launch(), and magma_t::worker_threads.

Referenced by process_start().

5.127.1.6 void queue_shutdown (void)

Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

Returns:

This function returns no value.

Definition at line 187 of file queue.c.

References magma, mm_cleanup, mutex_destroy(), queue, stats_decrement_by_name(), magma_t::system, thread_join(), and magma_t::worker_threads.

Referenced by process_stop(), and queue_init().

5.127.1.7 void queue_signal (void)

Signal all worker threads with SIGALRM to force their return.

Returns:

This function returns no value.

Definition at line 133 of file queue.c.

References log_info, magma, queue, status, magma_t::system, thread_signal(), and magma_t::worker_threads.

Referenced by signal_shutdown().

5.127.1.8 void requeue (void * *function*, void * *requeue*, void * *data*)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new queue_t object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

requeue an optional pointer to a requeue function to be called after function is executed.

data a pointer to an arbitrary block of data to be passed to function and/or requeue upon execution.

Returns:

This function returns no value.

Definition at line 33 of file queue.c.

References queue_t::data, queue_t::function, log_critical, mm_alloc(), mutex_lock(), mutex_unlock(), queue_t::next, queue, and queue_t::requeue().

Referenced by dmtp_process(), enqueue(), http_process(), http_requeue(), imap_process(), pop_process(), sess_release(), smtp_data(), and smtp_process().

5.128 src/engine/controller/protocol.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t ∗ protocol_type (connection_t ∗con)
- bool_t protocol_init (void)

  Initialize all protocol modules, and prime their command arrays for binary searching.

- void protocol_enqueue (connection_t ∗con)

  Enqueue a protocol-specific handler to service a specified connection, and update any statistics accordingly.

- void protocol_secure (connection_t ∗con)

  Establish a secure channel for an inbound TLS connection before passing it off to the general server request handler.

- void protocol_process (server_t ∗server, int sockd)

  Create a connection object for an accepted connection, and enqueue it to be handled.

5.128.1 Function Documentation

5.128.1.1 void protocol_enqueue (connection_t ∗ *con*)

Enqueue a protocol-specific handler to service a specified connection, and update any statistics accordingly.

Note:

If an invalid protocol is specified, the connection will be destroyed gracefully.

Parameters:

con a pointer to the connection object to be serviced.

Returns:

This function returns no value.

Definition at line 102 of file protocol.c.

References con_destroy(), con_secure(), DMTP, dmtp_init(), enqueue(), HTTP, http_init(), IMAP, imap_init(), log_check, log_pedantic, MOLTEN, molten_init(), POP, pop_init(), server_t::protocol, connection_t::server, SMTP, smtp_init(), stats_increment_by_name(), SUBMISSION, and submission_init().

Referenced by protocol_process(), and protocol_secure().

5.128.1.2 bool_t protocol_init (void)

Initialize all protocol modules, and prime their command arrays for binary searching. protocol.c

Returns:

This function always returns true.

Definition at line 86 of file protocol.c.

References dmtp_sort(), imap_sort(), molten_sort(), pop_sort(), portal_endpoint_sort(), and smtp_sort().

Referenced by process_start().

5.128.1.3 void protocol_process (server_t ∗ *server*, int *sockd*)

Create a connection object for an accepted connection, and enqueue it to be handled.

See also:

protocol_secure(), protocol_enqueue()

Note:

Depending on whether the server specifies a secure transport layer, protocol_secure() or protocol_enqueue() will be dispatched.

Parameters:

server a pointer to the server object of the server handling the connection.

sockd the socket descriptor of the newly accepted connection.

Definition at line 197 of file protocol.c.

References con_init(), server_t::context, enqueue(), log_pedantic, net_set_timeout(), server_t::network, protocol_enqueue(), protocol_secure(), server_t::timeout, server_t::tls, TLS_PORT, and server_t::type.

Referenced by net_accept().

5.128.1.4 void protocol_secure (connection_t ∗ *con*)

Establish a secure channel for an inbound TLS connection before passing it off to the general server request handler.

See also:

protocol_enqueue()

Note:

This function destroys the client connection completely and returns silently upon any TLS-related failure.

Parameters:

con the The connection object associated with the inbound TLS connection.

Returns:

This function returns no value.

Definition at line 165 of file protocol.c.

References connection_t::buffer, con_addr_presentation(), connection_t::lock, log_check, log_pedantic, M_SSL_BIO_NOCLOSE, MANAGEDBUF, mm_free(), mutex_destroy(), server_t::network, connection_t::network, server_t::port, protocol_enqueue(), protocol_type(), connection_t::server, connection_t::sockd, st_char_get(), st_free(), st_length_int(), connection_t::tls, tls_free(), and tls_server_alloc().

  } queue

5.129.1 Function Documentation

5.129.1.1 void dequeue (void)

Wait for work to appear on the queue and then perform the work; if the job is to be requeue'd then requeue it. queue.c

Note:

This is the thread pool entry point called from queue_init().

Returns:

This function returns no value.

Definition at line 79 of file queue.c.

References queue_t::data, queue_t::function, log_error, mm_free(), mutex_lock(), mutex_unlock(), queue_t::next, queue, queue_t::requeue(), stats_decrement_by_name(), stats_increment_by_name(), status, thread_start(), and thread_stop().

Referenced by queue_init().

5.129.1.2 void enqueue (void * *function*, void * *data*)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new queue_t object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

data a pointer to an arbitrary block of data to be passed to the specified function on execution.

Returns:

This function returns no value.

Definition at line 69 of file queue.c.

References requeue().

5.129.1.3 bool_t queue_init (void)

Create a queue of worker threads and set them into motion.

Note:

Up to magma.system.worker_threads number of threads will be created.

Returns:

false on failure or true on success.

Definition at line 153 of file queue.c.

References dequeue(), log_error, magma, mm_alloc(), mutex_init(), queue, queue_shutdown(), stats_increment_by_name(), magma_t::system, thread_launch(), and magma_t::worker_threads.

Referenced by process_start().

5.129.1.4 void queue_shutdown (void)

Attempt to wake any sleeping workers, wait for all worker threads to shutdown and exit, and destroy the worker queue.

Returns:

This function returns no value.

Definition at line 187 of file queue.c.

References magma, mm_cleanup, mutex_destroy(), queue, stats_decrement_by_name(), magma_t::system, thread_join(), and magma_t::worker_threads.

Referenced by process_stop(), and queue_init().

5.129.1.5 void queue_signal (void)

Signal all worker threads with SIGALRM to force their return.

Returns:

This function returns no value.

Definition at line 133 of file queue.c.

References log_info, magma, queue, status, magma_t::system, thread_signal(), and magma_t::worker_threads.

Referenced by signal_shutdown().

5.129.1.6 void requeue (void * *function*, void * *requeue*, void * *data*)

Push a function on the job queue to be executed asynchronously.

Note:

Warning: If this function fails to allocate a new queue_t object, the work unit is lost forever.

Parameters:

function a pointer to a function to be executed by the next available worker thread.

requeue an optional pointer to a requeue function to be called after function is executed.

data a pointer to an arbitrary block of data to be passed to function and/or requeue upon execution.

Returns:

This function returns no value.

Definition at line 33 of file queue.c.

- void log_enable (void)

  Enable logging.

- int_t print_backtrace (void)

  Print the current stack backtrace to stdout.

- void log_internal (const char *file, const char *function, const int line, M_LOG_OPTIONS options, const char *format,...)

  Logs the message described by format, and provided as a variadic argument list.

- void log_rotate (void)
- bool_t log_start (void)

Variables

- uint64_t log_date
- bool_t log_enabled = true
- pthread_mutex_t log_mutex = PTHREAD_MUTEX_INITIALIZER

5.131.1 Function Documentation

5.131.1.1 void log_disable (void)

Disable logging.

Returns:

This function returns no value.

Definition at line 18 of file log.c.

References log_enabled, log_mutex, mutex_lock(), and mutex_unlock().

5.131.1.2 void log_enable (void)

Enable logging.

Returns:

This function returns no value.

Definition at line 29 of file log.c.

References log_enabled, log_mutex, mutex_lock(), and mutex_unlock().

5.131.1.3 void log_internal (const char * *file*, const char * *function*, const int *line*, M_LOG_OPTIONS *options*, const char * *format*, ...)

Logs the message described by format, and provided as a variadic argument list.

Parameters:

file The log macros set this to the caller's filename.

function The log macros set this to the caller's function.

line The log macros set this to the line number where the log function was called.

options Global configuration options can be overridden on a per call basis using the options variable.

format The printf style format for the log message.

va_list A variadic list of data items to be used by the format string.

Returns:

This function returns no value.

Definition at line 111 of file log.c.

References magma_t::file, magma_t::function, magma_t::line, magma_t::log, log_enabled, log_mutex, M_LOG_FILE, M_LOG_FILE_DISABLE, M_LOG_FUNCTION, M_LOG_FUNCTION_DISABLE, M_LOG_LINE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE, M_LOG_STACK_TRACE_DISABLE, M_LOG_TIME, M_LOG_TIME_DISABLE, magma, mutex_lock(), mutex_unlock(), print_backtrace(), magma_t::stack, and magma_t::time.

Referenced by xml_error().

5.131.1.4 void log_rotate (void)

Definition at line 190 of file log.c.

References magma_t::file, log_critical, log_date, log_mutex, magma, MEMORYBUF, ns_length_get(), magma_t::output, magma_t::path, and time_datestamp().

Referenced by process_maint().

5.131.1.5 bool_t log_start (void)

Definition at line 232 of file log.c.

References magma_t::file, folder_exists(), log_critical, log_date, magma, MEMORYBUF, ns_length_get(), NULLER, magma_t::output, magma_t::path, and time_datestamp().

Referenced by process_start().

5.131.1.6 int_t print_backtrace (void)

Print the current stack backtrace to stdout.

Note:

This function was created because backtrace_symbols() can fail due to heap corruption.

Returns:

-1 if the backtrace failed, or 0 on success.

Definition at line 41 of file log.c.

Referenced by log_internal().

5.131.2 Variable Documentation

5.131.2.1 uint64_t log_date

Definition at line 10 of file log.c.

5.132.3 Function Documentation

5.132.3.1 void void log_disable (void)

Disable logging.

Returns:

This function returns no value.

Definition at line 18 of file log.c.

References log_enabled, log_mutex, mutex_lock(), and mutex_unlock().

5.132.3.2 void log_enable (void)

Enable logging.

Returns:

This function returns no value.

Definition at line 29 of file log.c.

References log_enabled, log_mutex, mutex_lock(), and mutex_unlock().

5.132.3.3 void log_internal (const char * *file*, const char * *function*, const int *line*, M_LOG_OPTIONS *options*, const char * *format*, ...)

5.132.3.4 void log_rotate (void)

Definition at line 190 of file log.c.

References magma_t::file, log_critical, log_date, log_mutex, magma, MEMORYBUF, ns_length_get(), magma_t::output, magma_t::path, and time_datestamp().

Referenced by process_maint().

5.132.3.5 bool_t log_start (void)

Definition at line 232 of file log.c.

References magma_t::file, folder_exists(), log_critical, log_date, magma, MEMORYBUF, ns_length_get(), NULLER, magma_t::output, magma_t::path, and time_datestamp().

Referenced by process_start().

5.132.3.6 int_t print_backtrace (void)

Print the current stack backtrace to stdout.

Note:

This function was created because backtrace_symbols() can fail due to heap corruption.

Returns:

-1 if the backtrace failed, or 0 on success.

Definition at line 41 of file log.c.

Referenced by log_internal().

5.133 src/engine/status/build.c File Reference

```
#include "magma.h"
```

Functions

- const char ∗ build_version (void)
  Get the magma version string.
- const char ∗ build_commit (void)
  Get the magma commit identity.
- const char ∗ build_stamp (void)
  Get the magma build stamp.

5.133.1 Function Documentation

5.133.1.1 const char∗ build_commit (void)

Get the magma commit identity.

Returns:

a pointer to a null-terminated string containing the last eight characters of current commit identity.

Definition at line 34 of file build.c.

Referenced by args_parse(), and lib_load().

5.133.1.2 const char∗ build_stamp (void)

Get the magma build stamp.

Returns:

a pointer to a null-terminated string containing the magma build information string.

Definition at line 42 of file build.c.

Referenced by args_parse(), http_response_options(), imap_id(), and lib_load().

5.133.1.3 const char∗ build_version (void)

Get the magma version string.

Returns:

a pointer to a null-terminated string containing the magma version string.

Definition at line 26 of file build.c.

Referenced by args_parse(), http_response_options(), imap_id(), imap_init(), lib_load(), and pop_capa().

5.134 src/engine/status/performance.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t perf_rdtsc (void)

5.134.1 Function Documentation

5.134.1.1 uint64_t perf_rdtsc (void)

Returns the CPU cycle counter. By calculating variations in the time stamp, we can discover the exact number of elapsed CPU ticks, making it possible to precisely time code execution. Note that in a multithreaded environment its possible that not all of the elapsed ticks were consumed by the code being timed.

Returns:

The number of CPU cycles that have elapsed since boot.

Definition at line 180 of file performance.c.

5.135 src/engine/status/statistics.c File Reference

```
#include "magma.h"
```

Functions

- uint64_t stats_sum_errors (void)
  Get the total sum of all error statistics maintained by magma (traditional and derived stats).
- uint64_t stats_derived_count (void)
  Get the number of derived statistics that are tracked.
- char * stats_derived_name (uint64_t position)
  Get the name of a derived statistic by index.
- uint64_t stats_derived_value (uint64_t position)
  Get the value of a derived statistic by index.
- uint64_t stats_get_name_pos (char *name)
  Get the index of a statistic by name.
- char * stats_get_name (uint64_t position)
  Get the name of a statistic by its index.
- void stats_set_by_name (char *name, uint64_t value)
  Provided a statistic by name, set its value.
- void stats_set_by_num (uint64_t position, uint64_t value)
  Provided a statistic by index, set its value.
- uint64_t stats_get_value_by_name (char *name)
  Provided a statistic by name, get its value.
- uint64_t stats_get_value_by_num (uint64_t position)
  Provided a statistic by index, get its value.
- void stats_adjust_by_name (char *name, int32_t value)
  Provided a statistic by name, increment its value by a specified amount.
- void stats_adjust_by_num (uint64_t position, int32_t value)
  Provided a statistic by index, increment its value by a specified amount.
- void stats_increment_by_name (char *name)
  Provided a statistic by name, increment its value by 1.
- void stats_increment_by_num (uint64_t position)
  Provided a statistic by index, increment its value by 1.
- void stats_decrement_by_name (char *name)
  Provided a statistic by name, decrement its value by 1.
- void stats_decrement_by_num (uint64_t position)

Provided a statistic by index, decrement its value by 1.

- uint64_t stats_get_count (void)

  Get the number of statistics being tracked.

- bool_t stats_init (void)

  Initialize and reset all statistics counters.

- void stats_shutdown (void)

  Destroy all statistics locks.

Variables

- struct {
  size_t count
  pthread_mutex_t locks [128][2]
  uint64_t values [128]
  char ∗ names [128]
  } stats

- char ∗ derived [ ]

5.135.1 Function Documentation

5.135.1.1 void stats_adjust_by_name (char ∗ *name*, int32_t *value*)

Provided a statistic by name, increment its value by a specified amount.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 360 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dkim_signature_create(), dkim_signature_verify(), obj_cache_prune(), pattern_check(), and spf_check().

5.135.1.2 void stats_adjust_by_num (uint64_t *position*, int32_t *value*)

Provided a statistic by index, increment its value by a specified amount.

Parameters:

position the zero-based index of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 381 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.135.1.3 void stats_decrement_by_name (char * *name*)

Provided a statistic by name, decrement its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 429 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by con_destroy(), dequeue(), and queue_shutdown().

5.135.1.4 void stats_decrement_by_num (uint64_t *position*)

Provided a statistic by index, decrement its value by 1.

Parameters:

position the zero-based index of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 449 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.135.1.5 uint64_t stats_derived_count (void)

Get the number of derived statistics that are tracked.

Returns:

the number of derived statistics being maintained by magma.

Definition at line 183 of file statistics.c.

References derived.

Referenced by molten_stats(), stats_derived_name(), and stats_sum_errors().

5.135.1.6 char* stats_derived_name (uint64_t *position*)

Get the name of a derived statistic by index.

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the name of the derived statistic on success.

Definition at line 193 of file statistics.c.

References derived, and stats_derived_count().

Referenced by molten_stats(), and stats_sum_errors().

5.135.1.7 uint64_t stats_derived_value (uint64_t *position*)

Get the value of a derived statistic by index.

See also:

mm_sec_stats()

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

0 on failure, or the value of the specified derived statistic on success.

Definition at line 208 of file statistics.c.

References bytes, items, log_pedantic, mm_sec_stats(), spool_error_stats(), and stats_sum_errors().

Referenced by molten_stats(), and stats_sum_errors().

5.135.1.8 uint64_t stats_get_count (void)

Get the number of statistics being tracked.

Returns:

the total number of statistics counters maintained by magma.

Definition at line 462 of file statistics.c.

References stats.

Referenced by molten_stats(), and stats_sum_errors().

5.135.1.9 char* stats_get_name (uint64_t *position*)

Get the name of a statistic by its index.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

0 on failure, or the name of the requested statistic on success.

Definition at line 272 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.135.1.10 uint64_t stats_get_name_pos (char * *name*)

Get the index of a statistic by name.

Parameters:

name the name of the statistic to be queried.

Returns:

0 on failure, or the zero-based index of the requested statistic on success.

Definition at line 251 of file statistics.c.

References log_info, mutex_lock(), mutex_unlock(), NULLER, st_cmp_cs_eq(), and stats.

Referenced by stats_adjust_by_name(), stats_decrement_by_name(), stats_get_value_by_name(), stats_increment_by_name(), and stats_-set_by_name().

5.135.1.11 uint64_t stats_get_value_by_name (char * *name*)

Provided a statistic by name, get its value.

Parameters:

name a null-terminated string containing the name of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 323 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

5.135.1.12 uint64_t stats_get_value_by_num (uint64_t *position*)

Provided a statistic by index, get its value.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 343 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.135.1.13 void stats_increment_by_name (char * *name*)

Provided a statistic by name, increment its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 395 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dequeue(), imap_starttls(), pop_starttls(), protocol_enqueue(), queue_init(), register_abuse_check_blocklist(), smtp_starttls(), virus_check(), virus_engine_refresh(), and virus_start().

5.135.1.14 void stats_increment_by_num (uint64_t *position*)

Provided a statistic by index, increment its value by 1.

Parameters:

position the zero-based index of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 415 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.135.1.15 bool_t stats_init (void)

Initialize and reset all statistics counters.

Returns:

false on failure or true on success.

Definition at line 471 of file statistics.c.

References log_critical, mm_wipe(), mutex_init(), and stats.

Referenced by process_start().

5.135.1.16 void stats_set_by_name (char * *name*, uint64_t *value*)

Provided a statistic by name, set its value.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 289 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by obj_cache_prune(), virus_engine_refresh(), virus_start(), and virus_stop().

5.135.1.17 void stats_set_by_num (uint64_t *position*, uint64_t *value*)

Provided a statistic by index, set its value.

Parameters:

position the zero-based index of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 309 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.135.1.18 void stats_shutdown (void)

Destroy all statistics locks.

Returns:

This function returns no value.

Definition at line 494 of file statistics.c.

References mutex_destroy(), and stats.

Referenced by process_stop().

5.135.1.19 uint64_t stats_sum_errors (void)

Get the total sum of all error statistics maintained by magma (traditional and derived stats).

Note:

Error statistics are all statistics that have a name that begins with "errors." or ends with ".errors".

Returns:

The total sum of all error statistics counters accumulated by magma.

Definition at line 137 of file statistics.c.

References CONSTANT, NULLER, st_cmp_cs_ends(), st_cmp_cs_eq(), st_cmp_cs_starts(), stats_derived_count(), stats_derived_name(), stats_derived_value(), stats_get_count(), stats_get_name(), and stats_get_value_by_num().

Referenced by stats_derived_value().

Functions

- void statistics_process (connection_t *con)

  Display the statistics page to the requesting connection.

Variables

- statistics_vp_t portal_stats [12]

5.136.1 Function Documentation

5.136.1.1 void statistics_process (connection_t * *con*)

Display the statistics page to the requesting connection. statistics.c

Parameters:

con a pointer to the connection object across which the server statistics will be transmitted.

Returns:

This function returns no value.

Definition at line 17 of file statistics.c.

References con_write_st(), http_page_free(), http_page_get(), http_print_500(), http_response_header(), log_pedantic, portal_stat_emails_received_today, portal_stat_emails_received_week, portal_stat_emails_sent_today, portal_stat_emails_sent_week, portal_stat_total_users, portal_stat_users_checked_email_today, portal_stat_users_checked_email_week, portal_stat_users_registered_today, portal_stat_users_registered_week, portal_stat_users_sent_email_today, portal_stat_users_sent_email_week, st_free(), st_length_get(), statistics_refresh(), statistics_vp_t::val, xml_dump_doc(), xml_set_xpath_ns(), and xml_set_xpath_uint64().

Definition at line 13 of file datatier.c.

5.137 src/engine/status/status.c File Reference

```
#include "magma.h"
```

Functions

- bool_t status (void)
  Check to see if a worker thread should continue processing.
- void status_set (int value)
  Set the status level to a specified value.
- void status_signal (void)
  Enqueued by the signal handler so the status can be updated asynchronously.
- int status_get (void)
  Get the current status level.
- void status_process (void)
  Update magma's basic process information (pid and start time).
- uint64_t status_pid (void)
  Get the magma instance's pid.
- uint64_t status_startup (void)
  Get the timestamp corresponding to when magma was started.

Variables

- struct {
  pid_t pid
  uint64_t startup
  } process
- int status_level = 0
- pthread_rwlock_t status_lock = PTHREAD_RWLOCK_INITIALIZER

5.137.1 Function Documentation

5.137.1.1 bool_t status (void)

Check to see if a worker thread should continue processing. status.c

Note:

This function should be called periodically by worker threads.

Returns:

true if the caller should continue processing (status level is positive) or false otherwise.

Definition at line 26 of file status.c.

References rwlock_lock_read(), rwlock_unlock(), status_level, and status_lock.

5.137.1.2 int status_get (void)

Get the current status level.

See also:

status()

Returns:

the current value of the status level.

Definition at line 66 of file status.c.

References rwlock_lock_read(), rwlock_unlock(), status_level, and status_lock.

5.137.1.3 uint64_t status_pid (void)

Get the magma instance's pid.

Returns:

the value of magma's pid.

Definition at line 88 of file status.c.

References process.

5.137.1.4 void status_process (void)

Update magma's basic process information (pid and start time).

Returns:

This function returns no value.

Definition at line 78 of file status.c.

References process, and process_my_pid().

Referenced by process_start(), system_fork_daemon(), and system_init_impersonation().

5.137.1.5 void status_set (int *value*)

Set the status level to a specified value.

See also:

status()

Parameters:

value the integer value of the new status level.

Returns:

This function returns no value.

Definition at line 43 of file status.c.

References rwlock_lock_write(), rwlock_unlock(), status_level, and status_lock.

Referenced by main().

5.137.1.6 void status_signal (void)

Enqueued by the signal handler so the status can be updated asynchronously.

Definition at line 53 of file status.c.

References log_pedantic, rwlock_lock_write(), rwlock_unlock(), status_level, and status_lock.

Referenced by signal_shutdown().

5.137.1.7 uint64_t status_startup (void)

Get the timestamp corresponding to when magma was started.

Returns:

the UNIX-style date-time value when magma was started.

Definition at line 96 of file status.c.

References process.

5.137.2 Variable Documentation

5.137.2.1 pid_t pid

Definition at line 11 of file status.c.

Referenced by main(), process_find_pid(), process_kill(), and system_fork_daemon().

5.137.2.2 struct { ... } process

Referenced by status_pid(), status_process(), and status_startup().

5.137.2.3 uint64_t startup

Definition at line 12 of file status.c.

5.137.2.4 int status_level = 0

Definition at line 18 of file status.c.

Referenced by status(), status_get(), status_set(), and status_signal().

5.137.2.5 pthread_rwlock_t status_lock = PTHREAD_RWLOCK_INITIALIZER

Definition at line 19 of file status.c.

Referenced by status(), status_get(), status_set(), and status_signal().

5.138 src/engine/status/status.h File Reference

Functions

- const char * build_stamp (void)
  Get the magma build stamp.
- const char * build_commit (void)
  Get the magma commit identity.
- const char * build_version (void)
  Get the magma version string.
- uint64_t perf_rdtsc (void)
- bool_t status (void)
  status.c
- int status_get (void)
  Get the current status level.
- uint64_t status_pid (void)
  Get the magma instance's pid.
- void status_process (void)
  Update magma's basic process information (pid and start time).
- void status_set (int value)
  Set the status level to a specified value.
- void status_signal (void)
  Enqueued by the signal handler so the status can be updated asynchronously.
- uint64_t status_startup (void)
  Get the timestamp corresponding to when magma was started.
- uint64_t stats_derived_count (void)
  Get the number of derived statistics that are tracked.
- char * stats_derived_name (uint64_t position)
  Get the name of a derived statistic by index.
- uint64_t stats_derived_value (uint64_t position)
  Get the value of a derived statistic by index.
- bool_t stats_init (void)
  Initialize and reset all statistics counters.
- void stats_shutdown (void)
  Destroy all statistics locks.
- uint64_t stats_get_count (void)
  Get the number of statistics being tracked.

- char * stats_get_name (uint64_t position)
  Get the name of a statistic by its index.
- uint64_t stats_get_value_by_name (char *name)
  Provided a statistic by name, get its value.
- uint64_t stats_get_value_by_num (uint64_t position)
  Provided a statistic by index, get its value.
- void stats_decrement_by_name (char *name)
  Provided a statistic by name, decrement its value by 1.
- void stats_decrement_by_num (uint64_t position)
  Provided a statistic by index, decrement its value by 1.
- void stats_increment_by_name (char *name)
  Provided a statistic by name, increment its value by 1.
- void stats_increment_by_num (uint64_t position)
  Provided a statistic by index, increment its value by 1.
- void stats_set_by_name (char *name, uint64_t value)
  Provided a statistic by name, set its value.
- void stats_set_by_num (uint64_t position, uint64_t value)
  Provided a statistic by index, set its value.
- void stats_adjust_by_name (char *name, int32_t value)
  Provided a statistic by name, increment its value by a specified amount.
- void stats_adjust_by_num (uint64_t position, int32_t value)
  Provided a statistic by index, increment its value by a specified amount.
- stringer_t * host_platform (stringer_t *output)
  Get a description of the local operating system.
- stringer_t * host_version (stringer_t *output)
  Get release information about the local OS.

5.138.1 Function Documentation

5.138.1.1 const char* build_commit (void)

Get the magma commit identity.

Returns:

a pointer to a null-terminated string containing the last eight characters of current commit identity.

Definition at line 34 of file build.c.

Referenced by args_parse(), and lib_load().

5.138.1.2 const char* build_stamp (void)

Get the magma build stamp.

Returns:

a pointer to a null-terminated string containing the magma build information string.

Definition at line 42 of file build.c.

Referenced by args_parse(), http_response_options(), imap_id(), and lib_load().

5.138.1.3 const char* build_version (void)

Get the magma version string.

Returns:

a pointer to a null-terminated string containing the magma version string.

Definition at line 26 of file build.c.

Referenced by args_parse(), http_response_options(), imap_id(), imap_init(), lib_load(), and pop_capa().

5.138.1.4 stringer_t* host_platform (stringer_t * *output*)

Get a description of the local operating system. host.c

Parameters:

output a pointer to a managed string to receive the OS description.

Returns:

NULL on failure, or the user-specified managed string containing the OS info on success.

Definition at line 15 of file host.c.

References log_pedantic, ns_length_get(), st_avail_get(), and st_sprint().

Referenced by lib_load().

5.138.1.5 stringer_t* host_version (stringer_t * *output*)

Get release information about the local OS.

Parameters:

output a pointer to a managed string to receive the release information.

Returns:

NULL on failure, or the user-specified managed string containing the release info on success.

Definition at line 41 of file host.c.

References log_pedantic, ns_length_get(), st_avail_get(), and st_sprint().

Referenced by lib_load().

5.138.1.6 uint64_t perf_rdtsc (void)

Returns the CPU cycle counter. By calculating variations in the time stamp, we can discover the exact number of elapsed CPU ticks, making it possible to precisely time code execution. Note that in a multithreaded environment its possible that not all of the elapsed ticks were consumed by the code being timed.

Returns:

The number of CPU cycles that have elapsed since boot.

Definition at line 180 of file performance.c.

5.138.1.7 void stats_adjust_by_name (char * *name*, int32_t *value*)

Provided a statistic by name, increment its value by a specified amount.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 360 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dkim_signature_create(), dkim_signature_verify(), obj_cache_prune(), pattern_check(), and spf_check().

5.138.1.8 void stats_adjust_by_num (uint64_t *position*, int32_t *value*)

Provided a statistic by index, increment its value by a specified amount.

Parameters:

position the zero-based index of the statistic to be set.

value the value by which to increment the specified statistic.

Returns:

This function returns no value.

Definition at line 381 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.138.1.9 void stats_decrement_by_name (char * *name*)

Provided a statistic by name, decrement its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 429 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by con_destroy(), dequeue(), and queue_shutdown().

5.138.1.10 void stats_decrement_by_num (uint64_t *position*)

Provided a statistic by index, decrement its value by 1.

Parameters:

position the zero-based index of the statistic to be decremented.

Returns:

This function returns no value.

Definition at line 449 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.138.1.11 uint64_t stats_derived_count (void)

Get the number of derived statistics that are tracked.

Returns:

the number of derived statistics being maintained by magma.

Definition at line 183 of file statistics.c.

References derived.

Referenced by molten_stats(), stats_derived_name(), and stats_sum_errors().

5.138.1.12 char* stats_derived_name (uint64_t *position*)

Get the name of a derived statistic by index.

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the name of the derived statistic on success.

Definition at line 193 of file statistics.c.

References derived, and stats_derived_count().

Referenced by molten_stats(), and stats_sum_errors().

5.138.1.13 uint64_t stats_derived_value (uint64_t *position*)

Get the value of a derived statistic by index.

See also:

mm_sec_stats()

Parameters:

position the zero-based index of the derived statistic to be queried.

Returns:

0 on failure, or the value of the specified derived statistic on success.

Definition at line 208 of file statistics.c.

References bytes, items, log_pedantic, mm_sec_stats(), spool_error_stats(), and stats_sum_errors().

Referenced by molten_stats(), and stats_sum_errors().

5.138.1.14 uint64_t stats_get_count (void)

Get the number of statistics being tracked.

Returns:

the total number of statistics counters maintained by magma.

Definition at line 462 of file statistics.c.

References stats.

Referenced by molten_stats(), and stats_sum_errors().

5.138.1.15 char* stats_get_name (uint64_t *position*)

Get the name of a statistic by its index.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

0 on failure, or the name of the requested statistic on success.

Definition at line 272 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.138.1.16 uint64_t stats_get_value_by_name (char * *name*)

Provided a statistic by name, get its value.

Parameters:

name a null-terminated string containing the name of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 323 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

5.138.1.17 uint64_t stats_get_value_by_num (uint64_t *position*)

Provided a statistic by index, get its value.

Parameters:

position the zero-based index of the statistic to be queried.

Returns:

the specified statistic's value, as an unsigned 64 bit integer.

Definition at line 343 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

Referenced by molten_stats(), and stats_sum_errors().

5.138.1.18 void stats_increment_by_name (char * *name*)

Provided a statistic by name, increment its value by 1.

Parameters:

name a null-terminated string containing the name of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 395 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by dequeue(), imap_starttls(), pop_starttls(), protocol_enqueue(), queue_init(), register_abuse_check_blocklist(), smtp_starttls(), virus_check(), virus_engine_refresh(), and virus_start().

5.138.1.19 void stats_increment_by_num (uint64_t *position*)

Provided a statistic by index, increment its value by 1.

Parameters:

position the zero-based index of the statistic to be incremented.

Returns:

This function returns no value.

Definition at line 415 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.138.1.20 bool_t stats_init (void)

Initialize and reset all statistics counters.

Returns:

false on failure or true on success.

Definition at line 471 of file statistics.c.

References log_critical, mm_wipe(), mutex_init(), and stats.

Referenced by process_start().

5.138.1.21 void stats_set_by_name (char * *name*, uint64_t *value*)

Provided a statistic by name, set its value.

Parameters:

name a null-terminated string containing the name of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 289 of file statistics.c.

References mutex_lock(), mutex_unlock(), stats, and stats_get_name_pos().

Referenced by obj_cache_prune(), virus_engine_refresh(), virus_start(), and virus_stop().

5.138.1.22 void stats_set_by_num (uint64_t *position*, uint64_t *value*)

Provided a statistic by index, set its value.

Parameters:

position the zero-based index of the statistic to be set.

value the new value of the specified statistic.

Returns:

This function returns no value.

Definition at line 309 of file statistics.c.

References mutex_lock(), mutex_unlock(), and stats.

5.138.1.23 void stats_shutdown (void)

Destroy all statistics locks.

Returns:

This function returns no value.

Definition at line 494 of file statistics.c.

References mutex_destroy(), and stats.

Referenced by process_stop().

5.138.1.24 bool_t status (void)

status.c status.c

Note:

This function should be called periodically by worker threads.

Returns:

true if the caller should continue processing (status level is positive) or false otherwise.

Definition at line 26 of file status.c.

References rwlock_lock_read(), rwlock_unlock(), status_level, and status_lock.

5.138.1.25 int status_get (void)

Get the current status level.

See also:

status()

Returns:

the current value of the status level.

Definition at line 66 of file status.c.

References rwlock_lock_read(), rwlock_unlock(), status_level, and status_lock.

5.138.1.26 uint64_t status_pid (void)

Get the magma instance's pid.

Returns:

the value of magma's pid.

Definition at line 88 of file status.c.

References process.

5.138.1.27 void status_process (void)

Update magma's basic process information (pid and start time).

Returns:

This function returns no value.

Definition at line 78 of file status.c.

References process, and process_my_pid().

Referenced by process_start(), system_fork_daemon(), and system_init_impersonation().

5.138.1.28 void status_set (int *value*)

Set the status level to a specified value.

See also:

status()

Parameters:

value the integer value of the new status level.

Returns:

This function returns no value.

Definition at line 43 of file status.c.

References rwlock_lock_write(), rwlock_unlock(), status_level, and status_lock.

Referenced by main().

5.138.1.29 void status_signal (void)

Enqueued by the signal handler so the status can be updated asynchronously.

Definition at line 53 of file status.c.

References log_pedantic, rwlock_lock_write(), rwlock_unlock(), status_level, and status_lock.

Referenced by signal_shutdown().

5.138.1.30 uint64_t status_startup (void)

Get the timestamp corresponding to when magma was started.

Returns:

the UNIX-style date-time value when magma was started.

Definition at line 96 of file status.c.

References process.

Functions

- ip_t ∗ con_addr (connection_t ∗con, ip_t ∗output)

  Return the IP address information of the remote end of a client connection.

- stringer_t ∗ con_addr_presentation (connection_t ∗con, stringer_t ∗output)

  Return a textual representation of the IP address of a specified connection handle.

- stringer_t ∗ con_addr_standard (connection_t ∗con, stringer_t ∗output)

  Get the IP address string for the client connection.

- stringer_t ∗ con_addr_reversed (connection_t ∗con, stringer_t ∗output)

  Get the reversed-IP address string for a client connection.

- stringer_t ∗ con_addr_subnet (connection_t ∗con, stringer_t ∗output)

  Get the subnet string for a specified connection.

- uint32_t con_addr_word (connection_t ∗con, int_t position)

  Get a specified 32-bit segment of a connection's peer IP address.

- octet_t con_addr_octet (connection_t ∗con, int_t position)

  Get a specified 8-bit octet of a connection's peer IP address.

- segment_t con_addr_segment (connection_t ∗con, int_t position)

  Extract a specified 16 bit segment from a connection's peer IP address.

5.141.1 Function Documentation

5.141.1.1 ip_t∗ con_addr (connection_t ∗ *con*, ip_t ∗ *output*)

Return the IP address information of the remote end of a client connection. addresses.c

Parameters:

con the input client connection.

output a pointer to an ip_t structure to receive the remote IP address, which is allocated for the caller if output is NULL.

Returns:

NULL on error, or a pointer to the IP address of the remote host.

Definition at line 16 of file addresses.c.

References connection_t::network, and connection_t::reverse.

Referenced by con_addr_octet(), con_addr_presentation(), con_addr_reversed(), con_addr_segment(), con_addr_standard(), con_addr_-subnet(), con_addr_word(), sess_create(), sess_get(), smtp_bypass_check(), and smtp_rcpt_to().

5.141.1.2 octet_t con_addr_octet (connection_t * *con*, int_t *position*)

Get a specified 8-bit octet of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 8-bit octets that comprise the target IP address.

Returns:

-1 on error, or the specified 8-bit octet of the passed address on success.

Definition at line 152 of file addresses.c.

References con_addr(), and ip_octet().

5.141.1.3 stringer_t* con_addr_presentation (connection_t * *con*, stringer_t * *output*)

Return a textual representation of the IP address of a specified connection handle.

Parameters:

con the remote connection to be queried.

output a managed string to store the result, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 62 of file addresses.c.

References con_addr(), and ip_presentation().

Referenced by api_endpoint_auth(), contact_abuse_checks(), contact_abuse_increment_history(), contact_business(), imap_id(), imap_-login(), mail_add_inbound_headers(), mail_add_outbound_headers(), pop_pass(), portal_endpoint_auth(), portal_meta(), protocol_secure(), register_abuse_checks(), register_data_insert_user(), register_session_cache(), register_session_get(), smtp_auth_login(), smtp_auth_plain(), and smtp_rcpt_to().

5.141.1.4 stringer_t* con_addr_reversed (connection_t * *con*, stringer_t * *output*)

Get the reversed-IP address string for a client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if passed as NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address on success.

Definition at line 98 of file addresses.c.

References con_addr(), and ip_reversed().

Referenced by smtp_check_greylist(), and smtp_check_rbl().

5.141.1.5 segment_t con_addr_segment (connection_t * *con*, int_t *position*)

Extract a specified 16 bit segment from a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position the zero-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 170 of file addresses.c.

References con_addr(), and ip_segment().

5.141.1.6 stringer_t* con_addr_standard (connection_t * *con*, stringer_t * *output*)

Get the IP address string for the client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 80 of file addresses.c.

References con_addr(), and ip_standard().

Referenced by register_abuse_check_blocklist(), register_abuse_checks(), and register_abuse_increment_history().

5.141.1.7 stringer_t* con_addr_subnet (connection_t * *con*, stringer_t * *output*)

Get the subnet string for a specified connection.

Parameters:

con the client connection to be queried.

output a managed string that will store the output of the subnet string lookup.

Returns:

NULL on failure, or a managed string containing a textual representation of a subnet address on success.

Definition at line 116 of file addresses.c.

References con_addr(), and ip_subnet().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_check_-receive_quota(), and smtp_update_receive_stats().

5.141.1.8 uint32_t con_addr_word (connection_t * *con*, int_t *position*)

Get a specified 32-bit segment of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

-1 if the connecting address can't be looked up, 0 on general error, or the specified 32-bit segment of the passed address on success.

Definition at line 134 of file addresses.c.

References con_addr(), and ip_word().

```
#include "magma.h"
```

Functions

- int_t client_status (client_t *client)
  Get the status of a network client.
- int_t client_secure (client_t *client)
  Establish a TLS connection with a network client instance.
- client_t * client_connect (chr_t *host, uint32_t port)
  Establish a network client connection to a remote host.
- void client_close (client_t *client)
  Close a network client connection.

5.142.1 Function Documentation

5.142.1.1 void client_close (client_t * *client*)

Close a network client connection. clients.c

Note:

If ssl is in use, this will also destroy the overlying ssl session.

Returns:

This function returns no value.

Definition at line 170 of file clients.c.

References client_t::buffer, client_t::ip, mm_cleanup, mm_free(), client_t::sockd, st_cleanup, client_t::tls, and tls_free().

Referenced by smtp_client_close(), and smtp_client_connect().

5.142.1.2 client_t* client_connect (chr_t * *host*, uint32_t *port*)

Establish a network client connection to a remote host.

Parameters:

host a pointer to a null-terminated string containing the hostname of the remote server.

port the port number of the server to which the connection will be established.

Returns:

NULL on failure or a pointer to a newly initialized network client object for the connection upon success.

Definition at line 70 of file clients.c.

References client_t::buffer, ip_t::family, FOREIGNDATA, client_t::ip, ip_t::ip4, ip_t::ip6, JOINTED, client_t::line, log_pedantic, MEMORYBUF, mm_alloc(), mm_cleanup, mm_copy(), mm_free(), PLACER_T, client_t::sockd, st_alloc(), STACK, and client_t::status.

Referenced by smtp_client_connect().

5.142.1.3 int_t client_secure (client_t ∗ *client*)

Establish a TLS connection with a network client instance.

Parameters:

client a pointer to the network client object to have its transport security upgraded.

Returns:

-1 on failure or 0 on success.

Definition at line 45 of file clients.c.

References client_t::sockd, client_t::status, client_t::tls, and tls_client_alloc().

Referenced by smtp_client_connect().

5.142.1.4 int_t client_status (client_t ∗ *client*)

Get the status of a network client.

Parameters:

client a pointer to the network client object to be queried.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 15 of file clients.c.

References client_t::sockd, client_t::status, tcp_status(), client_t::tls, and tls_status().

Referenced by client_read(), and client_write().

5.143 src/network/connections.c File Reference

```
#include "magma.h"
```

Functions

- int_t con_secure (connection_t *con)

  Return the security level of a specified connection.

- bool_t con_localhost (connection_t *con)

  Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

- bool_t con_private (connection_t *con)

  Determine whether a client connection is with a machine on the same private network.

- int_t con_status (connection_t *con)

  Return the status of a specified connection.

- void con_destroy (connection_t *con)

  Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

- uint64_t con_increment_refs (connection_t *con)

  Increment a connection object's reference counter.

- uint64_t con_decrement_refs (connection_t *con)

  Decrement a connection object's reference counter.

- bool_t con_init_network_buffer (connection_t *con)

  Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

- connection_t * con_init (int cond, server_t *server)

  Create a new connection object for a client connection.

5.143.1 Function Documentation

5.143.1.1 uint64_t con_decrement_refs (connection_t * *con*)

Decrement a connection object's reference counter. connections.c

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 194 of file connections.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), and connection_t::refs.

Referenced by con_destroy().

5.143.1.2 void con_destroy (connection_t * *con*)

Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

Parameters:

con a pointer to the connection to be destroyed.

Returns:

This function returns no value.

Definition at line 89 of file connections.c.

References connection_t::buffer, con_decrement_refs(), DMTP, dmtp_session_destroy(), HTTP, http_session_destroy(), IMAP, imap_session_destroy(), connection_t::lock, mm_cleanup, mm_free(), MOLTEN, molten_session_destroy(), mutex_destroy(), connection_t::network, POP, pop_session_destroy(), server_t::protocol, connection_t::reverse, connection_t::server, SMTP, smtp_session_destroy(), connection_t::sockd, st_cleanup, stats_decrement_by_name(), SUBMISSION, connection_t::tls, and tls_free().

Referenced by con_reverse_lookup(), dmtp_quit(), http_close(), imap_logout(), molten_quit(), pop_quit(), protocol_enqueue(), and smtp_quit().

5.143.1.3 uint64_t con_increment_refs (connection_t * *con*)

Increment a connection object's reference counter.

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 178 of file connections.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), and connection_t::refs.

Referenced by con_init().

5.143.1.4 connection_t* con_init (int *cond*, server_t * *server*)

Create a new connection object for a client connection.

Parameters:

cond the socket descriptor of the inbound client connection that was just accepted.

server the handle of the server that serviced the inbound request.

Definition at line 234 of file connections.c.

References con_increment_refs(), connection_t::lock, mm_alloc(), mm_free(), mutex_init(), connection_t::network, connection_t::reverse, connection_t::server, connection_t::sockd, and tcp_addr_ip().

Referenced by protocol_process().

5.143.1.5 bool_t con_init_network_buffer (connection_t * *con*)

Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

Note:

A network buffer of size magma.system.network_buffer bytes will be allocated for the connection if one does not exist.

Returns:

true if the connection object has been associated with a network buffer or false on failure.

Definition at line 210 of file connections.c.

References connection_t::buffer, connection_t::line, log_info, magma, connection_t::network, magma_t::network_buffer, pl_null(), st_alloc(), and magma_t::system.

Referenced by con_read(), and con_read_line().

5.143.1.6 bool_t con_localhost (connection_t ∗ *con*)

Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

See also:

ip_localhost()

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 32 of file connections.c.

References ip_localhost(), connection_t::network, and connection_t::reverse.

Referenced by json_api_dispatch(), portal_endpoint(), portal_endpoint_auth(), portal_process(), and portal_upload().

5.143.1.7 bool_t con_private (connection_t ∗ *con*)

Determine whether a client connection is with a machine on the same private network.

See also:

ip_private()

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 48 of file connections.c.

References ip_localhost(), connection_t::network, and connection_t::reverse.

5.143.1.8 int_t con_secure (connection_t ∗ *con*)

Return the security level of a specified connection.

Parameters:

con the input client connection.

Returns:

1 for a secure connection, 0 for insecure, and -1 if the server does not support SSL/TLS.

Definition at line 15 of file connections.c.

References server_t::context, connection_t::network, connection_t::server, server_t::tls, and connection_t::tls.

Referenced by contact_process(), http_print_301(), http_response_cookie(), imap_capability(), imap_init(), imap_login(), imap_starttls(), json_api_dispatch(), pop_capa(), pop_pass(), pop_starttls(), portal_endpoint(), portal_endpoint_auth(), portal_process(), portal_upload(), protocol_enqueue(), register_process(), sess_create(), sess_get(), smtp_ehlo(), smtp_rcpt_to(), smtp_starttls(), and teacher_process().

5.143.1.9 int_t con_status (connection_t * *con*)

Return the status of a specified connection.

Parameters:

con the input client connection.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 64 of file connections.c.

References connection_t::network, connection_t::sockd, connection_t::status, tcp_status(), connection_t::tls, and tls_status().

Referenced by con_read(), con_read_line(), con_write_bl(), dmtp_quit(), dmtp_requeue(), http_requeue(), imap_fetch(), imap_logout(), imap_requeue(), pop_quit(), pop_requeue(), smtp_quit(), and smtp_requeue().

Definition at line 20 of file dmtp.h.

5.145.3 Function Documentation

5.145.3.1 int _sgnt_resolv_dmtp_expect_banner (dmtp_session_t * *session*)

Attempt to receive a valid DMTP banner immediately after a connection is established.

Parameters:

session a pointer to the DMTP session to have the server banner read.

Returns:

-1 on failure or 0 if a banner was succesfully received advertising DMTPv1 compatibility.

Definition at line 1667 of file dmtp.c.

References _dbgprint(), _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_INT.

Referenced by _dx_connect_dual(), and _dx_connect_standard().

5.145.3.2 dmtp_mode_t _sgnt_resolv_dmtp_initiate_starttls (dmtp_session_t ∗ *session*, const char ∗ *dxname*)

Initiate a DMTP session over a plain TCP connection with the DMTP STARTTLS command.

Note:

The dxname argument will be used as a parameter to the STARTTLS command for requesting a TLS certificate explcitly by hostname.

Parameters:

session a pointer to the DMTP session to have its transport security upgraded with TLS.

dxname the name of the DX server providing the TLS service of this DMTP session.

Returns:

dmtp_mode_unknown on failure or the active mode of the DMTP session as reported by the server on success.

Definition at line 1585 of file dmtp.c.

References dmtp_session_t::_fd, _sgnt_resolv_dmtp_str_to_mode(), _sgnt_resolv_read_dmtp_line(), _sgnt_resolv_read_dmtp_multiline(), _ssl_starttls(), chr_isspace, dmtp_session_t::con, dmtp_mode_dmtp, dmtp_mode_unknown, ERR_BAD_PARAM, ERR_UNSPEC, dmtp_-session_t::mode, PUSH_ERROR_FMT, and RET_ERROR_CUST.

Referenced by _dx_connect_dual().

5.145.3.3 int _sgnt_resolv_dmtp_issue_command (dmtp_session_t ∗ *session*, const char ∗ *cmd*)

Issue a command to the remote server in a DMTP session.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

Returns:

-1 on failure or 0 if the command was successfully sent.

Definition at line 1715 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::con, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and SSL_write_d.

Referenced by _sgnt_resolv_dmtp_ehlo(), _sgnt_resolv_dmtp_help(), _sgnt_resolv_dmtp_history(), _sgnt_resolv_dmtp_send_and_read(), and _sgnt_resolv_dmtp_stats().

5.145.3.4 char∗ _sgnt_resolv_dmtp_send_and_read (dmtp_session_t ∗ *session*, const char ∗ *cmd*, unsigned short ∗ *rcode*)

Issue a command to a DMTP server and get the response.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

rcode

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server on success.

Definition at line 1756 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_-ERROR_PTR.

Referenced by _sgnt_resolv_dmtp_data(), _sgnt_resolv_dmtp_get_mode(), _sgnt_resolv_dmtp_get_signet(), _sgnt_resolv_dmtp_mail_-from(), _sgnt_resolv_dmtp_noop(), _sgnt_resolv_dmtp_quit(), _sgnt_resolv_dmtp_rcpt_to(), _sgnt_resolv_dmtp_reset(), and _sgnt_resolv_-dmtp_verify_signet().

5.145.3.5 dmtp_mode_t _sgnt_resolv_dmtp_str_to_mode (const char ∗ *modestr*)

Return the DMTP mode corresponding to a DMTP mode string.

Parameters:

modestr a null-terminated string containing the human-readable name of the mode.

Returns:

the DMTP mode type corresponding to the supplied mode string, or dmtp_mode_unknown otherwise.

Definition at line 1083 of file dmtp.c.

References dmtp_mode_dmtp, dmtp_mode_esmtp, dmtp_mode_smtp, and dmtp_mode_unknown.

Referenced by _sgnt_resolv_dmtp_get_mode(), and _sgnt_resolv_dmtp_initiate_starttls().

5.145.3.6 int _sgnt_resolv_dmtp_write_data (dmtp_session_t ∗ *session*, const void ∗ *buf*, size_t *buflen*)

Write raw data to the remote end of a DMTP session.

Parameters:

session a pointer to the DMTP session to which the data will be written.

buf a pointer to the buffer containing the raw data to be written.

buflen the size, in bytes, of the data buffer to be written to the DMTP session.

Returns:

0 if all requested bytes were written successfully to the connection, or -1 on failure.

Definition at line 1783 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::con, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and SSL_write_d.

Referenced by _sgnt_resolv_dmtp_data().

5.145.3.7 char* _sgnt_resolv_parse_line_code (const char * *line*, unsigned short * *rcode*, int * *multiline*)

Parse a DMTP line into a numerical code and the trailing text.

Parameters:

line a pointer to a null-terminated string to be parsed as a DMTP response line or lines.

rcode an opointer to a variable that will receive the numeric response code of the DMTP reply.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1524 of file dmtp.c.

References chr_isspace, ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _sgnt_resolv_read_dmtp_line().

5.145.3.8 char* _sgnt_resolv_read_dmtp_line (dmtp_session_t * *session*, int * *overflow*, unsigned short * *rcode*, int * *multiline*)

Read a CR/LF-terminated line of input from an active DMTP session.

Parameters:

session a pointer to the DMTP session from which the response line will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1292 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::_inbuf, dmtp_session_t::_inpos, _sgnt_resolv_parse_line_code(), _ssl_disconnect(), dmtp_session_t::active, dmtp_session_t::con, dmtp_mode_dmtp, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dmtp_session_t::mode, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and SSL_read_d.

Referenced by _sgnt_resolv_dmtp_data(), _sgnt_resolv_dmtp_expect_banner(), _sgnt_resolv_dmtp_initiate_starttls(), _sgnt_resolv_dmtp_send_and_read(), and _sgnt_resolv_read_dmtp_multiline().

5.145.3.9 char* _sgnt_resolv_read_dmtp_multiline (dmtp_session_t * *session*, int * *overflow*, unsigned short * *rcode*)

Read a multiple-line response from the DMTP server.

Note:

A multiline response is designated by the presence of a hyphen between the response code and the respones text. A regular response, or the final line of a multiline response will instead have a space.

Parameters:

session a pointer to the DMTP session from which the response line(s) will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

Returns:

NULL on failure or a pointer to a string containing the next response from the DMTP server on success.

Definition at line 1443 of file dmtp.c.

Functions

- void dmtp_requeue (connection_t *con)

  commands.c

- int_t dmtp_compare (const void *compare, const void *command)
- void dmtp_process (connection_t *con)

  The main entry point in the DMTP server for processing commands issued by clients.

- void dmtp_sort (void)

  Sort the DMTP command table to be ready for binary searches.

- void dmtp_ehlo (connection_t *con)

  dmtp.c

- void dmtp_helo (connection_t *con)

  Process an DMTP HELO command.

- void dmtp_noop (connection_t *con)

  Perform an DMTP NOOP (no-operation) command.

- void dmtp_mode (connection_t *con)
- void dmtp_rset (connection_t *con)

  Reset the DMTP session, in response to an DMTP RSET command.

- void dmtp_quit (connection_t *con)

  Gracefully terminate an DMTP session, especially in response to an DMTP QUIT command.

- void dmtp_mail (connection_t *con)

  Specify the origin domain for a message in response to an DMTP MAIL command.

- void dmtp_rcpt (connection_t *con)

  Specify the destination domain for a message in response to an DMTP RCPT command.

- void dmtp_data (connection_t *con)

  Process an DMTP MAIL command.

- void dmtp_sgnt (connection_t *con)
- void dmtp_hist (connection_t *con)
- void dmtp_vrfy (connection_t *con)
- void dmtp_help (connection_t *con)
- void dmtp_verb (connection_t *con)
- void dmtp_init (connection_t *con)

  The start of the protocol handler for the DMTP server.

- void dmtp_invalid (connection_t *con)

  A function that is executed when an invalid DMTP command is executed.

- void dmtp_session_reset (connection_t *con)

  session.c

- void dmtp_session_destroy (connection_t *con)
  Destroy the data associated with an DMTP session.

5.146.1 Function Documentation

5.146.1.1 int_t dmtp_compare (const void * *compare*, const void * *command*)

Definition at line 11 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by dmtp_process(), and dmtp_sort().

5.146.1.2 void dmtp_data (connection_t * *con*)

Process an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 123 of file dmtp.c.

References con_write_bl(), and dmtp_requeue().

Referenced by dmtp_process().

5.146.1.3 void dmtp_ehlo (connection_t * *con*)

dmtp.c dmtp.c

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 15 of file dmtp.c.

References con_print(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

5.146.1.4 void dmtp_helo (connection_t * *con*)

Process an DMTP HELO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 28 of file dmtp.c.

References con_print(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

5.146.1.5 void dmtp_help (connection_t * *con*)

Definition at line 158 of file dmtp.c.

References con_write_bl().

5.146.1.6 void dmtp_hist (connection_t * *con*)

Definition at line 144 of file dmtp.c.

References con_write_bl().

5.146.1.7 void dmtp_init (connection_t * *con*)

The start of the protocol handler for the DMTP server.

Parameters:

con the new inbound DMTP client connection.

Returns:

This function returns no value.

Definition at line 175 of file dmtp.c.

References con_print(), con_reverse_enqueue(), dmtp_requeue(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

Referenced by protocol_enqueue().

5.146.1.8 void dmtp_invalid (connection_t * *con*)

A function that is executed when an invalid DMTP command is executed.

Returns:

This function returns no value.

Definition at line 52 of file dmtp.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by dmtp_process().

5.146.1.9 void dmtp_mail (connection_t * *con*)

Specify the origin domain for a message in response to an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 111 of file dmtp.c.

References con_write_bl().

5.146.1.10 void dmtp_mode (connection_t * *con*)

Definition at line 130 of file dmtp.c.

References con_write_bl().

5.146.1.11 void dmtp_noop (connection_t * *con*)

Perform an DMTP NOOP (no-operation) command.

Note:

This command does essentially nothing and is mostly a way to keep connections alive without timing out due to inactivity.

Returns:

This function returns no value.

Definition at line 42 of file dmtp.c.

References con_write_bl().

5.146.1.12 void dmtp_process (connection_t * *con*)

The main entry point in the DMTP server for processing commands issued by clients.

Parameters:

con a pointer to the connection object of the client issuing the DMTP command.

Returns:

This function returns no value.

Definition at line 48 of file commands.c.

References connection_t::command, command, con_read_line(), server_t::cutoff, dmtp_commands, dmtp_compare(), dmtp_data(), dmtp_invalid(), dmtp_process(), dmtp_quit(), dmtp_requeue(), enqueue(), command_t::function, command_t::length, connection_t::line, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, command_t::string, server_t::violations, and connection_t::violations.

Referenced by dmtp_process(), and dmtp_requeue().

5.146.1.13 void dmtp_quit (connection_t * *con*)

Gracefully terminate an DMTP session, especially in response to an DMTP QUIT command.

Parameters:

the DMTP client connection to be terminated.

Returns:

This functi::include "smtp/smtp.h"on returns no value.

Definition at line 65 of file dmtp.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by dmtp_process(), and dmtp_requeue().

5.146.1.14 void dmtp_rcpt (connection_t * *con*)

Specify the destination domain for a message in response to an DMTP RCPT command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 100 of file dmtp.c.

References con_write_bl().

5.146.1.15 void dmtp_requeue (connection_t * *con*)

commands.c

Definition at line 31 of file commands.c.

References con_status(), server_t::cutoff, dmtp_process(), dmtp_quit(), enqueue(), connection_t::protocol, connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by dmtp_data(), dmtp_init(), and dmtp_process().

5.146.1.16 void dmtp_rset (connection_t * *con*)

Reset the DMTP session, in response to an DMTP RSET command.

Note:

This command clears any sender, recipient, and mail data, along with all buffers and state tables. The connection structure is reset to the same it was in immediately after the HELO/EHLO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 88 of file dmtp.c.

References con_write_bl(), and dmtp_session_reset().

5.146.1.17 void dmtp_session_destroy (connection_t * *con*)

Destroy the data associated with an DMTP session.

Parameters:

con the DMTP client connection to be destroyed.

Returns:

This function returns no value.

Definition at line 25 of file session.c.

Referenced by con_destroy().

5.146.1.18 void dmtp_session_reset (connection_t * *con*)

session.c session.c

Parameters:

con the DMTP client connection to be reset.

Returns:

This function returns no value.

Definition at line 15 of file session.c.

Referenced by dmtp_rset().

5.146.1.19 void dmtp_sgnt (connection_t * *con*)

Definition at line 137 of file dmtp.c.

References con_write_bl().

5.146.1.20 void dmtp_sort (void)

Sort the DMTP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References dmtp_commands, and dmtp_compare().

Referenced by protocol_init().

5.146.1.21 void dmtp_verb (connection_t * *con*)

Definition at line 164 of file dmtp.c.

References con_write_bl().

5.146.1.22 void dmtp_vrfy (connection_t * *con*)

Definition at line 151 of file dmtp.c.

References con_write_bl().

  HTTP_CLOSE = 1000 }

Functions

- bool_t http_content_load_directory (int_t template, chr_t *directory)
  content.c
- bool_t http_content_load_fonts (void)
  Load all fonts into the http server repository.
- bool_t http_content_refresh (void)
  Refresh the stored contents of the web app templates, static content, and fonts directories.
- bool_t http_content_start (void)
  Prime the the web app templates, static content, and fonts directories for future use.
- void http_content_stop (void)
  Purge the http contents repository of stored fonts, templates, and static web pages.
- void http_free_content (http_content_t *page)
  LOW: We should use basename() and dirname() to cleanup path strings.
- http_content_t * http_get_static (stringer_t *location)
  Get a cached copy of a static web page.
- http_content_t * http_get_template (chr_t *location)
  Return a template by location.
- bool_t http_load_file (int_t template, chr_t *filename)
  Load file content into the http server repository.
- void http_page_free (http_page_t *page)
  Free an http page object and all its underlying data.
- http_page_t * http_page_get (chr_t *location)
  Get a template page and prepare its xml document root for use.
- void http_data_free (http_data_t *data)
  data.c

- http_data_t * http_data_get (connection_t *con, HTTP_DATA source, chr_t *name)
  Get a name/value pair associated with an http connection, by name.
- http_data_t * http_data_header_parse_line (chr_t *buf, size_t len)
  Parse a data buffer into a http header name/value pair.
- http_data_t * http_data_header_parse (connection_t *con)
  Parse the current line of input from an http client connection into a http header name/value pair.
- void http_data_value_decode (stringer_t *string)
  Decode an escaped URI component into its original data.
- int_t http_data_value_parse (connection_t *con, HTTP_DATA source, placer_t pair)
  Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.
- void http_print_301 (connection_t *con, chr_t *location, int_t tls)
  errors.c
- void http_print_400 (connection_t *con)
  Return an HTTP 400 bad client request response to the client.
- void http_print_403 (connection_t *con)
  Return an HTTP 403 access denied response to the client.
- void http_print_404 (connection_t *con)
  Return an HTTP 404 location not found response to the client.
- void http_print_405 (connection_t *con)
  Return an HTTP 405 method not allowed response to the client.
- void http_print_500 (connection_t *con)
  Return an HTTP 500 internal server error response to the client.
- void http_print_500_log (connection_t *con, chr_t *logmsg)
  Return an HTTP 500 internal server error response to the client, with additional logging information.
- void http_print_501 (connection_t *con)
  Return an HTTP 501 method not implemented response to the client.
- void http_body (connection_t *con)
  http.c
- void http_close (connection_t *con)
  Close a connection corresponding to an http session.
- void http_init (connection_t *con)
  Handle a new http client connection.
- void http_process (connection_t *con)
  Process data sent by an http client.
- void http_requeue (connection_t *con)
  The main http server requeue entry point state machine for processing client data.

- void http_parse_context (connection_t *con, stringer_t *application, stringer_t *path)

  Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL.

- void http_parse_header (connection_t *con)

  Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's http.headers member.

- void http_parse_method (connection_t *con)

  Parse an http request and determine the request method and location.

- int_t http_parse_origin (stringer_t *s, placer_t *output)

  Get the origin of a resource from a url.

- void http_parse_pairs (connection_t *con)

  Parse all the GET and POST parameters present in an http client request, and store them with the connection.

- placer_t get_header_value_noopt (stringer_t *vstring)

  Get the simple value of an http header, with any optional parameters stripped away.

- placer_t get_header_opt (stringer_t *vstring, stringer_t *optname)

  Get the value of a named optional parameter from an http header value.

- bool_t multipart_get_boundary (connection_t *con, placer_t *output)

  Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.

- void http_response (connection_t *con)

  response.c

- stringer_t * http_response_allow_cross (connection_t *con)
- stringer_t * http_response_connection (connection_t *con, int_t force)

  Get an appropriate value for the Connection header of an http response.

- stringer_t * http_response_cookie (connection_t *con)
- void http_response_header (connection_t *con, int_t status, stringer_t *type, size_t len)

  Send a full set of http response headers to the remote client.

- void http_response_options (connection_t *con)

  Return a response to an http OPTIONS request.

- chr_t * http_response_status (int_t status)

  Get a descriptive string for a numerical http status code.

- void http_session_destroy (connection_t *con)

  sessions.c

- void http_session_reset (connection_t *con)

  Reset a client http connection to its original, uninitialized state.

5.148.2 Function Documentation

5.148.2.1 placer_t get_header_opt (stringer_t * *vstring*, stringer_t * *optname*)

Get the value of a named optional parameter from an http header value.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

optname a managed string with the name of the optional parameter to be found.

Returns:

a placer pointing to the named optional parameter of the specified http header value.

Definition at line 336 of file parse.c.

References pl_null(), pl_trim_start(), placer_t, st_cmp_cs_eq(), tok_get_count_st(), and tok_get_st().

Referenced by multipart_get_boundary(), and portal_upload().

5.148.2.2 placer_t get_header_value_noopt (stringer_t * *vstring*)

Get the simple value of an http header, with any optional parameters stripped away.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

Returns:

a placer pointing to the option-free header value of the specified input line.

Definition at line 313 of file parse.c.

References pl_init(), placer_t, st_char_get(), st_length_get(), tok_get_count_st(), and tok_get_st().

Referenced by http_parse_header(), and multipart_get_boundary().

5.148.2.3 void http_body (connection_t * *con*)

http.c http.c

Note:

Any request errors will be handled directly without returns. This function sets the value of the connection's http.body member.

Parameters:

con a pointer to the connection object of the remote http client.

Returns:

This function returns no value.

Definition at line 73 of file http.c.

References connection_t::buffer, con_read(), CONTIGUOUS, data, HEAP, magma_t::http, connection_t::http, http_data_get(), HTTP_-DATA_HEADER, HTTP_ERROR_400, HTTP_RESPOND, JOINTED, length, magma_t::log, log_pedantic, magma, MANAGED_T, MAPPED_T, connection_t::network, size_conv_bl(), st_alloc_opts(), st_append_opts(), st_char_get(), st_cleanup, st_data_get(), st_dupe_-opts(), st_empty, st_length_get(), st_length_int(), and http_data_t::value.

Referenced by http_requeue().

5.148.2.4 void http_close (connection_t ∗ *con*)

Close a connection corresponding to an http session.

Returns:

This function returns no value.

Definition at line 14 of file http.c.

References con_destroy().

Referenced by http_process(), and http_requeue().

5.148.2.5 bool_t http_content_load_directory (int_t *template*, chr_t ∗ *directory*)

content.c content.c

See also:

http_load_file()

Parameters:

template a value specifying whether the specified directory contains templates or regular web content.

directory a null-terminated string specifying the pathname of the directory to be scanned recursively.

Returns:

0 on failure or 1 on success.

Definition at line 313 of file content.c.

References http_content_load_directory(), http_load_file(), log_info, MEMORYBUF, NULLER, PLACER, st_char_get(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_free(), and st_merge.

Referenced by http_content_load_directory(), http_content_refresh(), and http_content_start().

5.148.2.6 bool_t http_content_load_fonts (void)

Load all fonts into the http server repository.

Note:

This function will load all fonts of extension ".ttf" from the directory configured in magma.http.fonts.

Returns:

0 on failure or 1 on success.

Definition at line 362 of file content.c.

References magma_t::content, content, magma_t::http, inx_insert(), magma_t::log, log_info, log_pedantic, M_TYPE_UINT64, magma, MEMORYBUF, NULLER, PLACER, st_cmp_ci_ends(), st_cmp_cs_ends(), st_free(), st_merge, multi_t::u64, and multi_t::val.

Referenced by http_content_refresh(), and http_content_start().

5.148.2.7 bool_t http_content_refresh (void)

Refresh the stored contents of the web app templates, static content, and fonts directories.

Returns:

true if all content directories were successfully refreshed, or false on failure.

Definition at line 449 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), inx_free(), M_INX_LINKED, magma, and st_free().

Referenced by signal_refresh().

5.148.2.8 bool_t http_content_start (void)

Prime the the web app templates, static content, and fonts directories for future use.

Note:

This function makes sure that the web templates, static content, and fonts directory have been properly set, and loads and caches their content for future use.

Returns:

true on success or false on failure.

Definition at line 407 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), log_pedantic, M_INX_LINKED, magma, NULLER, PLACER, st_cmp_cs_ends(), and st_free().

Referenced by process_start().

5.148.2.9 void http_content_stop (void)

Purge the http contents repository of stored fonts, templates, and static web pages.

Returns:

This function returns no value.

Definition at line 435 of file content.c.

References content, and inx_cleanup().

Referenced by process_stop().

5.148.2.10 void http_data_free (http_data_t * *data*)

data.c data.c

Parameters:

data the http data object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file data.c.

References mm_free(), http_data_t::name, st_cleanup, and http_data_t::value.

Referenced by http_data_value_parse(), http_parse_header(), http_parse_pairs(), and portal_upload().

5.148.2.11 http_data_t∗ http_data_get (connection_t ∗ *con*, HTTP_DATA *source*, chr_t ∗ *name*)

Get a name/value pair associated with an http connection, by name.

Note:

The name/value pairs searched can be supplied by a client through http request headers, or through GET or POST data.

Parameters:

con the connection object to be queried.

source the source of the client supplied value pair: HTTP_DATA_GET, HTTP_DATA_POST or HTTP_DATA_ANY.

name the name associated with the name/value pair to be retrieved.

Returns:

NULL on failure, or a pointer to the http name/value data pair requested on success.

TODO: We could just use the index find function.

Definition at line 34 of file data.c.

References data, connection_t::http, HTTP_DATA_ANY, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), http_data_t::name, NULLER, http_data_t::source, and st_cmp_ci_eq().

Referenced by contact_business(), contact_print_form(), contact_process(), http_body(), http_response_allow_cross(), multipart_get_-boundary(), register_business_step1(), register_business_step2(), register_process(), and teacher_process().

5.148.2.12 http_data_t∗ http_data_header_parse (connection_t ∗ *con*)

Parse the current line of input from an http client connection into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 226 of file data.c.

References http_data_header_parse_line(), connection_t::line, connection_t::network, st_char_get(), and st_length_get().

Referenced by http_parse_header().

5.148.2.13 http_data_t* http_data_header_parse_line (chr_t * *buf*, size_t *len*)

Parse a data buffer into a http header name/value pair.

Parameters:

con the connection object of the http client to be read.

Returns:

NULL on failure, or a pointer to an http header name/value pair on success.

Definition at line 163 of file data.c.

References HTTP_DATA_HEADER, mm_alloc(), http_data_t::name, http_data_t::source, st_free(), st_import(), and http_data_t::value.

Referenced by http_data_header_parse(), and portal_upload().

5.148.2.14 void http_data_value_decode (stringer_t * *string*)

Decode an escaped URI component into its original data.

Note:

Since the un-escaped string will always be at least as small as the encoded value, the input managed string is transformed in place.

Parameters:

string a managed string containing the escaped URI data to be decoded.

Returns:

This function returns no value.

Definition at line 68 of file data.c.

References hex_decode_chr(), length, st_char_get(), st_length_get(), and st_length_set().

Referenced by http_data_value_parse().

5.148.2.15 int_t http_data_value_parse (connection_t * *con*, HTTP_DATA *source*, placer_t *pair*)

Parse a string containing a name/value pair, and place it in the specified connection's pairs holder.

Note:

Each name/value pair is assumed to be delimited with a '=' character, and each half is URI-decoded before storage.

Parameters:

con a pointer to the connection object of the http client submitting the user data to be parsed.

source an HTTP_DATA value specifying the source of the name/value pair (can be HTTP_DATA_HEADER, HTTP_DATA_GET, or HTTP_DATA_POST).

pair a placer pointing to a string containing the name/value pair to be parsed.

Returns:

0 on general or parsing failure, or 1 if the specified input buffer was successfully parsed and stored.

Definition at line 111 of file data.c.

References CONTIGUOUS, data, HEAP, connection_t::http, magma_t::http, http_data_free(), http_data_value_decode(), inx_insert(), magma_t::log, log_pedantic, M_TYPE_STRINGER, magma, MANAGED_T, mm_alloc(), http_data_t::name, pl_empty(), placer_t, http_-data_t::source, multi_t::st, st_char_get(), st_dupe_opts(), st_free(), st_length_int(), tok_get_pl(), multi_t::val, and http_data_t::value.

Referenced by http_parse_pairs().

5.148.2.16 void http_free_content (http_content_t ∗ *page*)

LOW: We should use basename() and dirname() to cleanup path strings. LOW: These functions should all be renamed to http_content_XXXX. The file and directory functions should be updated to use the x64/reentrant alternatives. Specifically open64/fstat64/readdir64_r. An update function that can be triggered with a SIGHUP would also be nice. Free a stored piece of http content and all its underlying data.

Parameters:

page a pointer to the loaded content page to be freed.

Returns:

This function returns no value.

Definition at line 27 of file content.c.

References http_content_t::location, mm_free(), http_content_t::resource, st_cleanup, and http_content_t::type.

Referenced by http_content_refresh(), http_content_start(), and http_load_file().

5.148.2.17 http_content_t∗ http_get_static (stringer_t ∗ *location*)

Get a cached copy of a static web page.

Parameters:

location a pointer to a managed string containing the location of the requested resource.

Returns:

NULL on failure, or a pointer to an http content object with the contents of the requested resource on success.

Definition at line 67 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, and http_content_t::type.

Referenced by http_response().

5.148.2.18 http_content_t∗ http_get_template (chr_t ∗ *location*)

Return a template by location.

Parameters:

location a string specifying the location of the template.

Returns:

NULL on failure, or a pointer to an http_content_t object containing the template.

Definition at line 83 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, NULLER, and http_content_t::type.

Referenced by http_page_get(), register_print_message(), register_print_step1(), register_print_step2(), and register_print_step3().

5.148.2.19 void http_init (connection_t * *con*)

Handle a new http client connection.

Parameters:

con a pointer to the http client connection that was just accepted.

Returns:

This function returns no value.

Definition at line 178 of file http.c.

References con_reverse_enqueue(), and http_process().

Referenced by protocol_enqueue().

5.148.2.20 bool_t http_load_file (int_t *template*, chr_t * *filename*)

Load file content into the http server repository.

Note:

Each file that is loaded will be cached for retrieval by http clients, with its mime type determined automatically. Any files passed as a template will have the ".template" extension trimmed from the end of its resource path, and any file named 'index.html' will be read as the default directory index path. Each file will also be added to its respective parent page or template inx holder.

Parameters:

template a value specifying whether or not the specified file is a template.

filename a null-terminated string specifying the pathname of the file to be loaded.

Returns:

0 on failure or 1 on success.

Definition at line 149 of file content.c.

References magma_t::content, content, CONTIGUOUS, data, HEAP, magma_t::http, http_free_content(), inx_insert(), magma_t::log, log_-info, log_pedantic, M_TYPE_STRINGER, magma, MANAGED_T, MEMORYBUF, mm_alloc(), ns_length_get(), NULLER, PLACER, multi_t::st, st_alloc(), st_char_get(), st_cmp_ci_ends(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_dupe(), st_dupe_opts(), st_free(), st_import(), st_length_get(), st_length_int(), st_length_set(), and multi_t::val.

Referenced by http_content_load_directory().

5.148.2.21 void http_page_free (http_page_t * *page*)

Free an http page object and all its underlying data.

Parameters:

page a pointer to the http page object to be freed.

Definition at line 43 of file content.c.

References http_page_t::doc_ctx, http_page_t::doc_obj, mm_free(), xml_free_doc(), xml_free_parser_ctx(), xml_free_xpath_ctx(), and http_page_t::xpath_ctx.

Referenced by contact_print_form(), contact_print_message(), http_page_get(), portal_print_login(), statistics_process(), teacher_print_-form(), and teacher_print_message().

5.148.2.22 http_page_t* http_page_get (chr_t * *location*)

Get a template page and prepare its xml document root for use.

Note:

Each page is affixed with an xpath with a namespace after passing through the xml parser.

Parameters:

location a pointer to a null-terminated string with the pathname of the template to be returned.

Returns:

NULL on failure, or a pointer to the http page object of the requested template.

Definition at line 100 of file content.c.

References http_page_t::content, http_page_t::doc_ctx, http_page_t::doc_obj, http_get_template(), http_page_free(), log_pedantic, mm_-alloc(), http_content_t::resource, st_char_get(), st_length_get(), xml_create_doc(), xml_create_parser_ctx(), xml_create_xpath_ctx(), xml_-xpath_set_namespace(), and http_page_t::xpath_ctx.

Referenced by contact_business_add_error(), contact_print_form(), contact_print_message(), portal_print_login(), statistics_process(), teacher_add_error(), teacher_print_form(), and teacher_print_message().

5.148.2.23 void http_parse_context (connection_t * *con*, stringer_t * *application*, stringer_t * *path*)

Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL. TODO: The header and body parsers need limits on how many headers/bytes they will accept. parse.c

Parameters:

con a pointer to the connection object to be queried for a session id.

application a managed string containing the application associated with the connection's pending request.

path a managed string containing the path associated with the connection's pending request.

Returns:

This function returns no value.

TODO: Develop better logic for handling cookies. Namely add the ability to focibly trigger the Set-Cookie entity and if necessary delete the existing cookie.

Definition at line 115 of file parse.c.

References connection_t::http, HTTP_METHOD_POST, json_decref_d, json_loads_d, json_object_get_d, json_string_value_d, log_-pedantic, NULLER, pl_init(), placer_t, sess_get(), st_char_get(), st_cmp_ci_starts(), st_length_get(), tok_get_pl(), and tok_get_st().

Referenced by json_api_dispatch(), portal_endpoint(), portal_process(), and portal_upload().

5.148.2.24 void http_parse_header (connection_t * *con*)

Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's http.headers member.

Note:

If no more http headers can be read, control is returned by setting the connection http.mode to HTTP_RESPOND. Special actions are taken to store the "Host", "User-Agent", "Cookie", and "Connection" headers.

Parameters:

con the connection object of the http client to be read, and to store the results of the operation.

Returns:

This function returns no value.

LOW: Should we bother to throw an error if con->http.connection isn't HTTP_CONNECTION_NEUTRAL?

Definition at line 177 of file parse.c.

References con_print(), CONTIGUOUS, data, get_header_value_noopt(), HEAP, magma_t::http, connection_t::http, HTTP_-CONNECTION_CLOSE, HTTP_CONNECTION_KEEPALIVE, http_data_free(), http_data_header_parse(), HTTP_ERROR_500, HTTP_-RESPOND, int32_conv_bl(), inx_alloc(), inx_insert(), magma_t::log, log_info, lower_st(), M_INX_LINKED, M_TYPE_STRINGER, magma, MANAGED_T, http_data_t::name, PLACER, placer_t, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_length_get(), st_length_int(), st_length_set(), st_search_cs(), multi_t::val, and http_data_t::value.

Referenced by http_process().

5.148.2.25 void http_parse_method (connection_t * *con*)

Parse an http request and determine the request method and location.

Note:

This function returns no value but sets the internal method, location, and state of the underlying connection object.

Parameters:

con the client connection making an http request.

Returns:

This function returns no value.

Definition at line 269 of file parse.c.

References CONTIGUOUS, HEAP, magma_t::http, connection_t::http, HTTP_METHOD_CONNECT, HTTP_METHOD_DELETE, HTTP_METHOD_GET, HTTP_METHOD_HEAD, HTTP_METHOD_OPTIONS, HTTP_METHOD_POST, HTTP_METHOD_PUT, HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, HTTP_PARSE_HEADER, connection_t::line, magma_t::log, log_info, magma, MANAGED_T, connection_t::network, PLACER, placer_t, st_char_get(), st_cmp_ci_starts(), st_dupe_opts(), st_length_int(), tok_-get_count_st(), and tok_get_pl().

Referenced by http_process().

5.148.2.26 int_t http_parse_origin (stringer_t * *s*, placer_t * *output*)

Get the origin of a resource from a url.

Note:

Usually we'll be give the value of the Origin header field to work with so we'll end up returning the entire string, but if we had to fall back and use the Referrer instead this should strip off the path portion.

Parameters:

s a managed string containing the url to be parsed.

output a pointer to a placer that will be set to point to the origin string inside the user-supplied url.

Returns:

0 on success or -1 on failure.

Definition at line 18 of file parse.c.

References pl_init(), PLACER, st_cmp_ci_starts(), st_data_get(), st_empty_out(), and st_uchar_get().

Referenced by http_response_allow_cross().

5.148.2.27 void http_parse_pairs (connection_t * *con*)

Parse all the GET and POST parameters present in an http client request, and store them with the connection.

Note:

All valid field parameters will be stored in the connection's http.pairs object.

Parameters:

con a pointer to the connection object generating the http requesting being processed.

Returns:

This function returns no value.

Definition at line 73 of file parse.c.

References count, data, connection_t::http, http_data_free(), HTTP_DATA_GET, HTTP_DATA_POST, http_data_value_parse(), HTTP_-ERROR_500, inx_alloc(), M_INX_LINKED, pl_init(), PLACER, placer_t, st_char_get(), st_length_get(), st_search_cs(), tok_get_count_st(), and tok_get_st().

Referenced by http_requeue(), and http_response().

5.148.2.28 void http_print_301 (connection_t * *con*, chr_t * *location*, int_t *tls*)

errors.c errors.c

Note:

SSL downgrades are not possible; in order for an ssl upgrade, magma.web.ssl_redirect must first be set.

Parameters:

con the client's http connection handle.

location the url to which the client will be redirected.

tls if 1, direct to `https://` else direct to `http://` address.

Returns:

This function returns no value.

LOW: This function should probably move to the response file and be updated to use the cookie/xss helper functions.

Definition at line 18 of file errors.c.

References con_print(), con_secure(), connection_t::http, HTTP_COMPLETE, http_print_403(), http_print_500(), log_pedantic, magma, st_char_get(), st_cleanup, st_dupe(), st_free(), st_length_int(), st_merge, magma_t::tls_redirect, and magma_t::web.

Referenced by contact_process(), portal_endpoint(), portal_process(), portal_upload(), register_process(), and teacher_process().

5.148.2.29 void http_print_400 (connection_t * *con*)

Return an HTTP 400 bad client request response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 80 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.148.2.30 void http_print_403 (connection_t * *con*)

Return an HTTP 403 access denied response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 94 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_print_301(), and http_requeue().

5.148.2.31 void http_print_404 (connection_t * *con*)

Return an HTTP 404 location not found response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 108 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.148.2.32 void http_print_405 (connection_t * *con*)

Return an HTTP 405 method not allowed response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 122 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.148.2.33 void http_print_500 (connection_t * *con*)

Return an HTTP 500 internal server error response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 136 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, M_LOG_STACK_TRACE, and PLACER.

Referenced by contact_print_message(), http_print_301(), http_requeue(), portal_print_login(), register_print_captcha(), register_print_-message(), register_print_step3(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.148.2.34 void http_print_500_log (connection_t * *con*, chr_t * *logmsg*)

Return an HTTP 500 internal server error response to the client, with additional logging information.

Parameters:

con the client's http connection handle.

logmsg a pointer to a null-terminated string with an message describing the cause of the http 500 error.

Returns:

This function returns no value.

Definition at line 154 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), log_options, M_LOG_CRITICAL, and PLACER.

Referenced by contact_print_message(), register_print_step1(), and register_print_step2().

5.148.2.35 void http_print_501 (connection_t * *con*)

Return an HTTP 501 method not implemented response to the client.

Parameters:

con the client's http connection handle.

Returns:

This function returns no value.

Definition at line 169 of file errors.c.

References con_write_st(), connection_t::http, HTTP_CONNECTION_CLOSE, http_response_header(), and PLACER.

Referenced by http_requeue().

5.148.2.36 void http_process (connection_t * *con*)

Process data sent by an http client.

Note:

This is performed in two stages: first read the http method with http_parse_method(), then transfer control to http_parse_header(). If a failure occurs reading a line of data, or too many protocol violations occur, http_close() is called to drop the connection.

Parameters:

con the connection object from which to read data.

Returns:

This function returns no value.

Definition at line 137 of file http.c.

References con_read_line(), server_t::cutoff, enqueue(), connection_t::http, http_close(), http_parse_header(), HTTP_PARSE_HEADER, http_parse_method(), http_process(), HTTP_READY, http_requeue(), connection_t::line, log_pedantic, connection_t::network, pl_empty(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, server_t::violations, and connection_t::violations.

Referenced by http_init(), http_process(), and http_requeue().

5.148.2.37 void http_requeue (connection_t * *con*)

The main http server requeue entry point state machine for processing client data.

Returns:

This function returns no value.

Definition at line 24 of file http.c.

References con_status(), server_t::cutoff, enqueue(), connection_t::http, http_body(), http_close(), HTTP_CLOSE, HTTP_COMPLETE, HTTP_ERROR_400, HTTP_ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_ERROR_501, http_parse_pairs(), HTTP_PARSE_PAIRS, http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_print_501(), http_process(), HTTP_READ_BODY, http_requeue(), HTTP_RESPOND, http_response(), http_session_reset(), connection_t::protocol, requeue(), connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by http_process(), and http_requeue().

5.148.2.38 void http_response (connection_t * *con*)

response.c response.c

Note:

The following http methods aren't supported: PUT, DELETE, HEAD, TRACE, and CONNECT. The http server will first attempt to retrieve the requested url as a static page; otherwise the following special locations are supported: /portal, /portal/camel, /register, /contact, /report_abuse, /teacher, and /statistics.

Returns:

This function returns no value.

Definition at line 419 of file response.c.

References magma_t::abuse, magma_t::admin, con_write_st(), magma_t::contact, contact_process(), content, connection_t::http, HTTP_-ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_ERROR_501, http_get_static(), HTTP_METHOD_-CONNECT, HTTP_METHOD_DELETE, HTTP_METHOD_HEAD, HTTP_METHOD_OPTIONS, HTTP_METHOD_POST, HTTP_-METHOD_PUT, HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, http_parse_pairs(), HTTP_READ_BODY, HTTP_-RESPOND, http_response_header(), http_response_options(), json_api_dispatch(), magma, NULLER, PLACER, portal_endpoint(), portal_-process(), portal_upload(), register_process(), magma_t::registration, http_content_t::resource, st_cmp_ci_starts(), st_cmp_cs_eq(), st_cmp_-cs_starts(), st_length_get(), magma_t::statistics, statistics_process(), teacher_process(), http_content_t::type, and magma_t::web.

Referenced by http_requeue().

5.148.2.39 stringer_t* http_response_allow_cross (connection_t * *con*)

Definition at line 245 of file response.c.

References http_data_get(), HTTP_DATA_HEADER, http_parse_origin(), MANAGEDBUF, PLACER, placer_t, st_append, st_char_get(), st_cmp_ci_eq(), st_length_int(), st_quick(), upper_st(), and http_data_t::value.

Referenced by http_response_header(), and http_response_options().

5.148.2.40 stringer_t* http_response_connection (connection_t * *con*, int_t *force*)

Get an appropriate value for the Connection header of an http response.

Note:

If magma.http.close was set in the configuration options, the connection will be closed immediately.

Parameters:

con a pointer to the connection object of the outgoing response.

force either HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_NEUTRAL, or HTTP_CONNECTION_KEEPALIVE. HTTP_-CONNECTION_CLOSE will result in the connection being terminated immediately, HTTP_CONNECTION_KEEPALIVE will result in a "Connection: keep-alive" response, and HTTP_CONNECTION_NEUTRAL will not result in any output.

Returns:

a pointer to a managed string containing the http Connection header field that should be used for the response.

Definition at line 288 of file response.c.

References CONTIGUOUS, HEAP, connection_t::http, magma_t::http, HTTP_CLOSE, HTTP_CONNECTION_CLOSE, HTTP_-CONNECTION_KEEPALIVE, magma, MANAGED_T, PLACER, and st_dupe_opts().

Referenced by http_response_header(), and http_response_options().

5.148.2.41 stringer_t* http_response_cookie (connection_t * *con*)

Definition at line 190 of file response.c.

References con_secure(), HEAP, connection_t::http, HTTP_COOKIE_DELETE, HTTP_COOKIE_SET, JOINTED, MANAGED_T, MAN-AGEDBUF, PLACER, st_append, st_aprint_opts(), st_char_get(), st_length_int(), st_quick(), and time_print_gmt().

Referenced by http_response_header().

5.148.2.42 void http_response_header (connection_t * *con*, int_t *status*, stringer_t * *type*, size_t *len*)

Send a full set of http response headers to the remote client.

Note:

If the mode is HTTP_RESPOND it will be changed to HTTP_COMPLETE, to tell the http requeue function to reset the context and enqueue request processor.

Parameters:

con a pointer to the connection object across which the response will be sent.

status an integer containing the http status code for the response.

type a managed string containing the value of the Content-Type header.

len the value of the Content-Length header.

Returns:

This function returns no value.

Definition at line 364 of file response.c.

References con_print(), magma_t::http, connection_t::http, HTTP_COMPLETE, HTTP_CONNECTION_NEUTRAL, HTTP_RESPOND, http_response_allow_cross(), http_response_connection(), http_response_cookie(), http_response_status(), magma, MANAGEDBUF, mm_wipe(), st_char_get(), st_cleanup, st_length_int(), and time_print_gmt().

Referenced by api_response(), contact_print_form(), contact_print_message(), http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_print_500_log(), http_print_501(), http_response(), portal_endpoint(), portal_endpoint_attachments_progress(), portal_endpoint_error(), portal_endpoint_response(), portal_endpoint_search(), portal_print_login(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), statistics_process(), and teacher_print_form().

5.148.2.43 void http_response_options (connection_t ∗ *con*)

Return a response to an http OPTIONS request.

Parameters:

con the client connection which made the OPTIONS request.

Returns:

This function returns no value.

LOW: I couldn't find a definitive answer about whether the OPTION response should always return a Content-Type of text/plain or use the Content-Type associated with the location provided in the request.

Definition at line 316 of file response.c.

References build_stamp(), build_version(), con_print(), magma_t::http, connection_t::http, HTTP_COMPLETE, HTTP_CONNECTION_NEUTRAL, HTTP_RESPOND, http_response_allow_cross(), http_response_connection(), magma, MANAGEDBUF, mm_wipe(), st_char_get(), st_cleanup, st_length_int(), and time_print_gmt().

Referenced by http_response().

5.148.2.44 chr_t∗ http_response_status (int_t *status*)

Get a descriptive string for a numerical http status code.

Parameters:

status the value of the http status code to be looked up.

Returns:

NULL on failure, or a pointer to a null-terminated string containing a description of the specified http status code on success.

Definition at line 15 of file response.c.

References log_pedantic.

Referenced by http_response_header().

5.148.2.45 void http_session_destroy (connection_t * *con*)

sessions.c sessions.c

Parameters:

con the connection object to have its http session destroyed.

Returns:

This function returns no value.

Definition at line 77 of file sessions.c.

References http_session_reset().

Referenced by con_destroy().

5.148.2.46 void http_session_reset (connection_t * *con*)

Reset a client http connection to its original, uninitialized state.

Parameters:

con the connection object to have its http session state reset.

Returns:

This function returns no value.

Definition at line 15 of file sessions.c.

References connection_t::http, HTTP_CLOSE, HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_NEUTRAL, HTTP_MERGED, HTTP_METHOD_NONE, HTTP_PORTAL, HTTP_READY, inx_cleanup(), json_decref_d, sess_release(), and st_cleanup.

Referenced by http_requeue(), and http_session_destroy().

5.148.2.47 bool_t multipart_get_boundary (connection_t * *con*, placer_t * *output*)

Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.

Parameters:

con a pointer to the connection object of the client making the http request.

output a pointer to the address of a managed string that will receive a copy of the value of the boundary string on success.

Returns:

true on success or false on failure.

Definition at line 373 of file parse.c.

References get_header_opt(), get_header_value_noopt(), http_data_get(), HTTP_DATA_HEADER, NULLER, pl_empty(), placer_t, and http_data_t::value.

Referenced by portal_upload().

Functions

- int_t imap_compare (const void *compare, const void *command)

  commands.c

- void imap_process (connection_t *con)

  Perform client command processing on an established imap session.

- void imap_requeue (connection_t *con)

  Requeue an imap connection for processing, or log it out if there was an error or excess of protocol violations.

- void imap_sort (void)

  Sort the IMAP command table to be ready for binary searches.

- imap_fetch_response_t * imap_fetch_response_add (imap_fetch_response_t *response, stringer_t *key, stringer_t *value)

  fetch_response.c

- void imap_fetch_response_free (imap_fetch_response_t *response)
- inx_t * imap_duplicate_messages (inx_t *messages)

  fetch.c

- uint32_t imap_get_flag (stringer_t *string)
- void imap_update_flags (meta_user_t *user, inx_t *messages, uint64_t foldernum, int_t action, uint32_t flags)
- int_t imap_count_folder_levels (stringer_t *name)

  folders.c

- int_t imap_folder_compare (stringer_t *name, stringer_t *compare)
- int_t imap_folder_create (uint64_t usernum, inx_t *folders, stringer_t *name)

  Create a new imap folder.

- stringer_t * imap_folder_name_escaped (inx_t *folders, meta_folder_t *active)

  Get an imap folder's escaped name.

- int_t imap_folder_remove (uint64_t usernum, inx_t *folders, inx_t *messages, stringer_t *name)

  Remove an imap folder, both in memory and on the database.

- int_t imap_folder_rename (uint64_t usernum, inx_t *folders, stringer_t *original, stringer_t *rename)

  Rename an imap folder.

- int_t imap_folder_status (inx_t *folders, inx_t *messages, stringer_t *name, imap_folder_status_t *status)

  Get the status of a folder.

- inx_t * imap_narrow_folders (inx_t *folders, stringer_t *reference, stringer_t *mailbox)
- uint64_t imap_next_folder_order (inx_t *folders, uint64_t parent)

  Get the next order value for an imap folder.

- bool_t imap_valid_folder_name (stringer_t *name)

  Check to see if a name is a valid imap folder name.

- void imap_append (connection_t *con)

  imap.c

- void imap_capability (connection_t *con)

  Display the capability string for the IMAP server.

- void imap_check (connection_t *con)
- void imap_close (connection_t *con)
- void imap_copy (connection_t *con)
- void imap_create (connection_t *con)

  Create a new IMAP folder in response to the IMAP "CREATE" command.

- void imap_delete (connection_t *con)

  Handle the IMAP "DELETE" command and delete the specified IMAP folder.

- void imap_examine (connection_t *con)
- void imap_expunge (connection_t *con)
- void imap_fetch (connection_t *con)
- void imap_id (connection_t *con)
- void imap_idle (connection_t *con)
- void imap_init (connection_t *con)

  The main IMAP entry point for all inbound client connections, as dispatched by the generic protocol handler (display banner greeting).

- void imap_invalid (connection_t *con)

  Respond to an invalid IMAP command from a client.

- void imap_list (connection_t *con)
- void imap_login (connection_t *con)

  Attempt to perform a user login on an IMAP client connection.

- void imap_logout (connection_t *con)

  Terminate an IMAP session gracefully with a "BYE" message and destroy the underlying connection.

- void imap_lsub (connection_t *con)
- void imap_noop (connection_t *con)
- void imap_rename (connection_t *con)
- void imap_search (connection_t *con)
- void imap_select (connection_t *con)
- void imap_starttls (connection_t *con)

  Create a secure connection for an IMAP session.

- void imap_status (connection_t *con)
- void imap_store (connection_t *con)
- void imap_subscribe (connection_t *con)
- void imap_unsubscribe (connection_t *con)
- int_t imap_append_message (connection_t *con, meta_folder_t *folder, uint32_t flags, stringer_t *message, uint64_t *outnum)

  messages.c

- int_t imap_message_copier (connection_t *con, meta_message_t *message, uint64_t target, uint64_t *outnum)
- int_t imap_message_expunge (connection_t *con, meta_message_t *message)
- stringer_t * imap_build_array (chr_t *format,...)

  output.c

- stringer_t * imap_build_array_isliteral (placer_t data)
- stringer_t * imap_parse_address (stringer_t *address)

  parse_address.c

- placer_t imap_parse_address_breaker (stringer_t *address, uint32_t part)
- stringer_t * imap_parse_address_part (placer_t input)

- void imap_parse_address_put (stringer_t *buffer, chr_t c)

  LOW: Do we need an imap_parse_address_group() function?

- int_t imap_command_parser (connection_t *con)

  parse.c

- imap_arguments_t * imap_get_ar_ar (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as an imap arguments array.

- void * imap_get_ptr (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as a generic pointer.

- stringer_t * imap_get_st_ar (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as a managed string.

- int_t imap_get_type_ar (imap_arguments_t *array, size_t element)

  TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers.

- int_t imap_parse_arguments (connection_t *con, chr_t **start, size_t *length)

  Parse a chunk of input into an array of IMAP arguments.

- int_t imap_parse_array (int_t recursion, connection_t *con, imap_arguments_t **array, chr_t **start, size_t *length)

  Extract the contents of an array argument and advance the position of the parser stream.

- int_t imap_parse_astring (stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of an atomic string and advance the position of the parser stream.

- int_t imap_parse_literal (connection_t *con, stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of a literal string and advance the position of the parser stream.

- int_t imap_parse_nstring (stringer_t **output, chr_t **start, size_t *length, chr_t type)
- int_t imap_parse_qstring (stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of a quoted string and advance the position of the parser stream.

- stringer_t * imap_range_build (size_t length, uint64_t *numbers)

  range.c

- int_t imap_search_flag (uint32_t status, uint32_t flag, int_t has)

  search.c

- inx_t * imap_search_messages (connection_t *con)
- int_t imap_search_messages_body (connection_t *con, meta_user_t *user, mail_message_t **data, meta_message_t *active, stringer_t *value)
- int_t imap_search_messages_date (connection_t *con, meta_user_t *user, mail_message_t **data, stringer_t **header, meta_message_t *active, stringer_t *date, int_t internal, int_t expected)
- int_t imap_search_messages_date_compare (stringer_t *one, stringer_t *two)
- int_t imap_search_messages_header (connection_t *con, meta_user_t *user, mail_message_t **data, stringer_t **header, meta_message_t *active, stringer_t *field, stringer_t *value)
- int_t imap_search_messages_inner (connection_t *con, meta_user_t *user, mail_message_t **message, stringer_t **header, meta_message_t *current, imap_arguments_t *array, unsigned recursion)
- int_t imap_search_messages_range (meta_message_t *active, stringer_t *range, int_t uid)
- int_t imap_search_messages_size (meta_message_t *active, stringer_t *value, int_t expected)
- int_t imap_search_messages_text (connection_t *con, meta_user_t *user, mail_message_t **data, meta_message_t *active, stringer_t *value)

- void imap_session_destroy (connection_t *con)

  sessions.c

- int_t imap_session_update (connection_t *con)

  Returns 0 if the selected folder wasn't modified, or 1 if things changed and the updated status should be sent to the client, and a -1 is used to indicate the update check encountered a problem and should be retried later.

5.150.2 Function Documentation

5.150.2.1 void imap_append (connection_t ∗ *con*)

imap.c

BUG: If the user is over their quota check whether rollout is enabled and if so. If enabled make room for the appended message using the rollout logic.

Definition at line 1463 of file imap.c.

References ar_length_get(), con_print(), meta_message_t::foldernum, meta_folder_t::foldernum, connection_t::imap, imap_append_message(), IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_LITERAL, imap_flag_parse(), imap_get_ptr(), imap_get_st_ar(), imap_get_type_ar(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, MAIL_STATUS_EMPTY, MAIL_STATUS_RECENT, meta_folders_by_name(), META_USER_OVERQUOTA, meta_user_unlock(), meta_user_wlock(), st_char_get(), st_length_int(), and meta_message_t::status.

5.150.2.2 int_t imap_append_message (connection_t ∗ *con*, meta_folder_t ∗ *folder*, uint32_t *flags*, stringer_t ∗ *message*, uint64_t ∗ *outnum*)

messages.c

Definition at line 10 of file messages.c.

References magma_t::active, meta_folder_t::foldernum, connection_t::imap, inx_append(), log_pedantic, M_TYPE_UINT64, magma, MAIL_STATUS_APPENDED, MAIL_STATUS_RECENT, mail_store_message(), meta_messages_update_sequences(), META_USER_ENCRYPT_DATA, mm_alloc(), mm_free(), OBJECT_MESSAGES, serial_get(), serial_increment(), st_char_get(), st_length_get(), st_length_int(), magma_t::storage, multi_t::u64, and multi_t::val.

Referenced by imap_append().

5.150.2.3 stringer_t∗ imap_build_array (chr_t ∗ *format*, ...)

output.c

Definition at line 37 of file output.c.

References imap_build_array_isliteral(), length, log_error, log_pedantic, ns_length_get(), number, pl_data_get(), pl_empty(), pl_init(), pl_length_get(), placer_t, st_alloc(), st_char_get(), st_free(), st_length_get(), and st_length_set().

Referenced by imap_fetch_bodystructure(), imap_fetch_envelope(), imap_parse_address(), and imap_parse_address_part().

5.150.2.4 stringer_t∗ imap_build_array_isliteral (placer_t *data*)

Definition at line 10 of file output.c.

References length, pl_data_get(), pl_empty(), pl_length_get(), and st_merge.

Referenced by imap_build_array(), and imap_fetch_bodystructure().

5.150.2.5 void imap_capability (connection_t ∗ *con*)

Display the capability string for the IMAP server.

Note:

This string always needs to stay in sync with the banner greeting.

Returns:

This function returns no value.

Definition at line 1832 of file imap.c.

References con_print(), con_secure(), connection_t::imap, st_char_get(), and st_length_int().

5.150.2.6 void imap_check (connection_t ∗ *con*)

Definition at line 298 of file imap.c.

References con_print(), connection_t::imap, imap_session_update(), st_char_get(), and st_length_int().

5.150.2.7 void imap_close (connection_t ∗ *con*)

Definition at line 1088 of file imap.c.

References ar_length_get(), con_print(), meta_message_t::foldernum, connection_t::imap, imap_message_expunge(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_DELETED, MAIL_STATUS_RECENT, meta_messages_-update_sequences(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, serial_get(), serial_increment(), st_char_get(), st_length_int(), meta_message_t::status, user_lock(), and user_unlock().

5.150.2.8 int_t imap_command_parser (connection_t ∗ *con*)

parse.c parse.c

Note:

This function updates the protocol-specific IMAP structure with parsed values for the session's tag, command, and arguments fields. Special handling is performed for any command that is preceded by a "UID" prefix.

Parameters:

con the IMAP client connection issuing the command.

Returns:

1 on success or $<$ 0 on error. -1: the tag could not be read. -2: the IMAP command could not be read. -3: the arguments to the IMAP command could not be read.

Definition at line 886 of file parse.c.

References ar_free(), magma_t::imap, connection_t::imap, imap_command_log_safe(), imap_parse_arguments(), imap_parse_astring(), length, connection_t::line, magma_t::log, log_pedantic, magma, connection_t::network, PLACER, st_cleanup, st_cmp_ci_eq(), st_data_get(), st_free(), and st_length_get().

Referenced by imap_process().

5.150.2.9 int_t imap_compare (const void * *compare*, const void * *command*)

commands.c commands.c

Note:

This is an internal function used to sort imap commands and search for them.

Parameters:

compare a pointer to the first command to be compared.

command a pointer to the second command to be compared.

Returns:

-1 if compare < command, 1 if command < compare, or 0 if the two commands are equal.

Definition at line 18 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by imap_process(), and imap_sort().

5.150.2.10 void imap_copy (connection_t * *con*)

Definition at line 1297 of file imap.c.

References ar_length_get(), con_print(), count, meta_message_t::foldernum, meta_folder_t::foldernum, connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_get_st_ar(), imap_get_type_ar(), imap_message_copier(), imap_narrow_messages(), imap_range_build(), imap_valid_sequence(), inx_count(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), log_pedantic, MAIL_STATUS_RECENT, meta_message_t::messagenum, meta_folders_by_name(), meta_user_unlock(), meta_user_wlock(), mm_alloc(), mm_free(), meta_message_t::sequencenum, st_char_get(), st_length_get(), st_length_int(), meta_message_t::status, user_lock(), and user_unlock().

5.150.2.11 int_t imap_count_folder_levels (stringer_t * *name*)

folders.c folders.c

Note:

The smallest possible node level value is 1.

Parameters:

name a managed string containing the name of the imap folder.

Returns:

0 on failure, or the number of node levels indicated by the specified imap folder name, on success.

Definition at line 218 of file folders.c.

References IMAP_FOLDER_RECURSION_LMIIT, log_pedantic, and st_empty_out().

Referenced by imap_folder_create(), and imap_folder_rename().

5.150.2.12 void imap_create (connection_t * *con*)

Create a new IMAP folder in response to the IMAP "CREATE" command.

See also:

imap_folder_create()

Parameters:

con the connection across which the folder creation request was made.

Returns:

This function returns no value.

Definition at line 472 of file imap.c.

References ar_length_get(), con_print(), FOLDER_LENGTH_LIMIT, connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_create(), IMAP_FOLDER_RECURSION_LMIIT, imap_get_st_ar(), imap_get_type_ar(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), serial_increment(), st_char_get(), and st_length_int().

5.150.2.13 void imap_delete (connection_t ∗ *con*)

Handle the IMAP "DELETE" command and delete the specified IMAP folder.

See also:

imap_folder_remove()

Parameters:

con a pointer to the connection object of the IMAP session generating the delete request.

Returns:

This function returns no value.

Definition at line 539 of file imap.c.

5.150.2.38 int_t imap_folder_create (uint64_t *usernum*, inx_t * *folders*, stringer_t * *name*)

Create a new imap folder.

Note:

If they don't already exist, any parent folders specified in the fully qualified folder name will automatically be created first.

Parameters:

usernum the numerical id of the user to whom the new imap folder will belong.

folders an inx holder containing the set of folders into which the new imap folder will be inserted.

name a managed string containing the fully qualified name of the new imap folder to be created.

Returns:

1 on success or <= 0 on failure. 0: An invalid parameter was passed to the function, or an internal failure occurred. -1: The specified new folder name was invalid. -2: The node depth of the new folder is too large (imap folder recursion limit reached [IMAP_FOLDER_-RECURSION_LMIIT]). -3: Special folder "Inbox" cannot contain subfolders. -4: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks. -5: The specified folder name already exists.

Definition at line 264 of file folders.c.

References CONTIGUOUS, FOLDER_LENGTH_LIMIT, meta_folder_t::foldernum, HEAP, imap_count_folder_levels(), IMAP_-FOLDER_RECURSION_LMIIT, imap_next_folder_order(), imap_valid_folder_name(), inx_insert(), log_pedantic, M_TYPE_UINT64, MANAGED_T, meta_data_insert_folder(), meta_folders_by_name(), mm_alloc(), mm_copy(), mm_free(), meta_folder_t::name, meta_-folder_t::order, meta_folder_t::parent, pl_data_get(), pl_length_get(), PLACER, placer_t, st_cleanup, st_cmp_ci_eq(), st_dupe(), st_dupe_-opts(), st_free(), st_merge, st_replace(), tok_get_st(), multi_t::u64, and multi_t::val.

5.150.2.39 stringer_t* imap_folder_name_escaped (inx_t * *folders*, meta_folder_t * *active*)

Get an imap folder's escaped name. TODO: Since the Portal needs access to some of these folder manipulation functions the common logic should be extracted and moved into the folder object interface.

Parameters:

folders an inx holder containing the ancestor folders of the specified imap folder.

active a pointer to the meta folder object of the folder to have its name escaped.

Returns:

NULL on failure, or a pointer to a managed string containing the escaped name of the specified imap folder on success.

Definition at line 19 of file folders.c.

References meta_folders_name(), PLACER, st_free(), st_merge, and st_replace().

Referenced by imap_list(), and imap_lsub().

5.150.2.40 int_t imap_folder_remove (uint64_t *usernum*, inx_t * *folders*, inx_t * *messages*, stringer_t * *name*)

Remove an imap folder, both in memory and on the database.

Note:

Any child messages of the specified folder will be deleted, but if it has child folders, the folder will not be deleted. The function also protects the special "Inbox" folder from deletion.

Parameters:

usernum the numerical id of the user that owns the imap folder to be deleted.

folders an inx holder containing a collection of folders for looking up the specified imap folder by name.

messages an inx holder containing a collection of messages for looking up the contents of the specified imap folder.

name a managed string containing the name of the imap folder to be deleted.

Returns:

<= 0 on failure, or 1 on success. 0: General failure or if there was an error removing the folder from the database. -1: The specified folder name was invalid. -2: Removal failed because the "Inbox" folder was specified. -3: The specified folder could not be found.

Definition at line 412 of file folders.c.

References meta_folder_t::foldernum, meta_message_t::foldernum, imap_valid_folder_name(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_delete(), log_error, log_pedantic, M_TYPE_UINT64, mail_remove_message(), meta_message_t::messagenum, meta_data_delete_folder(), meta_folders_by_name(), meta_folders_children(), PLACER, placer_t, meta_message_t::server, meta_message_t::size, st_cmp_ci_eq(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_delete(), and portal_folder_mail_remove().

5.150.2.41 int_t imap_folder_rename (uint64_t *usernum*, inx_t * *folders*, stringer_t * *original*, stringer_t * *rename*)

Rename an imap folder.

Note:

Any parent folder components of the folder's fully qualified name will be created if they do not already exist.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

folders an inx holder containing the folders to be searched for the folder specified to be renamed.

original a managed string containing the original name of the folder to be renamed.

rename a managed string containing the new name of the specified folder.

Returns:

1 on success or 0 or less on failure. 0: One of the parameters passed to the function was invalid, or there was a memory allocation failure. -1: Either the original or new folder name was invalid. -2: Was unable to rename the "Inbox" folder. -3: The specified imap folder did not exist. -4: Either the original or new name exceeded the imap folder recursion limit. -5: A folder already exists with the new folder name. -6: A segment of the folder name was larger than FOLDER_LENGTH_LIMIT (16 bytes).

Definition at line 488 of file folders.c.

References CONTIGUOUS, FOLDER_LENGTH_LIMIT, meta_folder_t::foldernum, HEAP, imap_count_folder_levels(), IMAP_FOLDER_RECURSION_LMIIT, imap_next_folder_order(), imap_valid_folder_name(), inx_insert(), log_error, log_pedantic, M_TYPE_UINT64, MANAGED_T, meta_data_insert_folder(), meta_data_update_folder_name(), meta_folders_by_name(), mm_alloc(), mm_copy(), mm_free(), mm_wipe(), meta_folder_t::name, meta_folder_t::order, meta_folder_t::parent, pl_data_get(), pl_length_get(), PLACER, placer_t, st_cleanup, st_cmp_ci_eq(), st_dupe(), st_dupe_opts(), st_free(), st_merge, st_replace(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_rename(), and portal_endpoint_folders_rename().

5.150.2.42 int_t imap_folder_status (inx_t * *folders*, inx_t * *messages*, stringer_t * *name*, imap_folder_status_t * *status*)

Get the status of a folder.

Note:

This function will count the number of messages in a folder, as well as the number of messages marked recent or unseen, as well as the numerical id of the first message in the folder and the UIDNEXT of the specified folder.

Parameters:

folders an inx holder containing a list of folders to be searched for the specified folder.

messages an inx holder containing a complete list of a user's messages to be examined for gathering statistics.

name a managed string containing the name of the imap folder to be queried.

status a pointer to an imap folder status object to receive the folder's status information.

Returns:

1 on success or <= 0 on failure. 0: General failure. -1: The specified folder name was invalid. -2: The folder did not exist.

Definition at line 678 of file folders.c.

Referenced by imap_examine(), imap_select(), and imap_status().

5.150.2.43 imap_arguments_t* imap_get_ar_ar (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as an imap arguments array.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as an imap arguments array on success.

5.150.2.45 void* imap_get_ptr (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as a generic pointer.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value on success.

Definition at line 46 of file parse.c.

References ar_length_get(), and log_pedantic.

Referenced by imap_append(), imap_fetch_body(), and imap_store().

5.150.2.46 stringer_t* imap_get_st_ar (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as a managed string.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as a managed string on success.

Definition at line 71 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_ARRAY, imap_get_type_ar(), and log_pedantic.

5.150.2.47 int_t imap_get_type_ar (imap_arguments_t * *array*, size_t *element*)

TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers. Get the type code for a specified object in an array.

Note:

Valid return values include IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_ASTRING, IMAP_ARGUMENT_-TYPE_QSTRING, IMAP_ARGUMENT_TYPE_NSTRING, and IMAP_ARGUMENT_TYPE_LITERAL.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

IMAP_ARGUMENT_TYPE_EMPTY on failure, or the element type code of the specified object on success.

Definition at line 20 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_EMPTY, and log_pedantic.

5.150.2.50 void imap_init (connection_t ∗ *con*)

The main IMAP entry point for all inbound client connections, as dispatched by the generic protocol handler (display banner greeting).

Parameters:

con a pointer to the connection object of the newly connected client.

Returns:

This function returns no value.

Definition at line 1854 of file imap.c.

References build_version(), con_print(), con_reverse_enqueue(), con_secure(), server_t::domain, imap_requeue(), connection_t::server, st_-char_get(), st_length_get(), and st_length_int().

Referenced by protocol_enqueue().

5.150.2.51 void imap_invalid (connection_t ∗ *con*)

Respond to an invalid IMAP command from a client.

Parameters:

con a pointer to the client connection that issued the bad command.

Returns:

This function returns no value.

Definition at line 63 of file imap.c.

References con_print(), server_t::delay, connection_t::imap, connection_t::protocol, connection_t::server, st_char_get(), st_length_int(), server_t::violations, and connection_t::violations.

Referenced by imap_process(), and imap_starttls().

5.150.2.52 void imap_list (connection_t ∗ *con*)

Definition at line 313 of file imap.c.

References ar_length_get(), con_print(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_name_escaped(), imap_-get_st_ar(), imap_get_type_ar(), imap_narrow_folders(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_reset(), inx_cursor_t, inx_-cursor_value_next(), inx_free(), log_pedantic, magma_folder_name(), meta_user_rlock(), meta_user_unlock(), meta_folder_t::name, NULLER, meta_folder_t::parent, PLACER, st_char_get(), st_cmp_ci_eq(), st_free(), and st_length_int().

5.150.2.53 void imap_login (connection_t * *con*)

Attempt to perform a user login on an IMAP client connection.

Parameters:

con a pointer to the connection object of the remote session.

Returns:

This function returns no value.

HIGH: Inactivity locks shouldn't prevent a user from logging into the system.

Definition at line 106 of file imap.c.

References ar_length_get(), auth_free(), auth_login(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_print(), con_secure(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_get_st_ar(), imap_get_type_ar(), inx_count(), auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, MANAGEDBUF, auth_t::master, meta_data_update_log(), meta_get(), META_GET_FOLDERS, META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_PROTOCOL_IMAP, META_USER_ENCRYPT_DATA, meta_user_rlock(), META_USER_TLS, meta_user_unlock(), connection_t::protocol, auth_t::salt, auth_t::seasoning, st_char_get(), st_dupe(), st_free(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.150.2.54 void imap_logout (connection_t * *con*)

Terminate an IMAP session gracefully with a "BYE" message and destroy the underlying connection.

Parameters:

con the IMAP connection to be terminated.

Returns:

This function returns no value.

Definition at line 79 of file imap.c.

References con_destroy(), con_print(), con_status(), con_write_bl(), connection_t::imap, st_char_get(), st_length_int(), and status.

5.150.2.60 uint64_t imap_next_folder_order (inx_t * *folders*, uint64_t *parent*)

Get the next order value for an imap folder.

Note:

The next order value is the current highest order value of any child folder in the specified directory, incremented by one.

Parameters:

folder an inx holder containing the collection of imap folders to be scanned.

parent the numerical id of the folder to be queried.

Returns:

0 on failure, or the next order value of the specified folder on success.

Definition at line 67 of file folders.c.

Referenced by imap_parse_address().

5.150.2.65 void imap_parse_address_put (stringer_t * *buffer*, chr_t *c*)

LOW: Do we need an imap_parse_address_group() function?

Definition at line 12 of file parse_address.c.

References st_avail_get(), st_char_get(), st_length_get(), and st_length_set().

Referenced by imap_parse_address_part().

5.150.2.66 int_t imap_parse_arguments (connection_t * *con*, chr_t ** *start*, size_t * *length*)

Parse a chunk of input into an array of IMAP arguments.

See also:

imap_parse_qstring(), imap_parse_literal(), imap_parse_array(), imap_parse_astring()

Note:

This function scans a string for an array of arguments, performing the following logic when a particular character is encountered: : Parse argument as quoted string with imap_parse_qstring(). { : Parse argument as literal string with imap_parse_literal(). (or [: Parse argument as array with imap_parse_astring(). other : Defaults to parsing argument as atomic string with imap_parse_atomic(). The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

start the address of a pointer to the start of the buffer to be parsed, that will be continually updated to point to the next argument in the sequence during the parsing loop.

length a pointer to a size_t variable that contains the length of the string to be parsed, that will be continually updated with the input stream position during the parsing loop.

Returns:

-1 on parsing error or 1 on success.

Definition at line 709 of file parse.c.

References ar_append(), ar_free(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_ASTRING, IMAP_ARGUMENT_TYPE_LITERAL, IMAP_ARGUMENT_TYPE_QSTRING, imap_parse_array(), imap_parse_astring(), imap_parse_literal(), and imap_parse_qstring().

Referenced by imap_command_parser().

5.150.2.67 int_t imap_parse_array (int_t *recursion*, connection_t * *con*, imap_arguments_t ** *array*, chr_t ** *start*, size_t * *length*)

Extract the contents of an array argument and advance the position of the parser stream.

Note:

This function expects as input a string beginning either with '(' or '['.

Parameters:

length a pointer to a size_t variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

recursion d

con the client IMAP connection passing the array as input to the server.

array -

start -

length -

Returns:

Definition at line 595 of file parse.c.

References ar_append(), ar_free(), IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_LITERAL, IMAP_ARGUMENT_TYPE_NSTRING, IMAP_ARGUMENT_TYPE_QSTRING, IMAP_ARRAY_RECURSION_LIMIT, imap_parse_array(), imap_parse_literal(), imap_parse_nstring(), imap_parse_qstring(), log_pedantic, and type().

Referenced by imap_parse_arguments(), and imap_parse_array().

5.150.2.68 int_t imap_parse_astring (stringer_t ** *output*, chr_t ** *start*, size_t * *length*)

Extract the contents of an atomic string and advance the position of the parser stream.

Note:

This function scans a string, expecting printable ASCII characters until it encounters a space, ,
, (, or [. If any other character is encountered before that point, an error will be returned. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

output the address of a managed string that will receive a copy of the atomic string's contents on success, or NULL on failure.

start the address of a pointer to the start of the buffer to be parsed, that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed atomic string.

Returns:

-1 on general error or if an invalid character was encountered, or 1 if the supplied atomic string was valid.

Definition at line 154 of file parse.c.

References log_pedantic, and st_import().

Referenced by imap_command_parser(), and imap_parse_arguments().

5.150.2.69 imap_fetch_dataitems_t* imap_parse_dataitems (imap_arguments_t * *arguments*)

Definition at line 44 of file fetch.c.

References ar_append(), ar_length_get(), ARRAY_TYPE_ARRAY, ARRAY_TYPE_POINTER, imap_fetch_dataitems_t::body, imap_fetch_dataitems_t::bodystructure, imap_fetch_dataitems_t::envelope, imap_fetch_dataitems_t::flags, IMAP_ARGUMENT_TYPE_ARRAY, imap_fetch_free_items(), imap_get_ar_ar(), imap_get_st_ar(), imap_get_type_ar(), imap_fetch_dataitems_t::internaldate, log_error, mm_alloc(), imap_fetch_dataitems_t::normal, imap_fetch_dataitems_t::normal_partial, number, imap_fetch_dataitems_t::peek, imap_fetch_dataitems_t::peek_partial, PLACER, imap_fetch_dataitems_t::rfc822, imap_fetch_dataitems_t::rfc822_header, imap_fetch_dataitems_t::rfc822_size, imap_fetch_dataitems_t::rfc822_text, st_cmp_ci_eq(), st_cmp_cs_starts(), type(), and imap_fetch_dataitems_t::uid.

Referenced by imap_fetch().

5.150.2.70 int_t imap_parse_literal (connection_t * *con*, stringer_t ** *output*, chr_t ** *start*, size_t * *length*)

Extract the contents of a literal string and advance the position of the parser stream.

Note:

This function expects as input a string beginning with '{' and followed by a numerical string, an optional '+', and a closing '}'. After reading in the numerical size parameter, it then attempts to read in that many bytes of input from the network stream.

Parameters:

con the client IMAP connection passing the literal string as input to the server.

output the address of a managed string that will receive a copy of the literal string's contents on success, or NULL on failure or if it is zero length.

start the address of a pointer to the start of the buffer to be parsed (beginning with '{'), that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

Returns:

-1 on general or parse error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 381 of file parse.c.

References connection_t::buffer, con_read(), con_read_line(), con_write_bl(), connection_t::line, line_pl_st(), log_pedantic, mm_copy(), mm_move(), connection_t::network, number, pl_empty(), pl_length_get(), pl_null(), st_alloc(), st_char_get(), st_free(), st_length_set(), and uint64_conv_bl().

References log_error, and st_import().

Referenced by imap_parse_array().

5.150.2.72 int_t imap_parse_qstring (stringer_t ** *output*, chr_t ** *start*, size_t * *length*)

Extract the contents of a quoted string and advance the position of the parser stream.

Note:

This function scans a string beginning with '"' for a terminating '"', returning an error if or
is encountered first. It is also able to handle escaped characters. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

output the address of a managed string that will receive a copy of the quoted string's contents on success, or NULL on failure or if it is zero length.

start the address of a pointer to the start of the buffer to be parsed (beginning with \), that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed quoted string.

Returns:

-1 on general error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 251 of file parse.c.

References log_pedantic, st_alloc(), st_char_get(), and st_length_set().

Referenced by imap_parse_arguments(), and imap_parse_array().

5.150.2.73 void imap_process (connection_t * *con*)

Perform client command processing on an established imap session.

Note:

This function will read the next line of user input, parse the command, and then attempt to execute it with the appropriate handler.

Parameters:

con a pointer to the connection object underlying the imap session.

Returns:

This function returns no value.

Definition at line 61 of file commands.c.

References connection_t::command, command, con_print(), con_read_line(), con_write_bl(), server_t::cutoff, enqueue(), command_t::function, connection_t::imap, imap_command_parser(), imap_commands, imap_compare(), imap_invalid(), imap_logout(), imap_process(), imap_requeue(), command_t::length, connection_t::line, connection_t::network, pl_empty(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, st_char_get(), st_length_get(), st_length_int(), command_t::string, server_t::violations, and connection_t::violations.

Referenced by con_destroy().

5.150.2.90 int_t imap_session_update (connection_t * *con*)

Returns 0 if the selected folder wasn't modified, or 1 if things changed and the updated status should be sent to the client, and a -1 is used to indicate the update check encountered a problem and should be retried later.

Definition at line 14 of file sessions.c.

References meta_message_t::foldernum, connection_t::imap, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_RECENT, META_LOCKED, meta_messages_update(), meta_update_folders(), meta_update_user(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, serial_get(), and meta_message_t::status.

Referenced by imap_check(), imap_expunge(), imap_noop(), and imap_store().

5.150.2.91 void imap_sort (void)

Sort the IMAP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 33 of file commands.c.

References imap_commands, and imap_compare().

Referenced by protocol_init().

5.150.2.92 void imap_starttls (connection_t ∗ *con*)

Create a secure connection for an IMAP session. TODO: Review error messages and update them with the appropriate response code. LOW: When should we check the serial number to see if the local data is stale and needs to be refreshed? LOW: Add function descriptions to all of the different IMAP commands.

Note:

RFC 2595 / section 3.1 specifies that STARTTLS is only available in a non-authenticated state.

Parameters:

con the connection on top of which the TLS session will be established.

Returns:

This function returns no value.

Definition at line 23 of file imap.c.

References connection_t::buffer, con_print(), con_secure(), connection_t::imap, imap_invalid(), connection_t::line, log_pedantic, M_SSL_-BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::server, connection_t::sockd, st_char_get(), st_length_get(), st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

5.150.2.93 void imap_status (connection_t ∗ *con*)

Definition at line 657 of file imap.c.

References ar_length_get(), con_print(), imap_folder_status_t::foldernum, connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_status(), imap_get_ar_ar(), imap_get_st_ar(), imap_get_type_ar(), imap_folder_status_t::messages, meta_user_rlock(), meta_-user_unlock(), NULLER, number, PLACER, imap_folder_status_t::recent, st_append_opts(), st_char_get(), st_cmp_ci_eq(), st_free(), st_-length_get(), st_length_int(), status, imap_folder_status_t::uidnext, imap_folder_status_t::unseen, and values.

5.150.2.94 void imap_store (connection_t ∗ *con*)

LOW: Shouldn't we be checking for stale status info so the update doesn't make decisions based on incorrect status data? On the other hand the actual IMAP logic is passed all the way through to the DB so even if the server ends up with incorrect status information, the database should remain accurate.

Definition at line 953 of file imap.c.

References ar_length_get(), con_print(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_duplicate_messages(), imap_-flag_action(), imap_flag_parse(), IMAP_FLAG_SILENT, imap_get_ptr(), imap_get_st_ar(), imap_get_type_ar(), imap_narrow_messages(), imap_session_update(), imap_update_flags(), imap_valid_sequence(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_-value_next(), inx_free(), MAIL_STATUS_ANSWERED, MAIL_STATUS_DELETED, MAIL_STATUS_DRAFT, MAIL_STATUS_-FLAGGED, MAIL_STATUS_RECENT, MAIL_STATUS_SEEN, meta_message_t::messagenum, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, meta_message_t::sequencenum, serial_get(), serial_increment(), st_char_get(), st_length_int(), and meta_message_-t::status.

Referenced by imap_store().

5.150.2.98 bool_t imap_valid_folder_name (stringer_t * *name*)

Check to see if a name is a valid imap folder name.

Note:

The following naming checks are enforced: 1. The name can't be empty or begin with a period. 2. It cannot contain a non-printable character. 3. Trailing periods will be removed. 4. The folder name cannot contain consecutive periods.

Parameters:

name a managed string containing the imap folder name to be validated.

Returns:

true on success or false on failure.

Definition at line 157 of file folders.c.

References log_pedantic, st_empty_out(), st_length_get(), and st_length_set().

Referenced by contact_folder_create(), contact_folder_rename(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), and imap_folder_status().

Functions

- void net_accept (server_t *server)
- void net_listen (void)
- bool_t net_init (server_t *server)

  listeners.c

- void net_shutdown (server_t *server)

  The main network handler entry point; poll the listening socket of each configured protocol server, and dispatch the protocol-specific handler for any inbound client connection that is accepted.

5.151.1 Function Documentation

5.151.1.1 void net_accept (server_t * *server*)

Definition at line 10 of file listeners.c.

References server_t::network, protocol_process(), server_t::sockd, status, thread_start(), and thread_stop().

Referenced by net_listen().

5.151.1.2 bool_t net_init (server_t * *server*)

listeners.c

Definition at line 55 of file listeners.c.

References server_t::ipv6, server_t::listen_queue, log_critical, magma, mm_wipe(), net_set_buffer_length(), net_set_reuseable_address(), server_t::network, magma_t::network_buffer, server_t::port, server_t::sockd, and magma_t::system.

Referenced by servers_network_start().

5.151.1.3 void net_listen (void)

Definition at line 30 of file listeners.c.

References server_t::enabled, magma, MAGMA_SERVER_INSTANCES, mm_free(), mm_wipe(), net_accept(), server_t::network, magma_t::servers, server_t::sockd, thread_alloc(), and thread_join().

Referenced by main().

5.151.1.4 void net_shutdown (server_t * *server*)

The main network handler entry point; poll the listening socket of each configured protocol server, and dispatch the protocol-specific handler for any inbound client connection that is accepted.

See also:

protocol_process()

Returns:

This function returns no value. Initialize a server and listen for connections.

Note:

Each server listens on either an ipv4 or ipv6 address in non-blocking mode, and will be bound and listen on the configured port.

Parameters:

server a pointer to the server object to be initialized.

Returns:

true on successful initialization of the server, or false on failure. Close the listening socket associated with a server.
This function returns no value.

Definition at line 297 of file listeners.c.

References server_t::network, and server_t::sockd.

Referenced by servers_network_stop().

Data Structures

- struct key_pair_t
- struct meta_stats_tag_t

Functions

- meta_alert_t ∗ alert_alloc (uint64_t alertnum, stringer_t ∗type, stringer_t ∗message, uint64_t created)
  alerts.c
- meta_stats_tag_t ∗ meta_folder_stats_tag_alloc (stringer_t ∗tag)
  folders.c
- meta_folder_t ∗ meta_folders_by_name (inx_t ∗folders, stringer_t ∗name)
  Get a folder by its fully qualified name.
- meta_folder_t ∗ meta_folders_by_number (inx_t ∗folders, uint64_t number)
  Get a folder by number.
- int_t meta_folders_children (inx_t ∗folders, uint64_t number)
  Get the number of direct child folders of a specified parent folder.
- stringer_t ∗ meta_folders_name (inx_t ∗list, meta_folder_t ∗folder)
  Get a folder's fully qualified name.
- inx_t ∗ meta_folders_stats_tags (inx_t ∗messages, uint64_t folder)
  Create a collection of meta tag stats for a set of messages.
- bool_t meta_user_serial_check (meta_user_t ∗user, uint64_t object)
  serials.c
- uint64_t meta_user_serial_get (meta_user_t ∗user, uint64_t object)
  Get an object serial number for a given meta object.
- void meta_user_serial_set (meta_user_t ∗user, uint64_t object, uint64_t serial)
  Set an object serial number for a given meta user structure.
- int_t meta_update_aliases (meta_user_t ∗user, META_LOCK_STATUS locked)
  updaters.c
- int_t meta_update_contacts (meta_user_t ∗user, META_LOCK_STATUS locked)
  Update a user's contacts if necessary.
- int_t meta_update_folders (meta_user_t ∗user, META_LOCK_STATUS locked)
  Update a user's message folders if necessary.
- int_t meta_update_keys (meta_user_t ∗user, META_LOCK_STATUS locked)
  Fetches the user signet and private key. Relies on the mail realm to decrypt the values.
- int_t meta_update_message_folders (meta_user_t ∗user, META_LOCK_STATUS locked)

Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

- int_t meta_update_realms (meta_user_t *user, stringer_t *salt, stringer_t *master, META_LOCK_STATUS locked)

  Fetches the user realm keys and extracts the different components.

- int_t meta_update_user (meta_user_t *user, META_LOCK_STATUS locked)

  Build a user's meta information from specified data parameters.

- void meta_user_ref_add (meta_user_t *user, META_PROTOCOL protocol)

  references.c

- void meta_user_ref_dec (meta_user_t *user, META_PROTOCOL protocol)

  Decrement a user's reference counter for the specified protocol and update the activity timestamp.

- uint64_t meta_user_ref_protocol_total (meta_user_t *user, META_PROTOCOL protocol)

  Get the total reference count for the user object over the specified protocol.

- time_t meta_user_ref_stamp (meta_user_t *user)

  Get the activity timestamp for a meta user object.

- uint64_t meta_user_ref_total (meta_user_t *user)

  Get the total reference count for a user object, over all of the supported protocols.

- meta_user_t * meta_alloc (void)

  meta.c

- void meta_free (meta_user_t *user)

  Free a meta user object.

- int_t meta_get (uint64_t usernum, stringer_t *username, stringer_t *salt, stringer_t *master, stringer_t *verification, META_-PROTOCOL protocol, META_GET get, meta_user_t **output)

  Lookup user and return their meta user object.

- bool_t meta_data_acknowledge_alert (uint64_t alertnum, uint64_t usernum, uint32_t transaction)

  datatier.c

- uint64_t meta_data_delete_folder (uint64_t usernum, uint64_t foldernum)

  Delete a message folder from the database.

- int_t meta_data_delete_tag (meta_message_t *message, stringer_t *tag)

  Remove a tag from a message in the database.

- inx_t * meta_data_fetch_alerts (uint64_t usernum)

  Get all unacknowledged alert messages for a user.

- inx_t * meta_data_fetch_all_tags (uint64_t usernum)

  Fetch all the tags attached to messages of a specified user from the database.

- bool_t meta_data_fetch_folders (meta_user_t *user)

  Retrieve all of a user's message folders from the database.

- int_t meta_data_fetch_keys (meta_user_t *user, key_pair_t *output, int64_t transaction)

  Retrieve the encryption keys for a user account.

- int_t meta_data_fetch_mailbox_aliases (meta_user_t *user)

  Get all the mailbox aliases for a specified user.

- int_t meta_data_fetch_shard (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *output, uint_t *rotated, int64_t transaction)

  Retrieve a shard value for user account.

- int_t meta_data_fetch_user (meta_user_t *user)

  Build a meta user object by username, hashed password, and hashed key storage password.

- bool_t meta_data_flags_add (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Add the specified flags mask to a collection of mail messages.

- bool_t meta_data_flags_remove (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Remove the specified flags mask from a collection of mail messages.

- bool_t meta_data_flags_replace (inx_t *messages, uint64_t usernum, uint64_t foldernum, uint32_t flags)

  Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

- uint64_t meta_data_insert_folder (uint64_t usernum, stringer_t *name, uint64_t parent, uint32_t order)

  Insert a new mail folder into the database.

- int_t meta_data_insert_keys (uint64_t usernum, stringer_t *username, key_pair_t *input, int64_t transaction)

  Store the encryption keys for a user account.

- int_t meta_data_insert_shard (uint64_t usernum, uint16_t serial, stringer_t *label, stringer_t *shard, int64_t transaction)

  Store the user realm shard value.

- int_t meta_data_insert_tag (meta_message_t *message, stringer_t *tag)

  Insert a tag for a message into the database.

- int_t meta_data_truncate_tags (meta_message_t *message)

  Remove all tags associated with a message in the database.

- uint64_t meta_data_update_folder_name (uint64_t usernum, uint64_t foldernum, stringer_t *name, uint64_t parent, uint32_t order)

  Update the record for a message folder in the database.

- void meta_data_update_lock (uint64_t usernum, uint8_t lock)

  Update a user's lock in the database.

- void meta_data_update_log (meta_user_t *user, META_PROTOCOL prot)

  Update the per-user entry in the Log table for the specified protocol.

- void meta_user_rlock (meta_user_t *user)

  locking.c

- void meta_user_unlock (meta_user_t *user)

  Release the lock for a meta user object.

- void meta_user_wlock (meta_user_t *user)

  Acquire a write lock for a meta user object.

- meta_user_t ∗ meta_inx_find (uint64_t usernum, META_PROTOCOL protocol)
  indexes.c
- void meta_inx_remove (uint64_t usernum, META_PROTOCOL protocol)
  Lock a user's object in the cache and decrement their reference counter.
- int_t meta_crypto_keys_create (uint64_t usernum, stringer_t ∗username, stringer_t ∗realm, int64_t transaction)
  crypto.c
- meta_alias_t ∗ alias_alloc (uint64_t aliasnum, stringer_t ∗address, stringer_t ∗display, int_t selected, uint64_t created)
  alias.c

5.153.1 Function Documentation

5.153.1.1 meta_alert_t∗ alert_alloc (uint64_t *alertnum*, stringer_t ∗ *type*, stringer_t ∗ *message*, uint64_t *created*)

alerts.c alerts.c

Parameters:

alertnum the numerical id of the user alert.
type a pointer to a managed string containing the type of the alert (e.g. "warning" or "alert").
message a pointer to a managed string containing the alert message.
created the UTC timecode for when the alert message was created.

Returns:

NULL on error or a pointer to the newly initialized user alert message object on success.

Definition at line 18 of file alerts.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, meta_alert_t, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), and STACK.

Referenced by meta_data_fetch_alerts().

5.153.1.2 meta_alias_t∗ alias_alloc (uint64_t *aliasnum*, stringer_t ∗ *address*, stringer_t ∗ *display*, int_t *selected*, uint64_t *created*)

alias.c alias.c

Parameters:

aliasnum the numerical identifier of the user alias.
address a managed string containing the email address associated with the alias.
display a managed string containing the display name associated with the alias.
selected a flag specifying whether this alias is the default selection for the user.
created a UNIX timestamp for the creation of this alias.

Returns:

NULL on failure, or a pointer to the newly initialized user alias object on success.

Definition at line 19 of file alias.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, meta_alias_t, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), and STACK.

Referenced by meta_data_fetch_mailbox_aliases().

5.153.1.3 meta_user_t* meta_alloc (void)

meta.c meta.c

Returns:

NULL on failure, or a pointer to the newly allocated meta user object on success.

Definition at line 47 of file meta.c.

References meta_user_t::lock, log_pedantic, mm_alloc(), mm_free(), mm_wipe(), mutex_init(), meta_user_t::refs, rwlock_attr_destroy(), rwlock_attr_init(), rwlock_attr_setkind(), rwlock_destroy(), and rwlock_init().

Referenced by meta_inx_find().

5.153.1.4 int_t meta_crypto_keys_create (uint64_t *usernum*, stringer_t * *username*, stringer_t * *realm*, int64_t *transaction*)

crypto.c crypto.c

Parameters:

user

master

Returns:

-1 if an error occurs, 0 if successful, and 1 if the insertion fails because a key already exists.

Definition at line 18 of file crypto.c.

References BINARY, log_info, log_pedantic, meta_data_insert_keys(), NONE, org_key, prime_cleanup(), prime_free(), prime_get(), prime_key_encrypt(), prime_key_generate(), prime_request_generate(), prime_request_sign(), prime_t, PRIME_USER_KEY, key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_free(), and st_length_int().

Referenced by meta_update_keys(), and register_data_insert_user().

5.153.1.5 bool_t meta_data_acknowledge_alert (uint64_t *alertnum*, uint64_t *usernum*, uint32_t *transaction*)

datatier.c datatier.c

Note:

If the table is not updated immediately, another check is made to see if the alert is still pending. If so, false is returned.

Parameters:

alertnum the numerical id of the alert message to be acknowledged.

usernum the numerical id of the user to whom the alert message belongs.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

true if the alert was acknowledged successfully, or false on failure.

Definition at line 623 of file datatier.c.

References log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), stmt_exec_affected_conn(), and stmt_get_result_conn().

Referenced by portal_endpoint_alert_acknowledge().

5.153.1.6 uint64_t meta_data_delete_folder (uint64_t *usernum*, uint64_t *foldernum*)

Delete a message folder from the database.

Parameters:

usernum the numerical id of the user that owns the folder to be deleted.

foldernum the folder id of the message folder to be deleted.

Returns:

1 if the message folder was successfully, or <= 0 if there was an error.

Definition at line 971 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), stmt_exec_affected(), and type().

Referenced by imap_folder_remove().

5.153.1.7 int_t meta_data_delete_tag (meta_message_t * *message*, stringer_t * *tag*)

Remove a tag from a message in the database.

Parameters:

message a pointer to the meta message object of the message to have the tag stripped.

tag a managed string containing the name of the tag to be deleted.

Returns:

0 on success or -1 on failure.

Definition at line 1176 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.153.1.8 inx_t* meta_data_fetch_alerts (uint64_t *usernum*)

Get all unacknowledged alert messages for a user.

Parameters:

usernum the numerical id of the user for whom the alert messages will be fetched.

Returns:

NULL on failure, or a pointer to an inx holder containing all of the user's alert messages on success.

Definition at line 688 of file datatier.c.

References alert_alloc(), inx_alloc(), inx_free(), inx_insert(), log_error, log_info, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_alert_t, mm_free(), mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_alert_list().

5.153.1.9 inx_t* meta_data_fetch_all_tags (uint64_t *usernum*)

Fetch all the tags attached to messages of a specified user from the database.

Parameters:

usernum the numerical id of the user for whom the message tags will be fetched.

Returns:

NULL on failure, or an inx holder containing a list of all the user's messages' tags as managed strings on success.

Definition at line 1209 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, res_field_string(), res_row_-next(), res_table_free(), st_free(), stmt_get_result(), multi_t::type, multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_messages_tags().

5.153.1.10 bool_t meta_data_fetch_folders (meta_user_t * *user*)

Retrieve all of a user's message folders from the database.

Note:

If the user already had a working set of message folders they will be deleted first.

Parameters:

user a pointer to the meta user object of the user making the request, which will be updated on success.

Returns:

-1 on failure or 1 on success.

Definition at line 97 of file datatier.c.

References meta_folder_t::foldernum, meta_user_t::folders, inx_alloc(), inx_cleanup(), inx_insert(), log_error, log_pedantic, M_FOLDER_-MESSAGES, M_INX_LINKED, M_TYPE_UINT64, mm_alloc(), mm_copy(), mm_free(), mm_wipe(), meta_folder_t::name, meta_folder_-t::order, meta_folder_t::parent, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::type, type(), multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by meta_update_folders().

5.153.1.11 int_t meta_data_fetch_keys (meta_user_t * *user*, key_pair_t * *output*, int64_t *transaction*)

Retrieve the encryption keys for a user account.

Parameters:

user a meta object with the user number field populated.

output a key pair object to hold the results.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 346 of file datatier.c.

References base64_decode_mod(), log_pedantic, mm_wipe(), PLACER, key_pair_t::private, key_pair_t::public, res_field_block(), res_field_length(), res_row_next(), res_table_free(), st_char_get(), st_empty, st_free(), st_length_int(), stmt_get_result_conn(), meta_user_t::username, and meta_user_t::usernum.

Referenced by meta_update_keys().

5.153.1.12 int_t meta_data_fetch_mailbox_aliases (meta_user_t * *user*)

Get all the mailbox aliases for a specified user.

Parameters:

user a pointer to the partially populated meta user object to be queried, with its usernum field set.

Returns:

true on success or false on failure.

Definition at line 198 of file datatier.c.

References alias_alloc(), meta_user_t::aliases, inx_alloc(), inx_cleanup(), inx_insert(), log_error, log_info, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_alias_t, mm_free(), mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_field_uint8(), res_row_next(), res_table_free(), st_char_get(), st_length_int(), stmt_get_result(), multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by meta_update_aliases().

5.153.1.13 int_t meta_data_fetch_shard (uint64_t *usernum*, uint16_t *serial*, stringer_t * *label*, stringer_t * *output*, uint_t * *rotated*, int64_t *transaction*)

Retrieve a shard value for user account.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the serial number associated with the shard value.

label the textual label associated with the shard value.

output the buffer where the binary output should be stored.

rotated the buffer where the rotated variable is stored.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 479 of file datatier.c.

References base64_decode_mod(), log_pedantic, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint8(), res_row_next(), res_table_free(), st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_opt_get(), st_valid_destination(), STACIE_SHARD_LENGTH, and stmt_get_result_conn().

Referenced by meta_update_realms().

5.153.1.14 int_t meta_data_fetch_user (meta_user_t * *user*)

Build a meta user object by username, hashed password, and hashed key storage password.

Parameters:

user a meta object with the user number field populated.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if no rows are found.

Definition at line 263 of file datatier.c.

References base64_decode_mod(), meta_user_t::flags, log_pedantic, META_USER_ENCRYPT_DATA, META_USER_OVERQUOTA, META_USER_TLS, mm_wipe(), PLACER, res_field_block(), res_field_int8(), res_field_length(), res_field_string(), res_row_next(), res_table_free(), st_cleanup, st_empty, stmt_get_result(), meta_user_t::username, meta_user_t::usernum, and meta_user_t::verification.

Referenced by meta_update_user().

5.153.1.15 bool_t meta_data_flags_add (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Add the specified flags mask to a collection of mail messages.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 908 of file datatier.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, meta_message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_fetch(), imap_update_flags(), portal_endpoint_messages_flag(), and portal_endpoint_messages_tag().

5.153.1.16 bool_t meta_data_flags_remove (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Remove the specified flags mask from a collection of mail messages.

Parameters:

messages an inx holder containing the collection of messages to have their flags removed.

usernum the numerical id of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be stripped from any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 834 of file datatier.c.

References meta_message_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, meta_message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_select(), imap_update_flags(), portal_endpoint_messages_flag(), and portal_endpoint_messages_tag().

5.153.1.17 bool_t meta_data_flags_replace (inx_t * *messages*, uint64_t *usernum*, uint64_t *foldernum*, uint32_t *flags*)

Remove all user (non-system) flags from a collection of mail messages, and set the specified flags mask for them.

Note:

The new mask can contain both user and system flags, but only user flags will be stripped from each message initially.

Parameters:

messages an inx holder containing the collection of messages to have their flags updated.

usernum the numerical of the user to whom the target messages belong, for validation purposes.

foldernum the numerical id of the parent folder containing the messages to be updated, for validation purposes.

flags a mask of all flags that are to be added to any matching messages in the collection.

Returns:

true on success or false on failure.

Definition at line 752 of file datatier.c.

References meta_message_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, MAIL_STATUS_USER_FLAGS, meta_message_t::messagenum, mm_wipe(), and stmt_exec().

Referenced by imap_update_flags(), and portal_endpoint_messages_flag().

5.153.1.18 uint64_t meta_data_insert_folder (uint64_t *usernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*)

Insert a new mail folder into the database.

Parameters:

usernum the numerical id of the user to whom the new folder belongs.

name a managed string containing the name of the new mail folder.

parent the numerical id of the mail folder to be the parent of the new mail folder.

order the order number of this folder in its parent folder.

Returns:

0 on failure, or the numerical id of the newly inserted mail folder in the database on success.

Definition at line 1067 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), st_char_get(), st_length_get(), stmt_insert(), and type().

Referenced by imap_folder_create(), and imap_folder_rename().

5.153.1.19 int_t meta_data_insert_keys (uint64_t *usernum*, stringer_t * *username*, key_pair_t * *input*, int64_t *transaction*)

Store the encryption keys for a user account.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

username the plain text username.

input the public and private key pair.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 411 of file datatier.c.

References base64_encode_mod(), log_pedantic, mm_wipe(), key_pair_t::private, key_pair_t::public, st_char_get(), st_cleanup, st_length_get(), st_length_int(), st_populated, and stmt_exec_affected_conn().

Referenced by meta_crypto_keys_create().

5.153.1.20 int_t meta_data_insert_shard (uint64_t *usernum*, uint16_t *serial*, stringer_t * *label*, stringer_t * *shard*, int64_t *transaction*)

Store the user realm shard value.

Parameters:

usernum the numerical id of the user to whom the alert message belongs.

serial the nummerid serial number associated with the shard value.

label the textual label associated with the shard value.

shard the binary shard value.

transaction the mysql transaction id of the acknowledgment operation, in cases batch changes need to be rolled back.

Returns:

-1 for unexpected program/system error, 0 on success, 1 if the query executes, but no rows are affected.

Definition at line 547 of file datatier.c.

References base64_encode_mod(), log_pedantic, MANAGEDBUF, mm_wipe(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), STACIE_SHARD_LENGTH, and stmt_exec_affected_conn().

Referenced by meta_update_realms().

5.153.1.21 int_t meta_data_insert_tag (meta_message_t * *message*, stringer_t * *tag*)

Insert a tag for a message into the database.

Parameters:

message the meta message object of the message to be tagged.

tag a managed string containing the name of the tag.

Returns:

0 on success or -1 on failure.

Definition at line 1114 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.153.1.22 int_t meta_data_truncate_tags (meta_message_t * *message*)

Remove all tags associated with a message in the database.

Parameters:

message a pointer to the meta message object of the message to have all of its tags stripped.

Returns:

0 on success or -1 on failure.

Definition at line 1147 of file datatier.c.

References meta_message_t::messagenum, mm_wipe(), and stmt_exec_affected().

Referenced by portal_endpoint_messages_tag().

5.153.1.23 uint64_t meta_data_update_folder_name (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*)

Update the record for a message folder in the database.

Parameters:

usernum the numerical id of the user that owns the specified folder.

foldernum the id of the folder to have its properties adjusted.

name a managed string containing the new name of the specified folder.

parent the id of the new parent folder to be set for the specified message folder.

order the value of the order for the specified folder.

Returns:

1 on success, or <= 0 on failure.

Definition at line 1011 of file datatier.c.

References M_FOLDER_MESSAGES, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_affected(), and type().

Referenced by imap_folder_rename().

5.153.1.24 void meta_data_update_lock (uint64_t *usernum*, uint8_t *lock*)

Update a user's lock in the database.

Parameters:

usernum the numerical id of the user for whom the lock will be set.

lock the new value to which the specified user's lock will be set.

Returns:

This function returns no value.

Definition at line 57 of file datatier.c.

References log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by smtp_fetch_authorization().

5.153.1.25 void meta_data_update_log (meta_user_t * *user*, META_PROTOCOL *prot*)

Update the per-user entry in the Log table for the specified protocol.

Note:

This function will set the last session timestamp for the user, and increment the sessions counter in the database.

Parameters:

user the meta user object of the user making the logging request.

prot the protocol associated with the log request: META_PROT_POP, META_PROT_IMAP, or META_PROT_WEB.

Returns:

This function returns no value.

Definition at line 20 of file datatier.c.

References log_pedantic, META_PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_WEB, mm_wipe(), stmt_exec_affected(), and meta_user_t::usernum.

Referenced by imap_login(), and pop_pass().

5.153.1.26 meta_stats_tag_t* meta_folder_stats_tag_alloc (stringer_t * *tag*)

folders.c folders.c

Parameters:

tag a managed string containing the name of the message tag.

Returns:

NULL on failure, or a newly allocated and initialized meta tag stat object on success.

Definition at line 15 of file folders.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), STACK, and meta_stats_tag_t::tag.

Referenced by meta_folders_stats_tags().

5.153.1.27 meta_folder_t* meta_folders_by_name (inx_t * *folders*, stringer_t * *name*)

Get a folder by its fully qualified name.

Parameters:

folders a pointer to an inx holder containing a list of folders to be traversed in the search.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 138 of file folders.c.

References CONSTANT, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), meta_folders_name(), st_cmp_ci_eq(), st_cmp_cs_eq(), and st_free().

Referenced by imap_append(), imap_copy(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_folder_status(), imap_subscribe(), and portal_folder_mail_add().

5.153.1.28 meta_folder_t* meta_folders_by_number (inx_t * *folders*, uint64_t *number*)

Get a folder by number.

Parameters:

folders a pointer to an inx holder containing the folders to be searched.

number the numerical id of the folder to be retrieved.

Returns:

NULL on failure, or a pointer to the found meta folder object of the specified folder on success.

Definition at line 179 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, and inx_cursor_value_next().

Referenced by meta_folders_name(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_-tag(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.153.1.29 int_t meta_folders_children (inx_t * *folders*, uint64_t *number*)

Get the number of direct child folders of a specified parent folder.

Parameters:

folders a pointer to an inx holder containing the the collection of folders to be traversed.

number the folder id of the parent folder to be scanned for children.

Returns:

the number of children folders in the specified parent folder, or 0 on failure.

Definition at line 207 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), and meta_folder_t::parent.

Referenced by imap_folder_remove().

5.153.1.30 stringer_t* meta_folders_name (inx_t * *list*, meta_folder_t * *folder*)

Get a folder's fully qualified name.

Note:

This function will prepend the entire ancestor path of a folder to its name, with each level delimited by periods.

Parameters:

list a pointer to an inx holder containing a list of folders to be searched for parent folders.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 99 of file folders.c.

References FOLDER_RECURSION_LIMIT, log_pedantic, meta_folders_by_number(), meta_folder_t::name, ns_length_get(), meta_-folder_t::parent, st_free(), st_import(), and st_merge.

Referenced by imap_folder_name_escaped(), imap_narrow_folders(), meta_folders_by_name(), portal_endpoint_folders_rename(), portal_-folder_mail_add(), and portal_folder_mail_remove().

5.153.1.31 inx_t* meta_folders_stats_tags (inx_t * *messages*, uint64_t *folder*)

Create a collection of meta tag stats for a set of messages.

Note:

Each meta tag stat will contain the name of a message tag, along with the number of messages with which it was associated.

Parameters:

messages an inx holder containing the list of messages to be examined.

folder the numerical id of the parent folder that contains all target messages.

Returns:

NULL on failure, or an inx holder containing all of the messages' meta tag stats on success.

LOW: This is a very inefficient method for counting the number of times each tag appears.

Definition at line 40 of file folders.c.

References ar_field_st(), ar_length_get(), meta_stats_tag_t::count, meta_message_t::foldernum, inx_alloc(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_find(), inx_insert(), log_pedantic, M_INX_HASHED, M_TYPE_STRINGER, meta_folder_stats_tag_alloc(), mm_free(), multi_t::st, meta_message_t::tags, and multi_t::val.

Referenced by portal_endpoint_folders_tags().

5.153.1.32 void meta_free (meta_user_t * *user*)

Free a meta user object.

Parameters:

user a pointer to the meta user object to be destroyed.

Returns:

This function returns no value.

Definition at line 17 of file meta.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, inx_cleanup(), meta_user_t::key, meta_user_t::lock, meta_user_t::mail, meta_user_t::message_folders, meta_user_t::messages, mm_free(), mutex_destroy(), meta_user_t::prime, prime_cleanup(), meta_user_t::realm, meta_user_t::refs, rwlock_destroy(), meta_user_t::signet, st_cleanup, meta_user_t::username, and meta_user_t::verification.

Referenced by meta_inx_find(), and obj_cache_start().

5.153.1.33 int_t meta_get (uint64_t *usernum*, stringer_t * *username*, stringer_t * *salt*, stringer_t * *master*, stringer_t * *verification*, META_PROTOCOL *protocol*, META_GET *get*, meta_user_t ** *output*)

Lookup user and return their meta user object.

Note:

If the user is not found in the local session cache, the session will be constructed using the database, and then cached.

Parameters:

usernum the numeric identifier for the user account.

username the official username stored in the database.

salt the user specific salt value.

master the user account's master encryption key which will be used to unlock the private storage key.

verification the verification token.

protocol a set of protocol specifying the protocol used by the calling function. Values can be META_PROT_NONE, META_PROT_-SMTP, META_PROT_POP, META_PROT_IMAP, META_PROT_WEB, or META_PROT_GENERIC.

get a set of protocol specifying the data to be retrieved (META_GET_NONE, META_GET_MESSAGES, META_GET_FOLDERS, or META_GET_CONTACTS)

output the address of a meta user object that will store a pointer to the result of the lookup.

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 112 of file meta.c.

References log_pedantic, meta_user_t::mail, META_GET_ALIASES, META_GET_CONTACTS, META_GET_FOLDERS, META_GET_-KEYS, META_GET_MESSAGES, meta_inx_find(), meta_inx_remove(), META_LOCKED, meta_messages_update(), meta_update_-aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), meta_user_unlock(), meta_user_wlock(), meta_user_t::realm, st_cleanup, st_cmp_cs_eq(), st_empty, st_populated, and meta_user_t::verification.

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), and portal_endpoint_auth().

5.153.1.34 meta_user_t∗ meta_inx_find (uint64_t *usernum*, META_PROTOCOL *protocol*)

indexes.c

Definition at line 40 of file indexes.c.

References inx_find(), inx_insert(), inx_lock_write(), inx_unlock(), M_TYPE_UINT64, object_cache_t::meta, meta_alloc(), meta_free(), meta_user_ref_add(), objects, and meta_user_t::usernum.

Referenced by meta_get().

5.153.1.35 void meta_inx_remove (uint64_t *usernum*, META_PROTOCOL *protocol*)

Lock a user's object in the cache and decrement their reference counter.

See also:

meta_user_ref_dec()

Parameters:

username a managed string containing the name of the user to be adjusted.

protocol specifies the protocol bound to the reference counter to be decremented (META_PROT_WEB, META_PROT_IMAP, etc.)

Returns:

This function returns no value.

Definition at line 17 of file indexes.c.

References inx_find(), inx_lock_read(), inx_unlock(), M_TYPE_UINT64, object_cache_t::meta, meta_user_ref_dec(), and objects.

5.153.1.36 int_t meta_update_aliases (meta_user_t * *user*, META_LOCK_STATUS *locked*)

updaters.c updaters.c

Parameters:

user a pointer to the meta object that is to be populated.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

Definition at line 261 of file updaters.c.

References meta_user_t::aliases, meta_data_fetch_mailbox_aliases(), META_NEED_LOCK, meta_user_serial_get(), meta_user_serial_set(), meta_user_unlock(), meta_user_wlock(), OBJECT_ALIASES, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get(), and sess_update().

5.153.1.37 int_t meta_update_contacts (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Update a user's contacts if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

user a pointer to the meta user object that will have its message folders updated.

locked if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 310 of file updaters.c.

References meta_user_t::contacts, contacts_update(), inx_free(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get(), and sess_update().

5.153.1.38 int_t meta_update_folders (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Update a user's message folders if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

user a pointer to the meta user object that will have its message folders updated.

locked if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 367 of file updaters.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_folders(), meta_messages_update_sequences(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by imap_session_update(), meta_get(), and sess_update().

5.153.1.39 int_t meta_update_keys (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Fetches the user signet and private key. Relies on the mail realm to decrypt the values.

Parameters:

user a pointer to the meta object that is to be populated.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-2 if there is a problem unscrambling the private key, -1 for a system error, 0 for success, and 1 if the keys were created.

Definition at line 113 of file updaters.c.

References BINARY, meta_user_t::key, log_pedantic, meta_user_t::mail, meta_crypto_keys_create(), meta_data_fetch_keys(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), NONE, meta_user_t::prime, prime_key_decrypt(), prime_set(), key_pair_t::private, key_pair_t::public, meta_user_t::realm, meta_user_t::signet, st_char_get(), st_cleanup, st_length_int(), st_populated, tran_commit(), tran_rollback(), tran_start(), meta_user_t::username, and meta_user_t::usernum.

Referenced by meta_get().

5.153.1.40 int_t meta_update_message_folders (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

See also:

messages_update()

Parameters:

user a pointer to the meta user object requesting the folders.

locked if META_LOCKED, lock the meta user object for the duration of the request.

Returns:

-1 on failure, or 1 on success.

Definition at line 419 of file updaters.c.

References meta_user_t::folders, inx_free(), meta_user_t::message_folders, messages_update(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get().

5.153.1.41 int_t meta_update_realms (meta_user_t * *user*, stringer_t * *salt*, stringer_t * *master*, META_LOCK_STATUS *locked*)

Fetches the user realm keys and extracts the different components.

Parameters:

user a pointer to the meta object that is to be populated.

master the user master key value.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-2 if there is a problem extracting the key values, -1 for a system error, 0 for success, and 1 if the keys were created.

References log_pedantic, meta_user_t::mail, MANAGEDBUF, meta_data_fetch_shard(), meta_data_insert_shard(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), PLACER, meta_user_t::realm, st_char_get(), st_empty, st_length_get(), st_length_int(), stacie_create_shard(), STACIE_KEY_LENGTH, stacie_realm_key(), STACIE_SHARD_LENGTH, tran_commit(), tran_rollback(), tran_start(), meta_user_t::username, and meta_user_t::usernum.

Referenced by meta_get().

5.153.1.42 int_t meta_update_user (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Build a user's meta information from specified data parameters.

Note:

The user object will be pulled from the cache, if possible, or it falls back to a database lookup using the user number and the verification token.

Parameters:

user a pointer to the meta object that is to be populated.

usernum the user number.

verification the verification token for the specified user number.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 211 of file updaters.c.

References meta_data_fetch_user(), META_NEED_LOCK, meta_user_serial_get(), meta_user_serial_set(), meta_user_unlock(), meta_user_wlock(), OBJECT_USER, serial_get(), serial_increment(), meta_user_t::serials, st_populated, meta_user_t::user, meta_user_t::username, meta_user_t::usernum, and meta_user_t::verification.

Referenced by imap_session_update(), meta_get(), and sess_update().

5.153.1.43 void meta_user_ref_add (meta_user_t * *user*, META_PROTOCOL *protocol*)

references.c references.c

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session.

Returns:

This function returns no value.

Definition at line 20 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_-PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, meta_user_t::stamp, and meta_user_t::web.

Referenced by meta_inx_find().

5.153.1.44 void meta_user_ref_dec (meta_user_t ∗ *user*, META_PROTOCOL *protocol*)

Decrement a user's reference counter for the specified protocol and update the activity timestamp.

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

This function returns no value.

Definition at line 60 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_-PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, meta_user_t::stamp, and meta_user_t::web.

Referenced by meta_inx_remove(), and portal_endpoint_logout().

5.153.1.45 uint64_t meta_user_ref_protocol_total (meta_user_t ∗ *user*, META_PROTOCOL *protocol*)

Get the total reference count for the user object over the specified protocol.

Parameters:

user a pointer to the meta user object to be examined.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

the total number of references held by the user.

Definition at line 98 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_-PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, and meta_user_t::web.

Referenced by pop_pass().

5.153.1.46 time_t meta_user_ref_stamp (meta_user_t * *user*)

Get the activity timestamp for a meta user object.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

a timestamp containing the last time the meta user object's reference count changed.

Definition at line 161 of file references.c.

References meta_user_t::lock, mutex_lock(), mutex_unlock(), meta_user_t::refs, and meta_user_t::stamp.

Referenced by obj_cache_prune().

5.153.1.47 uint64_t meta_user_ref_total (meta_user_t * *user*)

Get the total reference count for a user object, over all of the supported protocols.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

the total number of references held by the user.

Definition at line 134 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, and meta_user_t::web.

Referenced by obj_cache_prune().

5.153.1.48 void meta_user_rlock (meta_user_t * *user*)

locking.c locking.c

Parameters:

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 15 of file locking.c.

References meta_user_t::lock, and rwlock_lock_read().

Referenced by imap_close(), imap_examine(), imap_expunge(), imap_fetch(), imap_list(), imap_login(), imap_lsub(), imap_search_messages(), imap_status(), pop_last(), pop_list(), pop_retr(), pop_stat(), pop_top(), pop_uidl(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), and portal_endpoint_messages_tag().

5.153.1.49 bool_t meta_user_serial_check (meta_user_t * *user*, uint64_t *object*)

serials.c serials.c

Note:

The object's serial number will be incremented regardless of whether it is consistent with the cache.

Parameters:

user the meta user object to whom the object belongs.

object the serial object to be checked for changes.

Returns:

0 if the object did not to be refreshed, or 1 if it doesn't match the internal checkpoint and should be updated.

Definition at line 86 of file serials.c.

References meta_user_serial_get(), meta_user_serial_set(), serial_get(), serial_increment(), and meta_user_t::usernum.

Referenced by portal_endpoint_messages_tag(), and sess_serial_check().

5.153.1.50 uint64_t meta_user_serial_get (meta_user_t * *user*, uint64_t *object*)

Get an object serial number for a given meta object.

Parameters:

user the meta user structure to be examined.

object the object to query for the serial number.

Returns:

the serial number value of the specified object, or 0 on failure. LOW: Swap the object and user params so the interface matches the serial_get/set functions.

Definition at line 53 of file serials.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, meta_user_t::messages, OBJECT_ALIASES, OBJECT_CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, meta_user_t::serials, and meta_user_t::user.

Referenced by meta_update_aliases(), meta_update_user(), and meta_user_serial_check().

5.153.1.51 void meta_user_serial_set (meta_user_t * *user*, uint64_t *object*, uint64_t *serial*)

Set an object serial number for a given meta user structure.

Parameters:

user the meta user object to be adjusted.

object the object to receive the new serial number.

serial the new serial number to be set.

Returns:

This function returns no value.

Definition at line 20 of file serials.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, meta_user_t::messages, OBJECT_ALIASES, OBJECT_CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, meta_user_t::serials, and meta_user_t::user.

Referenced by meta_update_aliases(), meta_update_user(), and meta_user_serial_check().

5.153.1.52 void meta_user_unlock (meta_user_t * *user*)

Release the lock for a meta user object.

Parameters:

user a pointer to the meta user object to be unlocked.

Returns:

This function returns no value.

Definition at line 47 of file locking.c.

References meta_user_t::lock, and rwlock_unlock().

Referenced by imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_list(), imap_login(), imap_lsub(), imap_rename(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_status(), imap_store(), imap_subscribe(), meta_get(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), pop_dele(), pop_last(), pop_list(), pop_pass(), pop_retr(), pop_session_destroy(), pop_session_reset(), pop_stat(), pop_top(), pop_uidl(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.153.1.53 void meta_user_wlock (meta_user_t * *user*)

Acquire a write lock for a meta user object.

Parameters:

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 31 of file locking.c.

References meta_user_t::lock, and rwlock_lock_write().

Referenced by imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_rename(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_subscribe(), meta_get(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), pop_dele(), pop_pass(), pop_session_destroy(), pop_session_reset(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

Data Structures

- struct command_t
- struct client_t
- struct connection_t

Enumerations

- enum { REVERSE_ERROR = -1, REVERSE_EMPTY = 0, REVERSE_PENDING = 1, REVERSE_COMPLETE = 2 }

Functions

- ip_t * con_addr (connection_t *con, ip_t *output)

  addresses.c

- octet_t con_addr_octet (connection_t *con, int_t position)

  Get a specified 8-bit octet of a connection's peer IP address.

- stringer_t * con_addr_presentation (connection_t *con, stringer_t *output)

  Return a textual representation of the IP address of a specified connection handle.

- stringer_t * con_addr_reversed (connection_t *con, stringer_t *output)

  Get the reversed-IP address string for a client connection.

- segment_t con_addr_segment (connection_t *con, int_t position)

  Extract a specified 16 bit segment from a connection's peer IP address.

- stringer_t * con_addr_standard (connection_t *con, stringer_t *output)

  Get the IP address string for the client connection.

- stringer_t * con_addr_subnet (connection_t *con, stringer_t *output)

  Get the subnet string for a specified connection.

- uint32_t con_addr_word (connection_t *con, int_t position)

  Get a specified 32-bit segment of a connection's peer IP address.

- uint64_t con_decrement_refs (connection_t *con)

  connections.c

- void con_destroy (connection_t *con)

  Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

- uint64_t con_increment_refs (connection_t *con)

  Increment a connection object's reference counter.

- connection_t * con_init (int cond, server_t *server)

  Create a new connection object for a client connection.

- bool_t con_init_network_buffer (connection_t *con)

  Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

- bool_t con_localhost (connection_t *con)

  Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

- bool_t con_private (connection_t *con)

  Determine whether a client connection is with a machine on the same private network.

- int_t con_secure (connection_t *con)

  Return the security level of a specified connection.

- int_t con_status (connection_t *con)

  Return the status of a specified connection.

- void client_close (client_t *client)

  clients.c

- client_t * client_connect (chr_t *host, uint32_t port)

  Establish a network client connection to a remote host.

- int_t client_secure (client_t *client)

  Establish a TLS connection with a network client instance.

- int_t client_status (client_t *client)

  Get the status of a network client.

- bool_t net_set_buffer_length (int sd, int buffer_recv, int buffer_send)

  options.c

- bool_t net_set_keepalive (int sd, bool_t keepalive, int_t idle, int_t interval, int_t tolerance)

  Set the keepalive flag, the.

- bool_t net_set_linger (int sd, bool_t linger, int_t timeout)

  Set the linger flag for a socket.

- bool_t net_set_nodelay (int sd, bool_t nodelay)

  Set the delay flag for a socket (to disable the Nagle algorithm).

- bool_t net_set_blocking (int sd, bool_t blocking)

  Set the blocking flag for a socket.

- bool_t net_set_reuseable_address (int sd, bool_t reuse)

  Set the reusable flag for a socket.

- bool_t net_set_timeout (int sd, uint32_t timeout_recv, uint32_t timeout_send)

  Set the send and receive timeouts for a socket.

- int64_t client_read (client_t *client)

  read.c

- int64_t client_read_line (client_t *client)

  Read a line of input from a network client session.

- int64_t con_read (connection_t *con)

  Read data from a network connection, and store the data in the connection context buffer.

- int64_t con_read_line (connection_t *con, bool_t block)

  Read a line of input from a network connection.

- stringer_t * con_reverse_check (connection_t *con, uint32_t timeout)

  reverse.c

- void con_reverse_domain (connection_t *con, stringer_t *domain, int_t status)

  Set the domain name and reverse lookup status of a connection.

- void con_reverse_enqueue (connection_t *con)

  Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.

- void con_reverse_lookup (connection_t *con)

  Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

- void con_reverse_status (connection_t *con, int_t status)
- bool_t net_init (server_t *server)

  listeners.c

- void net_listen (void)
- void net_shutdown (server_t *server)

  The main network handler entry point; poll the listening socket of each configured protocol server, and dispatch the protocol-specific handler for any inbound client connection that is accepted.

- int64_t client_print (client_t *client, chr_t *format,...)

  write.c

- int64_t client_write (client_t *client, stringer_t *s)

  Write data to a network client.

- int64_t con_print (connection_t *con, chr_t *format,...)

  Write a formatted string to a network connection.

- int64_t con_write_bl (connection_t *con, char *block, size_t length)

  Write data to a network connection.

- int64_t con_write_ns (connection_t *con, char *string)

  Write a null-terminated string to a network connection.

- int64_t con_write_pl (connection_t *con, placer_t string)

Write a placer to a network connection.

- int64_t con_write_st (connection_t ∗con, stringer_t ∗string)
  Write a managed string to a network connection.

- stringer_t ∗ protocol_type (connection_t ∗con)

5.154.1 Enumeration Type Documentation

5.154.1.1 anonymous enum

Enumerator:

REVERSE_ERROR
REVERSE_EMPTY
REVERSE_PENDING
REVERSE_COMPLETE

Definition at line 19 of file network.h.

5.154.2 Function Documentation

5.154.2.1 void client_close (client_t ∗ *client*)

clients.c clients.c

Note:

If ssl is in use, this will also destroy the overlying ssl session.

Returns:

This function returns no value.

Definition at line 170 of file clients.c.

References client_t::buffer, client_t::ip, mm_cleanup, mm_free(), client_t::sockd, st_cleanup, client_t::tls, and tls_free().

Referenced by smtp_client_close(), and smtp_client_connect().

5.154.2.2 client_t∗ client_connect (chr_t ∗ *host*, uint32_t *port*)

Establish a network client connection to a remote host.

Parameters:

host a pointer to a null-terminated string containing the hostname of the remote server.
port the port number of the server to which the connection will be established.

Returns:

NULL on failure or a pointer to a newly initialized network client object for the connection upon success.

Definition at line 70 of file clients.c.

References client_t::buffer, ip_t::family, FOREIGNDATA, client_t::ip, ip_t::ip4, ip_t::ip6, JOINTED, client_t::line, log_pedantic, MEMORYBUF, mm_alloc(), mm_cleanup, mm_copy(), mm_free(), PLACER_T, client_t::sockd, st_alloc(), STACK, and client_t::status.

Referenced by smtp_client_connect().

5.154.2.3 int64_t client_print (client_t * *client*, chr_t * *format*, ...)

write.c write.c

See also:

client_write()

Parameters:

client the network client connection to which the supplied data will be written.

format the format string for the data to be written to the network client connection.

... a va_arg style collection of variables to be expanded by the passed format string.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 293 of file write.c.

References client_write(), client_t::sockd, st_free(), st_vaprint, and client_t::status.

Referenced by smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.154.2.4 int64_t client_read (client_t * *client*)

read.c read.c

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 413 of file read.c.

References client_t::buffer, bytes, client_status(), client_t::ip, ip_presentation(), client_t::line, log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_length_get(), pl_null(), client_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_int(), st_length_set(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_read().

5.154.2.5 int64_t client_read_line (client_t * *client*)

Read a line of input from a network client session.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 306 of file read.c.

References client_t::buffer, bytes, client_t::ip, ip_presentation(), client_t::line, line_pl_st(), log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_empty(), pl_length_get(), pl_null(), client_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_length_set(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_read().

Referenced by smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.154.2.6 int_t client_secure (client_t * *client*)

Establish a TLS connection with a network client instance.

Parameters:

client a pointer to the network client object to have its transport security upgraded.

Returns:

-1 on failure or 0 on success.

Definition at line 45 of file clients.c.

References client_t::sockd, client_t::status, client_t::tls, and tls_client_alloc().

Referenced by smtp_client_connect().

5.154.2.7 int_t client_status (client_t ∗ *client*)

Get the status of a network client.

Parameters:

client a pointer to the network client object to be queried.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 15 of file clients.c.

References client_t::sockd, client_t::status, tcp_status(), client_t::tls, and tls_status().

Referenced by client_read(), and client_write().

5.154.2.8 int64_t client_write (client_t ∗ *client*, stringer_t ∗ *s*)

Write data to a network client.

Note:

This function works regardless of whether or not the client connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

client the network client connection to which the supplied data will be written.

s a managed string containing the data to be written to the network client connection.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 210 of file write.c.

References bytes, client_status(), client_t::ip, ip_presentation(), length, log_pedantic, MANAGEDBUF, MEMORYBUF, client_t::sockd, st_-char_get(), st_empty_out(), st_length_int(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_write().

Referenced by client_print(), smtp_client_close(), and smtp_client_send_data().

5.154.2.9 ip_t∗ con_addr (connection_t ∗ *con*, ip_t ∗ *output*)

addresses.c addresses.c

Parameters:

con the input client connection.

output a pointer to an ip_t structure to receive the remote IP address, which is allocated for the caller if output is NULL.

Returns:

NULL on error, or a pointer to the IP address of the remote host.

Definition at line 16 of file addresses.c.

References connection_t::network, and connection_t::reverse.

Referenced by con_addr_octet(), con_addr_presentation(), con_addr_reversed(), con_addr_segment(), con_addr_standard(), con_addr_-subnet(), con_addr_word(), sess_create(), sess_get(), smtp_bypass_check(), and smtp_rcpt_to().

5.154.2.10 octet_t con_addr_octet (connection_t ∗ *con*, int_t *position*)

Get a specified 8-bit octet of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 8-bit octets that comprise the target IP address.

Returns:

-1 on error, or the specified 8-bit octet of the passed address on success.

Definition at line 152 of file addresses.c.

References con_addr(), and ip_octet().

5.154.2.11 stringer_t∗ con_addr_presentation (connection_t ∗ *con*, stringer_t ∗ *output*)

Return a textual representation of the IP address of a specified connection handle.

Parameters:

con the remote connection to be queried.

output a managed string to store the result, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 62 of file addresses.c.

References con_addr(), and ip_presentation().

Referenced by api_endpoint_auth(), contact_abuse_checks(), contact_abuse_increment_history(), contact_business(), imap_id(), imap_-login(), mail_add_inbound_headers(), mail_add_outbound_headers(), pop_pass(), portal_endpoint_auth(), portal_meta(), protocol_secure(), register_abuse_checks(), register_data_insert_user(), register_session_cache(), register_session_get(), smtp_auth_login(), smtp_auth_plain(), and smtp_rcpt_to().

5.154.2.12 stringer_t∗ con_addr_reversed (connection_t ∗ *con*, stringer_t ∗ *output*)

Get the reversed-IP address string for a client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if passed as NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address on success.

Definition at line 98 of file addresses.c.

References con_addr(), and ip_reversed().

Referenced by smtp_check_greylist(), and smtp_check_rbl().

5.154.2.13 segment_t con_addr_segment (connection_t ∗ *con*, int_t *position*)

Extract a specified 16 bit segment from a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position the zero-indexed (starting at least-significant word) 16-bit segment of the IP address to be evaluated.

Returns:

-1 on failure, or the 32 bit-widened segment extracted from the supplied IP address.

Definition at line 170 of file addresses.c.

References con_addr(), and ip_segment().

5.154.2.14 stringer_t∗ con_addr_standard (connection_t ∗ *con*, stringer_t ∗ *output*)

Get the IP address string for the client connection.

Parameters:

con the client connection to be queried.

output a managed string to receive the output, which will be allocated for the caller if output is NULL.

Returns:

NULL on failure, or a pointer to a managed string containing a textual representation of the IP address.

Definition at line 80 of file addresses.c.

References con_addr(), and ip_standard().

Referenced by register_abuse_check_blocklist(), register_abuse_checks(), and register_abuse_increment_history().

5.154.2.15 stringer_t∗ con_addr_subnet (connection_t ∗ *con*, stringer_t ∗ *output*)

Get the subnet string for a specified connection.

Parameters:

con the client connection to be queried.

output a managed string that will store the output of the subnet string lookup.

Returns:

NULL on failure, or a managed string containing a textual representation of a subnet address on success.

Definition at line 116 of file addresses.c.

References con_addr(), and ip_subnet().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_check_receive_quota(), and smtp_update_receive_stats().

5.154.2.16 uint32_t con_addr_word (connection_t * *con*, int_t *position*)

Get a specified 32-bit segment of a connection's peer IP address.

Parameters:

con a pointer to the connection object to be examined.

position a zero-based index into the 32-bit word(s) that comprise the target IP address.

Returns:

-1 if the connecting address can't be looked up, 0 on general error, or the specified 32-bit segment of the passed address on success.

Definition at line 134 of file addresses.c.

References con_addr(), and ip_word().

5.154.2.17 uint64_t con_decrement_refs (connection_t * *con*)

connections.c connections.c

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 194 of file connections.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), and connection_t::refs.

Referenced by con_destroy().

5.154.2.18 void con_destroy (connection_t * *con*)

Destroy and free a generic connection object after executing its protocol-specific destructor; update any statistics accordingly.

Parameters:

con a pointer to the connection to be destroyed.

Returns:

This function returns no value.

Definition at line 89 of file connections.c.

References connection_t::buffer, con_decrement_refs(), DMTP, dmtp_session_destroy(), HTTP, http_session_destroy(), IMAP, imap_-session_destroy(), connection_t::lock, mm_cleanup, mm_free(), MOLTEN, molten_session_destroy(), mutex_destroy(), connection_-t::network, POP, pop_session_destroy(), server_t::protocol, connection_t::reverse, connection_t::server, SMTP, smtp_session_destroy(), connection_t::sockd, st_cleanup, stats_decrement_by_name(), SUBMISSION, connection_t::tls, and tls_free().

Referenced by con_reverse_lookup(), dmtp_quit(), http_close(), imap_logout(), molten_quit(), pop_quit(), protocol_enqueue(), and smtp_-quit().

5.154.2.19 uint64_t con_increment_refs (connection_t ∗ *con*)

Increment a connection object's reference counter.

Parameters:

con the connection object being referenced.

Returns:

an integer containing the new number of references to the specified connection.

Definition at line 178 of file connections.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), and connection_t::refs.

Referenced by con_init().

5.154.2.20 connection_t∗ con_init (int *cond*, server_t ∗ *server*)

Create a new connection object for a client connection.

Parameters:

cond the socket descriptor of the inbound client connection that was just accepted.

server the handle of the server that serviced the inbound request.

Definition at line 234 of file connections.c.

References con_increment_refs(), connection_t::lock, mm_alloc(), mm_free(), mutex_init(), connection_t::network, connection_t::reverse, connection_t::server, connection_t::sockd, and tcp_addr_ip().

Referenced by protocol_process().

5.154.2.21 bool_t con_init_network_buffer (connection_t ∗ *con*)

Allocate and initialize a new network buffer for a connection, if it is not already associated with one.

Note:

A network buffer of size magma.system.network_buffer bytes will be allocated for the connection if one does not exist.

Returns:

true if the connection object has been associated with a network buffer or false on failure.

Definition at line 210 of file connections.c.

References connection_t::buffer, connection_t::line, log_info, magma, connection_t::network, magma_t::network_buffer, pl_null(), st_alloc(), and magma_t::system.

Referenced by con_read(), and con_read_line().

5.154.2.22 bool_t con_localhost (connection_t * *con*)

Determine whether a client connection is from the same machine, using the loopback adapter, or a remote machine.

See also:

ip_localhost()

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 32 of file connections.c.

References ip_localhost(), connection_t::network, and connection_t::reverse.

Referenced by json_api_dispatch(), portal_endpoint(), portal_endpoint_auth(), portal_process(), and portal_upload().

5.154.2.23 int64_t con_print (connection_t * *con*, chr_t * *format*, ...)

Write a formatted string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

format a format string for the output string to be written to the connection's remote client.

... a variable argument list of parameters for the specified format string.

Returns:

-1 on general failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 153 of file write.c.

References buflen, bufptr, bytes, con_write_bl(), length, mm_alloc(), mm_free(), connection_t::network, connection_t::sockd, and connection_t::status.

Referenced by dmtp_ehlo(), dmtp_helo(), dmtp_init(), http_parse_header(), http_print_301(), http_response_header(), http_response_-options(), imap_append(), imap_capability(), imap_check(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_id(), imap_idle(), imap_init(), imap_invalid(), imap_list(), imap_login(), imap_logout(), imap_lsub(), imap_noop(), imap_process(), imap_rename(), imap_search(), imap_select(), imap_starttls(), imap_status(), imap_store(), imap_subscribe(), imap_unsubscribe(), molten_stats(), pop_capa(), pop_last(), pop_list(), pop_retr(), pop_stat(), pop_top(), pop_uidl(), register_print_captcha(), smtp_data(), smtp_data_inbound(), smtp_data_outbound(), smtp_disabled(), smtp_ehlo(), smtp_helo(), smtp_init(), smtp_rcpt_to(), and teacher_print_message().

5.154.2.24 bool_t con_private (connection_t * *con*)

Determine whether a client connection is with a machine on the same private network.

See also:

ip_private()

Returns:

true if the connection appears to be using the loopback adapter, or false, if the connection appears to be from anywhere else.

Definition at line 48 of file connections.c.

References ip_localhost(), connection_t::network, and connection_t::reverse.

5.154.2.25 int64_t con_read (connection_t * *con*)

Read data from a network connection, and store the data in the connection context buffer.

Note:

This function handles reading data from both regular and SSL connections. If the connection's network buffer hasn't been allocated, it will be initialized.

Parameters:

con a pointer to the connection object from which the data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 172 of file read.c.

References connection_t::buffer, bytes, con_init_network_buffer(), con_status(), connection_t::line, mm_move(), connection_t::network, pl_length_get(), pl_null(), connection_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_set(), status, connection_t::status, tcp_read(), connection_t::tls, and tls_read().

Referenced by http_body(), imap_parse_literal(), smtp_data_finish(), and smtp_data_read().

5.154.2.26 int64_t con_read_line (connection_t * *con*, bool_t *block*)

Read a line of input from a network connection.

Note:

This function handles reading data from both regular and ssl connections. This function continually attempts to read incoming data from the specified connection until a
terminated line of input is received. If a new line is read, the length of that line is returned to the caller, including the trailing
. If the read returns -1 and wasn't caused by a syscall interruption or blocking error, -1 is returned, and the connection status is set to -1. If the read returns 0 and wasn't caused by a syscall interruption or blocking error, -2 is returned, and the connection status is set to 2. Once a
character is reached, the length of the current line of input is returned to the user, and the connection status is set to 1.

Parameters:

con the network connection across which the line of data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 21 of file read.c.

References connection_t::buffer, bytes, con_init_network_buffer(), con_status(), connection_t::line, line_pl_st(), mm_move(), connection_t::network, pl_empty(), pl_length_get(), pl_null(), connection_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_set(), status, connection_t::status, tcp_read(), connection_t::tls, and tls_read().

Referenced by dmtp_process(), http_process(), imap_parse_literal(), imap_process(), molten_parse(), pop_process(), smtp_auth_login(), smtp_auth_plain(), and smtp_process().

5.154.2.27 stringer_t* con_reverse_check (connection_t * *con*, uint32_t *timeout*)

reverse.c reverse.c

Note:

Polling will occur every 100ms, for as many seconds as specified by the user.

Parameters:

con the specified connection object to be polled that is the target of the DNS lookup.

timeout the number of seconds to wait for the lookup operation to complete.

Returns:

NULL on failure, or a pointer to a managed string containing the connection's peer hostname on success.

Definition at line 75 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, connection_t::reverse, REVERSE_COMPLETE, REVERSE_PENDING, and status.

Referenced by mail_add_inbound_headers(), and mail_add_outbound_headers().

5.154.2.28 void con_reverse_domain (connection_t * *con*, stringer_t * *domain*, int_t *status*)

Set the domain name and reverse lookup status of a connection.

Note:

Possible values for status include REVERSE_ERROR, REVERSE_EMPTY, REVERSE_PENDING, and REVERSE_COMPLETE.

Parameters:

domain the new value of the connection's hostname.

status the new value of the connection's reverse lookup status.

Returns:

This function returns no value.

Definition at line 42 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, and connection_t::reverse.

Referenced by con_reverse_lookup().

5.154.2.29 void con_reverse_enqueue (connection_t * *con*)

Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.

Parameters:

con the connection object to be examined.

Returns:

This function returns no value.

Definition at line 15 of file reverse.c.

References con_reverse_lookup(), enqueue(), connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, connection_t::refs, connection_t::reverse, REVERSE_EMPTY, and REVERSE_PENDING.

Referenced by dmtp_init(), http_init(), imap_init(), and smtp_init().

5.154.2.30 void con_reverse_lookup (connection_t * *con*)

Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

Parameters:

con the connection object to be queried.

Returns:

This function returns no value.

Definition at line 107 of file reverse.c.

References con_destroy(), con_reverse_domain(), con_reverse_status(), MEMORYBUF, connection_t::network, ns_length_get(), REVERSE_COMPLETE, REVERSE_ERROR, connection_t::sockd, and st_import().

Referenced by con_reverse_enqueue().

5.154.2.31 void con_reverse_status (connection_t * *con*, int_t *status*)

Definition at line 59 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, and connection_t::reverse.

Referenced by con_reverse_lookup().

5.154.2.32 int_t con_secure (connection_t * *con*)

Return the security level of a specified connection.

Parameters:

con the input client connection.

Returns:

1 for a secure connection, 0 for insecure, and -1 if the server does not support SSL/TLS.

Definition at line 15 of file connections.c.

References server_t::context, connection_t::network, connection_t::server, server_t::tls, and connection_t::tls.

Referenced by contact_process(), http_print_301(), http_response_cookie(), imap_capability(), imap_init(), imap_login(), imap_starttls(), json_api_dispatch(), pop_capa(), pop_pass(), pop_starttls(), portal_endpoint(), portal_endpoint_auth(), portal_process(), portal_upload(), protocol_enqueue(), register_process(), sess_create(), sess_get(), smtp_ehlo(), smtp_rcpt_to(), smtp_starttls(), and teacher_process().

5.154.2.33 int_t con_status (connection_t * *con*)

Return the status of a specified connection.

Parameters:

con the input client connection.

Returns:

-1 on network errors, 0 for an unknown status, 1 for connected, and 2 for a graceful shutdown.

Definition at line 64 of file connections.c.

References connection_t::network, connection_t::sockd, connection_t::status, tcp_status(), connection_t::tls, and tls_status().

Referenced by con_read(), con_read_line(), con_write_bl(), dmtp_quit(), dmtp_requeue(), http_requeue(), imap_fetch(), imap_logout(), imap_requeue(), pop_quit(), pop_requeue(), smtp_quit(), and smtp_requeue().

5.154.2.34 int64_t con_write_bl (connection_t * *con*, char * *block*, size_t *length*)

Write data to a network connection. HIGH: Create a simpler method of triggering a queue event following a connection write operation, and audit the code to ensure write calls do not accidently orphan a connection by not queuing the connection upon completion. In other words, always ensure that enqueue() is being called on a connection after all processing is performed, so that it is not lost (whether it is to be kept or not).

Note:

This function works regardless of whether or not the connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

con the connection across which the supplied data will be written.
