block a pointer to a data buffer containing the data to be written to the connection's remote client.

length the length, in bytes, of the data buffer to be written.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 24 of file write.c.

References bytes, con_status(), connection_t::network, connection_t::sockd, status, connection_t::status, tcp_write(), connection_t::tls, and tls_write().

5.154.2.35 int64_t con_write_ns (connection_t * *con*, char * *string*)

Write a null-terminated string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a pointer to a null-terminated string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 128 of file write.c.

References con_write_bl(), and ns_length_get().

5.154.2.36 int64_t con_write_pl (connection_t * *con*, placer_t *string*)

Write a placer to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a placer pointing to the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 140 of file write.c.

References con_write_bl(), pl_char_get(), and pl_length_get().

5.154.2.37 int64_t con_write_st (connection_t * *con*, stringer_t * *string*)

Write a managed string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a managed string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 116 of file write.c.

References con_write_bl(), st_char_get(), and st_length_get().

5.154.2.39 void net_listen (void)

Definition at line 30 of file listeners.c.

References server_t::enabled, magma, MAGMA_SERVER_INSTANCES, mm_free(), mm_wipe(), net_accept(), server_t::network, magma_t::servers, server_t::sockd, thread_alloc(), and thread_join().

Referenced by main().

5.154.2.40 bool_t net_set_blocking (int *sd*, bool_t *blocking*)

Set the blocking flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

blocking a boolean, where true indicates the socket should be configured to use blocking system calls, and false to indicate the socket should use non-blocking calls.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 103 of file options.c.

References buflen, bufptr, log_error, and log_pedantic.

5.154.2.41 bool_t net_set_buffer_length (int *sd*, int *buffer_recv*, int *buffer_send*)

options.c options.c

Parameters:

sd the socket descriptor to be configured.

buffer_recv the length, in bytes, of the socket receive buffer.

buffer_send the length, in bytes, of the socket send buffer.

Returns:

true if both buffer values were set successfully, or false on failure.

Definition at line 163 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.154.2.42 bool_t net_set_keepalive (int *sd*, bool_t *keepalive*, int_t *idle*, int_t *interval*, int_t *tolerance*)

Set the keepalive flag, the. Controls whether to send periodic messages along idle socket connections to ensure the connected peer is still present. If the peer fails to respond the connection can be broken.

Parameters:

sd The socket being configured.

keepalive Whether to enable the keepalive process.

idle Controls how long a connection must be idle (in seconds) before the system will start sending keep alive probes.

interval They delay (in seconds) between each keep alive probe.

tolerance The maximum number of failed probes that must be sent before dropping a connection.

Returns:

Returns true if all the parameters are configured properly, otherwise false to indicate an error.

Definition at line 23 of file options.c.

References buflen, bufptr, and log_pedantic.

5.154.2.43 bool_t net_set_linger (int *sd*, bool_t *linger*, int_t *timeout*)

Set the linger flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

linger a boolean variable specifying whether the socket will linger before closing until all queued messages for the socket have been sent.

timeout a value specifying the number of seconds to linger, if linger is true.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 63 of file options.c.

References buflen, bufptr, and log_pedantic.

5.154.2.44 bool_t net_set_nodelay (int *sd*, bool_t *nodelay*)

Set the delay flag for a socket (to disable the Nagle algorithm).

Parameters:

sd the socket descriptor to be adjusted.

nodelay a boolean variable specifying whether the Nagle algorithm should be disabled (true) or not (false).

Returns:

true if the flag was successfully set or false on failure.

Definition at line 44 of file options.c.

References buflen, bufptr, and log_pedantic.

5.154.2.45 bool_t net_set_reuseable_address (int *sd*, bool_t *reuse*)

Set the reusable flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

reuse a boolean variable specifying whether the listening socket should be reusable or not.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 84 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.154.2.46 bool_t net_set_timeout (int *sd*, uint32_t *timeout_recv*, uint32_t *timeout_send*)

Set the send and receive timeouts for a socket.

Parameters:

sd the socket descriptor to be configured.

timeout_recv the receive timeout value for the socket, in seconds.

timeout_send the send timeout value for the socket, in seconds.

Returns:

true if both timeout values were set successfully, or false on failure.

Definition at line 131 of file options.c.

References buflen, bufptr, log_pedantic, and mm_wipe().

Referenced by protocol_process(), and smtp_client_connect().

5.154.2.47 void net_shutdown (server_t ∗ *server*)

The main network handler entry point; poll the listening socket of each configured protocol server, and dispatch the protocol-specific handler for any inbound client connection that is accepted.

See also:

protocol_process()

Returns:

This function returns no value. Initialize a server and listen for connections.

Note:

Each server listens on either an ipv4 or ipv6 address in non-blocking mode, and will be bound and listen on the configured port.

Parameters:

server a pointer to the server object to be initialized.

Returns:

true on successful initialization of the server, or false on failure. Close the listening socket associated with a server.
This function returns no value.

Definition at line 297 of file listeners.c.

References server_t::network, and server_t::sockd.

Referenced by servers_network_stop().

5.154.2.48 stringer_t* protocol_type (connection_t * *con*)

Definition at line 11 of file protocol.c.

Functions

- PUBLIC_FUNC_DECL (int, connect_host, const char ∗hostname, unsigned short port, int force_family)
- int _connect_timeout (int fd, const struct sockaddr ∗addr, socklen_t addrlen)

  Attempt a TCP connection with a time-out mechanism.

5.155.1 Function Documentation

5.155.1.1 int _connect_timeout (int *fd*, struct sockaddr const ∗ *addr*, socklen_t *addrlen*)

Attempt a TCP connection with a time-out mechanism.

Parameters:

fd the open socket descriptor across which the connection will be attempted.

addr a pointer to the prepared sockaddr structure that is the target of the connection.

addrlen the size of the supplied sockaddr structure.

Returns:

-1 on general error, 0 if the connection failed or timed out, and 1 on success.

Definition at line 113 of file network.c.

References CONNECT_TIMEOUT, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

  Set the linger flag for a socket.
- bool_t net_set_reuseable_address (int sd, bool_t reuse)
  Set the reusable flag for a socket.
- bool_t net_set_blocking (int sd, bool_t blocking)
  Set the blocking flag for a socket.
- bool_t net_set_timeout (int sd, uint32_t timeout_recv, uint32_t timeout_send)
  Set the send and receive timeouts for a socket.
- bool_t net_set_buffer_length (int sd, int buffer_recv, int buffer_send)
  Set the send and receive buffers for a socket at the system level.

5.156.1 Function Documentation

5.156.1.1 bool_t net_set_blocking (int *sd*, bool_t *blocking*)

Set the blocking flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

blocking a boolean, where true indicates the socket should be configured to use blocking system calls, and false to indicate the socket should use non-blocking calls.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 103 of file options.c.

References buflen, bufptr, log_error, and log_pedantic.

5.156.1.2 bool_t net_set_buffer_length (int *sd*, int *buffer_recv*, int *buffer_send*)

Set the send and receive buffers for a socket at the system level. options.c

Parameters:

sd the socket descriptor to be configured.

buffer_recv the length, in bytes, of the socket receive buffer.

buffer_send the length, in bytes, of the socket send buffer.

Returns:

true if both buffer values were set successfully, or false on failure.

Definition at line 163 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.156.1.3 bool_t net_set_keepalive (int *sd*, bool_t *keepalive*, int_t *idle*, int_t *interval*, int_t *tolerance*)

Set the keepalive flag, the. Controls whether to send periodic messages along idle socket connections to ensure the connected peer is still present. If the peer fails to respond the connection can be broken.

Parameters:

sd The socket being configured.

keepalive Whether to enable the keepalive process.

idle Controls how long a connection must be idle (in seconds) before the system will start sending keep alive probes.

interval They delay (in seconds) between each keep alive probe.

tolerance The maximum number of failed probes that must be sent before dropping a connection.

Returns:

Returns true if all the parameters are configured properly, otherwise false to indicate an error.

Definition at line 23 of file options.c.

References buflen, bufptr, and log_pedantic.

5.156.1.4 bool_t net_set_linger (int *sd*, bool_t *linger*, int_t *timeout*)

Set the linger flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

linger a boolean variable specifying whether the socket will linger before closing until all queued messages for the socket have been sent.

timeout a value specifying the number of seconds to linger, if linger is true.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 63 of file options.c.

References buflen, bufptr, and log_pedantic.

5.156.1.5 bool_t net_set_nodelay (int *sd*, bool_t *nodelay*)

Set the delay flag for a socket (to disable the Nagle algorithm).

Parameters:

sd the socket descriptor to be adjusted.

nodelay a boolean variable specifying whether the Nagle algorithm should be disabled (true) or not (false).

Returns:

true if the flag was successfully set or false on failure.

Definition at line 44 of file options.c.

References buflen, bufptr, and log_pedantic.

5.156.1.6 bool_t net_set_reuseable_address (int *sd*, bool_t *reuse*)

Set the reusable flag for a socket.

Parameters:

sd the socket descriptor to be adjusted.

reuse a boolean variable specifying whether the listening socket should be reusable or not.

Returns:

true if the flag was successfully set or false on failure.

Definition at line 84 of file options.c.

References buflen, bufptr, and log_pedantic.

Referenced by net_init().

5.156.1.7 bool_t net_set_timeout (int *sd*, uint32_t *timeout_recv*, uint32_t *timeout_send*)

Set the send and receive timeouts for a socket.

Parameters:

sd the socket descriptor to be configured.

timeout_recv the receive timeout value for the socket, in seconds.

timeout_send the send timeout value for the socket, in seconds.

Returns:

true if both timeout values were set successfully, or false on failure.

Definition at line 131 of file options.c.

References buflen, bufptr, log_pedantic, and mm_wipe().

  Initialize a new POP3 connection.
- void pop_invalid (connection_t *con)
  A function handler for invalid POP3 commands.
- void pop_last (connection_t *con)
  Get the sequence number of the last read message, in response to a POP3 LAST command.
- void pop_list (connection_t *con)
  Get the list of a user's messages, in response to a POP3 LIST command.

- void pop_noop (connection_t *con)
  Execute a POP3 no-operation command.
- void pop_pass (connection_t *con)
  Accept and verify a password for POP3 authentication.
- void pop_quit (connection_t *con)
  Gracefully destroy a POP3 session, whether because of an error or in response to a user QUIT command.
- void pop_retr (connection_t *con)
  Retrieve a user's message, in response to a POP3 RETR command.
- void pop_rset (connection_t *con)
  Reset the user's mailbox, in response to a POP3 RSET command.
- void pop_starttls (connection_t *con)
  TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension.
- void pop_stat (connection_t *con)
  Display a user's message statistics, in response to a POP3 STAT command.
- void pop_top (connection_t *con)
  Get the top lines of a message or collection of messages, in response to a POP3 TOP command.
- void pop_uidl (connection_t *con)
  Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.
- void pop_user (connection_t *con)
  Accept a username for POP3 authentication.
- void pop_session_destroy (connection_t *con)
  sessions.c
- int_t pop_session_reset (connection_t *con)
  Reset a POP3 session by guaranteeing that no messages are flagged to be deleted.

5.158.1 Function Documentation

5.158.1.1 void pop_capa (connection_t * *con*)

pop.c pop.c

Note:

See RFC 2449 POP3 Extension Mechanism for details.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 343 of file pop.c.

References build_version(), con_print(), con_secure(), and connection_t::pop.

5.158.1.2 int_t pop_compare (const void ∗ *compare*, const void ∗ *command*)

commands.c

Definition at line 11 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by pop_process(), and pop_sort().

5.158.1.3 void pop_dele (connection_t ∗ *con*)

Get a message, in response to a POP3 DELE command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 479 of file pop.c.

References con_write_bl(), MAIL_STATUS_HIDDEN, meta_user_unlock(), meta_user_wlock(), number, connection_t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), and meta_message_t::status.

5.158.1.4 uint64_t pop_get_last (inx_t ∗ *messages*)

mailbox.c mailbox.c

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the sequence number of the last message that isn't flagged as recent, or 0 on failure.

Definition at line 74 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, MAIL_STATUS_RECENT, and meta_message_t::status.

Referenced by pop_last().

5.158.1.5 meta_message_t∗ pop_get_message (inx_t ∗ *messages*, uint64_t *get*)

Get a message by its pop sequence number.

Parameters:

messages an inx holder containing the collection of the user's messages to be traversed.

number the zero-based pop sequence number of the message to be retrieved.

Returns:

NULL on failure or the meta message object of the message if it was found.

Definition at line 113 of file mailbox.c.

References count, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, and meta_-message_t::status.

Referenced by pop_dele(), pop_list(), pop_retr(), pop_top(), and pop_uidl().

5.158.1.6 void pop_init (connection_t ∗ *con*)

Initialize a new POP3 connection.

Parameters:

con the newly connected POP3 client connection.

Returns:

This function returns no value.

Definition at line 724 of file pop.c.

References con_write_bl(), and pop_requeue().

Referenced by protocol_enqueue().

5.158.1.7 void pop_invalid (connection_t ∗ *con*)

A function handler for invalid POP3 commands.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 67 of file pop.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by pop_dele(), pop_last(), pop_list(), pop_pass(), pop_process(), pop_retr(), pop_rset(), pop_starttls(), pop_stat(), pop_top(), pop_uidl(), and pop_user().

5.158.1.8 void pop_last (connection_t ∗ *con*)

Get the sequence number of the last read message, in response to a POP3 LAST command.

See also:

pop_get_last()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 391 of file pop.c.

References con_print(), meta_user_rlock(), meta_user_unlock(), number, connection_t::pop, pop_get_last(), and pop_invalid().

5.158.1.9 void pop_list (connection_t * *con*)

Get the list of a user's messages, in response to a POP3 LIST command.

See also:

pop_total_messages(), pop_get_message()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 416 of file pop.c.

References con_print(), con_write_bl(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_-APPENDED, MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, connection_t::pop, pop_get_message(), pop_-invalid(), pop_num_parse(), pop_total_messages(), meta_message_t::size, and meta_message_t::status.

5.158.1.10 void pop_noop (connection_t * *con*)

Execute a POP3 no-operation command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 56 of file pop.c.

References con_write_bl().

5.158.1.11 bool_t pop_num_parse (connection_t * *con*, uint64_t * *outnum*, bool_t *required*)

parse.c parse.c

Parameters:

con the connection across which the pop command was issued.

outnum a pointer to an unsigned 64-bit integer to receive the numerical argument of the pop command on success.

required specifies whether or not a parameter is required.

Returns:

true if the pop command contained a valid unsigned number or false on failure.

Definition at line 17 of file parse.c.

References length, connection_t::line, log_pedantic, connection_t::network, st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by pop_dele(), pop_list(), pop_retr(), and pop_uidl().

5.158.1.12 void pop_pass (connection_t ∗ *con*)

Accept and verify a password for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated, but which have already supplied a username. If the username/password combo was validated, the account information is retrieved and checked to see if it is locked. After successful authentication, this function will prohibit insecure connections for any user configured to use TLS only, and enforce the existence of only one POP3 session at a time. Finally, the database Log table for this user's POP3 access is updated, and all the user's messages are retrieved.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

HIGH: Inactivity locks shouldn't prevent a user from logging into the system.

Definition at line 168 of file pop.c.

References auth_free(), auth_login(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_secure(), con_write_bl(), inx_count(), auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, MANAGEDBUF, auth_t::master, meta_data_update_log(), meta_get(), META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_LOCKED, meta_messages_login_update(), META_PROTOCOL_POP, META_USER_ENCRYPT_DATA, meta_user_ref_protocol_total(), META_USER_TLS, meta_user_unlock(), meta_user_wlock(), connection_t::pop, pop_invalid(), pop_pass_parse(), connection_t::protocol, auth_t::salt, auth_t::seasoning, st_char_get(), st_dupe(), st_empty, st_free(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.158.1.13 stringer_t∗ pop_pass_parse (connection_t ∗ *con*)

Parse a POP3 PASS command.

Note:

This function will stop reading in password characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the PASS command.

Returns:

a managed string containing the user supplied password, or NULL on failure.

Definition at line 191 of file parse.c.

References CONTIGUOUS, length, connection_t::line, log_error, log_pedantic, MANAGED_T, connection_t::network, SECURE, st_alloc_opts(), st_copy_in(), st_data_get(), and st_length_get().

Referenced by pop_pass().

5.158.1.14 void pop_process (connection_t * *con*)

Definition at line 43 of file commands.c.

References connection_t::command, command, con_read_line(), server_t::cutoff, enqueue(), command_t::function, command_t::length, connection_t::line, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), connection_t::pop, pop_commands, pop_compare(), pop_invalid(), pop_process(), pop_quit(), pop_requeue(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, command_t::string, server_t::violations, and connection_t::violations.

Referenced by pop_process(), and pop_requeue().

5.158.1.15 void pop_quit (connection_t * *con*)

Gracefully destroy a POP3 session, whether because of an error or in response to a user QUIT command.

Parameters:

con the POP3 client connection to be shut down. This function returns no value.

Definition at line 107 of file pop.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by pop_process(), and pop_requeue().

5.158.1.16 void pop_requeue (connection_t * *con*)

Definition at line 31 of file commands.c.

References con_status(), server_t::cutoff, enqueue(), pop_process(), pop_quit(), connection_t::protocol, connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by pop_init(), and pop_process().

5.158.1.17 void pop_retr (connection_t * *con*)

Retrieve a user's message, in response to a POP3 RETR command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 654 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message(), MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, PLACER, connection_t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), connection_t::server, st_char_get(), st_length_get(), st_replace(), meta_message_t::status, and mail_message_t::text.

5.158.1.18 void pop_rset (connection_t * *con*)

Reset the user's mailbox, in response to a POP3 RSET command.

See also:

pop_session_reset()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 82 of file pop.c.

References con_write_bl(), connection_t::pop, pop_invalid(), and pop_session_reset().

5.158.1.19 void pop_session_destroy (connection_t ∗ *con*)

sessions.c sessions.c

Parameters:

con the POP3 client connection issuing the command. This function returns no value.

Definition at line 50 of file sessions.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_delete(), M_TYPE_UINT64, mail_cache_-reset(), mail_remove_message(), MAIL_STATUS_HIDDEN, meta_message_t::messagenum, meta_inx_remove(), meta_messages_update_-sequences(), META_PROTOCOL_POP, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, connection_t::pop, serial_-increment(), meta_message_t::server, meta_message_t::size, st_cleanup, meta_message_t::status, multi_t::u64, and multi_t::val.

Referenced by con_destroy().

5.158.1.20 int_t pop_session_reset (connection_t ∗ *con*)

Reset a POP3 session by guaranteeing that no messages are flagged to be deleted.

Parameters:

con the POP3 client connection issuing the command.

Returns:

-1 on general error, 0 if the connection hasn't been authenticated, or 1 if all messages have had their statuses successfully reset.

Definition at line 15 of file sessions.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_HIDDEN, meta_user_unlock(), meta_user_wlock(), connection_t::pop, and meta_message_t::status.

Referenced by pop_rset(), and pop_starttls().

5.158.1.21 void pop_sort (void)

Sort the POP3 command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References pop_commands, and pop_compare().

Referenced by protocol_init().

5.158.1.22 void pop_starttls (connection_t * *con*)

TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension. Initialize a TLS session for an unauthenticated POP3 session.

Note:

RFC 2595 / section 4 dictates that the STLS/STARTTLS command should only be available in the authorization state.

Parameters:

con the connection of the POP3 client requesting the transport layer security upgrade.

Returns:

This function returns no value (all error messages are written directly to the requesting client).

Definition at line 18 of file pop.c.

References connection_t::buffer, con_secure(), con_write_bl(), connection_t::line, log_pedantic, M_SSL_BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::pop, pop_invalid(), pop_session_reset(), connection_t::server, connection_t::sockd, st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

5.158.1.23 void pop_stat (connection_t * *con*)

Display a user's message statistics, in response to a POP3 STAT command.

See also:

pop_total_messages(), pop_total_size()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 365 of file pop.c.

References con_print(), count, meta_user_rlock(), meta_user_unlock(), connection_t::pop, pop_invalid(), pop_total_messages(), and pop_total_size().

5.158.1.24 void pop_top (connection_t * *con*)

Get the top lines of a message or collection of messages, in response to a POP3 TOP command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 583 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message_top(), MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, PLACER, connection_t::pop, pop_get_message(), pop_invalid(), pop_top_parse(), connection_t::server, st_char_get(), st_length_get(), st_replace(), meta_message_t::status, and mail_message_t::text.

5.158.1.25 bool_t pop_top_parse (connection_t * *con*, uint64_t * *number*, uint64_t * *lines*)

Parse the arguments to a POP3 TOP command.

Parameters:

con the POP3 client connection that issued the TOP command.
number a pointer to an unsigned 64 bit integer to receive the value of the TOP command's message sequence number.
lines a pointer to an unsigned 64 bit integer to receive the value of the TOP command's line number count.

Returns:

true on success or false if an error was encountered.

Definition at line 89 of file parse.c.

References length, connection_t::line, log_pedantic, connection_t::network, st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by pop_top().

5.158.1.26 uint64_t pop_total_messages (inx_t * *messages*)

Get the number of messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total number of messages available to the POP3 user, or 0 on failure.

Definition at line 16 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_-HIDDEN, and meta_message_t::status.

Referenced by pop_list(), pop_stat(), and pop_uidl().

5.158.1.27 uint64_t pop_total_size (inx_t * *messages*)

Get the total size of all messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total size, in bytes, of all messages available to the POP3 user, or 0 on failure.

Definition at line 45 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_-HIDDEN, meta_message_t::size, and meta_message_t::status.

Referenced by pop_stat().

5.158.1.28 void pop_uidl (connection_t * *con*)

Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 518 of file pop.c.

References con_print(), con_write_bl(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_-APPENDED, MAIL_STATUS_HIDDEN, meta_message_t::messagenum, meta_user_rlock(), meta_user_unlock(), number, connection_-t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), pop_total_messages(), and meta_message_t::status.

5.158.1.29 void pop_user (connection_t * *con*)

Accept a username for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated. If the username has already been supplied pre-authentication, the old value will be overwritten with the new one.

Parameters:

con the POP3 client connection issuing the command. This function returns no value.

Definition at line 131 of file pop.c.

References con_write_bl(), connection_t::pop, pop_invalid(), pop_user_parse(), and st_cleanup.

5.158.1.30 stringer_t* pop_user_parse (connection_t * *con*)

Parse a POP3 USER command.

Note:

The username can be at most 255 characters and will be returned in lowercase. This function will stop reading in username characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the USER command.

Returns:

a managed string containing the validated username, or NULL on failure.

Definition at line 257 of file parse.c.

References length, connection_t::line, log_pedantic, lower_chr(), connection_t::network, st_data_get(), st_import(), and st_length_get().

Referenced by pop_user().

5.159 src/network/read.c File Reference

```
#include "magma.h"
```

Functions

- int64_t con_read_line (connection_t *con, bool_t block)

  Read a line of input from a network connection.

- int64_t con_read (connection_t *con)

  Read data from a network connection, and store the data in the connection context buffer.

- int64_t client_read_line (client_t *client)

  Read a line of input from a network client session.

- int64_t client_read (client_t *client)

  Read data from a network connection, and store the data in the connection context buffer.

5.159.1 Function Documentation

5.159.1.1 int64_t client_read (client_t * *client*)

Read data from a network connection, and store the data in the connection context buffer. read.c

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 413 of file read.c.

References client_t::buffer, bytes, client_status(), client_t::ip, ip_presentation(), client_t::line, log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_length_get(), pl_null(), client_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_int(), st_length_set(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_read().

5.159.1.2 int64_t client_read_line (client_t * *client*)

Read a line of input from a network client session.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 306 of file read.c.

References client_t::buffer, bytes, client_t::ip, ip_presentation(), client_t::line, line_pl_st(), log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), pl_empty(), pl_length_get(), pl_null(), client_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_int(), st_length_set(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_read().

Referenced by smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.159.1.3 int64_t con_read (connection_t * *con*)

Read data from a network connection, and store the data in the connection context buffer.

Note:

This function handles reading data from both regular and SSL connections. If the connection's network buffer hasn't been allocated, it will be initialized.

Parameters:

con a pointer to the connection object from which the data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the amount of data that was read.

Definition at line 172 of file read.c.

References connection_t::buffer, bytes, con_init_network_buffer(), con_status(), connection_t::line, mm_move(), connection_t::network, pl_length_get(), pl_null(), connection_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_length_get(), st_length_set(), status, connection_t::status, tcp_read(), connection_t::tls, and tls_read().

Referenced by http_body(), imap_parse_literal(), smtp_data_finish(), and smtp_data_read().

5.159.1.4 int64_t con_read_line (connection_t * *con*, bool_t *block*)

Read a line of input from a network connection.

Note:

This function handles reading data from both regular and ssl connections. This function continually attempts to read incoming data from the specified connection until a
terminated line of input is received. If a new line is read, the length of that line is returned to the caller, including the trailing
. If the read returns -1 and wasn't caused by a syscall interruption or blocking error, -1 is returned, and the connection status is set to -1. If the read returns 0 and wasn't caused by a syscall interruption or blocking error, -2 is returned, and the connection status is set to 2. Once a
character is reached, the length of the current line of input is returned to the user, and the connection status is set to 1.

Parameters:

con the network connection across which the line of data will be read.

Returns:

-1 on general failure, -2 if the connection was reset, or the length of the current line of input, including the trailing new line character.

Definition at line 21 of file read.c.

References connection_t::buffer, bytes, con_init_network_buffer(), con_status(), connection_t::line, line_pl_st(), mm_move(), connection_t::network, pl_empty(), pl_length_get(), pl_null(), connection_t::sockd, st_avail_get(), st_char_get(), st_data_get(), st_empty, st_length_get(), st_length_set(), status, connection_t::status, tcp_read(), connection_t::tls, and tls_read().

Referenced by dmtp_process(), http_process(), imap_parse_literal(), imap_process(), molten_parse(), pop_process(), smtp_auth_login(), smtp_auth_plain(), and smtp_process().

5.160 src/network/reverse.c File Reference

```
#include "magma.h"
```

Functions

- void con_reverse_enqueue (connection_t *con)
  Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.
- void con_reverse_domain (connection_t *con, stringer_t *domain, int_t status)
  Set the domain name and reverse lookup status of a connection.
- void con_reverse_status (connection_t *con, int_t status)
- stringer_t * con_reverse_check (connection_t *con, uint32_t timeout)
  Poll a connection periodically to see if a reverse DNS lookup operation has completed.
- void con_reverse_lookup (connection_t *con)
  Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

5.160.1 Function Documentation

5.160.1.1 stringer_t* con_reverse_check (connection_t * *con*, uint32_t *timeout*)

Poll a connection periodically to see if a reverse DNS lookup operation has completed. reverse.c

Note:

Polling will occur every 100ms, for as many seconds as specified by the user.

Parameters:

con the specified connection object to be polled that is the target of the DNS lookup.

timeout the number of seconds to wait for the lookup operation to complete.

Returns:

NULL on failure, or a pointer to a managed string containing the connection's peer hostname on success.

Definition at line 75 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, connection_t::reverse, REVERSE_COMPLETE, REVERSE_PENDING, and status.

Referenced by mail_add_inbound_headers(), and mail_add_outbound_headers().

5.160.1.2 void con_reverse_domain (connection_t * *con*, stringer_t * *domain*, int_t *status*)

Set the domain name and reverse lookup status of a connection.

Note:

Possible values for status include REVERSE_ERROR, REVERSE_EMPTY, REVERSE_PENDING, and REVERSE_COMPLETE.

Parameters:

domain the new value of the connection's hostname.

status the new value of the connection's reverse lookup status.

Returns:

This function returns no value.

Definition at line 42 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, and connection_t::reverse.

Referenced by con_reverse_lookup().

5.160.1.3 void con_reverse_enqueue (connection_t * *con*)

Queue a reverse DNS lookup on the specified connection, if one hasn't been performed.

Parameters:

con the connection object to be examined.

Returns:

This function returns no value.

Definition at line 15 of file reverse.c.

References con_reverse_lookup(), enqueue(), connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, connection_t::refs, connection_t::reverse, REVERSE_EMPTY, and REVERSE_PENDING.

Referenced by dmtp_init(), http_init(), imap_init(), and smtp_init().

5.160.1.4 void con_reverse_lookup (connection_t * *con*)

Perform a reverse DNS lookup on the remote end of a connection, and save the hostname.

Parameters:

con the connection object to be queried.

Returns:

This function returns no value.

Definition at line 107 of file reverse.c.

References con_destroy(), con_reverse_domain(), con_reverse_status(), MEMORYBUF, connection_t::network, ns_length_get(), REVERSE_COMPLETE, REVERSE_ERROR, connection_t::sockd, and st_import().

Referenced by con_reverse_enqueue().

5.160.1.5 void con_reverse_status (connection_t * *con*, int_t *status*)

Definition at line 59 of file reverse.c.

References connection_t::lock, mutex_lock(), mutex_unlock(), connection_t::network, and connection_t::reverse.

Referenced by con_reverse_lookup().

Functions

- session_t * sess_create (connection_t *con, stringer_t *path, stringer_t *application)

  sessions.c

- void sess_destroy (session_t *sess)

  Destroy a web session and its associated data.

- int_t sess_get (connection_t *con, stringer_t *application, stringer_t *path, stringer_t *token)

  Try to retrieve the session associated with a client connection's supplied cookie.

- uint64_t sess_key (void)

  Generate a random 12 digit 64-bit web session key.

- uint64_t sess_number (void)

  Reserve a unique web session identifier.

- void sess_ref_add (session_t *sess)

  Increment the web session's reference counter and update its timestamp.

- void sess_ref_dec (session_t *sess)

  Decrement the web session's reference counter and update its timestamp.

- time_t sess_ref_stamp (session_t *sess)

  Get the timestamp for a web session's reference counter.

- uint64_t sess_ref_total (session_t *sess)

  Get the reference count of a web session.

- bool_t sess_refresh_check (session_t *sess)

  Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.

- void sess_refresh_flush (session_t *sess)

  Update a web session's refresh stamp and prevent redundant refreshing of a web session.

- time_t sess_refresh_stamp (session_t *sess)

  Get the timestamp for the last time the session was refreshed.

- void sess_release (session_t *sess)

  Release a web session.

- void sess_serial_check (session_t *sess, uint64_t object)

  Queue a web session refresh if there is stale data.

- stringer_t * sess_token (session_t *sess)

  Securely generate a unique zbase32-encoded token for a session.

- void sess_trigger (session_t *sess)

  Set a web session's trigger so it will be refreshed as soon as possible.

- void sess_update (session_t *sess)

Update a session's underlying data and its refresh timestamp.

- void sess_release_attachment (attachment_t *attachment)
  Free an attachment object.
- void sess_release_composition (composition_t *comp)
  Free a composition object.

5.162.1 Function Documentation

5.162.1.1 session_t* sess_create (connection_t * *con*, stringer_t * *path*, stringer_t * *application*)

sessions.c sessions.c

Note:

The session stores the following data points: remote IP address, request path, application name, the specified http hostname, the remote client's user agent string, the server's host number, a unique session id, the server's current timestamp, a randomly- generated session key for authentication, and an encrypted token for the session returned to the user as a cookie.

Parameters:

con a pointer to the connection underlying the web session.

path a pointer to a managed string containing the pathname of the generating request (should be "/portal/camel").

application a pointer to a managed string containing the name of the parent application of the session (should be "portal").

Returns:

NULL on failure or a pointer to a newly allocated session object for the specified connection.

Definition at line 371 of file sessions.c.

References session_t::agent, session_t::application, session_t::compositions, con_addr(), con_secure(), CONTIGUOUS, HEAP, magma_t::host, session_t::host, connection_t::http, session_t::httponly, inx_alloc(), inx_insert(), session_t::ip, ip_copy(), session_t::key, session_t::lock, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, magma, MANAGED_T, MEMORYBUF, mm_alloc(), mm_free(), session_t::number, magma_t::number, objects, session_t::path, session_t::request, session_t::secure, sess_destroy(), sess_key(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_release_composition(), sess_token(), object_cache_t::sessions, st_dupe_opts(), session_t::stamp, session_t::token, multi_t::u64, multi_t::val, and session_t::warden.

Referenced by json_api_dispatch(), and portal_endpoint().

5.162.1.2 void sess_destroy (session_t * *sess*)

Destroy a web session and its associated data.

Parameters:

sess a pointer to the web session to be destroyed.

Returns:

This function returns no value.

Definition at line 59 of file sessions.c.

References session_t::agent, session_t::application, session_t::compositions, session_t::host, inx_cleanup(), session_t::lock, meta_inx_remove(), META_PROTOCOL_WEB, mm_free(), mutex_destroy(), session_t::path, session_t::request, st_cleanup, session_t::token, session_t::user, meta_user_t::usernum, and session_t::warden.

Referenced by obj_cache_start(), and sess_create().

5.162.1.3 int_t sess_get (connection_t * *con*, stringer_t * *application*, stringer_t * *path*, stringer_t * *token*)

Try to retrieve the session associated with a client connection's supplied cookie.

Parameters:

con a pointer to the connection object sending the cookie.

application a managed string containing the application associated with the session.

path a managed string containing the path associated with the session.

token the encrypted user token retrieved from the supplied http cookie.

Returns:

1 if the cookie was found and valid, or one of the following values on failure: 0 = Session not found. -1 = Server error. -2 = Invalid token. -3 = Security violation / incorrect user-agent. -4 = Security violation / incorrect session key. -5 = Security violation / incorrect source address. -6 = Session terminated by logout. -7 = Session timed out.

Most session attributes need simple equality comparison, except for timeout checking. Make sure not to validate against a stale session that should have already timed out (which will have to be determined dynamically).

Definition at line 434 of file sessions.c.

References con_addr(), con_secure(), deprecated_scramble_decrypt(), deprecated_scramble_import(), magma_t::http, connection_t::http, inx_delete(), inx_find(), inx_lock_read(), inx_unlock(), ip_addr_eq(), log_error, log_pedantic, M_TYPE_UINT64, magma, MEMORYBUF, number, objects, magma_t::secure, sess_ref_add(), sess_ref_dec(), sess_refresh_stamp(), sess_update(), object_cache_t::sessions, magma_t::sessions, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_data_get(), st_free(), st_length_int(), multi_t::u64, multi_t::val, and zbase32_decode().

Referenced by http_parse_context().

5.162.1.4 uint64_t sess_key (void)

Generate a random 12 digit 64-bit web session key.

Returns:

the randomly generated web session key as an unsigned 64 bit integer.

Definition at line 22 of file sessions.c.

References log_pedantic, rand_get_uint64(), and uint64_digits().

Referenced by sess_create().

5.162.1.5 uint64_t sess_number (void)

Reserve a unique web session identifier.

Returns:

a number containing a unique web session identifier.

Definition at line 43 of file sessions.c.

References mutex_lock(), mutex_unlock(), and sessions.

Referenced by sess_create().

5.162.1.6 void sess_ref_add (session_t * *sess*)

Increment the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 87 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, session_t::stamp, and session_t::web.

Referenced by sess_create(), and sess_get().

5.162.1.7 void sess_ref_dec (session_t * *sess*)

Decrement the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 112 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, session_t::stamp, and session_t::web.

Referenced by sess_create(), sess_get(), and sess_release().

5.162.1.8 time_t sess_ref_stamp (session_t * *sess*)

Get the timestamp for a web session's reference counter.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the last-modified UTC timestamp value of the specified web session.

Definition at line 162 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, and session_t::stamp.

Referenced by obj_cache_prune().

5.162.1.9 uint64_t sess_ref_total (session_t * *sess*)

Get the reference count of a web session.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the total number of references to the specified web session.

Definition at line 137 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, and session_t::web.

Referenced by obj_cache_prune().

5.162.1.10 bool_t sess_refresh_check (session_t * *sess*)

Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.

Note:

The caller needs to make immediate use of this function's return value because the refresh trigger will be cleared if it was previously set. Any session longer than 2 minutes will be marked as ready for refresh.

Parameters:

a pointer to the web session to be queried.

Returns:

true if the web session is ready to be refreshed, or false if it is not.

Definition at line 217 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, session_t::stamp, and session_t::trigger.

Referenced by sess_release().

5.162.1.11 void sess_refresh_flush (session_t * *sess*)

Update a web session's refresh stamp and prevent redundant refreshing of a web session.

Parameters:

sess a pointer to the web session to be touched.

Returns:

This function returns no value.

Definition at line 180 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, session_t::stamp, and session_t::trigger.

Referenced by sess_update().

5.162.1.12 time_t sess_refresh_stamp (session_t * *sess*)

Get the timestamp for the last time the session was refreshed.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the last-refreshed UTC timestamp value of the specified web session.

Definition at line 197 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, and session_t::stamp.

Referenced by sess_get().

5.162.1.13 void sess_release (session_t * *sess*)

Release a web session.

Note:

If the web session should have been refreshed, it will be refreshed before the reference counter is decremented.

Parameters:

sess a pointer to the web session to be released.

Returns:

This function returns no value.

Definition at line 302 of file sessions.c.

References requeue(), sess_ref_dec(), sess_refresh_check(), and sess_update().

Referenced by http_session_reset().

5.162.1.14 void sess_release_attachment (attachment_t * *attachment*)

Free an attachment object.

Note:

This is an inx helper function.

Parameters:

attachment a pointer to the attachment object to be destroyed.

Returns:

This function returns no value.

Definition at line 321 of file sessions.c.

References attachment_t::filedata, attachment_t::filename, mm_free(), and st_cleanup.

Referenced by portal_endpoint_attachments_add(), and portal_endpoint_messages_compose().

5.162.1.15 void sess_release_composition (composition_t * *comp*)

Free a composition object.

Note:

This is an inx helper function.

Parameters:

comp a pointer to the composition object to be destroyed.

Returns:

This function returns no value.

Definition at line 337 of file sessions.c.

References composition_t::attachments, inx_cleanup(), and mm_free().

Referenced by portal_endpoint_messages_compose(), and sess_create().

5.162.1.16 void sess_serial_check (session_t * *sess*, uint64_t *object*)

Queue a web session refresh if there is stale data.

Parameters:

sess a pointer to the web session to be queried.

object the value of the object in the cache to be checked (can include OBJECT_CONTACTS and OBJECT_FOLDERS).

Definition at line 352 of file sessions.c.

References meta_user_serial_check(), sess_trigger(), and session_t::user.

Referenced by portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.162.1.17 stringer_t* sess_token (session_t * *sess*)

Securely generate a unique zbase32-encoded token for a session.

Parameters:

sess a pointer to the input web session.

Returns:

a managed string containing the generated web session token.

Definition at line 241 of file sessions.c.

References deprecated_scramble_encrypt(), deprecated_scramble_free(), deprecated_scramble_total_length(), session_t::host, session_t::key, log_pedantic, magma, session_t::number, PLACER, magma_t::secure, magma_t::sessions, st_cleanup, st_merge, session_t::stamp, session_t::warden, and zbase32_encode().

Referenced by sess_create().

5.162.1.18 void sess_trigger (session_t * *sess*)

Set a web session's trigger so it will be refreshed as soon as possible.

Parameters:

sess a pointer to the web session to be refreshed.

Returns:

This function returns no value.

Definition at line 285 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, and session_t::trigger.

Referenced by portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_-messages_move(), portal_endpoint_messages_remove(), and sess_serial_check().

5.162.1.19 void sess_update (session_t * *sess*)

Update a session's underlying data and its refresh timestamp.

Note:

This function ensures the session's associated meta user data, mail folders and messages, and contact folders and contact entries are all current.

Parameters:

sess a pointer to the session object to be updated.

Returns:

This function returns no value.

Definition at line 264 of file sessions.c.

References meta_messages_update(), META_NEED_LOCK, meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_user(), sess_refresh_flush(), and session_t::user.

Referenced by sess_get(), and sess_release().

Functions

- int_t smtp_accept_message (connection_t *con, smtp_inbound_prefs_t *prefs)
  accept.c
- int_t smtp_rollout (smtp_inbound_prefs_t *prefs)
  Delete the oldest mail message owned by a user until their storage usage falls below their storage quota.
- int_t smtp_store_message (smtp_inbound_prefs_t *prefs, stringer_t **local)
  Store a received SMTP message as a generic mail message, both on disk and in the database.
- bool_t smtp_store_spamsig (smtp_inbound_prefs_t *prefs, int_t spam)
  Generate a random key for a spam signature and store it in the database.
- int_t smtp_check_filters (smtp_inbound_prefs_t *prefs, stringer_t **local)
  checkers.c
- int_t smtp_check_greylist (connection_t *con, smtp_inbound_prefs_t *prefs)
  Check to see if a transmitting address is in a user's greylist.
- int_t smtp_check_rbl (connection_t *con)
  Check the SMTP connection's remote address against a collection of real-time blacklists.
- bool_t smtp_add_bypass_entry (stringer_t *subnet)
  Add an entry to the SMTP subnet bypass list.
- bool_t smtp_bypass_check (connection_t *con)
  Check if a connection should bypass certain SMTP checks.
- void smtp_requeue (connection_t *con)
  commands.c
- int_t smtp_compare (const void *compare, const void *command)
- void smtp_process (connection_t *con)
  The main entry point in the SMTP server for processing commands issued by clients.
- void smtp_sort (void)
  Sort the SMTP command table to be ready for binary searches.
- int_t smtp_check_authorized_from (uint64_t usernum, stringer_t *address)
  datatier.c
- int_t smtp_check_receive_quota (connection_t *con, smtp_inbound_prefs_t *prefs)
  Check the user's received statistics from the database to see if receiving a message would result in a quota overage.
- int_t smtp_check_transmit_quota (uint64_t usernum, size_t num_recipients, smtp_outbound_prefs_t *prefs)
  Check to see if a user's current mail send request would push them over their daily transmission quota.
- int_t smtp_fetch_authorization (stringer_t *username, stringer_t *verification, smtp_outbound_prefs_t **output)
  Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.

- stringer_t * smtp_fetch_autoreply (uint64_t autoreply, uint64_t usernum)

  Fetch a specified auto-reply message for a user.

- int_t smtp_fetch_inbound (stringer_t *address, smtp_inbound_prefs_t **output)

  Fetch a user's smtp inbound preferences from the database.

- table_t * smtp_fetch_rollmessages (uint64_t usernum)

  Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.

- int_t smtp_get_action (chr_t *string, size_t length)

  Parse an smtp event action string from the Dispatch table.

- uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t *prefs, uint64_t key, int_t code)

  Store a spam signature in the database.

- void smtp_update_receive_stats (connection_t *con, smtp_inbound_prefs_t *prefs)

  Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.

- void smtp_update_transmission_stats (connection_t *con)

  Update the transmission and per-user log tables in the database for a successfully sent smtp message.

- void smtp_auth_login (connection_t *con)

  smtp.c

- void smtp_auth_plain (connection_t *con)
- void smtp_data (connection_t *con)
- void smtp_disabled (connection_t *con)

  A stub function for an SMTP command that has not been implemented.

- void smtp_ehlo (connection_t *con)

  Process an SMTP EHLO command.

- void smtp_helo (connection_t *con)

  Process an SMTP HELO command.

- void smtp_init (connection_t *con)

  The start of the protocol handler for the SMTP server.

- void smtp_invalid (connection_t *con)

  A function that is executed when an invalid SMTP command is executed.

- void smtp_mail_from (connection_t *con)

  Specify the identity of a message's sender, in response to an SMTP MAIL FROM command.

- void smtp_noop (connection_t *con)

  Perform an SMTP NOOP (no-operation) command.

- void smtp_quit (connection_t *con)

  Gracefully terminate an SMTP session, especially in response to an SMTP QUIT command.

- void smtp_rcpt_to (connection_t *con)
- void smtp_rset (connection_t *con)

  Reset the SMTP session, in response to an SMTP RSET command.

- void smtp_starttls (connection_t *con)

  TODO: Review error messages and update them with the appropriate response code.

- void submission_init (connection_t *con)
- stringer_t * smtp_parse_auth (stringer_t *data)

  parse.c

- stringer_t * smtp_parse_helo_domain (connection_t *con)

  Parse the domain specified as the parameter to an SMTP HELO or EHLO command.

- stringer_t * smtp_parse_mail_from_path (connection_t *con)
- stringer_t * smtp_parse_rcpt_to (connection_t *con)
- void smtp_client_close (client_t *client)

  relay.c

- client_t * smtp_client_connect (int_t premium)

  Connect to a randomly selected mail relay server, and wait for a successful banner message.

- int_t smtp_client_send_data (client_t *client, stringer_t *message, bool_t dotstuffed)

  Issue a DATA command to an smtp server, and wait for a successful response.

- int_t smtp_client_send_helo (client_t *client)

  Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.

- int_t smtp_client_send_mailfrom (client_t *client, stringer_t *mailfrom, size_t send_size)

  Issue a MAIL FROM command to an smtp server, and wait for a successful response.

- int_t smtp_client_send_nullfrom (client_t *client)

  Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.

- int_t smtp_client_send_rcptto (client_t *client, stringer_t *rcptto)

  Issue a RCPT TO command to an smtp server, and wait for a successful response.

- void smtp_add_inbound (connection_t *con, smtp_inbound_prefs_t *inbound)

  session.c

- void smtp_add_outbound (connection_t *con, smtp_outbound_prefs_t *outbound)

  Attach a set of SMTP outbound mail preferences to an SMTP client connection.

- bool_t smtp_add_recipient (connection_t *con, stringer_t *address)

  Add an entry to an SMTP session's recipients list for outbound/relayed mail.

- bool_t smtp_check_duplicate_recipient (connection_t *con, uint64_t usernum)

  Check whether the usernum on the inbound structure has already been used.

- void smtp_free_inbound (smtp_inbound_prefs_t *inbound)

  Free a list of SMTP inbound mail preferences and its underlying data.

- void smtp_free_outbound (smtp_outbound_prefs_t *outbound)

  Free a set of SMTP outbound mail preferences and its underlying data.

- void smtp_free_recipients (smtp_recipients_t *recipients)

Free a list of SMTP recipients and its underlying data.

- void smtp_list_free_filter (smtp_inbound_filter_t ∗filter)

  Free an SMTP inbound filter and its underlying data.

- void smtp_session_destroy (connection_t ∗con)

  Destroy the data associated with an SMTP session.

- void smtp_session_reset (connection_t ∗con)

  Reset an SMTP session to its initialized state.

- int_t smtp_bounce (connection_t ∗con)

  transmit.c

- int_t smtp_forward_message (server_t ∗server, stringer_t ∗sender, stringer_t ∗address, stringer_t ∗message, stringer_t ∗id, int_t mark, uint64_t signum, uint64_t sigkey)
- int_t smtp_relay_message (connection_t ∗con, stringer_t ∗∗result)

  Relay an outbound smtp message for a user.

- int_t smtp_reply (stringer_t ∗from, stringer_t ∗to, uint64_t usernum, uint64_t autoreply, int_t spf, int_t dkim)
- int_t smtp_send_message (stringer_t ∗to, stringer_t ∗from, stringer_t ∗message)

  Relay an outbound smtp message for the user.

5.164.1 Function Documentation

5.164.1.1 int_t smtp_accept_message (connection_t ∗ *con*, smtp_inbound_prefs_t ∗ *prefs*)

accept.c

Definition at line 185 of file accept.c.

References magma_t::abuse, magma_t::admin, smtp_inbound_prefs_t::autoreply, smtp_inbound_prefs_t::bounces, smtp_session_t::bypass, smtp_session_t::checked, magma_t::contact, smtp_session_t::dkim, smtp_inbound_prefs_t::dkim, dkim_signature_verify(), smtp_inbound_prefs_t::dkimaction, dspam_check(), smtp_inbound_prefs_t::filters, smtp_inbound_prefs_t::foldernum, smtp_inbound_prefs_t::forwarded, smtp_message_t::id, smtp_inbound_prefs_t::inbox, log_error, log_pedantic, magma, mail_add_inbound_headers(), smtp_session_t::mailfrom, smtp_inbound_prefs_t::mark, smtp_session_t::message, smtp_inbound_prefs_t::overquota, smtp_inbound_prefs_t::phish, smtp_inbound_prefs_t::phishaction, PLACER, smtp_session_t::rbl, smtp_inbound_prefs_t::rbl, smtp_inbound_prefs_t::rblaction, smtp_inbound_prefs_t::rcpttto, smtp_inbound_prefs_t::recv_size_limit, smtp_inbound_prefs_t::rollout, connection_t::server, smtp_inbound_prefs_t::signum, connection_t::smtp, SMTP_ACTION_BOUNCE, SMTP_ACTION_DELETE, SMTP_ACTION_MARK, SMTP_ACTION_MARK_READ, smtp_check_filters(), smtp_forward_message(), SMTP_MARK_NONE, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_READ, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, SMTP_OUTCOME_BOUNCE_DKIM, SMTP_OUTCOME_BOUNCE_PHISH, SMTP_OUTCOME_BOUNCE_RBL, SMTP_OUTCOME_BOUNCE_SPAM, SMTP_OUTCOME_BOUNCE_SPF, SMTP_OUTCOME_BOUNCE_VIRUS, SMTP_OUTCOME_PERM_FAILURE, SMTP_OUTCOME_SUCESS, SMTP_OUTCOME_TEMP_LOCKED, SMTP_OUTCOME_TEMP_OVERQUOTA, SMTP_OUTCOME_TEMP_SERVER, smtp_reply(), smtp_rollout(), smtp_store_message(), smtp_store_spamsig(), smtp_update_receive_stats(), smtp_inbound_prefs_t::spam, smtp_inbound_prefs_t::spam_checked, smtp_inbound_prefs_t::spamaction, smtp_inbound_prefs_t::spamkey, smtp_inbound_prefs_t::spamsig, smtp_session_t::spf, smtp_inbound_prefs_t::spf, smtp_inbound_prefs_t::spfaction, st_cmp_ci_eq(), st_cmp_cs_eq(), st_free(), st_length_get(), smtp_message_t::text, smtp_inbound_prefs_t::usernum, smtp_session_t::virus, smtp_inbound_prefs_t::virus, virus_check(), and smtp_inbound_prefs_t::virusaction.

Referenced by smtp_data_inbound().

5.164.1.2 bool_t smtp_add_bypass_entry (stringer_t ∗ *subnet*)

Add an entry to the SMTP subnet bypass list.

Parameters:

subnet a pointer to a managed string containing the IP address or subnet address to be bypassed for checks.

Returns:

true if the entry was valid and was added, or false on failure.

Definition at line 249 of file checkers.c.

References magma_t::bypass_subnets, inx_alloc(), inx_insert(), ip_subnet_st(), log_error, log_pedantic, M_INX_LINKED, M_TYPE_-UINT64, magma, mm_alloc(), mm_free(), magma_t::smtp, st_char_get(), multi_t::type, multi_t::u64, and multi_t::val.

Referenced by config_value_set().

5.164.1.3 void smtp_add_inbound (connection_t ∗ *con*, smtp_inbound_prefs_t ∗ *inbound*)

session.c session.c

Parameters:

con the SMTP client connection specifying the added local recipient.

inbound a pointer to the SMTP inbound preferences object to be added to the SMTP session's inbound preferences list.

Returns:

true if the requested inbound preferences object was added successfully to the inbound preferences list, or false on failure.

Definition at line 150 of file session.c.

References smtp_session_t::in_prefs, smtp_inbound_prefs_t::next, smtp_session_t::num_recipients, and connection_t::smtp.

Referenced by smtp_rcpt_to().

5.164.1.4 void smtp_add_outbound (connection_t ∗ *con*, smtp_outbound_prefs_t ∗ *outbound*)

Attach a set of SMTP outbound mail preferences to an SMTP client connection.

Parameters:

con the SMTP client connection to which the outbound mail preferences should be attached.

outbound a pointer to the SMTP outbound mail preferences to be set for the specified connection.

Returns:

This function returns no value.

Definition at line 179 of file session.c.

References smtp_session_t::out_prefs, and connection_t::smtp.

Referenced by smtp_auth_login(), and smtp_auth_plain().

5.164.1.5 bool_t smtp_add_recipient (connection_t ∗ *con*, stringer_t ∗ *address*)

Add an entry to an SMTP session's recipients list for outbound/relayed mail.

Note:

If the recipients list does not exist, it will be created automatically.

Parameters:

con the SMTP client connection specifying the added recipient.

address a managed string containing the recipient's email address.

Returns:

true if the requested recipient was added successfully to the recipients list, or false on failure.

Definition at line 107 of file session.c.

References smtp_recipients_t::address, log_pedantic, mm_alloc(), mm_free(), smtp_recipients_t::next, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_outbound_prefs_t::recipients, connection_t::smtp, and st_dupe().

Referenced by smtp_rcpt_to().

5.164.1.6 void smtp_auth_login (connection_t ∗ *con*)

smtp.c

Definition at line 391 of file smtp.c.

References auth_free(), auth_login(), smtp_session_t::authenticated, base64_decode(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_read_line(), con_write_bl(), connection_t::line, lock_get(), lock_release(), log_info, MANAGEDBUF, smtp_session_t::max_length, connection_t::network, pl_char_get(), pl_length_get(), PLACER, connection_t::protocol, smtp_outbound_prefs_t::send_size_limit, connection_t::smtp, smtp_add_outbound(), smtp_fetch_authorization(), smtp_parse_auth(), smtp_session_reset(), st_char_get(), st_cleanup, st_cmp_ci_eq(), st_empty, st_free(), st_length_int(), st_populated, st_quick(), time_datestamp(), auth_t::tokens, auth_t::username, auth_t::verification, and connection_t::violations.

5.164.1.7 void smtp_auth_plain (connection_t ∗ *con*)

BUG: The SMTP server is not handling AUTH requests in accordance with RFC 2554 <http://tools.ietf.org/html/rfc2554> and RFC 4954 <http://tools.ietf.org/html/rfc4954>, according to a user.

In this particular case it's erroring out when users present an AUTH PLAIN request without the optional initial response. This could affect other protocols as well.

According to the RFC, a client can send either the following: 1. "AUTH mechanism" (e.g. "AUTH PLAIN"), which the server acknowledges with a "334 " (note the space). The client then sends the base64-encoded authentication response on a separate line.

2. "AUTH mechanism [initial response]" (e.g. "AUTH PLAIN dGVzdAB0ZXN0ADEyMzQ="), where user transmits the auth mechanism and the base64 authentication response in a single line, so as to minimize the back-and-forth traffic.

Definition at line 240 of file smtp.c.

Referenced by smtp_data_inbound().

5.164.1.9 bool_t smtp_bypass_check (connection_t * *con*)

Check if a connection should bypass certain SMTP checks.

Note:

This check is run against host and/or subnet masks configured in the magma.smtp.bypass_addr option.

Parameters:

con a pointer to the connection object to be checked.

Returns:

true if the specified connection meets the SMTP bypass check or false on failure or if it does not.

Definition at line 289 of file checkers.c.

References magma_t::bypass_subnets, con_addr(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), ip_matches_subnet(), magma, and magma_t::smtp.

Referenced by smtp_init().

5.164.1.10 int_t smtp_check_authorized_from (uint64_t *usernum*, stringer_t * *address*)

datatier.c datatier.c

Note:

The authorization attempt first checks against the specified email address, and if unsuccessful, upon the domain component of the email address if wildcards are enabled for that domain.

Parameters:

usernum the numerical id of the user attempting to send the mail message.

address a pointer to a managed string containing the From address value of the mail message to be sent.

Returns:

1 if the user is authorized to send email from the specified address, or 0 otherwise.

Definition at line 782 of file datatier.c.

References domain_wildcard(), mail_domain_get(), mm_wipe(), placer_t, res_row_count(), res_table_free(), st_char_get(), st_length_get(), and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.164.1.11 bool_t smtp_check_duplicate_recipient (connection_t * *con*, uint64_t *usernum*)

Check whether the usernum on the inbound structure has already been used.

Definition at line 80 of file session.c.

References smtp_session_t::in_prefs, smtp_inbound_prefs_t::next, connection_t::smtp, and smtp_inbound_prefs_t::usernum.

Referenced by smtp_rcpt_to().

5.164.1.12 int_t smtp_check_filters (smtp_inbound_prefs_t * *prefs*, stringer_t ** *local*)

checkers.c Apply any user specific filters. Return -1 for errors, and -2 to delete a message. Return 1 if no action was taken, and 2 if the message was moved to a different folder, 3 if the message content was modified, and 4 if the message was marked read.

Definition at line 126 of file checkers.c.

References data, smtp_inbound_prefs_t::filters, smtp_inbound_prefs_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), length, log_pedantic, mail_header_end(), mail_header_fetch_all(), mail_mod_subject(), smtp_inbound_prefs_t::mark, MEMORYBUF, mm_wipe(), pl_data_get(), pl_init(), pl_length_get(), pl_null(), PLACER, placer_t, SMTP_FILTER_ACTION_DELETE, SMTP_FILTER_ACTION_LABEL, SMTP_FILTER_ACTION_MARK_READ, SMTP_FILTER_ACTION_MOVE, SMTP_FILTER_LOCATION_BODY, SMTP_FILTER_LOCATION_ENTIRE, SMTP_FILTER_LOCATION_FIELD, SMTP_FILTER_LOCATION_HEADER, SMTP_MARK_NONE, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_READ, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, st_char_get(), st_cleanup, st_cmp_ci_eq(), st_length_get(), st_length_int(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.164.1.13 int_t smtp_check_greylist (connection_t * *con*, smtp_inbound_prefs_t * *prefs*)

Check to see if a transmitting address is in a user's greylist.

Note:

The greylist is configured in the Dispatch table and specifies the minimum time, in minutes, that a transmitting smtp relay server must wait in order to be able to send more messages to the same recipient address again.

Parameters:

con the connection to have its remote address checked against the user's greylist.

prefs the smtp inbound preferences of the user

Returns:

-1 on an internal server error, 0 if the sender must wait longer, and 1 if the check was passed.

Definition at line 18 of file checkers.c.

References BLOCK_T, smtp_session_t::bypass, cache_get(), cache_set(), con_addr_reversed(), CONTIGUOUS, smtp_inbound_prefs_t::greytime, HEAP, imap_fetch_response_t::key, log_pedantic, MANAGEDBUF, connection_t::smtp, st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_length_get(), st_length_int(), st_sprint(), smtp_inbound_prefs_t::usernum, and imap_fetch_response_t::value.

Referenced by smtp_rcpt_to().

5.164.1.14 int_t smtp_check_rbl (connection_t * *con*)

Check the SMTP connection's remote address against a collection of real-time blacklists.

Note:

The connection's IP address will be checked against each of the servers configured in magma.smtp.blacklists.domain.

Parameters:

con the connection to have its address examined against the RBLs.

Returns:

-1 on general error, -2 if the address was blacklisted, or 1 if it passed the check.

Definition at line 77 of file checkers.c.

References magma_t::blacklists, con_addr_reversed(), log_pedantic, magma, MANAGEDBUF, mm_wipe(), magma_t::smtp, st_char_get(), and st_length_int().

Referenced by smtp_rcpt_to().

5.164.1.15 int_t smtp_check_receive_quota (connection_t ∗ *con*, smtp_inbound_prefs_t ∗ *prefs*)

Check the user's received statistics from the database to see if receiving a message would result in a quota overage.

Note:

The sum total of all emails received by the user over the past 24 hours is calculated from the database, and these checks are made: 1. The amount of mail messages received in the past 24 hours by the user does not exceed their daily mail received quota. 2. The messages received in the past 24 hours by the user from this subnet does not exceed the user's daily per-subnet received quota.

Parameters:

con a pointer to the connection object over which the smtp message was received.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

0 if message receipt is permitted, 1 if the general daily receiving limit was exceeded, 2 if the sending subnet's transmission limit was exceeded, or -1 if there was a general error.

Definition at line 717 of file datatier.c.

References con_addr_subnet(), smtp_inbound_prefs_t::daily_recv_limit, smtp_inbound_prefs_t::daily_recv_limit_ip, log_pedantic, mm_wipe(), number, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), st_char_get(), st_free(), st_length_get(), stmt_get_result(), uint64_conv_bl(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_rcpt_to().

5.164.1.16 int_t smtp_check_transmit_quota (uint64_t *usernum*, size_t *num_recipients*, smtp_outbound_prefs_t ∗ *prefs*)

Check to see if a user's current mail send request would push them over their daily transmission quota.

Note:

This check is performed by querying the database to see how many messages a user has sent in the past 24 hour period, and by adding the current number of recipients of the pending email request to that number to see if their quota would be exceeded.

Parameters:

con a pointer to the connection object of the user attempting to send mail.

Returns:

-1 on error, 0 if the send operation is permitted, or 1 if the send operation would result in a daily send quota overage.

Definition at line 542 of file datatier.c.

References smtp_outbound_prefs_t::daily_send_limit, log_pedantic, mm_wipe(), res_field_uint64(), res_row_next(), res_table_free(), smtp_-outbound_prefs_t::sent_today, and stmt_get_result().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.164.1.17 void smtp_client_close (client_t ∗ *client*)

relay.c relay.c

Parameters:

client a pointer to the smtp client session to be closed.

Returns:

This function returns no value.

Definition at line 15 of file relay.c.

References client_close(), client_read_line(), client_write(), and PLACER.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_-send_message().

5.164.1.18 client_t∗ smtp_client_connect (int_t *premium*)

Connect to a randomly selected mail relay server, and wait for a successful banner message.

Parameters:

premium if set, a premium relay will be selected instead of a standard one.

Returns:

NULL on failure or a pointer to the newly established network client object connected to a mail relay on success.

Definition at line 31 of file relay.c.

References client_t::buffer, client_close(), client_connect(), client_read_line(), client_secure(), magma_t::count, magma_t::host, client_-t::line, log_pedantic, magma, MAGMA_RELAY_INSTANCES, relay_t::name, net_set_timeout(), relay_t::port, magma_t::premium, rand_-get_uint32(), magma_t::relay, relay_t::secure, client_t::sockd, st_char_get(), st_length_get(), st_length_int(), and magma_t::timeout.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_-send_message().

5.164.1.19 int_t smtp_client_send_data (client_t ∗ *client*, stringer_t ∗ *message*, bool_t *dotstuffed*)

Issue a DATA command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the DATA command.

message a pointer to a managed string containing the body of the message to be sent.

dotstuffed a boolean to where true indicates the supplied message has already been dotstuffed.

Returns:

-3 for internal errors, -2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 243 of file relay.c.

References client_read_line(), client_write(), HEAP, JOINTED, client_t::line, log_pedantic, MANAGEDBUF, MAPPED_T, pl_char_get(), pl_length_int(), pl_starts_with_char(), PLACER, st_char_get(), st_cleanup, st_cmp_cs_ends(), st_dupe_opts(), st_empty, st_length_get(), st_length_int(), st_quick(), and st_replace().

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_-send_message().

5.164.1.20 int_t smtp_client_send_helo (client_t ∗ *client*)

Issue a EHLO command to an smtp server, or fall back to HELO, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the remote command.

Returns:

-1 on failure or 1 on success.

Definition at line 110 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), magma_t::domain, magma_t::host, client_t::line, log_pedantic, magma, magma_t::name, ns_length_get(), pl_init(), pl_null(), placer_t, st_char_get(), st_empty, st_length_get(), and magma_t::system.

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_-send_message().

5.164.1.21 int_t smtp_client_send_mailfrom (client_t ∗ *client*, stringer_t ∗ *mailfrom*, size_t *send_size*)

Issue a MAIL FROM command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.

mailfrom a pointer to a managed string containing the address parameter for the MAIL FROM command.

send_size if greater than 0, specify the optional SIZE parameter to the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

LOW: Technically we should only be sending the size parameter if the EHLO response indicates support.

Definition at line 168 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_forward_message(), smtp_relay_message(), and smtp_send_message().

5.164.1.22 int_t smtp_client_send_nullfrom (client_t ∗ *client*)

Issue a MAIL FROM command to an smtp server with a null sender, and wait for a successful response.

Note:

Null senders are used when the sender is not concerned about being notified about bounced messages.

Parameters:

client a pointer to the network client to issue the MAIL FROM command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 196 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), and st_length_int().

Referenced by smtp_bounce(), and smtp_reply().

5.164.1.23 int_t smtp_client_send_rcptto (client_t ∗ *client*, stringer_t ∗ *rcptto*)

Issue a RCPT TO command to an smtp server, and wait for a successful response.

Parameters:

client a pointer to the network client to issue the RCPT TO command.

rcptto a pointer to a managed string containing the recipient address parameter for the RCPT TO command.

Returns:

-2 if the remote server rejected the command, -1 on general network failure, or 1 on success.

Definition at line 219 of file relay.c.

References client_t::buffer, client_print(), client_read_line(), client_t::line, log_pedantic, st_char_get(), st_length_get(), and st_length_int().

Referenced by portal_smtp_relay_message(), smtp_bounce(), smtp_forward_message(), smtp_relay_message(), smtp_reply(), and smtp_-send_message().

5.164.1.24 int_t smtp_compare (const void ∗ *compare*, const void ∗ *command*)

Definition at line 11 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by smtp_process(), and smtp_sort().

5.164.1.25 void smtp_data (connection_t ∗ *con*)

Definition at line 1137 of file smtp.c.

References smtp_session_t::authenticated, con_print(), con_write_bl(), smtp_session_t::helo, smtp_session_t::in_prefs, magma, mail_-add_required_headers(), mail_count_received(), mail_create_message(), mail_destroy_message(), mail_message_cleanup(), smtp_-session_t::mailfrom, smtp_session_t::max_length, smtp_session_t::message, smtp_session_t::out_prefs, smtp_outbound_prefs_t::recipients, magma_t::relay_limit, requeue(), magma_t::smtp, connection_t::smtp, smtp_data_inbound(), smtp_data_outbound(), smtp_data_read(), smtp_quit(), smtp_requeue(), and st_free().

Referenced by smtp_process().

5.164.1.26 void smtp_disabled (connection_t ∗ *con*)

A stub function for an SMTP command that has not been implemented.

Note:

Executing a disabled command while result in a small delay and the protocol violation counter being incremented.

Returns:

This function returns no value.

Definition at line 163 of file smtp.c.

References connection_t::command, con_print(), server_t::delay, command_t::length, connection_t::protocol, connection_t::server, command_t::string, server_t::violations, and connection_t::violations.

5.164.1.27 void smtp_ehlo (connection_t * *con*)

Process an SMTP EHLO command.

See also:

smtp_parse_helo_domain()

Note:

Any prior domain specified by a HELO/EHLO command will be overwritten.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 98 of file smtp.c.

References con_print(), con_secure(), con_write_bl(), server_t::domain, smtp_session_t::esmtp, smtp_session_t::helo, magma, magma_t::message_length_limit, connection_t::server, magma_t::smtp, connection_t::smtp, smtp_parse_helo_domain(), st_char_get(), st_cleanup, and st_length_int().

5.164.1.28 int_t smtp_fetch_authorization (stringer_t * *username*, stringer_t * *verification*, smtp_outbound_prefs_t ** *output*)

Check if a user is authorized to send messages, and retrieve the user's outbound smtp preferences.

Note:

This function first checks if the account is locked in the Users table; next it populates the user's outbound mail preferences with a combination of data from the Users and Dispatch tables. The number of messages the user has sent in the past 24 hours is also computed from the Transmitting table.

Parameters:

cred a pointer to a credential object for the user, which must be of type CREDENTIAL_AUTH.

output a pointer to the address of an outbound smtp preferences object to receive the value of the lookup.

Returns:

1 on success or <= 0 on failure. 0: authentication failure (invalid username/password combination). -1: general or database failure. -2: the account is subject to an administrative lock. -3: the account is locked due to suspicion of abuse violations. -4: the account has been locked at the request of the user.

Definition at line 594 of file datatier.c.

References base64_encode_mod(), smtp_outbound_prefs_t::daily_send_limit, smtp_outbound_prefs_t::domain, smtp_outbound_prefs_t::importance, log_error, log_pedantic, meta_data_update_lock(), mm_alloc(), mm_free(), mm_wipe(), res_field_int8(), res_field_string(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), smtp_outbound_prefs_t::send_size_limit, smtp_outbound_prefs_t::sent_today, st_char_get(), st_free(), st_length_get(), st_length_int(), st_populated, stmt_get_result(), smtp_outbound_prefs_t::tls, and smtp_outbound_prefs_t::usernum.

Referenced by portal_outbound_checks(), smtp_auth_login(), and smtp_auth_plain().

5.164.1.29 stringer_t* smtp_fetch_autoreply (uint64_t *autoreply*, uint64_t *usernum*)

Fetch a specified auto-reply message for a user.

Note:

This function first checks the cache, and falls back to the database.

Parameters:

autoreply the numerical id of the auto-reply message in the database.

usernum the numerical id of the user to whom the auto-reply message belongs.

Returns:

NULL on failure, or a pointer to a managed string containing the user's auto-reply on success.

Definition at line 51 of file datatier.c.

References cache_get(), cache_set(), log_pedantic, mm_wipe(), PLACER, res_field_string(), res_row_next(), res_table_free(), and stmt_get_result().

Referenced by smtp_reply().

5.164.1.30 int_t smtp_fetch_inbound (stringer_t * *address*, smtp_inbound_prefs_t ** *output*)

Fetch a user's smtp inbound preferences from the database.

Parameters:

cred a pointer to the credential object of a user with

address Returns -1 for errors, -2 for an admin lock, -3 for an inactivity lock, -4 for a user lock, -5 for an abuse lock, -6 if the domain isn't local and 0 if the domain is local but the address wasn't found. If everything works, return 1 to indicate success.

Definition at line 111 of file datatier.c.

Referenced by smtp_rcpt_to().

5.164.1.31 table_t* smtp_fetch_rollmessages (uint64_t *usernum*)

Retrieve a list, at a maximum of 20 entries, of the oldest messages owned by a user.

Parameters:

usernum the numerical id of the user whose messages are to be queried.

Returns:

NULL on failure, or a pointer to a sql results set containing the user's oldest messages on success.

Definition at line 344 of file datatier.c.

Referenced by smtp_accept_message().

5.164.1.33 void smtp_free_inbound (smtp_inbound_prefs_t * *inbound*)

Free a list of SMTP inbound mail preferences and its underlying data.

Parameters:

inbound a pointer to the head of the SMTP inbound mail preferences list to be destroyed.

Returns:

This function returns no value.

Definition at line 228 of file session.c.

References smtp_inbound_prefs_t::address, smtp_inbound_prefs_t::domain, smtp_inbound_prefs_t::filters, smtp_inbound_prefs_t::forwarded, inx_cleanup(), mm_free(), smtp_inbound_prefs_t::next, prime_cleanup(), smtp_inbound_prefs_t::rcptto, smtp_inbound_prefs_t::signet, smtp_inbound_prefs_t::spamsig, and st_cleanup.

Referenced by smtp_fetch_inbound(), smtp_rcpt_to(), smtp_session_destroy(), and smtp_session_reset().

5.164.1.34 void smtp_free_outbound (smtp_outbound_prefs_t * *outbound*)

Free a set of SMTP outbound mail preferences and its underlying data.

Parameters:

outbound a pointer to the SMTP outbound mail preferences set to be destroyed.

Returns:

This function returns no value.

Definition at line 210 of file session.c.

References smtp_outbound_prefs_t::domain, mm_free(), smtp_outbound_prefs_t::recipients, smtp_free_recipients(), and st_cleanup.

Referenced by smtp_session_destroy().

5.164.1.35 void smtp_free_recipients (smtp_recipients_t * *recipients*)

Free a list of SMTP recipients and its underlying data.

Parameters:

recipients a pointer to the head of the recipients list to be destroyed.

Returns:

This function returns no value.

Definition at line 191 of file session.c.

References smtp_recipients_t::address, mm_free(), smtp_recipients_t::next, and st_cleanup.

Referenced by smtp_free_outbound(), and smtp_session_reset().

5.164.1.36 int_t smtp_get_action (chr_t * *string*, size_t *length*)

Parse an smtp event action string from the Dispatch table.

Note:

These values describe user-specified actions for events related to the spam filter, virus scanner, phishing detection, SPF, DKIM, and RBL checks.

Parameters:

string a pointer to a null-terminated string containing the name of the action.

length the length, in bytes, of the action string.

Returns:

the code of the corresponding smtp event action, SMTP_ACTION_UNDEFINED if the action is not known, or SMTP_ACTION_ERROR on failure.

Definition at line 19 of file datatier.c.

References log_error, PLACER, SMTP_ACTION_BOUNCE, SMTP_ACTION_DELETE, SMTP_ACTION_ERROR, SMTP_ACTION_-MARK, SMTP_ACTION_MARK_READ, SMTP_ACTION_REJECT, SMTP_ACTION_UNDEFINED, and st_cmp_cs_eq().

Referenced by smtp_fetch_inbound().

5.164.1.37 void smtp_helo (connection_t * *con*)

Process an SMTP HELO command.

See also:

smtp_parse_helo_domain()

Note:

Any prior domain specified by a HELO/EHLO command will be overwritten.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 127 of file smtp.c.

References con_print(), con_write_bl(), server_t::domain, smtp_session_t::esmtp, smtp_session_t::helo, connection_t::server, connection_t::smtp, smtp_parse_helo_domain(), st_char_get(), st_cleanup, and st_length_int().

5.164.1.38 void smtp_init (connection_t * *con*)

The start of the protocol handler for the SMTP server.

Parameters:

con the new inbound SMTP client connection.

Returns:

This function returns no value.

Definition at line 1248 of file smtp.c.

References smtp_session_t::bypass, con_print(), con_reverse_enqueue(), server_t::domain, connection_t::server, connection_t::smtp, smtp_bypass_check(), smtp_requeue(), st_char_get(), and st_length_int().

Referenced by protocol_enqueue(), and submission_init().

5.164.1.39 uint64_t smtp_insert_spamsig (smtp_inbound_prefs_t * *prefs*, uint64_t *key*, int_t *code*)

Store a spam signature in the database.

See also:

dspam_process()

Parameters:

prefs a pointer to the specified user's inbound mail preferences data.

key a randomly chosen authentication key for the signature.

code the dspam return code for the message from dspam_process()

Returns:

0 on failure, or the number of the newly inserted spam signature on success.

Definition at line 445 of file datatier.c.

References log_pedantic, mm_wipe(), smtp_inbound_prefs_t::spamsig, st_char_get(), st_length_get(), stmt_insert(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_store_spamsig().

5.164.1.40 void smtp_invalid (connection_t * *con*)

A function that is executed when an invalid SMTP command is executed.

Returns:

This function returns no value.

Definition at line 176 of file smtp.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by smtp_process().

5.164.1.41 void smtp_list_free_filter (smtp_inbound_filter_t * *filter*)

Free an SMTP inbound filter and its underlying data.

Parameters:

filter a pointer to the SMTP inbound filter to be destroyed.

Returns:

This function returns no value.

Definition at line 249 of file session.c.

References smtp_inbound_filter_t::expression, smtp_inbound_filter_t::field, smtp_inbound_filter_t::label, mm_free(), and st_cleanup.

Referenced by smtp_fetch_inbound().

5.164.1.42 void smtp_mail_from (connection_t * *con*)

Specify the identity of a message's sender, in response to an SMTP MAIL FROM command.

See also:

smtp_parse_mail_from_path()

Note:

This command must be preceded by a HELO command and successful authentication. Any prior email address specified by a MAIL FROM command will be overwritten. If the SIZE parameter was specified with the MAIL FROM command, its value will be compared to the maximum value specified in the smtp.message_length_limit configuration option.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 57 of file smtp.c.

References smtp_session_t::authenticated, con_write_bl(), smtp_session_t::helo, magma, smtp_session_t::mailfrom, magma_t::message_length_limit, magma_t::smtp, connection_t::smtp, smtp_parse_mail_from_path(), smtp_session_reset(), st_free(), and smtp_session_t::suggested_length.

5.164.1.43 void smtp_noop (connection_t * *con*)

Perform an SMTP NOOP (no-operation) command.

Note:

This command does essentially nothing and is mostly a way to keep connections alive without timing out due to inactivity.

Returns:

This function returns no value.

Definition at line 152 of file smtp.c.

References con_write_bl().

5.164.1.44 stringer_t∗ smtp_parse_auth (stringer_t ∗ *data*)

parse.c parse.c

Note:

This function will stop reading input when an invalid base64-encoding character is encountered.

Parameters:

con the SMTP client connection issuing the AUTH command.

Returns:

a managed string containing the domain specified by the AUTH command, or NULL on failure.

Definition at line 113 of file parse.c.

References length, log_pedantic, st_empty_out(), and st_import().

Referenced by smtp_auth_login(), and smtp_auth_plain().

5.164.1.45 stringer_t∗ smtp_parse_helo_domain (connection_t ∗ *con*)

Parse the domain specified as the parameter to an SMTP HELO or EHLO command.

Note:

Valid domain names may only contain letters, numbers, periods and hyphens. This function will return a lowercase domain name, and stop reading input when an invalid character is encountered.

Parameters:

con the SMTP client connection issuing the command.

Returns:

a managed string containing the domain specified by the HELO command, or NULL on failure.

Definition at line 310 of file parse.c.

References connection_t::command, magma_t::helo_length_limit, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim_end(), magma_t::smtp, st_import(), and command_t::string.

Referenced by smtp_ehlo(), and smtp_helo().

5.164.1.46 stringer_t∗ smtp_parse_mail_from_path (connection_t ∗ *con*)

Extract the provided path from the command line Reverse-path = Path Forward-path = Path Path = "<" [A-d-l ":"] Mailbox ">" A-d-l = At-domain ∗("," A-d-l) At-domain = @ domain

Parameters:

con A connection structure which presumably contains a the MAIL FROM value inside the line buffer.

Returns:

Returns a stringer with the path that was extracted or NULL to indicate a problem.

Definition at line 168 of file parse.c.

References magma_t::address_length_limit, connection_t::command, CONSTANT, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim(), pl_trim_end(), PLACER, placer_t, connection_t::smtp, magma_t::smtp, st_cmp_ci_starts(), st_cmp_cs_eq(), st_import(), command_t::string, smtp_session_t::suggested_eight_-bit, smtp_session_t::suggested_length, tok_get_bl(), tok_get_count_bl(), tok_get_pl(), and uint64_conv_pl().

Referenced by smtp_mail_from().

5.164.1.47 stringer_t∗ smtp_parse_rcpt_to (connection_t ∗ *con*)

LOW: The list of characters allowed in an email address needs to be verified against the RFC's. LOW: The parser should use different lists of valid characters for the the local and domain portions of an email address. Extract the provided path from the command line Reverse-path = Path Forward-path = Path Path = "<" [A-d-l ":"] Mailbox ">" A-d-l = At-domain ∗("," A-d-l) At-domain = @ domain

Parameters:

con A connection structure which presumably contains a the RCPT TO value inside the line buffer.

Returns:

Returns a stringer with the path that was extracted or NULL to indicate a problem.

Definition at line 24 of file parse.c.

References magma_t::address_length_limit, connection_t::command, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim_end(), magma_t::smtp, st_import(), and command_t::string.

Referenced by smtp_rcpt_to().

5.164.1.48 void smtp_process (connection_t ∗ *con*)

The main entry point in the SMTP server for processing commands issued by clients.

Parameters:

con a pointer to the connection object of the client issuing the SMTP command.

Returns:

This function returns no value.

Definition at line 48 of file commands.c.

References connection_t::command, command, con_read_line(), server_t::cutoff, enqueue(), command_t::function, command_t::length, connection_t::line, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), connection_t::protocol, requeue(), connection_-t::server, smtp_commands, smtp_compare(), smtp_data(), smtp_invalid(), smtp_process(), smtp_quit(), smtp_requeue(), connection_t::spins, command_t::string, server_t::violations, and connection_t::violations.

Referenced by smtp_process(), and smtp_requeue().

5.164.1.49 void smtp_quit (connection_t ∗ *con*)

Gracefully terminate an SMTP session, especially in response to an SMTP QUIT command.

Note:

The standards specify that the receiver MUST send an OK reply, and then close the transmission channel.

Parameters:

the SMTP client connection to be terminated.

Returns:

This function returns no value.

Definition at line 191 of file smtp.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by smtp_data(), smtp_process(), and smtp_requeue().

5.164.1.50 void smtp_rcpt_to (connection_t ∗ *con*)

BUG: Detect messages 'from' a local user/domain and tell them to authenticate first.

Definition at line 531 of file smtp.c.

References magma_t::abuse, magma_t::admin, auth_sanitize_address(), smtp_session_t::authenticated, smtp_session_t::bypass, smtp_session_t::checked, con_addr(), con_addr_presentation(), con_print(), con_secure(), con_write_bl(), magma_t::contact, smtp_inbound_prefs_t::daily_recv_limit, smtp_inbound_prefs_t::daily_recv_limit_ip, smtp_outbound_prefs_t::daily_send_limit, smtp_inbound_prefs_t::forwarded, smtp_inbound_prefs_t::greylist, smtp_inbound_prefs_t::greytime, smtp_session_t::helo, lower_st(), magma, mail_domain_get(), smtp_session_t::mailfrom, MANAGEDBUF, smtp_session_t::max_length, MEMORYBUF, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_inbound_prefs_t::overquota, pl_null(), placer_t, smtp_session_t::rbl, smtp_inbound_prefs_t::rbl, smtp_inbound_prefs_t::rblaction, smtp_inbound_prefs_t::rcptto, magma_t::recipient_limit, smtp_inbound_prefs_t::recv_size_limit, smtp_inbound_prefs_t::rollout, smtp_outbound_prefs_t::send_size_limit, smtp_outbound_prefs_t::sent_today, magma_t::smtp, connection_t::smtp, SMTP_ACTION_REJECT, smtp_add_inbound(), smtp_add_recipient(), smtp_check_duplicate_recipient(), smtp_check_greylist(), smtp_check_rbl(), smtp_check_receive_quota(), smtp_fetch_inbound(), smtp_free_inbound(), smtp_parse_rcpt_to(), smtp_session_t::spf, smtp_inbound_prefs_t::spf, spf_check(), smtp_inbound_prefs_t::spfaction, st_char_get(), st_cmp_ci_eq(), st_free(), st_length_int(), smtp_session_t::suggested_length, smtp_outbound_prefs_t::tls, and smtp_inbound_prefs_t::usernum.

5.164.1.51 int_t smtp_relay_message (connection_t ∗ *con*, stringer_t ∗∗ *result*)

Relay an outbound smtp message for a user.

Note:

The following process occurs before the message will be sent: 1. Necessary outbound headers are attached to the message.∗ 2. An outbound connection to a mail relay server is established (with a premium or normal server pool). 3. Once the connection is negotiated, an RCPT TO command is issued for each of the message's recipients. 4. The mail message data is sent and the client connection is closed.

Parameters:

con a pointer to the connection object across which the outbound mail was attempted to be sent.

result a pointer to the address of a managed string that will receive the server's last response to the mail send attempt, regardless of whether or not it was successful.

Returns:

1 if the message was successfully sent or -1 on failure.

Definition at line 22 of file transmit.c.

References smtp_recipients_t::address, CONTIGUOUS, HEAP, smtp_outbound_prefs_t::importance, client_t::line, log_pedantic, mail_add_outbound_headers(), smtp_session_t::mailfrom, MANAGED_T, smtp_session_t::message, smtp_recipients_t::next, smtp_session_t::out_prefs, PLACER, smtp_outbound_prefs_t::recipients, connection_t::smtp, smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_rcptto(), st_dupe_opts(), st_replace(), and smtp_message_t::text.

Referenced by smtp_data_outbound().

5.164.1.52 int_t smtp_reply (stringer_t * *from*, stringer_t * *to*, uint64_t *usernum*, uint64_t *autoreply*, int_t *spf*, int_t *dkim*)

Definition at line 363 of file transmit.c.

Referenced by smtp_accept_message().

5.164.1.53 void smtp_requeue (connection_t * *con*)

commands.c

Definition at line 31 of file commands.c.

References con_status(), server_t::cutoff, enqueue(), connection_t::protocol, connection_t::server, smtp_process(), smtp_quit(), status, server_t::violations, and connection_t::violations.

Referenced by smtp_data(), smtp_init(), and smtp_process().

5.164.1.54 int_t smtp_rollout (smtp_inbound_prefs_t * *prefs*)

Delete the oldest mail message owned by a user until their storage usage falls below their storage quota.

Parameters:

prefs a pointer to the specified user's inbound mail preferences data.

Returns:

1 on success or < 0 on failure, where -1: An error occurred retrieving the rollout message list from the database. -2: The user lock could not be acquired.

Definition at line 79 of file accept.c.

References log_pedantic, mail_remove_message(), OBJECT_MESSAGES, smtp_inbound_prefs_t::quota, res_field_string(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), serial_increment(), smtp_fetch_rollmessages(), st_char_get(), st_free(), smtp_inbound_prefs_t::stor_size, user_lock(), user_unlock(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.164.1.55 void smtp_rset (connection_t * *con*)

Reset the SMTP session, in response to an SMTP RSET command.

Note:

This command clears any sender, recipient, and mail data, along with all buffers and state tables. The connection structure is reset to the same it was in immediately after the HELO/EHLO command.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 215 of file smtp.c.

References con_write_bl(), and smtp_session_reset().

5.164.1.56 int_t smtp_send_message (stringer_t * *to*, stringer_t * *from*, stringer_t * *message*)

Relay an outbound smtp message for the user.

Parameters:

to a managed string containing the name of the mail recipient.

from a managed string containing the address from which the email is being sent.

message a managed string containing the raw body of the mail message.

Returns:

-1 on error or 1 on success.

Definition at line 503 of file transmit.c.

References log_pedantic, smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), and smtp_client_send_rcptto().

Referenced by contact_business(), and register_business_step2().

5.164.1.57 void smtp_session_destroy (connection_t * *con*)

Destroy the data associated with an SMTP session.

Parameters:

con the SMTP client connection to be destroyed.

Returns:

This function returns no value.

Definition at line 57 of file session.c.

References smtp_session_t::helo, smtp_session_t::in_prefs, mail_destroy_message(), smtp_session_t::mailfrom, smtp_session_t::message, smtp_session_t::out_prefs, connection_t::smtp, smtp_free_inbound(), smtp_free_outbound(), and st_cleanup.

Referenced by con_destroy().

5.164.1.58 void smtp_session_reset (connection_t * *con*)

Reset an SMTP session to its initialized state.

Parameters:

con the SMTP client connection to be reset.

Returns:

This function returns no value.

Definition at line 15 of file session.c.

References smtp_session_t::checked, smtp_session_t::dkim, smtp_session_t::in_prefs, mail_destroy_message(), smtp_session_t::mailfrom, smtp_session_t::max_length, smtp_session_t::message, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_session_t::rbl, smtp_outbound_prefs_t::recipients, connection_t::smtp, smtp_free_inbound(), smtp_free_recipients(), smtp_session_t::spf, st_cleanup, smtp_session_t::suggested_eight_bit, smtp_session_t::suggested_length, and smtp_session_t::virus.

Referenced by smtp_auth_login(), smtp_auth_plain(), smtp_data_inbound(), smtp_data_outbound(), smtp_mail_from(), smtp_rset(), and smtp_starttls().

5.164.1.59 void smtp_sort (void)

Sort the SMTP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References smtp_commands, and smtp_compare().

Referenced by protocol_init().

5.164.1.60 void smtp_starttls (connection_t ∗ *con*)

TODO: Review error messages and update them with the appropriate response code. Initialize a TLS session for an unauthenticated SMTP session.

Parameters:

con the connection of the SMTP endpoint requesting the transport layer security upgrade.

Returns:

This function returns no value.

Definition at line 17 of file smtp.c.

References connection_t::buffer, con_secure(), con_write_bl(), connection_t::line, log_pedantic, M_SSL_BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::server, smtp_session_reset(), connection_t::sockd, st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

5.164.1.61 int_t smtp_store_message (smtp_inbound_prefs_t ∗ *prefs*, stringer_t ∗∗ *local*)

Store a received SMTP message as a generic mail message, both on disk and in the database.

See also:

mail_store_messages()

Returns:

-1 on failure or 1 on success.

Definition at line 15 of file accept.c.

References smtp_inbound_prefs_t::foldernum, log_error, log_pedantic, MAIL_MARK_BLACKHOLED, MAIL_MARK_INFECTED, MAIL_MARK_JUNK, MAIL_MARK_PHISHING, MAIL_MARK_SPOOFED, MAIL_STATUS_RECENT, MAIL_STATUS_SEEN, mail_store_message(), smtp_inbound_prefs_t::mark, smtp_inbound_prefs_t::messagenum, OBJECT_MESSAGES, serial_increment(), smtp_inbound_prefs_t::signet, smtp_inbound_prefs_t::signum, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_READ, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, smtp_inbound_prefs_t::spamkey, status, user_lock(), user_unlock(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.164.1.62 bool_t smtp_store_spamsig (smtp_inbound_prefs_t ∗ *prefs*, int_t *spam*)

Generate a random key for a spam signature and store it in the database.

Parameters:

prefs the user's smtp inbound preferences object, with the spam signature field set.

spam the dspam return code associated with the spam signature.

Returns:

true if the key was inserted into the database successfully, or false on failure.

Definition at line 161 of file accept.c.

References imap_fetch_response_t::key, log_pedantic, rand_get_uint64(), smtp_inbound_prefs_t::signum, smtp_insert_spamsig(), smtp_-inbound_prefs_t::spamkey, and uint64_digits().

Referenced by smtp_accept_message().

5.164.1.63 void smtp_update_receive_stats (connection_t * *con*, smtp_inbound_prefs_t * *prefs*)

Update the receiving statistics and per-user log tables in the database for a successfully received smtp message.

Note:

The Receiving table is updated with the subnet address from which the message was received; the Log table for the user is updated to reflect the newly calculated totals of bounces or messages received.

Parameters:

con the connection across which the smtp message was received.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 373 of file datatier.c.

References smtp_inbound_prefs_t::bounces, con_addr_subnet(), log_pedantic, smtp_session_t::mailfrom, mm_wipe(), PLACER, connection_t::smtp, st_char_get(), st_cmp_cs_eq(), st_free(), st_length_get(), stmt_exec(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.164.1.64 void smtp_update_transmission_stats (connection_t * *con*)

Update the transmission and per-user log tables in the database for a successfully sent smtp message.

Note:

The Transmitting table is updated with the timestamp of this transaction; the Log table for the user is updated to reflect the newly calculated total for messages sent.

Parameters:

con a pointer to the connection object across which the smtp message was sent.

prefs a pointer to the user's smtp inbound mail preferences.

Returns:

This function returns no value.

Definition at line 497 of file datatier.c.

References log_pedantic, mm_wipe(), smtp_session_t::num_recipients, smtp_session_t::out_prefs, connection_t::smtp, stmt_exec(), and smtp_outbound_prefs_t::usernum.

Referenced by smtp_data_outbound().

5.164.1.65 void submission_init (connection_t * *con*)

Definition at line 1265 of file smtp.c.

References connection_t::smtp, smtp_init(), and smtp_session_t::submission.

Referenced by protocol_enqueue().

5.165 src/network/write.c File Reference

```
#include "magma.h"
```

Functions

- int64_t con_write_bl (connection_t *con, char *block, size_t length)

  Write data to a network connection.

- int64_t con_write_st (connection_t *con, stringer_t *string)

  Write a managed string to a network connection.

- int64_t con_write_ns (connection_t *con, char *string)

  Write a null-terminated string to a network connection.

- int64_t con_write_pl (connection_t *con, placer_t string)

  Write a placer to a network connection.

- int64_t con_print (connection_t *con, chr_t *format,...)

  Write a formatted string to a network connection.

- int64_t client_write (client_t *client, stringer_t *s)

  Write data to a network client.

- int64_t client_print (client_t *client, chr_t *format,...)

  Write a formatted string to a network client.

5.165.1 Function Documentation

5.165.1.1 int64_t client_print (client_t * *client*, chr_t * *format*, ...)

Write a formatted string to a network client. write.c

See also:

client_write()

Parameters:

client the network client connection to which the supplied data will be written.

format the format string for the data to be written to the network client connection.

... a va_arg style collection of variables to be expanded by the passed format string.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 293 of file write.c.

References client_write(), client_t::sockd, st_free(), st_vaprint, and client_t::status.

Referenced by smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_nullfrom(), and smtp_client_send_rcptto().

5.165.1.2 int64_t client_write (client_t * *client*, stringer_t * *s*)

Write data to a network client.

Note:

This function works regardless of whether or not the client connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

client the network client connection to which the supplied data will be written.

s a managed string containing the data to be written to the network client connection.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 210 of file write.c.

References bytes, client_status(), client_t::ip, ip_presentation(), length, log_pedantic, MANAGEDBUF, MEMORYBUF, client_t::sockd, st_-char_get(), st_empty_out(), st_length_int(), status, client_t::status, tcp_status(), client_t::tls, tls_cipher(), tls_error(), and tls_write().

Referenced by client_print(), smtp_client_close(), and smtp_client_send_data().

5.165.1.3 int64_t con_print (connection_t * *con*, chr_t * *format*, ...)

Write a formatted string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

format a format string for the output string to be written to the connection's remote client.

... a variable argument list of parameters for the specified format string.

Returns:

-1 on general failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 153 of file write.c.

References buflen, bufptr, bytes, con_write_bl(), length, mm_alloc(), mm_free(), connection_t::network, connection_t::sockd, and connection_t::status.

Referenced by dmtp_ehlo(), dmtp_helo(), dmtp_init(), http_parse_header(), http_print_301(), http_response_header(), http_response_-options(), imap_append(), imap_capability(), imap_check(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_id(), imap_idle(), imap_init(), imap_invalid(), imap_list(), imap_login(), imap_logout(), imap_lsub(), imap_noop(), imap_process(), imap_rename(), imap_search(), imap_select(), imap_starttls(), imap_status(), imap_store(), imap_subscribe(), imap_unsubscribe(), molten_stats(), pop_capa(), pop_last(), pop_list(), pop_retr(), pop_stat(), pop_top(), pop_uidl(), register_print_captcha(), smtp_data(), smtp_data_inbound(), smtp_data_outbound(), smtp_disabled(), smtp_ehlo(), smtp_helo(), smtp_init(), smtp_rcpt_to(), and teacher_print_message().

5.165.1.4 int64_t con_write_bl (connection_t * *con*, char * *block*, size_t *length*)

Write data to a network connection. HIGH: Create a simpler method of triggering a queue event following a connection write operation, and audit the code to ensure write calls do not accidently orphan a connection by not queuing the connection upon completion. In other words, always ensure that enqueue() is being called on a connection after all processing is performed, so that it is not lost (whether it is to be kept or not).

Note:

This function works regardless of whether or not the connection is ssl-enabled. If the network write requires multiple system calls, then this code will loop until all the data has been transmitted.

Parameters:

con the connection across which the supplied data will be written.

block a pointer to a data buffer containing the data to be written to the connection's remote client.

length the length, in bytes, of the data buffer to be written.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 24 of file write.c.

References bytes, con_status(), connection_t::network, connection_t::sockd, status, connection_t::status, tcp_write(), connection_t::tls, and tls_write().

Referenced by con_print(), con_write_ns(), con_write_pl(), con_write_st(), dmtp_data(), dmtp_help(), dmtp_hist(), dmtp_invalid(), dmtp_mail(), dmtp_mode(), dmtp_noop(), dmtp_quit(), dmtp_rcpt(), dmtp_rset(), dmtp_sgnt(), dmtp_verb(), dmtp_vrfy(), imap_fetch(), imap_logout(), imap_parse_literal(), imap_process(), molten_invalid(), molten_stats(), pop_dele(), pop_init(), pop_invalid(), pop_list(), pop_noop(), pop_pass(), pop_quit(), pop_retr(), pop_rset(), pop_starttls(), pop_top(), pop_uidl(), pop_user(), smtp_auth_login(), smtp_auth_plain(), smtp_data(), smtp_data_inbound(), smtp_data_outbound(), smtp_ehlo(), smtp_helo(), smtp_invalid(), smtp_mail_from(), smtp_noop(), smtp_quit(), smtp_rcpt_to(), smtp_rset(), and smtp_starttls().

5.165.1.5 int64_t con_write_ns (connection_t ∗ *con*, char ∗ *string*)

Write a null-terminated string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a pointer to a null-terminated string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 128 of file write.c.

References con_write_bl(), and ns_length_get().

5.165.1.6 int64_t con_write_pl (connection_t ∗ *con*, placer_t *string*)

Write a placer to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a placer pointing to the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 140 of file write.c.

References con_write_bl(), pl_char_get(), and pl_length_get().

5.165.1.7 int64_t con_write_st (connection_t ∗ *con*, stringer_t ∗ *string*)

Write a managed string to a network connection.

See also:

con_write_bl()

Parameters:

con the connection across which the supplied data will be written.

string a managed string containing the data to be written to the connection's remote client.

Returns:

-1 on general network failure, -2 if the connection was reset or closed, or the number of bytes that were written across the connection.

Definition at line 116 of file write.c.

References con_write_bl(), st_char_get(), and st_length_get().

Referenced by api_response(), contact_print_form(), contact_print_message(), http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_print_500_log(), http_print_501(), http_response(), imap_fetch(), imap_search(), pop_retr(), pop_top(), portal_endpoint_attachments_progress(), portal_endpoint_error(), portal_endpoint_response(), portal_endpoint_search(), portal_print_login(), register_print_captcha(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), smtp_data_outbound(), statistics_process(), teacher_print_form(), and teacher_print_message().

Functions

- void auth_free (auth_t *auth)

  Free an authentication object.

- auth_t * auth_alloc (void)

  Allocate an empty authentication object.

- auth_t * auth_challenge (stringer_t *username)

  Used to sanitize and normalize a username, then retrieve the authentication information for that account. For STACIE authentications, this function creates a nonce value, which the user's client can combine with the verification token value to derive an ephemeral login token, which may only be used once.

- int_t auth_response (auth_t *auth, stringer_t *ephemeral)

  Test an ephemeral token for validity. If the token is invalid, generate a different nonce for the next attempt.

- int_t auth_login (stringer_t *username, stringer_t *password, auth_t **output)

  Loads a user's authentication information and calculates the tokens for comparison.

5.166.1 Function Documentation

5.166.1.1 auth_t* auth_alloc (void)

Allocate an empty authentication object. auth.c

Returns:

an empty authentication object allocated off the stack.

Definition at line 32 of file auth.c.

References log_pedantic, mm_alloc(), and mm_wipe().

Referenced by auth_challenge().

5.166.1.2 auth_t* auth_challenge (stringer_t * *username*)

Used to sanitize and normalize a username, then retrieve the authentication information for that account. For STACIE authentications, this function creates a nonce value, which the user's client can combine with the verification token value to derive an ephemeral login token, which may only be used once.

Parameters:

username the unsanitized username, which may also be an email address.

Returns:

Definition at line 54 of file auth.c.

References auth_alloc(), auth_data_fetch(), auth_free(), auth_sanitize_username(), log_error, log_pedantic, auth_t::nonce, auth_t::seasoning, st_empty, st_length_get(), stacie_create_nonce(), STACIE_NONCE_LENGTH, auth_t::tokens, auth_t::username, and auth_t::verification.

Referenced by auth_login(), and teacher_process().

5.166.1.3 void auth_free (auth_t * *auth*)

Free an authentication object.

Parameters:

auth a pointer to the authentication object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file auth.c.

References auth_t::ephemeral, auth_t::key, auth_t::keys, auth_t::legacy, log_pedantic, auth_t::master, mm_free(), auth_t::nonce, auth_t::salt, auth_t::seasoning, st_cleanup, auth_t::token, auth_t::tokens, auth_t::username, and auth_t::verification.

Referenced by api_endpoint_auth(), auth_challenge(), auth_login(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

5.166.1.4 int_t auth_login (stringer_t * *username*, stringer_t * *password*, auth_t ** *output*)

Loads a user's authentication information and calculates the tokens for comparison.

Note:

If the username and password combination is valid, but involves an account with legacy authentication tokens, the plain text password is used to replace the legacy tokens with STACIE compliant values. Also note the complexity of this function. It will be far simpler once support for legacy login tokens is removed.

Parameters:

username the unsanitized username, provided with the login attempt.

password the plain text password.

output pointer location which will hold the resulting auth_t structure, but only if the inputs authenticate successfully, and 0 is returned; also note that output must be pointing at NULL when its passed in to avoid creating a memory leak.

Returns:

if a technical error occurs unrelated to the provided credentials, -1 will be returned, if the username and password combination are invalid, 1 will be returned. The output parameter is invalid, 1 will be returned, and the output will be emptied.

Definition at line 177 of file auth.c.

References auth_challenge(), auth_data_update_legacy(), auth_free(), auth_legacy(), auth_legacy_free(), auth_stacie(), auth_stacie_free(), base64_encode_mod(), auth_t::bonus, hex_encode_st(), auth_legacy_t::key, auth_t::key, auth_stacie_t::keys, auth_t::keys, auth_t::legacy, log_error, log_pedantic, auth_stacie_t::master, auth_t::master, auth_t::salt, auth_t::seasoning, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_dupe(), st_empty, st_length_get(), st_length_int(), stacie_create_salt(), auth_legacy_t::token, auth_t::token, auth_stacie_t::tokens, auth_-t::tokens, auth_t::username, auth_t::usernum, auth_stacie_t::verification, and auth_t::verification.

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

5.166.1.5 int_t auth_response (auth_t * *auth*, stringer_t * *ephemeral*)

Test an ephemeral token for validity. If the token is invalid, generate a different nonce for the next attempt.

Parameters:

auth the challenge values, including the verification token, and a nonce value.

ephemeral the ephemeral token value provided by the user for comparison.

Returns:

return -1 if an error occurs, 0 if the response is validated, and 1 if the ephemeral token is invalid.

Definition at line 98 of file auth.c.

References auth_stacie(), auth_stacie_cleanup(), auth_stacie_free(), auth_t::bonus, auth_t::ephemeral, auth_stacie_t::ephemeral, log_pedantic, mm_move(), auth_t::nonce, auth_t::salt, auth_t::seasoning, st_char_get(), st_cmp_cs_eq(), st_data_get(), st_dupe(), st_empty, st_free(), st_length_get(), st_length_int(), stacie_create_nonce(), STACIE_NONCE_LENGTH, STACIE_TOKEN_LENGTH, auth_stacie_t::tokens, auth_t::tokens, auth_t::username, and auth_t::verification.

  Loads a user's authentication information and calculates the tokens for comparison.

- int_t auth_response (auth_t *auth, stringer_t *ephemeral)

  Test an ephemeral token for validity. If the token is invalid, generate a different nonce for the next attempt.

- int_t auth_data_fetch (auth_t *auth)

  datatier.c

- int_t auth_data_update_legacy (uint64_t usernum, stringer_t *legacy, stringer_t *salt, stringer_t *verification, uint32_t bonus)

  Replaces legacy auth tokens with STACIE compatible tokens.

- auth_stacie_t * auth_stacie (uint32_t bonus, stringer_t *username, stringer_t *password, stringer_t *salt, stringer_t *verification, stringer_t *nonce)

  stacie.c

- auth_stacie_t * auth_stacie_alloc (void)

  Allocate and initialize a STACIE object.

- void auth_stacie_cleanup (auth_stacie_t *stacie)

  A checked cleanup function which can be used free a STACIE object.

- void auth_stacie_free (auth_stacie_t *stacie)

  A checked cleanup function which can be used free a STACIE object.

- auth_legacy_t * auth_legacy (stringer_t *username, stringer_t *password)

  legacy.c

- auth_legacy_t * auth_legacy_alloc (void)
- void auth_legacy_free (auth_legacy_t *legacy)

5.167.1 Enumeration Type Documentation

5.167.1.1 enum auth_lock_status_t

Enumerator:

AUTH_LOCK_NONE Normal unlocked account.

AUTH_LOCK_INACTIVITY An inactive account lock, that gets cleared automatically when the user authenticates.

AUTH_LOCK_EXPIRED The user subscription has expired, messages are accepted, but logins are refused.

AUTH_LOCK_ADMIN An administrative lock, and used for a variety of reasons.

AUTH_LOCK_ABUSE Abuse locks are applied to accounts that appear to be violating the acceptable use policy.

AUTH_LOCK_USER The account has been locked at the request of the user.

Definition at line 14 of file auth.h.

5.167.2 Function Documentation

5.167.2.1 auth_t* auth_alloc (void)

auth.c auth.c

Returns:

an empty authentication object allocated off the stack.

Definition at line 32 of file auth.c.

References log_pedantic, mm_alloc(), and mm_wipe().

Referenced by auth_challenge().

5.167.2.2 auth_t* auth_challenge (stringer_t * *username*)

Used to sanitize and normalize a username, then retrieve the authentication information for that account. For STACIE authentications, this function creates a nonce value, which the user's client can combine with the verification token value to derive an ephemeral login token, which may only be used once.

Parameters:

username the unsanitized username, which may also be an email address.

Returns:

Definition at line 54 of file auth.c.

References auth_alloc(), auth_data_fetch(), auth_free(), auth_sanitize_username(), log_error, log_pedantic, auth_t::nonce, auth_t::seasoning, st_empty, st_length_get(), stacie_create_nonce(), STACIE_NONCE_LENGTH, auth_t::tokens, auth_t::username, and auth_t::verification.

Referenced by auth_login(), and teacher_process().

5.167.2.3 int_t auth_data_fetch (auth_t * *auth*)

datatier.c datatier.c

Note:

This function searches the Users table first, and the Mailboxes table second. This way if someone sneaks a username into the Mailboxes table, they won't override the Users table.

Parameters:

auth The authentication object providing the username, and used to store the result.

Returns:

0 if the user information is pulled correctly, 1 if the user isn't found, and -1 if an error occurs.

Definition at line 91 of file datatier.c.

References base64_decode_mod(), auth_t::bonus, hex_decode_st(), auth_t::legacy, auth_t::locked, log_error, log_pedantic, mm_wipe(), PLACER, res_field_block(), res_field_int8(), res_field_length(), res_field_string(), res_field_uint32(), res_field_uint64(), res_row_count(), res_row_next(), res_table_free(), auth_t::salt, auth_t::seasoning, st_char_get(), st_cmp_cs_eq(), st_empty, st_free(), st_length_get(), st_length_int(), st_search_chr(), STACIE_KEY_ROUNDS_MAX, STACIE_SALT_LENGTH, STACIE_TOKEN_LENGTH, auth_t::status, stmt_get_result(), auth_t::token, auth_t::tokens, auth_t::username, auth_t::usernum, and auth_t::verification.

Referenced by auth_challenge().

5.167.2.4 int_t auth_data_update_legacy (uint64_t *usernum*, stringer_t * *legacy*, stringer_t * *salt*, stringer_t * *verification*, uint32_t *bonus*)

Replaces legacy auth tokens with STACIE compatible tokens.

Parameters:

usernum The user account number.

legacy The legacy auth token, encoded as a hexadecimal string.

salt The user specific salt value, encoded as a hexadecimal string.

verification The STACIE verification token, encoded as a hexadecimal string.

bonus The number of bonus hash rounds.

Returns:

0 if the user information was updated correctly, or -1 if an error occurs.

Definition at line 22 of file datatier.c.

References log_error, log_pedantic, mm_wipe(), st_char_get(), st_empty, st_length_get(), STACIE_KEY_ROUNDS_MAX, and stmt_exec_affected().

Referenced by auth_login().

5.167.2.5 void auth_free (auth_t * *auth*)

Free an authentication object.

Parameters:

auth a pointer to the authentication object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file auth.c.

References auth_t::ephemeral, auth_t::key, auth_t::keys, auth_t::legacy, log_pedantic, auth_t::master, mm_free(), auth_t::nonce, auth_t::salt, auth_t::seasoning, st_cleanup, auth_t::token, auth_t::tokens, auth_t::username, and auth_t::verification.

Referenced by api_endpoint_auth(), auth_challenge(), auth_login(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), and teacher_process().

5.167.2.6 auth_legacy_t* auth_legacy (stringer_t * *username*, stringer_t * *password*)

legacy.c legacy.c

Parameters:

username a managed string holding the sanitzed username.

password a managed string holding the plain text user password.

Returns:

an auth_legacy_t structure is returned upon success, and NULL upon failure.

Definition at line 60 of file legacy.c.

References auth_legacy_alloc(), auth_legacy_free(), CONTIGUOUS, hash_sha512(), auth_legacy_t::key, log_error, magma, MANAGED_T, MANAGEDBUF, magma_t::salt, SECURE, magma_t::secure, st_alloc(), st_alloc_opts(), st_empty, st_free(), st_merge, and auth_legacy_t::token.

Referenced by auth_login().

5.167.2.7 auth_legacy_t* auth_legacy_alloc (void)

Definition at line 43 of file legacy.c.

References mm_alloc(), and mm_wipe().

Referenced by auth_legacy().

5.167.2.8 void auth_legacy_free (auth_legacy_t * *legacy*)

Definition at line 34 of file legacy.c.

References auth_legacy_t::key, mm_free(), st_cleanup, and auth_legacy_t::token.

Referenced by auth_legacy(), and auth_login().

5.167.2.9 int_t auth_login (stringer_t * *username*, stringer_t * *password*, auth_t ** *output*)

Loads a user's authentication information and calculates the tokens for comparison.

Note:

If the username and password combination is valid, but involves an account with legacy authentication tokens, the plain text password is used to replace the legacy tokens with STACIE compliant values. Also note the complexity of this function. It will be far simpler once support for legacy login tokens is removed.

Parameters:

username the unsanitized username, provided with the login attempt.

password the plain text password.

output pointer location which will hold the resulting auth_t structure, but only if the inputs authenticate successfully, and 0 is returned; also note that output must be pointing at NULL when its passed in to avoid creating a memory leak.

Returns:

if a technical error occurs unrelated to the provided credentials, -1 will be returned, if the username and password combination are invalid, 1 will be returned. The output parameter is invalid, 1 will be returned, and the output will be emptied.

Definition at line 177 of file auth.c.

References auth_challenge(), auth_data_update_legacy(), auth_free(), auth_legacy(), auth_legacy_free(), auth_stacie(), auth_stacie_free(), base64_encode_mod(), auth_t::bonus, hex_encode_st(), auth_legacy_t::key, auth_t::key, auth_stacie_t::keys, auth_t::keys, auth_t::legacy, log_error, log_pedantic, auth_stacie_t::master, auth_t::master, auth_t::salt, auth_t::seasoning, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_dupe(), st_empty, st_length_get(), st_length_int(), stacie_create_salt(), auth_legacy_t::token, auth_t::token, auth_stacie_t::tokens, auth_t::tokens, auth_t::username, auth_t::usernum, auth_stacie_t::verification, and auth_t::verification.

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), and smtp_auth_plain().

5.167.2.10 int_t auth_response (auth_t * *auth*, stringer_t * *ephemeral*)

Test an ephemeral token for validity. If the token is invalid, generate a different nonce for the next attempt.

Parameters:

auth the challenge values, including the verification token, and a nonce value.

ephemeral the ephemeral token value provided by the user for comparison.

Returns:

return -1 if an error occurs, 0 if the response is validated, and 1 if the ephemeral token is invalid.

Definition at line 98 of file auth.c.

References auth_stacie(), auth_stacie_cleanup(), auth_stacie_free(), auth_t::bonus, auth_t::ephemeral, auth_stacie_t::ephemeral, log_pedantic, mm_move(), auth_t::nonce, auth_t::salt, auth_t::seasoning, st_char_get(), st_cmp_cs_eq(), st_data_get(), st_dupe(), st_empty, st_free(), st_length_get(), st_length_int(), stacie_create_nonce(), STACIE_NONCE_LENGTH, STACIE_TOKEN_LENGTH, auth_stacie_t::tokens, auth_t::tokens, auth_t::username, and auth_t::verification.

5.167.2.11 stringer_t* auth_sanitize_address (stringer_t * *username*)

username.c username.c

Parameters:

username a managed string containing the user supplied login name to be processed, it may contain an optional domain suffix.

Note:

This function duplicates the input address string, with all characters converted to lowercase, and whitespace removed. '.' and '-' are also converted to '_' in the username, and if there is a '+' in the local portion of an email address, all subsequent characters in that local part will be ignored, as they constitute a label.

Returns:

NULL on failure, or a managed string containing the sanitized address on success, that must be freed by the caller.

Definition at line 18 of file username.c.

References chr_whitespace(), lower_chr(), PLACER, st_alloc(), st_char_get(), st_empty_out(), st_length_get(), and st_length_set().

Referenced by auth_sanitize_username(), smtp_data_outbound(), and smtp_rcpt_to().

5.167.2.12 stringer_t* auth_sanitize_username (stringer_t * *username*)

Get the username portion of a fully qualified email address.

Parameters:

username a managed string containing the username to be processed, with an optional domain suffix.

Returns:

NULL on failure, or a managed string containing the credential username portion of the supplied address.

Definition at line 103 of file username.c.

References auth_sanitize_address(), magma_t::domain, magma, PLACER, st_char_get(), st_cmp_cs_eq(), st_length_get(), st_length_set(), st_search_cs(), and magma_t::system.

Referenced by auth_challenge().

5.167.2.13 auth_stacie_t* auth_stacie (uint32_t *bonus*, stringer_t * *username*, stringer_t * *password*, stringer_t * *salt*, stringer_t * *verification*, stringer_t * *nonce*)

stacie.c stacie.c

Note:

If the password is NULL, then a nonce is required, and only the ephemeral token will be populated in the resulting auth_stacie_t structure. Likewise, if the nonce is NULL, then the password must be provided, and the ephemeral token will be absent in the resulting auth_stacie_t structure. If the password and nonce are both set to NULL, then an error is triggered and NULL is returned.

Parameters:

bonus the number of bonus hash rounds to be applied for this particular user account.

username a managed string holding the normalized username.

password a managed string holding the plain text user password.

salt a managed string with the salt value for the current user.

nonce the randomly generated nonce value for the ephemeral token.

Returns:

an auth_stacie_t structure is returned upon success, and NULL upon failure.

Definition at line 92 of file stacie.c.

References auth_stacie_alloc(), auth_stacie_free(), auth_stacie_t::ephemeral, auth_stacie_t::keys, log_pedantic, auth_stacie_t::master, auth_stacie_t::password, st_empty, stacie_derive_key(), stacie_derive_rounds(), stacie_derive_seed(), stacie_derive_token(), STACIE_KEY_ROUNDS_MAX, auth_stacie_t::tokens, and auth_stacie_t::verification.

Referenced by auth_login(), auth_response(), and register_data_insert_user().

5.167.2.14 auth_stacie_t* auth_stacie_alloc (void)

Allocate and initialize a STACIE object.

Returns:

NULL on failure, or a pointer to the newly allocated STACIE object on success.

Definition at line 60 of file stacie.c.

References log_pedantic, mm_alloc(), and mm_wipe().

Referenced by auth_stacie().

5.167.2.15 void auth_stacie_cleanup (auth_stacie_t * *stacie*)

A checked cleanup function which can be used free a STACIE object.

Note:

Use this function when the STACIE object pointer could potentially be NULL. Call the free function directly if the STACIE object is guaranteed not to be NULL.

See also:

auth_stacie_free()

Parameters:

stacie the STACIE object which will be freed.

Returns:

This function returns no value.

Definition at line 48 of file stacie.c.

References auth_stacie_free().

Referenced by auth_response(), and register_data_insert_user().

5.167.2.16 void auth_stacie_free (auth_stacie_t * *stacie*)

A checked cleanup function which can be used free a STACIE object.

Note:

Use this function when the STACIE object is guaranteed not to be NULL. Call the cleanup function directly if the STACIE object pointer could potentially be NULL.

See also:

auth_stacie_cleanup()

Parameters:

stacie the STACIE object which will be freed.

Returns:

This function returns no value.

Definition at line 19 of file stacie.c.

References auth_stacie_t::ephemeral, auth_stacie_t::keys, log_pedantic, auth_stacie_t::master, mm_free(), auth_stacie_t::password, st_cleanup, auth_stacie_t::tokens, and auth_stacie_t::verification.

Referenced by auth_login(), auth_response(), auth_stacie(), and auth_stacie_cleanup().

5.170 src/objects/auth/username.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t * auth_sanitize_address (stringer_t *username)

  Process an email address or username to ensure it only contains valid characters.

- stringer_t * auth_sanitize_username (stringer_t *username)

  Get the username portion of a fully qualified email address.

5.170.1 Function Documentation

5.170.1.1 stringer_t* auth_sanitize_address (stringer_t * *username*)

Process an email address or username to ensure it only contains valid characters. username.c

Parameters:

username a managed string containing the user supplied login name to be processed, it may contain an optional domain suffix.

Note:

This function duplicates the input address string, with all characters converted to lowercase, and whitespace removed. '.' and '-' are also converted to '_' in the username, and if there is a '+' in the local portion of an email address, all subsequent characters in that local part will be ignored, as they constitute a label.

Returns:

NULL on failure, or a managed string containing the sanitized address on success, that must be freed by the caller.

Definition at line 18 of file username.c.

References chr_whitespace(), lower_chr(), PLACER, st_alloc(), st_char_get(), st_empty_out(), st_length_get(), and st_length_set().

Referenced by auth_sanitize_username(), smtp_data_outbound(), and smtp_rcpt_to().

5.170.1.2 stringer_t* auth_sanitize_username (stringer_t * *username*)

Get the username portion of a fully qualified email address.

Parameters:

username a managed string containing the username to be processed, with an optional domain suffix.

Returns:

NULL on failure, or a managed string containing the credential username portion of the supplied address.

Definition at line 103 of file username.c.

References auth_sanitize_address(), magma_t::domain, magma, PLACER, st_char_get(), st_cmp_cs_eq(), st_length_get(), st_length_set(), st_search_cs(), and magma_t::system.

Referenced by auth_challenge().

Functions

- void user_config_entry_free (user_config_entry_t *entry)
  Destroy a user config entry.
- void user_config_free (user_config_t *collection)
  Free a user config collection object.
- user_config_t * user_config_alloc (uint64_t usernum)
  Allocate a user config collection object for a user.
- user_config_entry_t * user_config_entry_alloc (stringer_t *key, stringer_t *value, uint64_t flags)
  Create and initialize new user config entry object.
- user_config_t * user_config_create (uint64_t usernum)
  Create a new user config collection object for the specified user and populate it with config entries from the database.
- int_t user_config_update (user_config_t *collection)
  Update a collection of user config options from the database, if necessary.
- int_t user_config_edit (user_config_t *collection, stringer_t *key, stringer_t *value)
  Change the value of, or delete a key from a user's config collection.

5.171.1 Function Documentation

5.171.1.1 user_config_t* user_config_alloc (uint64_t *usernum*)

Allocate a user config collection object for a user. config.c

Parameters:

usernum the numerical user id for the requested user.

Returns:

NULL on failure or a pointer to the newly allocated user config collection object on success.

Definition at line 44 of file config.c.

References align(), inx_alloc(), log_pedantic, M_INX_TREE, mm_alloc(), mm_free(), user_config_entry_free(), and user_config_t.

Referenced by user_config_create().

5.171.1.2 user_config_t* user_config_create (uint64_t *usernum*)

Create a new user config collection object for the specified user and populate it with config entries from the database.

Parameters:

usernum the numerical user id for the user to be queried.

Returns:

NULL on failure, or a pointer to the newly created user config collection object on success.

Definition at line 106 of file config.c.

References log_pedantic, OBJECT_CONFIG, serial_get(), user_config_alloc(), user_config_fetch(), user_config_free(), and user_config_t.

Referenced by portal_endpoint_config_edit(), and portal_endpoint_config_load().

5.171.1.3 int_t user_config_edit (user_config_t ∗ *collection*, stringer_t ∗ *key*, stringer_t ∗ *value*)

Change the value of, or delete a key from a user's config collection.

Parameters:

collection a pointer to a collection of user's config entries.

key a pointer to a managed string containing the name of the user config key to be modified.

value a pointer to a managed string containing the name of the new value of the key, or NULL if it is to be deleted.

Returns:

-1 on error or 1 on success.

Definition at line 160 of file config.c.

References inx_delete(), inx_find(), inx_replace(), log_pedantic, M_TYPE_STRINGER, OBJECT_CONFIG, serial_increment(), multi_t::st, st_cmp_cs_eq(), st_empty, user_config_delete(), user_config_entry_alloc(), user_config_entry_free(), user_config_entry_t, user_config_upsert(), and multi_t::val.

Referenced by portal_endpoint_config_edit().

5.171.1.4 user_config_entry_t∗ user_config_entry_alloc (stringer_t ∗ *key*, stringer_t ∗ *value*, uint64_t *flags*)

Create and initialize new user config entry object.

Parameters:

key a managed string containing the key of the config entry object.

value a managed string containing the value of the config entry object.

flags a bitmask reflecting the flags of the config entry object.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized user config entry object on success.

Definition at line 70 of file config.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), STACK, and user_config_entry_t.

Referenced by user_config_edit(), and user_config_fetch().

5.171.1.5 void user_config_entry_free (user_config_entry_t ∗ *entry*)

Destroy a user config entry.

Parameters:

entry a pointer to the user config entry object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file config.c.

References mm_free().

Referenced by user_config_alloc(), user_config_edit(), and user_config_fetch().

5.171.1.6 void user_config_free (user_config_t * *collection*)

Free a user config collection object.

Parameters:

collection a pointer to the user config collection object to be freed.

Returns:

This function returns no value.

Definition at line 29 of file config.c.

References inx_cleanup(), and mm_free().

Referenced by portal_endpoint_config_edit(), portal_endpoint_config_load(), and user_config_create().

5.171.1.7 int_t user_config_update (user_config_t * *collection*)

Update a collection of user config options from the database, if necessary.

Note:

This function is not currently being used anywhere. If this function returns -1, the config entries are left in an undefined state and should not be relied upon.

Parameters:

collection a pointer to a collection of user config entries to be checked for updates.

Returns:

1 if the collection is up-to-date, 0 if it was refreshed to update changes, or -1 if the refresh operation failed.

Definition at line 132 of file config.c.

References inx_truncate(), OBJECT_CONFIG, serial_get(), and user_config_fetch().

5.172 src/web/portal/config.c File Reference

#include "magma.h"
```

Functions

- json_t ∗ portal_config_entry_flags (user_config_entry_t ∗entry)

  Get a user config entry's flags as a json object.

- json_t ∗ portal_config_entry (user_config_entry_t ∗entry)
- json_t ∗ portal_config_collection (user_config_t ∗collection)

  Get a collection of user config options as a json object.

5.172.1 Function Documentation

5.172.1.1 json_t∗ portal_config_collection (user_config_t ∗ *collection*)

Get a collection of user config options as a json object. config.c

Parameters:

collection a pointer to a user config object that contains all the config options pairs to be serialized.

Returns:

NULL on failure, or a pointer to a json object containing the collection of user config options on success.

Definition at line 62 of file config.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_decref_d, json_object_d, json_object_set_new_d, log_error, log_options, M_LOG_CRITICAL, portal_config_entry(), st_char_get(), USER_CONF_STATUS_CRITICAL, and user_config_entry_t.

Referenced by portal_endpoint_config_load().

5.172.1.2 json_t∗ portal_config_entry (user_config_entry_t ∗ *entry*)

Definition at line 35 of file config.c.

References json_decref_d, json_pack_ex_d, log_pedantic, portal_config_entry_flags(), st_char_get(), and st_length_int().

Referenced by portal_config_collection().

5.172.1.3 json_t∗ portal_config_entry_flags (user_config_entry_t ∗ *entry*)

Get a user config entry's flags as a json object.

Parameters:

entry a pointer to the user config entry object to have its flags serialized.

Returns:

NULL on failure or a pointer to a json object storing the user's flags on success.

Definition at line 15 of file config.c.

References json_array_append_new_d, json_array_d, json_decref_d, json_string_d, and USER_CONF_STATUS_CRITICAL.

Referenced by portal_config_entry().

Functions

- void contact_free (contact_t ∗contact)
  Free a contact entry object.
- void contact_detail_free (contact_detail_t ∗detail)
  Free a contact entry detail.
- contact_t ∗ contact_alloc (uint64_t contactnum, stringer_t ∗name)
  Create a new contact entry object.
- contact_detail_t ∗ contact_detail_alloc (stringer_t ∗key, stringer_t ∗value, uint64_t flags)
  Create a new contact detail from a key-value pair.
- void contact_name (contact_t ∗contact, stringer_t ∗name)
  Update the name (in memory) of a contact entry.
- inx_t ∗ contacts_update (uint64_t usernum)
  Retrieve all of a user's contacts (and contact folders) from the database.
- contact_t ∗ contact_create (uint64_t usernum, uint64_t foldernum, stringer_t ∗name)
  Create a new contact entry object and insert it into the database.
- int_t contact_remove (contact_t ∗contact, uint64_t usernum, uint64_t foldernum)
  Remove a contact entry and its associated details from the database.
- int_t contact_move (contact_folder_t ∗source, contact_folder_t ∗target, contact_t ∗contact, uint64_t usernum)
  Move a contact entry from one contact to another.
- int_t contact_edit (contact_t ∗contact, uint64_t usernum, uint64_t foldernum, stringer_t ∗key, stringer_t ∗value)
  Change a detail of a contact entry.
- bool_t contact_validate_name (stringer_t ∗name, chr_t ∗∗errmsg)
  Validate the name of a requested contact entry name.
- bool_t contact_validate_detail (stringer_t ∗key, stringer_t ∗value, chr_t ∗∗errmsg)
  Validate the value of a requested contact entry detail.

5.173.1 Function Documentation

5.173.1.1 contact_t∗ contact_alloc (uint64_t *contactnum*, stringer_t ∗ *name*)

Create a new contact entry object. contacts.c

Parameters:

contactnum the numerical id of the new contact entry.

name a managed string containing the name of the contact.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized contact entry object on success.

Definition at line 48 of file contacts.c.

References align(), contact_detail_free(), contact_t, FOREIGNDATA, inx_alloc(), JOINTED, log_pedantic, M_INX_TREE, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, st_data_get(), st_length_get(), and STACK.

Referenced by contact_create(), contact_move(), and contacts_fetch().

5.173.1.2 contact_t∗ contact_create (uint64_t *usernum*, uint64_t *foldernum*, stringer_t ∗ *name*)

Create a new contact entry object and insert it into the database.

Parameters:

usernum the numerical id of the user to whom the new contact will belong.

foldernum the numerical id of the parent folder that will contain the contact entry.

name a pointer to a managed string containing the name of the new contact entry.

Returns:

NULL on failure, or a pointer to the newly created contact entry object on success.

Definition at line 185 of file contacts.c.

References contact_alloc(), contact_insert(), contact_t, log_pedantic, and st_empty.

Referenced by portal_endpoint_contacts_add(), and portal_endpoint_contacts_copy().

5.173.1.3 contact_detail_t∗ contact_detail_alloc (stringer_t ∗ *key*, stringer_t ∗ *value*, uint64_t *flags*)

Create a new contact detail from a key-value pair.

Parameters:

key a managed string containing the name of the detail.

value a managed string containing the value associated with the detail.

flags a bitmask of flags associated with the detail.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized contact detail object on success.

Definition at line 79 of file contacts.c.

References align(), contact_detail_t, FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_-get(), st_length_get(), and STACK.

Referenced by contact_details_fetch(), and contact_edit().

5.173.1.4 void contact_detail_free (contact_detail_t ∗ *detail*)

Free a contact entry detail.

Parameters:

detail a pointer to the contact entry detail to be freed.

Returns:

This function returns no value.

Definition at line 36 of file contacts.c.

References mm_cleanup.

Referenced by contact_alloc(), contact_details_fetch(), and contact_edit().

5.173.1.5 int_t contact_edit (contact_t ∗ *contact*, uint64_t *usernum*, uint64_t *foldernum*, stringer_t ∗ *key*, stringer_t ∗ *value*)

Change a detail of a contact entry.

Parameters:

contact a pointer to the target contact entry.

usernum the numerical id of the user to whom the specified contact entry belongs.

foldernum

key a managed string containing the name of the contact entry detail to be changed. If the special value "name" is passed as the key, the contact name will be changed instead.

value a managed string containing the new value of the specified contact entry detail; if NULL is passed, the contact detail will be deleted rather than modified.

Returns:

-1 on failure or 1 on success.

LOW: It would be nice if we didn't call this function each time we updated a contact, but rather we called it when all of the updates have been completed.

LOW: It would be nice if we didn't call this function each time we updated a contact, but rather we called it when all of the updates have been completed.

Definition at line 274 of file contacts.c.

References contact_detail_alloc(), contact_detail_delete(), contact_detail_free(), contact_detail_t, contact_detail_upsert(), contact_name(), contact_update(), contact_update_stamp(), inx_delete(), inx_replace(), log_pedantic, M_TYPE_STRINGER, PLACER, multi_t::st, st_cmp_ci_eq(), st_empty, and multi_t::val.

Referenced by portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), and portal_endpoint_contacts_edit().

5.173.1.6 void contact_free (contact_t ∗ *contact*)

Free a contact entry object.

Parameters:

contact a pointer to the contact entry to be freed.

Returns:

This function returns no value.

Definition at line 16 of file contacts.c.

References FOREIGNDATA, inx_cleanup(), mm_free(), st_free(), and st_opt_test().

Referenced by contact_folder_alloc(), contact_move(), contacts_fetch(), portal_endpoint_contacts_add(), and portal_endpoint_contacts_copy().

5.173.1.7 int_t contact_move (contact_folder_t * *source*, contact_folder_t * *target*, contact_t * *contact*, uint64_t *usernum*)

Move a contact entry from one contact to another.

Parameters:

source a pointer to the original parent contact folder object of the contact entry to be moved.

target a pointer to the contact folder object that will become the new parent of the specified contact entry.

contact a pointer to the contact object that is to be moved.

usernum the numerical id of the user to whom the specified contact entry belongs.

Returns:

-1 on error, or 1 if the contact move operation was successful.

Definition at line 229 of file contacts.c.

References contact_alloc(), contact_free(), contact_t, contact_update(), inx_delete(), inx_insert(), log_pedantic, M_TYPE_UINT64, OBJECT_CONTACTS, serial_increment(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_contacts_move().

5.173.1.8 void contact_name (contact_t * *contact*, stringer_t * *name*)

Update the name (in memory) of a contact entry.

Parameters:

contact a pointer to the contact entry object to be updated.

name a managed string containing the new name of the specified contact entry.

Returns:

This function returns no value.

HIGH: A possible segfault is exposed here, related to the contacts.edit camelface call and having to do with the way foreign data is handled.

Definition at line 118 of file contacts.c.

References data, FOREIGNDATA, JOINTED, mm_dupe(), mm_free(), st_data_get(), st_data_set(), st_empty_out(), st_length_set(), st_opt_set(), and st_opt_test().

Referenced by contact_edit().

5.173.1.9 int_t contact_remove (contact_t * *contact*, uint64_t *usernum*, uint64_t *foldernum*)

Remove a contact entry and its associated details from the database.

See also:

contact_delete()

Note:

This function is not currently in use anywhere in the code.

Parameters:

contact a pointer to the contact entry to be deleted from the database.

usernum the numerical id of the user to whom the contact entry belongs.

foldernum the numerical id of the parent folder containing the specified contact entry.

Returns:

1 if the specified contact was deleted successfully, 0 if no matching contact was found in the database, or -1 on general failure.

Definition at line 211 of file contacts.c.

References contact_delete(), and log_pedantic.

5.173.1.10 bool_t contact_validate_detail (stringer_t * *key*, stringer_t * *value*, chr_t ** *errmsg*)

Validate the value of a requested contact entry detail.

Parameters:

key a pointer to a managed string containing the name of the contact detail key to be validated.

value a pointer to a managed string containing the value of the contact detail to be validated.

errmsg if not NULL, the address of a string pointer that will receive a descriptive error message upon validation failure.

Returns:

true if the proposed contact key/value pair was valid, or false if it was not.

Definition at line 373 of file contacts.c.

References chr_printable(), and st_empty_out().

Referenced by portal_endpoint_contacts_add().

5.173.1.11 bool_t contact_validate_name (stringer_t * *name*, chr_t ** *errmsg*)

Validate the name of a requested contact entry name.

Parameters:

name a pointer to a managed string containing the name of the contact to be validated.

errmsg if not NULL, the address of a string pointer that will receive a descriptive error message upon validation failure.

Returns:

true if the proposed contact name was valid, or false if it was not.

Definition at line 338 of file contacts.c.

References chr_printable(), and st_empty_out().

Referenced by portal_endpoint_contacts_add().

5.173.1.12 inx_t* contacts_update (uint64_t *usernum*)

Retrieve all of a user's contacts (and contact folders) from the database.

Parameters:

usernum the numerical id of the user whose contact folders and contact entries should be fetched.

Returns:

NULL on failure, or a pointer to an inx holder containing all of the specified user's contact folders and entries on success.

Definition at line 152 of file contacts.c.

References contacts_fetch(), inx_cleanup(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), log_-pedantic, M_FOLDER_CONTACTS, and magma_folder_fetch().

Referenced by meta_update_contacts().

```

Functions

- void contact_folder_free (contact_folder_t ∗folder)
  Free a contact folder object.
- contact_folder_t ∗ contact_folder_alloc (uint64_t foldernum, uint64_t parent, uint32_t order, stringer_t ∗name)
  Allocate and initialize a new contact folder object.
- int_t contact_folder_create (uint64_t usernum, uint64_t parent, stringer_t ∗name, inx_t ∗folders)
  Create a new contact folder.
- int_t contact_folder_remove (uint64_t usernum, uint64_t foldernum, inx_t ∗folders)
  Remove a user's contact folder.
- bool_t contact_folder_rename (uint64_t usernum, uint64_t foldernum, stringer_t ∗rename, inx_t ∗folders)
  Rename a user's contact folder.

5.174.1 Function Documentation

5.174.1.1 contact_folder_t∗ contact_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t ∗ *name*)

Allocate and initialize a new contact folder object. contacts.c

Parameters:

foldernum the numerical id of this contact folder.

parent the numerical id of the parent folder of this contact folder.

order the order number of this folder in its parent folder.

name a managed string containing the name of this folder.

Returns:

NULL on failure, or a pointer to the newly initialized contact folder object on success.

Definition at line 29 of file contacts.c.

References contact_free(), inx_alloc(), M_INX_TREE, magma_folder_alloc(), and mm_cleanup.

Referenced by contact_folder_create(), and magma_folder_funcs().

5.174.1.2 int_t contact_folder_create (uint64_t *usernum*, uint64_t *parent*, stringer_t ∗ *name*, inx_t ∗ *folders*)

Create a new contact folder.

Parameters:

usernum the numerical id of the user to whom the new imap folder will belong.

parent the numerical id of the parent folder to contain the new contact folder, or 0 for a root folder.

name a managed string containing the fully qualified name of the new contact folder to be created.

folders an inx holder containing the set of folders into which the new contact folder will be inserted.

Returns:

1 on success or <= 0 on failure. 0: An invalid parameter was passed to the function, or an internal failure occurred. -1: The specified new folder name was invalid. -2: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks. -3: The specified folder name already exists. -4: An invalid parent folder was specified. -5: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks.

Definition at line 55 of file contacts.c.

References contact_folder_alloc(), contact_folder_free(), FOLDER_LENGTH_LIMIT, IMAP_FOLDER_RECURSION_LMIIT, imap_valid_folder_name(), inx_insert(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_UINT64, magma_folder_children(), magma_folder_find_name(), magma_folder_find_number(), magma_folder_insert(), magma_folder_t, st_empty, st_length_get(), multi_t::u64, and multi_t::val.

Referenced by portal_folder_contacts_add().

5.174.1.3 void contact_folder_free (contact_folder_t ∗ *folder*)

Free a contact folder object.

Parameters:

folder a pointer to the contact folder object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file contacts.c.

References magma_folder_free().

Referenced by contact_folder_create(), and magma_folder_funcs().

5.174.1.4 int_t contact_folder_remove (uint64_t *usernum*, uint64_t *foldernum*, inx_t ∗ *folders*)

Remove a user's contact folder.

See also:

magma_folder_delete()

Note:

This operation will only succeed if the specified contact folder is empty.

Parameters:

usernum the numerical id of the user requesting the contact folder removal.

foldernum the numerical id of the folder to be removed.

folders an inx holder containing the contact folders to be searched for the folder specified for removal.

Returns:

0 on success or < 0 on failure. -1: There was an unexpected internal error. -2: The specified folder could not be found. -3: Contact folder was not empty.

Definition at line 121 of file contacts.c.

References inx_count(), inx_delete(), inx_find(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_UINT64, magma_folder_children(), and magma_folder_delete().

5.174.1.5 bool_t contact_folder_rename (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *rename*, inx_t * *folders*)

Rename a user's contact folder.

See also:

magma_folder_rename()

Parameters:

usernum the numerical id of the user requesting the contact folder renaming.

foldernum the numerical id of the folder to be renamed.

rename a managed string containing the new name of the specified folder.

folders an inx holder containing the contact folders to be searched for the folder specified to be renamed.

Returns:

true on success or false on failure.

Definition at line 161 of file contacts.c.

References FOLDER_LENGTH_LIMIT, imap_valid_folder_name(), inx_find(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_-UINT64, magma_folder_find_name(), magma_folder_rename(), st_dupe(), st_empty, st_free(), and st_length_get().

Functions

- json_t ∗ portal_contact_detail_flags (contact_detail_t ∗detail)

  TODO: Right now this function doesn't really do anything. It needs to be updated if/once flag values are determined.

- json_t ∗ portal_contact_details (contact_t ∗contact)

  Retrieve all the details about a contact entry as a json object.

5.175.1 Function Documentation

5.175.1.1 json_t∗ portal_contact_detail_flags (contact_detail_t ∗ *detail*)

TODO: Right now this function doesn't really do anything. It needs to be updated if/once flag values are determined. contacts.c

Pack a json array representing the flags associated with a user contact entry detail.

Parameters:

detail a pointer to the user contact detail to have its flags queried.

Returns:

NULL on failure or a pointer to a json array containing strings describing the specified contact detail's flags.

Definition at line 16 of file contacts.c.

References CONTACT_DETAIL_FLAG_CRITICAL, json_array_append_new_d, json_array_d, and json_string_d.

Referenced by portal_contact_details().

5.175.1.2 json_t∗ portal_contact_details (contact_t ∗ *contact*)

Retrieve all the details about a contact entry as a json object.

Parameters:

contact a pointer to the contact object whose details will be retrieved.

Returns:

a pointer to a json object containing the details of the specified contact entry.

Definition at line 35 of file contacts.c.

- void contact_detail_free (contact_detail_t ∗detail)

  Free a contact entry detail.

- int_t contact_edit (contact_t ∗contact, uint64_t usernum, uint64_t foldernum, stringer_t ∗key, stringer_t ∗value)

  Change a detail of a contact entry.

- void contact_free (contact_t ∗contact)

  Free a contact entry object.

- int_t contact_move (contact_folder_t ∗source, contact_folder_t ∗target, contact_t ∗contact, uint64_t usernum)

  Move a contact entry from one contact to another.

- void contact_name (contact_t ∗contact, stringer_t ∗name)

  Update the name (in memory) of a contact entry.

- int_t contact_remove (contact_t ∗contact, uint64_t usernum, uint64_t foldernum)

  Remove a contact entry and its associated details from the database.

- bool_t contact_validate_name (stringer_t ∗name, chr_t ∗∗errmsg)

  Validate the name of a requested contact entry name.

- bool_t contact_validate_detail (stringer_t ∗key, stringer_t ∗value, chr_t ∗∗errmsg)

  Validate the value of a requested contact entry detail.

- inx_t ∗ contacts_update (uint64_t usernum)

  Retrieve all of a user's contacts (and contact folders) from the database.

- int_t contact_delete (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

  datatier.c

- int_t contact_detail_delete (uint64_t contactnum, stringer_t ∗key)

  Delete the specified contact detail of a contact entry from the database.

- int_t contact_detail_upsert (uint64_t contactnum, stringer_t ∗key, stringer_t ∗value, uint64_t flags)

Update a specified contact detail in the database, or insert it if it does not exist.

- int_t contact_details_fetch (contact_t *contact)

  Populate a contact entry with its details from the database.

- uint64_t contact_insert (uint64_t usernum, uint64_t foldernum, stringer_t *name)

  Insert a new contact entry into the database.

- int_t contact_update (uint64_t contactnum, uint64_t usernum, uint64_t cur_folder, uint64_t target_folder, stringer_t *name)

  Update a user contact entry in the database.

- int_t contact_update_stamp (uint64_t contactnum, uint64_t usernum, uint64_t foldernum)

  Touch the last updated time stamp of a contact entry in the database.

- int_t contacts_fetch (uint64_t usernum, contact_folder_t *folder)

  Retrieve all of a user's contact entries in a specified contacts folder from the database.

- contact_t * contact_find_detail (contact_folder_t *folder, stringer_t *key, stringer_t *target)

  find.c

- contact_t * contact_find_name (contact_folder_t *folder, stringer_t *target)

  Get a contact entry by name (case insensitive).

- contact_t * contact_find_number (contact_folder_t *folder, uint64_t target)

  Find a contact entry in a contact folder by number.

Variables

- contact_detail_t
- contact_t

5.176.1 Enumeration Type Documentation

5.176.1.1 anonymous enum

Enumerator:

CONTACT_DETAIL_FLAG_NONE

CONTACT_DETAIL_FLAG_CRITICAL

Definition at line 11 of file contacts.h.

5.176.2 Function Documentation

5.176.2.1 struct __attribute__ ((packed)) [read]

Definition at line 21 of file contacts.h.

5.176.2.2 contact_t* contact_alloc (uint64_t *contactnum*, stringer_t * *name*)

contacts.c contacts.c

Parameters:

contactnum the numerical id of the new contact entry.

name a managed string containing the name of the contact.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized contact entry object on success.

Definition at line 48 of file contacts.c.

References align(), contact_detail_free(), contact_t, FOREIGNDATA, inx_alloc(), JOINTED, log_pedantic, M_INX_TREE, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, st_data_get(), st_length_get(), and STACK.

Referenced by contact_create(), contact_move(), and contacts_fetch().

5.176.2.3 contact_t* contact_create (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *name*)

Create a new contact entry object and insert it into the database.

Parameters:

usernum the numerical id of the user to whom the new contact will belong.

foldernum the numerical id of the parent folder that will contain the contact entry.

name a pointer to a managed string containing the name of the new contact entry.

Returns:

NULL on failure, or a pointer to the newly created contact entry object on success.

Definition at line 185 of file contacts.c.

References contact_alloc(), contact_insert(), contact_t, log_pedantic, and st_empty.

Referenced by portal_endpoint_contacts_add(), and portal_endpoint_contacts_copy().

5.176.2.4 int_t contact_delete (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *foldernum*)

datatier.c datatier.c

Parameters:

contactnum the numerical id of the contact entry to be deleted.

usernum the numerical id of the user to whom the specified contact entry belongs.

foldernum the numerical id of the parent contact folder containing the contact entry.

Returns:

1 if the specified contact was deleted successfully, 0 if no matching contact was found in the database, or -1 on general failure.

Definition at line 61 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by contact_remove(), and portal_endpoint_contacts_remove().

5.176.2.5 contact_detail_t* contact_detail_alloc (stringer_t * *key*, stringer_t * *value*, uint64_t *flags*)

Create a new contact detail from a key-value pair.

Parameters:

key a managed string containing the name of the detail.

value a managed string containing the value associated with the detail.

flags a bitmask of flags associated with the detail.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized contact detail object on success.

Definition at line 79 of file contacts.c.

References align(), contact_detail_t, FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_-get(), st_length_get(), and STACK.

Referenced by contact_details_fetch(), and contact_edit().

5.176.2.6 int_t contact_detail_delete (uint64_t *contactnum*, stringer_t * *key*)

Delete the specified contact detail of a contact entry from the database.

Parameters:

contactnum the numerical id of the contact entry to have the specified detail removed.

key a managed string containing the name of the contact detail to be removed from the entry.

Returns:

-1 on error, 0 if no matching detail was found in the database, or 1 if the delete operation was successful.

Definition at line 204 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by contact_edit().

5.176.2.7 void contact_detail_free (contact_detail_t * *detail*)

Free a contact entry detail.

Parameters:

detail a pointer to the contact entry detail to be freed.

Returns:

This function returns no value.

Definition at line 36 of file contacts.c.

References mm_cleanup.

Referenced by contact_alloc(), contact_details_fetch(), and contact_edit().

5.176.2.8 int_t contact_detail_upsert (uint64_t *contactnum*, stringer_t * *key*, stringer_t * *value*, uint64_t *flags*)

Update a specified contact detail in the database, or insert it if it does not exist.

Parameters:

contactnum the numerical id of the contact entry to be modified.

key a managed string containing the name of the contact detail to be updated.

value a managed string containing the new value of the specified contact detail.

flags a bitmask of flags to be associated with the specified contact entry detail.

Returns:

-1 on error, 0 if no update was necessary, 1 if a new contact detail was inserted into the database, or 2 if the specified contact detail was updated successfully.

Definition at line 241 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), st_char_get(), st_length_get(), st_length_int(), and stmt_exec_affected().

Referenced by contact_edit().

5.176.2.9 int_t contact_details_fetch (contact_t * *contact*)

Populate a contact entry with its details from the database.

Parameters:

contact a pointer to the contact entry object that will be updated.

Returns:

-1 on failure or 1 on success.

Definition at line 285 of file datatier.c.

References contact_detail_alloc(), contact_detail_free(), contact_detail_t, inx_insert(), log_info, log_pedantic, M_TYPE_STRINGER, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), multi_t::st, stmt_get_result(), and multi_t::val.

Referenced by contacts_fetch().

5.176.2.10 int_t contact_edit (contact_t * *contact*, uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *key*, stringer_t * *value*)

Change a detail of a contact entry.

Parameters:

contact a pointer to the target contact entry.

usernum the numerical id of the user to whom the specified contact entry belongs.

foldernum

key a managed string containing the name of the contact entry detail to be changed. If the special value "name" is passed as the key, the contact name will be changed instead.

value a managed string containing the new value of the specified contact entry detail; if NULL is passed, the contact detail will be deleted rather than modified.

Returns:

-1 on failure or 1 on success.

LOW: It would be nice if we didn't call this function each time we updated a contact, but rather we called it when all of the updates have been completed.

LOW: It would be nice if we didn't call this function each time we updated a contact, but rather we called it when all of the updates have been completed.

Definition at line 274 of file contacts.c.

References contact_detail_alloc(), contact_detail_delete(), contact_detail_free(), contact_detail_t, contact_detail_upsert(), contact_name(), contact_update(), contact_update_stamp(), inx_delete(), inx_replace(), log_pedantic, M_TYPE_STRINGER, PLACER, multi_t::st, st_cmp_ci_eq(), st_empty, and multi_t::val.

Referenced by portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), and portal_endpoint_contacts_edit().

5.176.2.11 contact_t* contact_find_detail (contact_folder_t * *folder*, stringer_t * *key*, stringer_t * *target*)

find.c

Note:

This is a bit of a weird function that currently isn't being called from anywhere. It may or may not be here to stay.

Definition at line 13 of file find.c.

References contact_detail_t, contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_find(), M_TYPE_STRINGER, st_cmp_ci_eq(), and st_empty.

5.176.2.12 contact_t* contact_find_name (contact_folder_t * *folder*, stringer_t * *target*)

Get a contact entry by name (case insensitive).

Parameters:

folder a pointer to the contact folder to have its contents searched for the entry.

target a managed string containing the name of the target entry.

Returns:

NULL on failure or a pointer to the found user contact entry on success.

Definition at line 50 of file find.c.

References contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_cmp_ci_eq(), and st_empty.

5.176.2.13 contact_t* contact_find_number (contact_folder_t * *folder*, uint64_t *target*)

Find a contact entry in a contact folder by number.

Parameters:

folder a pointer to a contact folder object containing the contact entries to be searched.

target the numerical id of the contact entry to be located in the specified folder.

Returns:

NULL on failure or a pointer to the found user contact entry on success.

Definition at line 79 of file find.c.

References contact_t, inx_find(), log_pedantic, and M_TYPE_UINT64.

Referenced by portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), and portal_endpoint_contacts_remove().

5.176.2.14 void contact_free (contact_t * *contact*)

Free a contact entry object.

Parameters:

contact a pointer to the contact entry to be freed.

Returns:

This function returns no value.

Definition at line 16 of file contacts.c.

References FOREIGNDATA, inx_cleanup(), mm_free(), st_free(), and st_opt_test().

Referenced by contact_folder_alloc(), contact_move(), contacts_fetch(), portal_endpoint_contacts_add(), and portal_endpoint_contacts_copy().

5.176.2.15 uint64_t contact_insert (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *name*)

Insert a new contact entry into the database.

Parameters:

usernum the numerical id of the user to whom the contact entry belongs.

foldernum the numerical id of the parent folder to contain the contact entry.

name a pointer to a managed string containing the name of the new contact entry.

Returns:

-1 on failure, 0 if no item was inserted into the database, or the id of the newly inserted contact entry in the database on success.

Definition at line 172 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_insert().

Referenced by contact_create().

5.176.2.16 int_t contact_move (contact_folder_t * *source*, contact_folder_t * *target*, contact_t * *contact*, uint64_t *usernum*)

Move a contact entry from one contact to another.

Parameters:

source a pointer to the original parent contact folder object of the contact entry to be moved.

target a pointer to the contact folder object that will become the new parent of the specified contact entry.

contact a pointer to the contact object that is to be moved.

usernum the numerical id of the user to whom the specified contact entry belongs.

Returns:

-1 on error, or 1 if the contact move operation was successful.

Definition at line 229 of file contacts.c.

References contact_alloc(), contact_free(), contact_t, contact_update(), inx_delete(), inx_insert(), log_pedantic, M_TYPE_UINT64, OBJECT_CONTACTS, serial_increment(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_contacts_move().

5.176.2.17 void contact_name (contact_t * *contact*, stringer_t * *name*)

Update the name (in memory) of a contact entry.

Parameters:

contact a pointer to the contact entry object to be updated.

name a managed string containing the new name of the specified contact entry.

Returns:

This function returns no value.

HIGH: A possible segfault is exposed here, related to the contacts.edit camelface call and having to do with the way foreign data is handled.

Definition at line 118 of file contacts.c.

References data, FOREIGNDATA, JOINTED, mm_dupe(), mm_free(), st_data_get(), st_data_set(), st_empty_out(), st_length_set(), st_opt_set(), and st_opt_test().

Referenced by contact_edit().

5.176.2.18 int_t contact_remove (contact_t * *contact*, uint64_t *usernum*, uint64_t *foldernum*)

Remove a contact entry and its associated details from the database.

See also:

contact_delete()

Note:

This function is not currently in use anywhere in the code.

Parameters:

contact a pointer to the contact entry to be deleted from the database.

usernum the numerical id of the user to whom the contact entry belongs.

foldernum the numerical id of the parent folder containing the specified contact entry.

Returns:

1 if the specified contact was deleted successfully, 0 if no matching contact was found in the database, or -1 on general failure.

Definition at line 211 of file contacts.c.

References contact_delete(), and log_pedantic.

5.176.2.19 int_t contact_update (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *cur_folder*, uint64_t *target_folder*, stringer_t * *name*)

Update a user contact entry in the database.

Parameters:

contactnum the numerical id of the contact entry to be modified.

usernum the numerical id of the user to whom the specified contact entry belongs.

cur_folder the numerical id of the parent contact containing the specified contact entry.

target_folder if not 0, sets the new parent contact folder to which the specified contact entry will belong.

name if not NULL, sets the new name of the specified contact entry.

Returns:

-1 on error, 0 if the specified contact entry was not found in the database, or 1 if the contact entry was successfully updated.

Definition at line 106 of file datatier.c.

References ISNULL, log_check, log_pedantic, mm_wipe(), st_char_get(), st_empty, st_length_get(), and stmt_exec_affected().

Referenced by contact_edit(), and contact_move().

5.176.2.20 int_t contact_update_stamp (uint64_t *contactnum*, uint64_t *usernum*, uint64_t *foldernum*)

Touch the last updated time stamp of a contact entry in the database.

Parameters:

contactnum the numerical id of the contact entry to have its time stamp updated.

usernum the numerical id of the user to whom the contact entry belongs.

foldernum the numerical id of the parent folder containing the contact entry.

Returns:

1 if the contact time stamp was updated successfully, 0 if the specified contact was not found, or -1 on general failure.

Definition at line 17 of file datatier.c.

References log_check, log_pedantic, mm_wipe(), and stmt_exec_affected().

Referenced by contact_edit().

5.176.2.21 bool_t contact_validate_detail (stringer_t * *key*, stringer_t * *value*, chr_t ** *errmsg*)

Validate the value of a requested contact entry detail.

Parameters:

key a pointer to a managed string containing the name of the contact detail key to be validated.

value a pointer to a managed string containing the value of the contact detail to be validated.

errmsg if not NULL, the address of a string pointer that will receive a descriptive error message upon validation failure.

Returns:

true if the proposed contact key/value pair was valid, or false if it was not.

Definition at line 373 of file contacts.c.

References chr_printable(), and st_empty_out().

Referenced by portal_endpoint_contacts_add().

5.176.2.22 bool_t contact_validate_name (stringer_t * *name*, chr_t ** *errmsg*)

Validate the name of a requested contact entry name.

Parameters:

name a pointer to a managed string containing the name of the contact to be validated.

errmsg if not NULL, the address of a string pointer that will receive a descriptive error message upon validation failure.

Returns:

true if the proposed contact name was valid, or false if it was not.

Definition at line 338 of file contacts.c.

References chr_printable(), and st_empty_out().

Referenced by portal_endpoint_contacts_add().

5.176.2.23 int_t contacts_fetch (uint64_t *usernum*, contact_folder_t ∗ *folder*)

Retrieve all of a user's contact entries in a specified contacts folder from the database.

Parameters:

usernum the numerical id of the user whose contacts will be retrieved.

folder a pointer to the contact folder which will have its contents listed.

Returns:

-1 on failure or 1 on success.

LOW: Should we bother with error checking?

Definition at line 339 of file datatier.c.

References contact_alloc(), contact_details_fetch(), contact_free(), contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), log_info, log_pedantic, M_TYPE_UINT64, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by contacts_update().

5.176.2.24 inx_t∗ contacts_update (uint64_t *usernum*)

Retrieve all of a user's contacts (and contact folders) from the database.

Parameters:

usernum the numerical id of the user whose contact folders and contact entries should be fetched.

Returns:

NULL on failure, or a pointer to an inx holder containing all of the specified user's contact folders and entries on success.

Definition at line 152 of file contacts.c.

References contacts_fetch(), inx_cleanup(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), log_pedantic, M_FOLDER_CONTACTS, and magma_folder_fetch().

Functions

- contact_t ∗ contact_find_detail (contact_folder_t ∗folder, stringer_t ∗key, stringer_t ∗target)

  find.c

- contact_t ∗ contact_find_name (contact_folder_t ∗folder, stringer_t ∗target)

  Get a contact entry by name (case insensitive).

- contact_t ∗ contact_find_number (contact_folder_t ∗folder, uint64_t target)

  Find a contact entry in a contact folder by number.

5.177.1 Function Documentation

5.177.1.1 contact_t∗ contact_find_detail (contact_folder_t ∗ *folder*, stringer_t ∗ *key*, stringer_t ∗ *target*)

find.c

Note:

This is a bit of a weird function that currently isn't being called from anywhere. It may or may not be here to stay.

Definition at line 13 of file find.c.

References contact_detail_t, contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_find(), M_TYPE_-STRINGER, st_cmp_ci_eq(), and st_empty.

5.177.1.2 contact_t∗ contact_find_name (contact_folder_t ∗ *folder*, stringer_t ∗ *target*)

Get a contact entry by name (case insensitive).

Parameters:

folder a pointer to the contact folder to have its contents searched for the entry.

target a managed string containing the name of the target entry.

Returns:

NULL on failure or a pointer to the found user contact entry on success.

Definition at line 50 of file find.c.

References contact_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_cmp_ci_eq(), and st_empty.

5.177.1.3 contact_t∗ contact_find_number (contact_folder_t ∗ *folder*, uint64_t *target*)

Find a contact entry in a contact folder by number.

Parameters:

folder a pointer to a contact folder object containing the contact entries to be searched.

target the numerical id of the contact entry to be located in the specified folder.

Returns:

NULL on failure or a pointer to the found user contact entry on success.

Definition at line 79 of file find.c.

Functions

- magma_folder_t ∗ magma_folder_find_name (inx_t ∗folders, stringer_t ∗target, uint64_t parent, bool_t check_inbox)

  Get a magma folder by name.

- magma_folder_t ∗ magma_folder_find_full_name (inx_t ∗folders, stringer_t ∗target, bool_t check_inbox)

  Get a magma folder by its fully qualified name.

- magma_folder_t ∗ magma_folder_find_number (inx_t ∗folders, uint64_t target)

  Get a magma folder by number.

5.178.1 Function Documentation

5.178.1.1 magma_folder_t∗ magma_folder_find_full_name (inx_t ∗ *folders*, stringer_t ∗ *target*, bool_t *check_inbox*)

Get a magma folder by its fully qualified name.

See also:

magma_folder_name()

Parameters:

folders an inx holder containing the collection of magma folders to be searched.

target a managed string containing the fully qualified (expanded) name of the magma folder to be found.

Returns:

NULL on failure, or a pointer to the found folder on success.

Definition at line 56 of file find.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), magma_folder_name(), magma_folder_t, PLACER, st_cleanup, st_cmp_ci_eq(), st_cmp_cs_eq(), and st_empty.

5.178.1.2 magma_folder_t∗ magma_folder_find_name (inx_t ∗ *folders*, stringer_t ∗ *target*, uint64_t *parent*, bool_t *check_inbox*)

Get a magma folder by name. find.c

Parameters:

folders an inx holder containing the collection of magma folders to be searched.

target a managed string containing the name of the magma folder to be found.

parent the numerical id of the parent folder in which to search for the specified magma folder.

check_inbox if true, a case-insensitive comparison will be used if the specified folder name is "Inbox".

Returns:

NULL on failure, or a pointer to the found folder on success.

Definition at line 18 of file find.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), magma_folder_t, PLACER, st_cmp_ci_eq(), st_cmp_cs_eq(), and st_empty.

```

Functions

- stringer_t ∗ magma_folder_name (inx_t ∗folders, magma_folder_t ∗target)

  TODO: The assumption is that message folders will start using the interface as well.

- int_t magma_folder_children (inx_t ∗folders, uint64_t target)

  Get the number of child folders a specified folder has.

- void magma_folder_free (magma_folder_t ∗folder)

  Free a magma folder object and its underlying records.

- magma_folder_t ∗ magma_folder_alloc (uint64_t foldernum, uint64_t parent, uint32_t order, stringer_t ∗name)

  Create a new magma folder object.

- bool_t magma_folder_funcs (uint_t type, magma_folder_t ∗(∗∗folder_alloc)(uint64_t, uint64_t, uint32_t, stringer_t ∗), void(∗∗folder_-free)(magma_folder_t ∗))

  Retrieve the appropriate folder management functions for message folders or contact folders.

5.179.1 Function Documentation

5.179.1.1 magma_folder_t∗ magma_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t ∗ *name*)

Create a new magma folder object. folders.c

Parameters:

foldernum the numerical id of this folder.

parent the folder id of this folder's containing parent folder.

order the order number of this folder in its parent folder.

name a managed string with the name of the target folder.

Returns:

NULL on failure or a pointer to the newly allocated magma folder object on success.

Definition at line 103 of file folders.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, magma_folder_t, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, rwlock_init(), st_data_get(), st_length_get(), and STACK.

Referenced by contact_folder_alloc(), and message_folder_alloc().

5.179.1.2 int_t magma_folder_children (inx_t ∗ *folders*, uint64_t *target*)

Get the number of child folders a specified folder has.

Parameters:

folders an inx object holding all of the user's folders.

target the folder number of the target folder.

Returns:

the number of child folders contained by the specified folder, or 0 on failure.

Definition at line 57 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), and magma_folder_t.

Referenced by contact_folder_create(), contact_folder_remove(), message_folder_create(), and message_folder_remove().

5.179.1.3 void magma_folder_free (magma_folder_t ∗ *folder*)

Free a magma folder object and its underlying records.

Returns:

This function returns no value.

Definition at line 84 of file folders.c.

References inx_cleanup(), mm_free(), and rwlock_destroy().

Referenced by contact_folder_free(), and message_folder_free().

5.179.1.4 bool_t magma_folder_funcs (uint_t *type*, magma_folder_t ∗(∗∗)(uint64_t, uint64_t, uint32_t, stringer_t ∗) *folder_alloc*, void(∗∗)(magma_folder_t ∗) *folder_free*)

Retrieve the appropriate folder management functions for message folders or contact folders.

Parameters:

type the magma folder class of the desired management functions (M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

folder_alloc the address of a folder allocation function pointer that will be updated appropriately.

folder_free the address of a folder free function pointer that will be updated appropriately.

Returns:

true on success or false on failure.

Definition at line 136 of file folders.c.

References contact_folder_alloc(), contact_folder_free(), M_FOLDER_CONTACTS, M_FOLDER_MESSAGES, message_folder_alloc(), and message_folder_free().

Referenced by magma_folder_fetch().

5.179.1.5 stringer_t∗ magma_folder_name (inx_t ∗ *folders*, magma_folder_t ∗ *target*)

TODO: The assumption is that message folders will start using the interface as well. Get the fully expanded name of a folder.

Note:

The folder hierarchy will be delimited with a "." character.

Parameters:

folders the inx object holding all of a user's magma folders.

target a pointer to the magma folder object to have its name expanded.

Returns:

NULL on failure or a pointer to a managed string with the fully expanded name of the specified folder.

Definition at line 19 of file folders.c.

References FOLDER_RECURSION_LIMIT, HEAP, JOINTED, log_pedantic, magma_folder_find_number(), MANAGED_T, PLACER, st_-append, st_dupe_opts(), and st_empty.

```

Functions

- meta_stats_tag_t ∗ meta_folder_stats_tag_alloc (stringer_t ∗tag)
  Allocate a new meta tag stat object for tracking message tags.
- inx_t ∗ meta_folders_stats_tags (inx_t ∗messages, uint64_t folder)
  Create a collection of meta tag stats for a set of messages.
- stringer_t ∗ meta_folders_name (inx_t ∗list, meta_folder_t ∗folder)
  Get a folder's fully qualified name.
- meta_folder_t ∗ meta_folders_by_name (inx_t ∗folders, stringer_t ∗name)
  Get a folder by its fully qualified name.
- meta_folder_t ∗ meta_folders_by_number (inx_t ∗folders, uint64_t number)
  Get a folder by number.
- int_t meta_folders_children (inx_t ∗folders, uint64_t number)
  Get the number of direct child folders of a specified parent folder.

5.180.1 Function Documentation

5.180.1.1 meta_stats_tag_t∗ meta_folder_stats_tag_alloc (stringer_t ∗ *tag*)

Allocate a new meta tag stat object for tracking message tags. folders.c

Parameters:

tag a managed string containing the name of the message tag.

Returns:

NULL on failure, or a newly allocated and initialized meta tag stat object on success.

Definition at line 15 of file folders.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), STACK, and meta_stats_tag_t::tag.

Referenced by meta_folders_stats_tags().

5.180.1.2 meta_folder_t∗ meta_folders_by_name (inx_t ∗ *folders*, stringer_t ∗ *name*)

Get a folder by its fully qualified name.

Parameters:

folders a pointer to an inx holder containing a list of folders to be traversed in the search.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 138 of file folders.c.

References CONSTANT, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), meta_folders_name(), st_cmp_ci_eq(), st_cmp_cs_eq(), and st_free().

Referenced by imap_append(), imap_copy(), imap_folder_create(), imap_folder_remove(), imap_folder_rename(), imap_folder_status(), imap_subscribe(), and portal_folder_mail_add().

5.180.1.3 meta_folder_t* meta_folders_by_number (inx_t * *folders*, uint64_t *number*)

Get a folder by number.

Parameters:

folders a pointer to an inx holder containing the folders to be searched.

number the numerical id of the folder to be retrieved.

Returns:

NULL on failure, or a pointer to the found meta folder object of the specified folder on success.

Definition at line 179 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, and inx_cursor_value_next().

Referenced by meta_folders_name(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.180.1.4 int_t meta_folders_children (inx_t * *folders*, uint64_t *number*)

Get the number of direct child folders of a specified parent folder.

Parameters:

folders a pointer to an inx holder containing the the collection of folders to be traversed.

number the folder id of the parent folder to be scanned for children.

Returns:

the number of children folders in the specified parent folder, or 0 on failure.

Definition at line 207 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), and meta_folder_t::parent.

Referenced by imap_folder_remove().

5.180.1.5 stringer_t* meta_folders_name (inx_t * *list*, meta_folder_t * *folder*)

Get a folder's fully qualified name.

Note:

This function will prepend the entire ancestor path of a folder to its name, with each level delimited by periods.

Parameters:

list a pointer to an inx holder containing a list of folders to be searched for parent folders.

folder a pointer to the meta folder object that is the leaf node of the folder path.

Returns:

NULL on failure or a managed string containing the fully qualified folder name on success.

Definition at line 99 of file folders.c.

References FOLDER_RECURSION_LIMIT, log_pedantic, meta_folders_by_number(), meta_folder_t::name, ns_length_get(), meta_folder_t::parent, st_free(), st_import(), and st_merge.

Referenced by imap_folder_name_escaped(), imap_narrow_folders(), meta_folders_by_name(), portal_endpoint_folders_rename(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.180.1.6 inx_t* meta_folders_stats_tags (inx_t * *messages*, uint64_t *folder*)

Create a collection of meta tag stats for a set of messages.

Note:

Each meta tag stat will contain the name of a message tag, along with the number of messages with which it was associated.

Parameters:

messages an inx holder containing the list of messages to be examined.

folder the numerical id of the parent folder that contains all target messages.

Returns:

NULL on failure, or an inx holder containing all of the messages' meta tag stats on success.

LOW: This is a very inefficient method for counting the number of times each tag appears.

Definition at line 40 of file folders.c.

References ar_field_st(), ar_length_get(), meta_stats_tag_t::count, meta_message_t::foldernum, inx_alloc(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_find(), inx_insert(), log_pedantic, M_INX_HASHED, M_TYPE_STRINGER, meta_folder_stats_tag_alloc(), mm_free(), multi_t::st, meta_message_t::tags, and multi_t::val.

Referenced by portal_endpoint_folders_tags().

```

Functions

- stringer_t ∗ imap_folder_name_escaped (inx_t ∗folders, meta_folder_t ∗active)
  Get an imap folder's escaped name.
- uint64_t imap_next_folder_order (inx_t ∗folders, uint64_t parent)
  Get the next order value for an imap folder.
- int_t imap_folder_compare (stringer_t ∗name, stringer_t ∗compare)
- bool_t imap_valid_folder_name (stringer_t ∗name)
  Check to see if a name is a valid imap folder name.
- int_t imap_count_folder_levels (stringer_t ∗name)
  Get the highest node level indicated by an imap folder name.
- int_t imap_folder_create (uint64_t usernum, inx_t ∗folders, stringer_t ∗name)
  Create a new imap folder.
- int_t imap_folder_remove (uint64_t usernum, inx_t ∗folders, inx_t ∗messages, stringer_t ∗name)
  Remove an imap folder, both in memory and on the database.
- int_t imap_folder_rename (uint64_t usernum, inx_t ∗folders, stringer_t ∗original, stringer_t ∗rename)
  Rename an imap folder.
- int_t imap_folder_status (inx_t ∗folders, inx_t ∗messages, stringer_t ∗name, imap_folder_status_t ∗status)
  Get the status of a folder.
- inx_t ∗ imap_narrow_folders (inx_t ∗folders, stringer_t ∗reference, stringer_t ∗mailbox)

5.181.1 Function Documentation

5.181.1.1 int_t imap_count_folder_levels (stringer_t ∗ *name*)

Get the highest node level indicated by an imap folder name. folders.c

Note:

The smallest possible node level value is 1.

Parameters:

name a managed string containing the name of the imap folder.

Returns:

0 on failure, or the number of node levels indicated by the specified imap folder name, on success.

Definition at line 218 of file folders.c.

References IMAP_FOLDER_RECURSION_LMIIT, log_pedantic, and st_empty_out().

Referenced by imap_folder_create(), and imap_folder_rename().

5.181.1.2 int_t imap_folder_compare (stringer_t * *name*, stringer_t * *compare*)

Definition at line 91 of file folders.c.

References PLACER, st_char_get(), st_cmp_ci_eq(), and st_length_get().

Referenced by imap_narrow_folders().

5.181.1.3 int_t imap_folder_create (uint64_t *usernum*, inx_t * *folders*, stringer_t * *name*)

Create a new imap folder.

Note:

If they don't already exist, any parent folders specified in the fully qualified folder name will automatically be created first.

Parameters:

usernum the numerical id of the user to whom the new imap folder will belong.

folders an inx holder containing the set of folders into which the new imap folder will be inserted.

name a managed string containing the fully qualified name of the new imap folder to be created.

Returns:

1 on success or <= 0 on failure. 0: An invalid parameter was passed to the function, or an internal failure occurred. -1: The specified new folder name was invalid. -2: The node depth of the new folder is too large (imap folder recursion limit reached [IMAP_FOLDER_-RECURSION_LMIIT]). -3: Special folder "Inbox" cannot contain subfolders. -4: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks. -5: The specified folder name already exists.

Definition at line 264 of file folders.c.

References CONTIGUOUS, FOLDER_LENGTH_LIMIT, meta_folder_t::foldernum, HEAP, imap_count_folder_levels(), IMAP_-FOLDER_RECURSION_LMIIT, imap_next_folder_order(), imap_valid_folder_name(), inx_insert(), log_pedantic, M_TYPE_UINT64, MANAGED_T, meta_data_insert_folder(), meta_folders_by_name(), mm_alloc(), mm_copy(), mm_free(), meta_folder_t::name, meta_-folder_t::order, meta_folder_t::parent, pl_data_get(), pl_length_get(), PLACER, placer_t, st_cleanup, st_cmp_ci_eq(), st_dupe(), st_dupe_-opts(), st_free(), st_merge, st_replace(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_create(), imap_subscribe(), and portal_folder_mail_add().

5.181.1.4 stringer_t* imap_folder_name_escaped (inx_t * *folders*, meta_folder_t * *active*)

Get an imap folder's escaped name. TODO: Since the Portal needs access to some of these folder manipulation functions the common logic should be extracted and moved into the folder object interface.

Parameters:

folders an inx holder containing the ancestor folders of the specified imap folder.

active a pointer to the meta folder object of the folder to have its name escaped.

Returns:

NULL on failure, or a pointer to a managed string containing the escaped name of the specified imap folder on success.

Definition at line 19 of file folders.c.

References meta_folders_name(), PLACER, st_free(), st_merge, and st_replace().

Referenced by imap_list(), and imap_lsub().

5.181.1.5 int_t imap_folder_remove (uint64_t *usernum*, inx_t * *folders*, inx_t * *messages*, stringer_t * *name*)

Remove an imap folder, both in memory and on the database.

Note:

Any child messages of the specified folder will be deleted, but if it has child folders, the folder will not be deleted. The function also protects the special "Inbox" folder from deletion.

Parameters:

usernum the numerical id of the user that owns the imap folder to be deleted.

folders an inx holder containing a collection of folders for looking up the specified imap folder by name.

messages an inx holder containing a collection of messages for looking up the contents of the specified imap folder.

name a managed string containing the name of the imap folder to be deleted.

Returns:

<= 0 on failure, or 1 on success. 0: General failure or if there was an error removing the folder from the database. -1: The specified folder name was invalid. -2: Removal failed because the "Inbox" folder was specified. -3: The specified folder could not be found.

Definition at line 412 of file folders.c.

References meta_folder_t::foldernum, meta_message_t::foldernum, imap_valid_folder_name(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_delete(), log_error, log_pedantic, M_TYPE_UINT64, mail_remove_message(), meta_message_t::messagenum, meta_data_delete_folder(), meta_folders_by_name(), meta_folders_children(), PLACER, placer_t, meta_message_t::server, meta_message_t::size, st_cmp_ci_eq(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_delete(), and portal_folder_mail_remove().

5.181.1.6 int_t imap_folder_rename (uint64_t *usernum*, inx_t * *folders*, stringer_t * *original*, stringer_t * *rename*)

Rename an imap folder.

Note:

Any parent folder components of the folder's fully qualified name will be created if they do not already exist.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

folders an inx holder containing the folders to be searched for the folder specified to be renamed.

original a managed string containing the original name of the folder to be renamed.

rename a managed string containing the new name of the specified folder.

Returns:

1 on success or 0 or less on failure. 0: One of the parameters passed to the function was invalid, or there was a memory allocation failure. -1: Either the original or new folder name was invalid. -2: Was unable to rename the "Inbox" folder. -3: The specified imap folder did not exist. -4: Either the original or new name exceeded the imap folder recursion limit. -5: A folder already exists with the new folder name. -6: A segment of the folder name was larger than FOLDER_LENGTH_LIMIT (16 bytes).

Definition at line 488 of file folders.c.

References CONTIGUOUS, FOLDER_LENGTH_LIMIT, meta_folder_t::foldernum, HEAP, imap_count_folder_levels(), IMAP_FOLDER_RECURSION_LMIIT, imap_next_folder_order(), imap_valid_folder_name(), inx_insert(), log_error, log_pedantic, M_TYPE_UINT64, MANAGED_T, meta_data_insert_folder(), meta_data_update_folder_name(), meta_folders_by_name(), mm_alloc(), mm_copy(), mm_free(), mm_wipe(), meta_folder_t::name, meta_folder_t::order, meta_folder_t::parent, pl_data_get(), pl_length_get(), PLACER, placer_t, st_cleanup, st_cmp_ci_eq(), st_dupe(), st_dupe_opts(), st_free(), st_merge, st_replace(), tok_get_st(), multi_t::u64, and multi_t::val.

Referenced by imap_rename(), and portal_endpoint_folders_rename().

5.181.1.7 int_t imap_folder_status (inx_t * *folders*, inx_t * *messages*, stringer_t * *name*, imap_folder_status_t * *status*)

Get the status of a folder.

Note:

This function will count the number of messages in a folder, as well as the number of messages marked recent or unseen, as well as the numerical id of the first message in the folder and the UIDNEXT of the specified folder.

Parameters:

folders an inx holder containing a list of folders to be searched for the specified folder.

messages an inx holder containing a complete list of a user's messages to be examined for gathering statistics.

name a managed string containing the name of the imap folder to be queried.

status a pointer to an imap folder status object to receive the folder's status information.

Returns:

1 on success or <= 0 on failure. 0: General failure. -1: The specified folder name was invalid. -2: The folder did not exist.

Definition at line 678 of file folders.c.

References imap_folder_status_t::first, meta_message_t::foldernum, meta_folder_t::foldernum, imap_folder_status_t::foldernum, imap_valid_folder_name(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, MAIL_STATUS_RECENT, MAIL_STATUS_SEEN, meta_message_t::messagenum, imap_folder_status_t::messages, meta_folders_by_name(), mm_wipe(), imap_folder_status_t::recent, meta_message_t::status, imap_folder_status_t::uidnext, and imap_folder_status_t::unseen.

Referenced by imap_examine(), imap_select(), and imap_status().

Definition at line 743 of file folders.c.

References meta_folder_t::foldernum, imap_folder_compare(), inx_alloc(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_UINT64, meta_folders_name(), mm_dupe(), mm_free(), st_free(), st_length_get(), st_merge, multi_t::u64, and multi_t::val.

Referenced by imap_list(), and imap_lsub().

5.181.1.9 uint64_t imap_next_folder_order (inx_t * *folders*, uint64_t *parent*)

Get the next order value for an imap folder.

Note:

The next order value is the current highest order value of any child folder in the specified directory, incremented by one.

Parameters:

folder an inx holder containing the collection of imap folders to be scanned.

parent the numerical id of the folder to be queried.

Returns:

0 on failure, or the next order value of the specified folder on success.

Definition at line 67 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), meta_folder_t::order, and meta_folder_t::parent.

Referenced by imap_folder_create(), and imap_folder_rename().

5.181.1.10 bool_t imap_valid_folder_name (stringer_t * *name*)

Check to see if a name is a valid imap folder name.

Note:

The following naming checks are enforced: 1. The name can't be empty or begin with a period. 2. It cannot contain a non-printable character. 3. Trailing periods will be removed. 4. The folder name cannot contain consecutive periods.

Parameters:

name a managed string containing the imap folder name to be validated.

Returns:

true on success or false on failure.

Definition at line 157 of file folders.c.

References log_pedantic, st_empty_out(), st_length_get(), and st_length_set().

```

Functions

- void portal_folder_mail_add (connection_t *con, stringer_t *name, uint64_t parent)
  Add a new mail folder for a user.
- void portal_folder_contacts_add (connection_t *con, stringer_t *name, uint64_t parent)
  Add a new contact folder for a user.
- void portal_folder_mail_remove (connection_t *con, uint64_t foldernum)
  Remove a user's mail folder.
- void portal_folder_contacts_remove (connection_t *con, uint64_t foldernum)
  Remove a user's contacts folder.

5.182.1 Function Documentation

5.182.1.1 void portal_folder_contacts_add (connection_t * *con*, stringer_t * *name*, uint64_t *parent*)

Add a new contact folder for a user. folders.c

Note:

If parent is 0, then the new folder is assumed to be a root folder. This function returns no value, but returns the appropriate portal json-rpc response directly.

Parameters:

con a pointer to the connection object across which the add folder response will be sent.

name a managed string containing the name of the new folder.

parent the numerical id of the folder that will be the parent of the new folder (or 0 to specify a root folder).

Returns:

This function returns no value.

Definition at line 82 of file folders.c.

References contact_folder_create(), connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, magma_folder_find_name(), magma_folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_-ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), sess_serial_check(), and st_cleanup.

Referenced by portal_endpoint_folders_add().

5.182.1.2 void portal_folder_contacts_remove (connection_t * *con*, uint64_t *foldernum*)

Remove a user's contacts folder.

Parameters:

con a pointer to the connection object across which the remove folder response will be sent.

foldernum the numerical id of the contacts folder that will be removed.

Returns:

This function returns no value.

Definition at line 201 of file folders.c.

References contact_folder_remove(), connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, magma_folder_find_-number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_-CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_FOLDERS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), and sess_serial_check().

Referenced by portal_endpoint_folders_remove().

5.182.1.3 void portal_folder_mail_add (connection_t ∗ *con*, stringer_t ∗ *name*, uint64_t *parent*)

Add a new mail folder for a user.

Note:

If parent is 0, then the new folder is assumed to be a root folder. This function returns no value, but returns the appropriate portal json-rpc response directly.

Parameters:

con a pointer to the connection object across which the add folder response will be sent.

name a managed string containing the name of the new folder.

parent the numerical id of the folder that will be the parent of the new folder (or 0 to specify a root folder).

Returns:

This function returns no value.

Definition at line 20 of file folders.c.

References meta_folder_t::foldernum, connection_t::http, imap_folder_create(), JSON_RPC_2_ERROR_SERVER_INTERNAL, meta_-folders_by_name(), meta_folders_by_number(), meta_folders_name(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_-endpoint_response(), sess_serial_check(), st_cleanup, and st_merge.

Referenced by portal_endpoint_folders_add().

5.182.1.4 void portal_folder_mail_remove (connection_t ∗ *con*, uint64_t *foldernum*)

Remove a user's mail folder.

Parameters:

con a pointer to the connection object across which the remove folder response will be sent.

foldernum the numerical id of the mail folder that will be removed.

Returns:

This function returns no value.

Definition at line 148 of file folders.c.

References connection_t::http, imap_folder_remove(), JSON_RPC_2_ERROR_SERVER_INTERNAL, meta_folders_by_number(), meta_folders_name(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_FOLDERS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), sess_serial_check(), and st_cleanup.

  Create a new contact folder.

- void contact_folder_free (contact_folder_t ∗folder)

  Free a contact folder object.

- int_t contact_folder_remove (uint64_t usernum, uint64_t foldernum, inx_t ∗folders)

  Remove a user's contact folder.

- bool_t contact_folder_rename (uint64_t usernum, uint64_t foldernum, stringer_t ∗rename, inx_t ∗folders)

  Rename a user's contact folder.

- bool_t magma_folder_delete (uint64_t usernum, uint64_t foldernum, uint_t type)

  datatier.c

- inx_t ∗ magma_folder_fetch (uint64_t usernum, uint_t type)

  Fetch all of a user's folders of a specified type from the database.

- uint64_t magma_folder_insert (uint64_t usernum, stringer_t ∗name, uint64_t parent, uint32_t order, uint_t type)

  Insert a new folder into the database.

- bool_t magma_folder_rename (uint64_t usernum, uint64_t foldernum, uint_t type, stringer_t *rename)
  Rename a folder in the database.
- magma_folder_t * magma_folder_find_name (inx_t *folders, stringer_t *target, uint64_t parent, bool_t check_inbox)
  find.c
- magma_folder_t * magma_folder_find_full_name (inx_t *folders, stringer_t *target, bool_t check_inbox)
  Get a magma folder by its fully qualified name.
- magma_folder_t * magma_folder_find_number (inx_t *folders, uint64_t target)
  Get a magma folder by number.
- magma_folder_t * magma_folder_alloc (uint64_t foldernum, uint64_t parent, uint32_t order, stringer_t *name)
  folders.c
- int_t magma_folder_children (inx_t *folders, uint64_t target)
  Get the number of child folders a specified folder has.
- void magma_folder_free (magma_folder_t *folder)
  Free a magma folder object and its underlying records.
- bool_t magma_folder_funcs (uint_t type, magma_folder_t *(**folder_alloc)(uint64_t, uint64_t, uint32_t, stringer_t *), void(**folder_-free)(magma_folder_t *))
  Retrieve the appropriate folder management functions for message folders or contact folders.
- stringer_t * magma_folder_name (inx_t *folders, magma_folder_t *target)
  TODO: The assumption is that message folders will start using the interface as well.

Variables

- magma_folder_t

5.183.1 Define Documentation

5.183.1.1 #define FOLDER_LENGTH_LIMIT 16

Definition at line 11 of file folders.h.

Referenced by contact_folder_create(), contact_folder_rename(), imap_create(), imap_folder_create(), imap_folder_rename(), imap_-rename(), and imap_subscribe().

5.183.1.2 #define FOLDER_RECURSION_LIMIT 16

Definition at line 12 of file folders.h.

Referenced by magma_folder_name(), and meta_folders_name().

5.183.2 Typedef Documentation

5.183.2.1 typedef magma_folder_t contact_folder_t

Definition at line 30 of file folders.h.

5.183.2.2 typedef magma_folder_t message_folder_t

Definition at line 31 of file folders.h.

5.183.3 Enumeration Type Documentation

5.183.3.1 anonymous enum

Enumerator:

M_FOLDER_MESSAGES M_FOLDER_MESSAGES.

M_FOLDER_CONTACTS M_FOLDER_CONTACTS.

Definition at line 17 of file folders.h.

5.183.4 Function Documentation

5.183.4.1 struct __attribute__ ((packed)) `[read]`

Definition at line 22 of file folders.h.

References lock.

5.183.4.2 contact_folder_t* contact_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t * *name*)

contacts.c contacts.c

Parameters:

foldernum the numerical id of this contact folder.

parent the numerical id of the parent folder of this contact folder.

order the order number of this folder in its parent folder.

name a managed string containing the name of this folder.

Returns:

NULL on failure, or a pointer to the newly initialized contact folder object on success.

Definition at line 29 of file contacts.c.

References contact_free(), inx_alloc(), M_INX_TREE, magma_folder_alloc(), and mm_cleanup.

Referenced by contact_folder_create(), and magma_folder_funcs().

5.183.4.3 int_t contact_folder_create (uint64_t *usernum*, uint64_t *parent*, stringer_t * *name*, inx_t * *folders*)

Create a new contact folder.

Parameters:

usernum the numerical id of the user to whom the new imap folder will belong.

parent the numerical id of the parent folder to contain the new contact folder, or 0 for a root folder.

name a managed string containing the fully qualified name of the new contact folder to be created.

folders an inx holder containing the set of folders into which the new contact folder will be inserted.

Returns:

1 on success or <= 0 on failure. 0: An invalid parameter was passed to the function, or an internal failure occurred. -1: The specified new folder name was invalid. -2: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks. -3: The specified folder name already exists. -4: An invalid parent folder was specified. -5: Part of the folder path name exceeds 16 characters (FOLDER_LENGTH_LIMIT) after being unescaped for quotation marks.

Definition at line 55 of file contacts.c.

References contact_folder_alloc(), contact_folder_free(), FOLDER_LENGTH_LIMIT, IMAP_FOLDER_RECURSION_LMIIT, imap_valid_folder_name(), inx_insert(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_UINT64, magma_folder_children(), magma_folder_find_name(), magma_folder_find_number(), magma_folder_insert(), magma_folder_t, st_empty, st_length_get(), multi_t::u64, and multi_t::val.

Referenced by portal_folder_contacts_add().

5.183.4.4 void contact_folder_free (contact_folder_t ∗ *folder*)

Free a contact folder object.

Parameters:

folder a pointer to the contact folder object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file contacts.c.

References magma_folder_free().

Referenced by contact_folder_create(), and magma_folder_funcs().

5.183.4.5 int_t contact_folder_remove (uint64_t *usernum*, uint64_t *foldernum*, inx_t ∗ *folders*)

Remove a user's contact folder.

See also:

magma_folder_delete()

Note:

This operation will only succeed if the specified contact folder is empty.

Parameters:

usernum the numerical id of the user requesting the contact folder removal.

foldernum the numerical id of the folder to be removed.

folders an inx holder containing the contact folders to be searched for the folder specified for removal.

Returns:

0 on success or < 0 on failure. -1: There was an unexpected internal error. -2: The specified folder could not be found. -3: Contact folder was not empty.

Definition at line 121 of file contacts.c.

References inx_count(), inx_delete(), inx_find(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_UINT64, magma_folder_children(), and magma_folder_delete().

Referenced by portal_folder_contacts_remove().

5.183.4.6 bool_t contact_folder_rename (uint64_t *usernum*, uint64_t *foldernum*, stringer_t * *rename*, inx_t * *folders*)

Rename a user's contact folder.

See also:

magma_folder_rename()

Parameters:

usernum the numerical id of the user requesting the contact folder renaming.

foldernum the numerical id of the folder to be renamed.

rename a managed string containing the new name of the specified folder.

folders an inx holder containing the contact folders to be searched for the folder specified to be renamed.

Returns:

true on success or false on failure.

Definition at line 161 of file contacts.c.

References FOLDER_LENGTH_LIMIT, imap_valid_folder_name(), inx_find(), log_pedantic, M_FOLDER_CONTACTS, M_TYPE_-UINT64, magma_folder_find_name(), magma_folder_rename(), st_dupe(), st_empty, st_free(), and st_length_get().

Referenced by portal_endpoint_folders_rename().

5.183.4.7 magma_folder_t* magma_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t * *name*)

folders.c folders.c

Parameters:

foldernum the numerical id of this folder.

parent the folder id of this folder's containing parent folder.

order the order number of this folder in its parent folder.

name a managed string with the name of the target folder.

Returns:

NULL on failure or a pointer to the newly allocated magma folder object on success.

Definition at line 103 of file folders.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, magma_folder_t, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, rwlock_init(), st_data_get(), st_length_get(), and STACK.

Referenced by contact_folder_alloc(), and message_folder_alloc().

5.183.4.8 int_t magma_folder_children (inx_t * *folders*, uint64_t *target*)

Get the number of child folders a specified folder has.

Parameters:

folders an inx object holding all of the user's folders.

target the folder number of the target folder.

Returns:

the number of child folders contained by the specified folder, or 0 on failure.

Definition at line 57 of file folders.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), and magma_folder_t.

Referenced by contact_folder_create(), contact_folder_remove(), message_folder_create(), and message_folder_remove().

5.183.4.9 bool_t magma_folder_delete (uint64_t *usernum*, uint64_t *foldernum*, uint_t *type*)

datatier.c datatier.c

Parameters:

usernum the numerical id of the user requesting the folder removal.

foldernum the numerical id of the folder to be removed.

type the type of the folder to be deleted (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

true on success or false on failure.

Definition at line 136 of file datatier.c.

References mm_wipe(), and stmt_exec_affected().

Referenced by contact_folder_remove(), and message_folder_remove().

5.183.4.10 inx_t* magma_folder_fetch (uint64_t *usernum*, uint_t *type*)

Fetch all of a user's folders of a specified type from the database.

Parameters:

usernum the numerical id of the requested user.

type the folder class of the folders to be retrieved (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

NULL on failure, or an inx object holding all of the requested folders on success.

Definition at line 16 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_info, log_pedantic, M_INX_TREE, M_TYPE_UINT64, magma_folder_funcs(), magma_folder_t, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by contacts_update(), and messages_update().

5.183.4.11 magma_folder_t* magma_folder_find_full_name (inx_t * *folders*, stringer_t * *target*, bool_t *check_inbox*)

Get a magma folder by its fully qualified name.

See also:

magma_folder_name()

Parameters:

folders an inx holder containing the collection of magma folders to be searched.

target a managed string containing the fully qualified (expanded) name of the magma folder to be found.

Returns:

NULL on failure, or a pointer to the found folder on success.

Definition at line 56 of file find.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), magma_folder_name(), magma_folder_t, PLACER, st_cleanup, st_cmp_ci_eq(), st_cmp_cs_eq(), and st_empty.

5.183.4.12 magma_folder_t* magma_folder_find_name (inx_t * *folders*, stringer_t * *target*, uint64_t *parent*, bool_t *check_inbox*)

find.c find.c

Parameters:

folders an inx holder containing the collection of magma folders to be searched.

target a managed string containing the name of the magma folder to be found.

parent the numerical id of the parent folder in which to search for the specified magma folder.

check_inbox if true, a case-insensitive comparison will be used if the specified folder name is "Inbox".

Returns:

NULL on failure, or a pointer to the found folder on success.

Definition at line 18 of file find.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), magma_folder_t, PLACER, st_cmp_ci_eq(), st_cmp_cs_eq(), and st_empty.

Referenced by contact_folder_create(), contact_folder_rename(), and portal_folder_contacts_add().

5.183.4.13 magma_folder_t* magma_folder_find_number (inx_t * *folders*, uint64_t *target*)

Get a magma folder by number.

Parameters:

folders an inx holder containing the collection of magma folders to be searched.

target the numerical id of the magma folder to be found.

Returns:

NULL on failure, or a pointer to the found folder on success.

Definition at line 95 of file find.c.

References inx_find(), and M_TYPE_UINT64.

Referenced by contact_folder_create(), magma_folder_name(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_list(), portal_endpoint_contacts_load(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_folder_contacts_add(), and portal_folder_contacts_remove().

5.183.4.14 void magma_folder_free (magma_folder_t * *folder*)

Free a magma folder object and its underlying records.

Returns:

This function returns no value.

Definition at line 84 of file folders.c.

References inx_cleanup(), mm_free(), and rwlock_destroy().

Referenced by contact_folder_free(), and message_folder_free().

5.183.4.15 bool_t magma_folder_funcs (uint_t *type*, magma_folder_t *(**)(uint64_t, uint64_t, uint32_t, stringer_t *) *folder_alloc*, void(**)(magma_folder_t *) *folder_free*)

Retrieve the appropriate folder management functions for message folders or contact folders.

Parameters:

type the magma folder class of the desired management functions (M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

folder_alloc the address of a folder allocation function pointer that will be updated appropriately.

folder_free the address of a folder free function pointer that will be updated appropriately.

Returns:

true on success or false on failure.

Definition at line 136 of file folders.c.

References contact_folder_alloc(), contact_folder_free(), M_FOLDER_CONTACTS, M_FOLDER_MESSAGES, message_folder_alloc(), and message_folder_free().

Referenced by magma_folder_fetch().

5.183.4.16 uint64_t magma_folder_insert (uint64_t *usernum*, stringer_t * *name*, uint64_t *parent*, uint32_t *order*, uint_t *type*)

Insert a new folder into the database.

Parameters:

usernum the numerical id of the user to whom the new folder belongs.

name a managed string containing the name of the new folder.

parent the numerical id of the mail folder to be the parent of the new mail folder.

order the order number of this folder in its parent folder.

type the type of the new folder (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

Returns:

0 on failure, or the numerical id of the newly inserted folder in the database on success.

Definition at line 91 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_insert().

Referenced by contact_folder_create(), and message_folder_create().

5.183.4.17 stringer_t* magma_folder_name (inx_t * *folders*, magma_folder_t * *target*)

TODO: The assumption is that message folders will start using the interface as well. Get the fully expanded name of a folder.

Note:

The folder hierarchy will be delimited with a "." character.

Parameters:

folders the inx object holding all of a user's magma folders.

target a pointer to the magma folder object to have its name expanded.

Returns:

NULL on failure or a pointer to a managed string with the fully expanded name of the specified folder.

Definition at line 19 of file folders.c.

References FOLDER_RECURSION_LIMIT, HEAP, JOINTED, log_pedantic, magma_folder_find_number(), MANAGED_T, PLACER, st_-append, st_dupe_opts(), and st_empty.

Referenced by imap_list(), magma_folder_find_full_name(), and portal_endpoint_folders_rename().

5.183.4.18 bool_t magma_folder_rename (uint64_t *usernum*, uint64_t *foldernum*, uint_t *type*, stringer_t ∗ *rename*)

Rename a folder in the database.

Parameters:

usernum the numerical id of the user requesting the folder renaming.

foldernum the numerical id of the folder to be renamed.

type the type of the folder to be renamed (can be M_FOLDER_MESSAGES or M_FOLDER_CONTACTS).

rename a managed string containing the new name of the specified folder.

Returns:

true on success or false on failure.

Definition at line 176 of file datatier.c.

References mm_wipe(), st_char_get(), st_length_get(), and stmt_exec_affected().

Referenced by contact_folder_rename().

5.183.4.19 message_folder_t∗ message_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t ∗ *name*)

messages.c messages.c

Parameters:

foldernum the numerical id of the new message folder.

parent the numerical id of the parent folder containing the target message folder.

order the order number of this folder in its parent folder.

name a managed string containing the name of the new message folder.

Returns:

NULL on failure or a pointer to the newly allocated and initialized message folder object on success.

Definition at line 28 of file messages.c.

References inx_alloc(), M_INX_TREE, magma_folder_alloc(), message_free(), and mm_cleanup.

Referenced by magma_folder_funcs(), and message_folder_create().

5.183.4.20 int_t message_folder_create (uint64_t *usernum*, uint64_t *parent*, stringer_t * *name*, inx_t * *folders*)

TODO: Add validation: check whether the parent exists, and enforce the length and depth limits. Also make sure the name doesn't conflict with any built in folder names. Finally, setup a list of error codes and return the appropriate value.

Note:

This function isn't called from anywhere else at the moment.

Definition at line 45 of file messages.c.

References inx_insert(), log_pedantic, M_FOLDER_MESSAGES, M_TYPE_UINT64, magma_folder_children(), magma_folder_insert(), message_folder_alloc(), message_folder_free(), st_empty, multi_t::u64, and multi_t::val.

5.183.4.21 void message_folder_free (message_folder_t * *folder*)

Free a message folder object.

Returns:

This function returns no value.

Definition at line 14 of file messages.c.

References magma_folder_free().

Referenced by magma_folder_funcs(), and message_folder_create().

5.183.4.22 bool_t message_folder_remove (uint64_t *usernum*, uint64_t *foldernum*, inx_t * *folders*)

Remove a user's message folder.

See also:

magma_folder_delete()

Note:

This operation will only succeed if the specified message folder is empty.

Parameters:

usernum the numerical id of the user requesting the message folder removal.

foldernum the numerical id of the folder to be removed.

folders an inx holder containing the message folders to be searched for the folder specified for removal.

Returns:

true on success or false on failure.

Definition at line 81 of file messages.c.

References inx_count(), inx_delete(), inx_find(), log_pedantic, M_FOLDER_MESSAGES, M_TYPE_UINT64, magma_folder_children(), and magma_folder_delete().

5.183.5 Variable Documentation

5.183.5.1 magma_folder_t

Definition at line 28 of file folders.h.

Referenced by contact_folder_create(), magma_folder_alloc(), magma_folder_children(), magma_folder_fetch(), magma_folder_find_full_-name(), magma_folder_find_name(), portal_endpoint_folders_list(), and portal_endpoint_folders_rename().

```
#include "magma.h"
```

Functions

- void message_folder_free (message_folder_t *folder)

  Free a message folder object.

- message_folder_t * message_folder_alloc (uint64_t foldernum, uint64_t parent, uint32_t order, stringer_t *name)

  Create and initialize a new message folder object.

- int_t message_folder_create (uint64_t usernum, uint64_t parent, stringer_t *name, inx_t *folders)
- bool_t message_folder_remove (uint64_t usernum, uint64_t foldernum, inx_t *folders)

  Remove a user's message folder.

5.184.1 Function Documentation

5.184.1.1 message_folder_t* message_folder_alloc (uint64_t *foldernum*, uint64_t *parent*, uint32_t *order*, stringer_t * *name*)

Create and initialize a new message folder object. messages.c

Parameters:

foldernum the numerical id of the new message folder.

parent the numerical id of the parent folder containing the target message folder.

order the order number of this folder in its parent folder.

name a managed string containing the name of the new message folder.

Returns:

NULL on failure or a pointer to the newly allocated and initialized message folder object on success.

Definition at line 28 of file messages.c.

References inx_alloc(), M_INX_TREE, magma_folder_alloc(), message_free(), and mm_cleanup.

Referenced by magma_folder_funcs(), and message_folder_create().

5.184.1.2 int_t message_folder_create (uint64_t *usernum*, uint64_t *parent*, stringer_t * *name*, inx_t * *folders*)

TODO: Add validation: check whether the parent exists, and enforce the length and depth limits. Also make sure the name doesn't conflict with any built in folder names. Finally, setup a list of error codes and return the appropriate value.

Note:

This function isn't called from anywhere else at the moment.

5.184.1.3 void message_folder_free (message_folder_t * *folder*)

Free a message folder object.

Returns:

This function returns no value.

Definition at line 14 of file messages.c.

References magma_folder_free().

Referenced by magma_folder_funcs(), and message_folder_create().

5.184.1.4 bool_t message_folder_remove (uint64_t *usernum*, uint64_t *foldernum*, inx_t * *folders*)

Remove a user's message folder.

See also:

magma_folder_delete()

Note:

This operation will only succeed if the specified message folder is empty.

Parameters:

usernum the numerical id of the user requesting the message folder removal.

foldernum the numerical id of the folder to be removed.

folders an inx holder containing the message folders to be searched for the folder specified for removal.

Returns:

true on success or false on failure.

Definition at line 81 of file messages.c.

References inx_count(), inx_delete(), inx_find(), log_pedantic, M_FOLDER_MESSAGES, M_TYPE_UINT64, magma_folder_children(), and magma_folder_delete().

```
#include "magma.h"
```

Functions

- void message_free (message_t *message)

  Free a message object and its underlying data.

- message_t * message_alloc (uint64_t messagenum, uint64_t created, uint64_t signature, uint64_t key, uint64_t flags, stringer_t *server, size_t size)

  Allocate a new message object.

- inx_t * messages_update (uint64_t usernum)

  Fetch all of a user's message folders and their child messages from the database.

5.185.1 Function Documentation

5.185.1.1 message_t* message_alloc (uint64_t *messagenum*, uint64_t *created*, uint64_t *signature*, uint64_t *key*, uint64_t *flags*, stringer_t * *server*, size_t *size*)

Allocate a new message object. messages.c

Parameters:

messagenum the numerical message id of the new message.

created the message creation timestamp.

signature the message's spam filter signature number.

key the message's spam filter access key.

flags the message's flags value.

server a managed string containing the name of the server where the message will be stored.

size the size, in bytes, of the raw message data.

Returns:

NULL on failure, or the newly allocated message object on success.

Definition at line 60 of file messages.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, message_t, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, rwlock_init(), st_data_get(), st_length_get(), and STACK.

Referenced by meta_data_fetch_folder_messages().

5.185.1.2 void message_free (message_t * *message*)

Free a message object and its underlying data.

Returns:

This function returns no value.

Definition at line 39 of file messages.c.

References mm_cleanup, rwlock_destroy(), and st_cleanup.

Referenced by message_folder_alloc(), and meta_data_fetch_folder_messages().

5.185.1.3 inx_t* messages_update (uint64_t *usernum*)

Fetch all of a user's message folders and their child messages from the database.

Parameters:

usernum the numerical id of the target user.

Returns:

NULL on failure or an inx object holding all the retrieved and populated message folder objects on success.

Definition at line 96 of file messages.c.

References inx_cleanup(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), log_pedantic, M_FOLDER_MESSAGES, magma_folder_fetch(), and meta_data_fetch_folder_messages().

5.189 src/objects/locks.c File Reference

```
#include "magma.h"
```

Defines

- #define MAGMA_LOCK_TIMEOUT 60
- #define MAGMA_LOCK_EXPIRATION 600

Functions

- int_t lock_get (stringer_t *key)

  Acquire a named lock, with synchronization provided via memcached.

- void lock_release (stringer_t *key)

  Release a named lock, with synchronization provided via memcached.

- int_t user_lock (uint64_t usernum)

  Acquire a lock in the magma.user keyspace.

- void user_unlock (uint64_t usernum)

  Unlock a lock in the magma.user keyspace.

5.189.1 Define Documentation

5.189.1.1 #define MAGMA_LOCK_EXPIRATION 600

Definition at line 11 of file locks.c.

Referenced by lock_get().

5.189.1.2 #define MAGMA_LOCK_TIMEOUT 60

Definition at line 10 of file locks.c.

Referenced by lock_get().

5.189.2 Function Documentation

5.189.2.1 int_t lock_get (stringer_t * *key*)

Acquire a named lock, with synchronization provided via memcached. locks.c

See also:

cache_silent_add()

Note:

The lock will be held for a maximum of 10 minutes, and failed locking attempts will be retried periodically for a maxmimum of 1 minute before returing failure.

Parameters:

key a managed string containing the name of the lock to be acquired.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

Definition at line 21 of file locks.c.

References cache_silent_add(), lock, log_pedantic, MAGMA_LOCK_EXPIRATION, MAGMA_LOCK_TIMEOUT, MANAGEDBUF, PLACER, st_char_get(), st_empty, st_length_int(), and st_sprint().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_reply(), and user_lock().

5.189.2.2 void lock_release (stringer_t ∗ *key*)

Release a named lock, with synchronization provided via memcached.

See also:

cache_delete()

Note:

The lock will be held for 10 seconds, and locking attempts will occur periodically for 60 seconds prior to failure.

Parameters:

key a managed string containing the name of the lock to be released.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

LOW: At some point we should add logic to check whether this cluster node even owns the lock before blindly deleting the lock.

Definition at line 61 of file locks.c.

References cache_delete(), lock, log_pedantic, MANAGEDBUF, st_char_get(), st_empty, st_length_int(), and st_sprint().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_reply(), and user_unlock().

5.189.2.3 int_t user_lock (uint64_t *usernum*)

Acquire a lock in the magma.user keyspace.

Parameters:

usernum the numerical id of the user for whom the lock will be acquired.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

Definition at line 82 of file locks.c.

References lock_get(), MANAGEDBUF, and st_sprint().

Referenced by imap_close(), imap_copy(), imap_expunge(), smtp_rollout(), and smtp_store_message().

5.189.2.4 void user_unlock (uint64_t *usernum*)

Unlock a lock in the magma.user keyspace.

Parameters:

usernum the numerical id of the user for whom the lock will be unlocked.

Returns:

This function returns no value.

Definition at line 98 of file locks.c.

References lock_release(), MANAGEDBUF, and st_sprint().

Referenced by imap_close(), imap_copy(), imap_expunge(), smtp_rollout(), and smtp_store_message().

5.190 src/objects/mail/cleanup.c File Reference

```
#include "magma.h"
```

Functions

- void mail_destroy_header (stringer_t *header)

  Destroy a mail header.

- bool_t mail_message_cleanup (stringer_t **message)

  Clean up the body of a message read in via smtp, enforcing magma.smtp.wrap_line_length.

5.190.1 Function Documentation

5.190.1.1 void mail_destroy_header (stringer_t * *header*)

Destroy a mail header. cleanup.c

Parameters:

header a managed string containing the mail header to be freed.

Returns:

This function returns nov alue.

Definition at line 15 of file cleanup.c.

References st_cleanup.

Referenced by imap_fetch_body(), imap_fetch_message(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_-text(), and imap_search_messages().

5.190.1.2 bool_t mail_message_cleanup (stringer_t ** *message*)

Clean up the body of a message read in via smtp, enforcing magma.smtp.wrap_line_length.

Note:

This function fixes broken line separators by making sure each is followed by
and vice versa. All Return-Path: header lines are also removed. New lines are begun whenever the current length of any line reaches the configuration value set in magma.smtp.wrap_line_length. The trailing dot at the end of the smtp DATA command is also stripped.
If the original message ends with , it will have
appended to it.

Parameters:

message a pointer to a managed string that contains the message input, and will also store the cleaned output on success.

Returns:

true on success or false on failure.

LOW: Splitting lines, particularly headers causes more problems then it fixes, so this code is currently disabled. At some point we should survey other mail systems and see how they handle long lines.

Definition at line 31 of file cleanup.c.

References HEAP, JOINTED, length, log_pedantic, magma, MAPPED_T, mm_cmp_ci_eq(), magma_t::smtp, st_alloc_opts(), st_char_get(), st_free(), st_length_get(), st_length_set(), and magma_t::wrap_line_length.

5.191 src/objects/mail/counters.c File Reference

```
#include "magma.h"
```

Functions

- uint32_t mail_count_received (stringer_t *message)
  Count the number of "Received:" lines in a mail message.
- size_t mail_header_end (stringer_t *message)
  Get the number of bytes taken up by a mail header.

5.191.1 Function Documentation

5.191.1.1 uint32_t mail_count_received (stringer_t * *message*)

Count the number of "Received:" lines in a mail message. counters.c

Parameters:

message a managed string containing the mail message to be scanned.

Returns:

the number of matching lines found, or 0 on failure.

Definition at line 15 of file counters.c.

References log_pedantic, PLACER, st_cmp_ci_starts(), and st_empty_out().

Referenced by smtp_data().

5.191.1.2 size_t mail_header_end (stringer_t * *message*)

Get the number of bytes taken up by a mail header.

Parameters:

message a managed string containing the full smtp mail message.

Returns:

0 on failure, or the number of bytes occupied by the mail header.

Definition at line 56 of file counters.c.

References length, log_pedantic, st_char_get(), and st_length_get().

Referenced by mail_add_forward_headers(), mail_add_outbound_headers(), mail_add_required_headers(), mail_create_message(), mail_-headers(), mail_message(), mail_mod_subject(), naked_message_set(), and smtp_check_filters().

```
#include "magma.h"
```

Functions

- int stamp_counter_check (char ∗key, size_t keylen, unsigned long interval)
- void stamp_counter_increment (char ∗key, size_t keylen)

5.192.1 Function Documentation

5.192.1.1 int stamp_counter_check (char ∗ *key*, size_t *keylen*, unsigned long *interval*)

Definition at line 10 of file counters.c.

References cache_get(), count, length, log_pedantic, PLACER, placer_t, st_free(), tok_get_count_st(), tok_get_st(), and uint64_conv_pl().

5.192.1.2 void stamp_counter_increment (char ∗ *key*, size_t *keylen*)

Definition at line 41 of file counters.c.

References cache_append(), log_pedantic, and PLACER.

5.193 src/objects/mail/headers.c File Reference

```
#include "magma.h"
```

Functions

- stringer_t ∗ mail_header_fetch_cleaned (stringer_t ∗header, stringer_t ∗key)
  Fetch the value of a specified line from a mail header, performing whitespace and line cleaning.
- stringer_t ∗ mail_header_fetch_all (stringer_t ∗header, stringer_t ∗key)
  Get all the values that match a named header line in a message header.
- placer_t mail_header_pop (stringer_t ∗header, size_t ∗position)
  Pop the next header line from a mail message header.
- placer_t mail_store_header (chr_t ∗stream, size_t length)
  Return a placer pointing to the trimmed value of a mail header.
- bool_t mail_headers (smtp_message_t ∗message)
  Parse an smtp message header and store the To, From, Date, and Subject header values.
- void mail_mod_subject (stringer_t ∗∗message, chr_t ∗label)
  Prepend text to a Subject header line inside of a mail message.
- bool_t mail_add_required_headers (connection_t ∗con, smtp_message_t ∗message)
  Generate any missing required headers for an smtp message object.
- stringer_t ∗ mail_add_inbound_headers (connection_t ∗con, smtp_inbound_prefs_t ∗prefs)
  Prepend the Return-Path: and Received: headers to an inbound smtp message.
- void mail_add_forward_headers (server_t ∗server, stringer_t ∗∗message, stringer_t ∗id, int_t mark, uint64_t signum, uint64_t sigkey)
  Add necessary headers to a forwarded mail message.
- int_t mail_add_outbound_headers (connection_t ∗con)
  Add a Received: header and dkim signature to an outbound relayed smtp message.

5.193.1 Function Documentation

5.193.1.1 void mail_add_forward_headers (server_t ∗ *server*, stringer_t ∗∗ *message*, stringer_t ∗ *id*, int_t *mark*, uint64_t *signum*, uint64_t *sigkey*)

Add necessary headers to a forwarded mail message. headers.c

Note:

This function will prepend tags to the Subject line like "JUNK", "INFECTED", "SPOOFED", etc. The following headers will be stripped from the message: Sender, Return-Path, DKIM-Signature, and DomainKey-Signature. This daemon will be reinserted into the headers as the origin of the Sender: header value. If signum and sigkey are both set, then a spam training url will also be inserted into the message. Finally, if magma.dkim.enabled is set, a dkim signature will be added to the message.

Parameters:

server the server object of the web server where the teacher application is hosted.

message the address of a managed string containing the message data that will be set to the modified messagee data on success.

id a managed string containing the message id (for dkim).

mark a bitmask of marks to be tagged in the message subject (SMTP_MARK_SPAM, SMTP_MARK_VIRUS, SMTP_MARK_SPOOF, SMTP_MARK_RBL, and SMTP_MARK_PHISH).

signum the optional spam signature number referenced by the teacher url.

sigkey the optional spam signature key for client verification in the teacher app.

Returns:

This function returns no value. LOW: We should be passing the message as a stringer_t ∗ and then returning it as a stringer_t ∗.

Definition at line 730 of file headers.c.

References CONSTANT, magma_t::dkim, dkim_signature_create(), magma_t::enabled, HEAP, JOINTED, log_pedantic, magma, mail_destroy(), mail_header_end(), mail_header_pop(), MAIL_MARK_JUNK, mail_message(), mail_mod_subject(), mail_signature_add(), MAPPED_T, mm_cmp_ci_eq(), pl_empty(), PLACER, placer_t, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, st_alloc_opts(), st_append_opts(), st_char_get(), st_cleanup, st_cmp_ci_starts(), st_cmp_cs_starts(), st_data_get(), st_dupe(), st_dupe_opts(), st_free(), st_length_get(), st_merge_opts(), status, and mail_message_t::text.

Referenced by smtp_forward_message().

5.193.1.2 stringer_t∗ mail_add_inbound_headers (connection_t ∗ *con*, smtp_inbound_prefs_t ∗ *prefs*)

Prepend the Return-Path: and Received: headers to an inbound smtp message.

Parameters:

con the connection across which the inbound smtp message was accepted.

prefs the smtp inbound preferences corresponding to the connection, with the rcptto field populated.

Returns:

NULL on failure, or a managed string containing the message data preceded by the Return-Path and Received headers on success.

Definition at line 638 of file headers.c.

References con_addr_presentation(), con_reverse_check(), CONSTANT, server_t::domain, smtp_session_t::esmtp, HEAP, smtp_session_t::helo, smtp_message_t::id, JOINTED, log_pedantic, smtp_session_t::mailfrom, MANAGEDBUF, MAPPED_T, smtp_session_t::message, smtp_inbound_prefs_t::rcptto, connection_t::server, connection_t::smtp, st_cmp_ci_eq(), st_cmp_cs_eq(), st_merge_opts(), and smtp_message_t::text.

Referenced by smtp_accept_message().

5.193.1.3 int_t mail_add_outbound_headers (connection_t ∗ *con*)

Add a Received: header and dkim signature to an outbound relayed smtp message.

Note:

If the message already has a Received header, the dkim signature will be inserted right before the first instance.

Parameters:

con the connection across which the outbound smtp message is being sent.

Returns:

NULL on failure, or a managed string containing the message data preceded by the Received header and including the dkim signature on success.

Definition at line 849 of file headers.c.

References smtp_recipients_t::address, con_addr_presentation(), con_reverse_check(), magma_t::dkim, dkim_signature_create(), server_t::domain, magma_t::enabled, smtp_session_t::esmtp, HEAP, smtp_session_t::helo, smtp_message_t::id, JOINTED, log_pedantic, magma, mail_header_end(), mail_header_pop(), MANAGEDBUF, MAPPED_T, smtp_session_t::message, mm_cmp_ci_eq(), smtp_session_t::num_recipients, smtp_session_t::out_prefs, pl_empty(), PLACER, placer_t, smtp_outbound_prefs_t::recipients, connection_t::server, connection_t::smtp, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_data_get(), st_dupe(), st_empty, st_free(), st_import(), st_length_get(), st_merge_opts(), and smtp_message_t::text.

Referenced by smtp_relay_message().

5.193.1.4 bool_t mail_add_required_headers (connection_t ∗ *con*, smtp_message_t ∗ *message*)

Generate any missing required headers for an smtp message object.

Note:

These required headers include To, From, Subject and Date, and if they are absent, they will be generated from the specified connection's inbound or outbound preferences, accordingly.

Parameters:

con a pointer to the connection object across which the smtp message was received.

message the smtp message object to be updated for any missing required headers.

Returns:

true on success or false on failure.

Definition at line 457 of file headers.c.

Referenced by smtp_data().

5.193.1.5 stringer_t∗ mail_header_fetch_all (stringer_t ∗ *header*, stringer_t ∗ *key*)

Get all the values that match a named header line in a message header.

Parameters:

header a managed string containing the message header.

key a managed string containing the header name to be searched for.

Returns:

NULL on failure or a managed string containing all the matching header line values separated by newlines.

Definition at line 147 of file headers.c.

References mm_cmp_ci_eq(), PLACER, st_char_get(), st_empty, st_free(), st_import(), st_length_get(), and st_merge.

5.193.1.6 stringer_t* mail_header_fetch_cleaned (stringer_t * *header*, stringer_t * *key*)

Fetch the value of a specified line from a mail header, performing whitespace and line cleaning.

Note:

This function handles mail header values that span new lines, although the output excludes line breaks and consecutive space characters.

Parameters:

header a managed string containing the full header of the target mail message.

key a managed string containing the name of the desired header name to be extracted, excluding the trailing ":"

Returns:

NULL on failure, or a managed string containing the cleaned value of the specified mail header line on success.

Definition at line 17 of file headers.c.

References PLACER, st_alloc(), st_char_get(), st_cmp_ci_starts(), st_empty, st_length_get(), st_length_set(), and st_trim().

Referenced by imap_fetch_bodystructure(), imap_fetch_envelope(), imap_search_messages_date(), mail_headers(), mail_message(), mail_mime_content_encoding(), mail_mime_content_id(), mail_mime_encoding(), mail_mime_type(), mail_mime_type_group(), mail_mime_type_parameters(), mail_mime_type_sub(), naked_message_set(), portal_endpoint_messages_list(), and portal_message_header().

5.193.1.7 placer_t mail_header_pop (stringer_t * *header*, size_t * *position*)

Pop the next header line from a mail message header.

Parameters:

header a managed string containing the entire mail message header.

position a pointer to a size_t that contains the tracker index into the entire header for the pop operation, and will also receive the new value of the tracker for the subsequent call, when a new header line is located.

Returns:

pl_null() on error or a placer pointing to the next mail message subject line on success.

Definition at line 236 of file headers.c.

References pl_init(), pl_null(), st_char_get(), st_empty, and st_length_get().

Referenced by imap_fetch_body_header(), mail_add_forward_headers(), mail_add_outbound_headers(), and mail_mod_subject().

5.193.1.8 bool_t mail_headers (smtp_message_t * *message*)

Parse an smtp message header and store the To, From, Date, and Subject header values.

Note:

The found header fields will be stored inside the same smtp message object passed by the caller as input.

Parameters:

message a pointer to a partially populated smtp message object that contains the raw message data to be parsed.

Returns:

true on success or false on failure.

Definition at line 318 of file headers.c.

References smtp_message_t::date, smtp_message_t::from, smtp_message_t::header_length, length, log_pedantic, mail_header_end(), mail_header_fetch_cleaned(), mail_store_header(), mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), st_length_get(), smtp_message_t::subject, smtp_message_t::text, and smtp_message_t::to.

Referenced by mail_add_required_headers(), and mail_create_message().

5.193.1.9 void mail_mod_subject (stringer_t ** *message*, chr_t * *label*)

Prepend text to a Subject header line inside of a mail message.

Note:

If no Subject line is found in the header of the message, one will be created and inserted with the specified label at the end of the header.

Parameters:

message a pointer to the address of a managed string that contains the mail message header or mail message body, and will receive the value of the resulting managed string that will be allocated to hold the modified contents.

label a null-terminated string that will be prepended to the value of the subject header value.

Returns:

This function returns no value.

Definition at line 389 of file headers.c.

References CONSTANT, log_pedantic, mail_header_end(), mail_header_pop(), pl_empty(), PLACER, placer_t, st_char_get(), st_cmp_ci_starts(), st_data_get(), st_free(), st_length_get(), and st_merge.

Referenced by mail_add_forward_headers(), mail_load_message(), and smtp_check_filters().

5.193.1.10 placer_t mail_store_header (chr_t * *stream*, size_t *length*)

Return a placer pointing to the trimmed value of a mail header.

Note:

This function merely marks a string residing between leading whitespace and a trailing or
.

Parameters:

stream a pointer to a buffer containing the start of the mail header data.

length the length, in bytes, of the mail header field. a placer containing the trimmed value of the mail header line.

Definition at line 291 of file headers.c.

References pl_init().

Referenced by mail_headers(), and mail_message().

Referenced by org_signet_get().

5.194.1.7 int_t prime_header_read (stringer_t ∗ *object*, uint16_t ∗ *type*, uint32_t ∗ *size*)

Read the first few bytes of a serialized PRIME object and return the magic number and object size in native form.

Parameters:

data The serialized object buffer.

type A pointer where the type will be stored, if sucessful.

size A pointer to where the parsed size will be stored, if the read is sucessful.

Returns:

0 if sucessful, negative values if the object data is invalid, or postive numbers if a programmatic error occurs. 2 = The object buffer was empty. 1 = A null pointer was supplied. 0 = Success. -1 = The buffer is too short for a valid PRIME object header. -2 = The size in the header doesn't match the amount of data supplied. (size = header_len + object_len). -3 = The header indicates an unrecognized PRIME type.

5.195 src/objects/mail/load_message.c File Reference

```
#include "magma.h"
```

Functions

- mail_message_t ∗ mail_load_message (meta_message_t ∗meta, meta_user_t ∗user, server_t ∗server, bool_t parse)
  Load a stored mail message from disk.
- stringer_t ∗ mail_load_header (meta_message_t ∗meta, meta_user_t ∗user, server_t ∗server, bool_t parse)
  Get the header of a message, checking first in the cache and then on disk.
- mail_message_t ∗ mail_load_message_top (meta_message_t ∗meta, meta_user_t ∗user, server_t ∗server, uint64_t lines, bool_t parse)
  Get the top of a mail message, up to a specified maximum number of lines of content.

5.195.1 Function Documentation

5.195.1.1 stringer_t∗ mail_load_header (meta_message_t ∗ *meta*, meta_user_t ∗ *user*, server_t ∗ *server*, bool_t *parse*)

Get the header of a message, checking first in the cache and then on disk. load_message.c

Note:

The file data is first unencrypted and decompressed, according to the file header flags. When extracted, the header's Subject line is branded with any applicable labels such as JUNK, INFECTED, SPOOFED, BLACKHOLED, PHISHING.

Parameters:

meta the meta message object of the message to be queried.

user the meta user object of the user that owns the message.

Returns:

NULL on failure or a managed string containing the message's header on success.

Definition at line 237 of file load_message.c.

References mail_message_t::header_length, log_pedantic, mail_destroy(), mail_load_message(), st_char_get(), st_import(), and mail_message_t::text.

Referenced by imap_fetch_return_header(), imap_search_messages_date(), imap_search_messages_header(), and portal_endpoint_messages_list().

5.195.1.2 mail_message_t∗ mail_load_message (meta_message_t ∗ *meta*, meta_user_t ∗ *user*, server_t ∗ *server*, bool_t *parse*)

Load a stored mail message from disk.

Note:

The mail message will always, at the very least, be compressed using the lzo algorithm; however, on-disk encryption may be enabled. If parsing is enabled, a spam signature training link may be embedded in the message.

Parameters:

meta the meta message object of the message to be loaded from disk.

user the meta user object of the user that owns the requested message.

server the server object of the web server where the spam teacher application is hosted.

parse if true, the header's Subject line is branded with any applicable labels such as JUNK, INFECTED, SPOOFED, BLACKHOLED, PHISHING.

Returns:

NULL on failure or a a mail message object containing the retrieved mail message data on success.

Definition at line 20 of file load_message.c.

References compress_import(), decompress_lzo(), meta_user_t::flags, FMESSAGE_MAGIC_1, FMESSAGE_MAGIC_2, FMESSAGE_OPT_COMPRESSED, FMESSAGE_OPT_ENCRYPTED, meta_user_t::key, log_info, log_pedantic, mail_cache_get(), mail_cache_set(), mail_db_hide_message(), MAIL_MARK_BLACKHOLED, MAIL_MARK_INFECTED, MAIL_MARK_JUNK, MAIL_MARK_PHISHING, MAIL_MARK_SPOOFED, mail_message(), mail_message_path(), mail_mod_subject(), mail_signature_add(), MAIL_STATUS_ENCRYPTED, message_header_t, meta_message_t::messagenum, META_USER_ENCRYPT_DATA, ns_free(), OBJECT_MESSAGES, org_signet, meta_user_t::prime, prime_message_decrypt(), serial_increment(), meta_message_t::server, meta_message_t::sigkey, meta_message_t::signum, st_alloc(), st_char_get(), st_free(), st_length_int(), st_length_set(), meta_message_t::status, mail_message_t::text, meta_user_t::username, and meta_user_t::usernum.

5.195.1.3 mail_message_t* mail_load_message_top (meta_message_t * *meta*, meta_user_t * *user*, server_t * *server*, uint64_t *lines*, bool_t *parse*)

Get the top of a mail message, up to a specified maximum number of lines of content.

See also:

mail_load_message()

Parameters:

meta the meta message object of the message to be loaded from disk.

user the meta user object of the user that owns the requested message.

server the server object of the web server where the spam teacher application is hosted.

lines the maximum number of lines to be retrieved from the loaded message.

parse sets the parse parameter passed to mail_load_message().

Returns:

NULL on failure or a a mail message object containing the retrieved mail message data (truncated if necessary) on success.

Definition at line 278 of file load_message.c.

References length, mail_load_message(), st_char_get(), st_length_get(), st_length_set(), and mail_message_t::text.

Referenced by pop_top().

Data Structures

- struct mail_cache_t
- struct mail_mime_t
- struct mail_message_t
- struct media_type_t

Defines

- #define MAIL_MIME_RECURSION_LIMIT 16
- #define MAIL_SIGNATURES_RECURSION_LIMIT 16

Functions

- void mail_cache_destroy (void *holder)

  cache.c

- stringer_t * mail_cache_get (uint64_t messagenum)

  Attempt to retrieve the contents of a message from the thread's cached data.

- void mail_cache_reset (void)

  Reset the thread's mail cache and free any held message.

- void mail_cache_set (uint64_t messagenum, stringer_t *text)

  Set the contents of the thread's mail cache.

- bool_t mail_cache_start (void)

  Initialize the thread-specific data key used for the mail message cache.

- void mail_cache_stop (void)

  Destroy the thread-specific data key used for the mail message cache.

- void mail_cache_thread_stop (void)

  Free the thread-specific data for the mail message cache.

- void mail_destroy_header (stringer_t *header)

  cleanup.c

- bool_t mail_message_cleanup (stringer_t **message)

  Clean up the body of a message read in via smtp, enforcing magma.smtp.wrap_line_length.

- uint32_t mail_count_received (stringer_t *message)

  counters.c

- size_t mail_header_end (stringer_t *message)

  Get the number of bytes taken up by a mail header.

- bool_t mail_db_delete_message (uint64_t usernum, uint64_t messagenum, uint32_t size, int_t transaction)

  datatier.c

- void mail_db_hide_message (uint64_t messagenum)

  Set a message invisible in the database.

- uint64_t mail_db_insert_duplicate_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, uint64_t created, int_t transaction)

  Insert a duplicate entry for a message in the database.

- uint64_t mail_db_insert_message (uint64_t usernum, uint64_t foldernum, uint32_t status, uint32_t size, uint64_t signum, uint64_t sigkey, int_t transaction)

  Insert a mail message into the database.

- int_t mail_db_update_message_folder (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target, int64_t transaction)

  Update a mail message's parent folder in the database.

- void mail_add_forward_headers (server_t *server, stringer_t **message, stringer_t *id, int_t mark, uint64_t signum, uint64_t sigkey)

  headers.c

- stringer_t * mail_add_inbound_headers (connection_t *con, smtp_inbound_prefs_t *prefs)

  Prepend the Return-Path: and Received: headers to an inbound smtp message.

- int_t mail_add_outbound_headers (connection_t *con)

  Add a Received: header and dkim signature to an outbound relayed smtp message.

- bool_t mail_add_required_headers (connection_t *con, smtp_message_t *message)

  Generate any missing required headers for an smtp message object.

- stringer_t * mail_header_fetch_all (stringer_t *header, stringer_t *key)

  Get all the values that match a named header line in a message header.

- stringer_t * mail_header_fetch_cleaned (stringer_t *header, stringer_t *key)

  Fetch the value of a specified line from a mail header, performing whitespace and line cleaning.

- placer_t mail_header_pop (stringer_t *header, size_t *position)

  Pop the next header line from a mail message header.

- bool_t mail_headers (smtp_message_t *message)

  Parse an smtp message header and store the To, From, Date, and Subject header values.

- void mail_mod_subject (stringer_t **message, chr_t *label)

  Prepend text to a Subject header line inside of a mail message.

- placer_t mail_store_header (chr_t *stream, size_t length)

  Return a placer pointing to the trimmed value of a mail header.

- stringer_t * mail_load_header (meta_message_t *meta, meta_user_t *user, server_t *server, bool_t parse)

  load_message.c

- mail_message_t * mail_load_message (meta_message_t *meta, meta_user_t *user, server_t *server, bool_t parse)

  Load a stored mail message from disk.

- mail_message_t * mail_load_message_top (meta_message_t *meta, meta_user_t *user, server_t *server, uint64_t lines, bool_t parse)

  Get the top of a mail message, up to a specified maximum number of lines of content.

- stringer_t * mail_mime_boundary (placer_t header)
  mime.c
- placer_t mail_mime_child (placer_t body, stringer_t *boundary, uint32_t child)
  Get a placer pointing to the specified child inside a MIME body.
- stringer_t * mail_mime_content_encoding (placer_t header)
  Get the content encoding type from a mime header.
- stringer_t * mail_mime_content_id (placer_t header)
  Get the content id from a mime header.
- uint32_t mail_mime_count (placer_t body, stringer_t *boundary)
  Count the number of instances of a boundary string inside a MIME body.
- int_t mail_mime_encoding (placer_t header)
  Get the encoding type from a MIME header.
- void mail_mime_free (mail_mime_t *mime)
  Free a mail mime object and its underlying data, and recursively free its children parts.
- placer_t mail_mime_header (stringer_t *part)
  Get a placer pointing to a mime header in a mime part.
- mail_mime_t * mail_mime_part (stringer_t *part, uint32_t recursion)
  Parse a block of data into a mail mime object.
- array_t * mail_mime_split (placer_t body, stringer_t *boundary)
  Split a mime body into an array of children by a boundary string.
- int_t mail_mime_type (placer_t header)
  Get the content type from a MIME header.
- stringer_t * mail_mime_type_group (placer_t header)
  Get the value of the Content-Type header from a mime header.
- array_t * mail_mime_type_parameters (placer_t header)
  Get an array of the key/value pairs of parameters passed to the value of the mime Content-Type header.
- stringer_t * mail_mime_type_parameters_key (stringer_t *parameter)
  Get the key name of a mime header line parameter.
- stringer_t * mail_mime_type_parameters_value (stringer_t *parameter)
  Get the value of a mime header line parameter.
- stringer_t * mail_mime_type_sub (placer_t header)
  Get the subtype of the Content-Type header value from a mime header.
- int_t mail_mime_update (mail_message_t *message)
  Re-parse a mail message's data as a mime part, freeing any existing mime part(s) that may have already existed.
- media_type_t * mail_mime_get_media_type (chr_t *extension)
  Get the media type for a given file extension.

- stringer_t * mail_mime_generate_boundary (array_t *parts)

  Generate a MIME boundary string that is unique to a collection of content.

- stringer_t * mail_mime_encode_part (stringer_t *data, stringer_t *filename, stringer_t *boundary)

  Encode a MIME part for a provided block of data (file attachment) with the specified filename.

- stringer_t * mail_mime_get_smtp_envelope (stringer_t *from, inx_t *tos, inx_t *ccs, inx_t *bccs, stringer_t *subject, stringer_t *boundary, bool_t attached)

  Get smtp envelope data for an outbound message sent by a webmail client.

- mail_message_t * mail_message (stringer_t *text)

  objects.c

- smtp_message_t * mail_create_message (stringer_t *text)

  Create an smtp message object out of a buffer of raw data supplied via the smtp DATA command.

- void mail_destroy (mail_message_t *message)

  Free a mail message and all its underlying data.

- void mail_destroy_message (smtp_message_t *message)

  Destroy an smtp message and free all of its underlying data.

- stringer_t * mail_extract_address (stringer_t *address)

  parsing.c

- placer_t * mail_domain_get (stringer_t *address, placer_t *output)

  Get the domain portion of an email address.

- chr_t * mail_message_path (uint64_t number, chr_t *server)

  paths.c

- bool_t mail_create_directory (uint64_t number, chr_t *server)

  Create the on-disk directory structure necessary to hold a given message's file data.

- int_t mail_path_finder (chr_t *string)
- bool_t mail_remove_message (uint64_t usernum, uint64_t messagenum, uint32_t size, chr_t *server)

  remove_message.c

- stringer_t * mail_build_signature (server_t *server, int_t content_type, int_t content_encoding, uint64_t signum, uint64_t sigkey, int_t disposition)

  signatures.c

- int_t mail_discover_encoding (stringer_t *header)

  Get the value of the Content-Transfer-Encoding header in a mail message header.

- size_t mail_discover_insertion_point (stringer_t *message, stringer_t *part, int_t type)

  Find the position in a mail message where a custom message can be inserted.

- int_t mail_discover_type (stringer_t *header)

  Get the value of the Content-Type header in a mail message header.

- stringer_t * mail_extract_tag (chr_t *stream, size_t length)

Extract an html tag from a data buffer, searching backwards.

- stringer_t ∗ mail_get_boundary (stringer_t ∗header)

  Get the boundary string from a message header.

- placer_t ∗ mail_get_chunk (placer_t ∗result, stringer_t ∗message, stringer_t ∗boundary, int_t chunk)

  Get a specified chunk (mime part) of a multipart mime message.

- stringer_t ∗ mail_insert_chunk_base64 (server_t ∗server, stringer_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t type, int_t encoding)

  Insert a spam signature training link into a base64-encoded message part.

- stringer_t ∗ mail_insert_chunk_text (server_t ∗server, stringer_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t type, int_t encoding)

  Insert a spam signature training link into a plain text message part.

- int_t mail_modify_part (server_t ∗server, mail_message_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t recursion)

  Insert a spam signature training link into a specified part of a mime message.

- void mail_signature_add (mail_message_t ∗message, server_t ∗server, uint64_t signum, uint64_t sigkey, int_t disposition)

  Insert a spam signature training link into a mail message.

- uint64_t mail_copy_message (uint64_t usernum, uint64_t original, chr_t ∗server, uint32_t size, uint64_t foldernum, uint32_t status, uint64_t signum, uint64_t sigkey, uint64_t created)

  store_message.c

- int_t mail_move_message (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target)

  Move a message to a new folder in the database.

- uint64_t mail_store_message (uint64_t usernum, prime_t ∗signet, uint64_t foldernum, uint32_t ∗status, uint64_t signum, uint64_t sigkey, stringer_t ∗message)

  Store a mail message, with its meta-information in the database, and the contents persisted to disk.

- bool_t mail_store_message_data (uint64_t messagenum, uint8_t fflags, stringer_t ∗data, chr_t ∗∗pathptr)

  Persist a message's data to disk.

5.196.1 Define Documentation

5.196.1.1 #define MAIL_MIME_RECURSION_LIMIT 16

Definition at line 11 of file mail.h.

Referenced by mail_mime_part(), and portal_message_body().

5.196.1.2 #define MAIL_SIGNATURES_RECURSION_LIMIT 16

Definition at line 12 of file mail.h.

Referenced by mail_modify_part().

5.196.2 Function Documentation

5.196.2.1 void mail_add_forward_headers (server_t * *server*, stringer_t ** *message*, stringer_t * *id*, int_t *mark*, uint64_t *signum*, uint64_t *sigkey*)

headers.c headers.c

Note:

This function will prepend tags to the Subject line like "JUNK", "INFECTED", "SPOOFED", etc. The following headers will be stripped from the message: Sender, Return-Path, DKIM-Signature, and DomainKey-Signature. This daemon will be reinserted into the headers as the origin of the Sender: header value. If signum and sigkey are both set, then a spam training url will also be inserted into the message. Finally, if magma.dkim.enabled is set, a dkim signature will be added to the message.

Parameters:

server the server object of the web server where the teacher application is hosted.

message the address of a managed string containing the message data that will be set to the modified messagee data on success.

id a managed string containing the message id (for dkim).

mark a bitmask of marks to be tagged in the message subject (SMTP_MARK_SPAM, SMTP_MARK_VIRUS, SMTP_MARK_SPOOF, SMTP_MARK_RBL, and SMTP_MARK_PHISH).

signum the optional spam signature number referenced by the teacher url.

sigkey the optional spam signature key for client verification in the teacher app.

Returns:

This function returns no value. LOW: We should be passing the message as a stringer_t * and then returning it as a stringer_t *.

Definition at line 730 of file headers.c.

References CONSTANT, magma_t::dkim, dkim_signature_create(), magma_t::enabled, HEAP, JOINTED, log_pedantic, magma, mail_destroy(), mail_header_end(), mail_header_pop(), MAIL_MARK_JUNK, mail_message(), mail_mod_subject(), mail_signature_add(), MAPPED_T, mm_cmp_ci_eq(), pl_empty(), PLACER, placer_t, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, st_alloc_opts(), st_append_opts(), st_char_get(), st_cleanup, st_cmp_ci_starts(), st_cmp_cs_starts(), st_data_get(), st_dupe(), st_dupe_opts(), st_free(), st_length_get(), st_merge_opts(), status, and mail_message_t::text.

Referenced by smtp_forward_message().

5.196.2.2 stringer_t* mail_add_inbound_headers (connection_t * *con*, smtp_inbound_prefs_t * *prefs*)

Prepend the Return-Path: and Received: headers to an inbound smtp message.

Parameters:

con the connection across which the inbound smtp message was accepted.

prefs the smtp inbound preferences corresponding to the connection, with the rcptto field populated.

Returns:

NULL on failure, or a managed string containing the message data preceded by the Return-Path and Received headers on success.

Definition at line 638 of file headers.c.

References con_addr_presentation(), con_reverse_check(), CONSTANT, server_t::domain, smtp_session_t::esmtp, HEAP, smtp_session_t::helo, smtp_message_t::id, JOINTED, log_pedantic, smtp_session_t::mailfrom, MANAGEDBUF, MAPPED_T, smtp_session_t::message, smtp_inbound_prefs_t::rcptto, connection_t::server, connection_t::smtp, st_cmp_ci_eq(), st_cmp_cs_eq(), st_merge_opts(), and smtp_message_t::text.

Referenced by smtp_accept_message().

5.196.2.3 int_t mail_add_outbound_headers (connection_t * *con*)

Add a Received: header and dkim signature to an outbound relayed smtp message.

Note:

If the message already has a Received header, the dkim signature will be inserted right before the first instance.

Parameters:

con the connection across which the outbound smtp message is being sent.

Returns:

NULL on failure, or a managed string containing the message data preceded by the Received header and including the dkim signature on success.

Definition at line 849 of file headers.c.

References smtp_recipients_t::address, con_addr_presentation(), con_reverse_check(), magma_t::dkim, dkim_signature_create(), server_t::domain, magma_t::enabled, smtp_session_t::esmtp, HEAP, smtp_session_t::helo, smtp_message_t::id, JOINTED, log_pedantic, magma, mail_header_end(), mail_header_pop(), MANAGEDBUF, MAPPED_T, smtp_session_t::message, mm_cmp_ci_eq(), smtp_session_t::num_recipients, smtp_session_t::out_prefs, pl_empty(), PLACER, placer_t, smtp_outbound_prefs_t::recipients, connection_t::server, connection_t::smtp, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_data_get(), st_dupe(), st_empty, st_free(), st_import(), st_length_get(), st_merge_opts(), and smtp_message_t::text.

Referenced by smtp_relay_message().

5.196.2.4 bool_t mail_add_required_headers (connection_t * *con*, smtp_message_t * *message*)

Generate any missing required headers for an smtp message object.

Note:

These required headers include To, From, Subject and Date, and if they are absent, they will be generated from the specified connection's inbound or outbound preferences, accordingly.

Parameters:

con a pointer to the connection object across which the smtp message was received.

message the smtp message object to be updated for any missing required headers.

Returns:

true on success or false on failure.

Definition at line 457 of file headers.c.

References smtp_recipients_t::address, smtp_session_t::authenticated, smtp_message_t::date, smtp_message_t::from, smtp_message_t::header_length, HEAP, smtp_session_t::in_prefs, JOINTED, length, log_pedantic, mail_header_end(), mail_headers(), smtp_session_t::mailfrom, MAPPED_T, smtp_recipients_t::next, smtp_inbound_prefs_t::next, smtp_session_t::out_prefs, PLACER, smtp_inbound_prefs_t::rcptto, smtp_outbound_prefs_t::recipients, connection_t::smtp, st_alloc(), st_avail_get(), st_char_get(), st_cleanup, st_empty, st_free(), st_import(), st_length_get(), st_length_set(), st_merge, st_merge_opts(), smtp_message_t::subject, smtp_message_t::text, and smtp_message_t::to.

Referenced by smtp_data().

5.196.2.5 stringer_t* mail_build_signature (server_t * *server*, int_t *content_type*, int_t *content_encoding*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*)

signatures.c signatures.c

Parameters:

server the server object of the web server where the teacher application is hosted.

type MESSAGE_TYPE_HTML to generate an html-based signature, or any other value for plain text.

content_encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

Returns:

NULL on failure, or a newly allocated managed string containing the desired mail signature on success.

Definition at line 20 of file signatures.c.

References server_t::domain, length, log_pedantic, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_TYPE_HTML, qp_-encode(), st_alloc(), st_char_get(), st_cleanup, st_free(), st_length_get(), st_merge, st_sprint(), and uint64_digits().

Referenced by mail_insert_chunk_base64(), and mail_insert_chunk_text().

5.196.2.6 void mail_cache_destroy (void ∗ *holder*)

cache.c cache.c

Parameters:

holder a pointer to the cached mail message object to be freed.

Returns:

This function returns no value.

Definition at line 17 of file cache.c.

References mm_free(), st_cleanup, and mail_cache_t::text.

Referenced by mail_cache_start(), and mail_cache_thread_stop().

5.196.2.7 stringer_t∗ mail_cache_get (uint64_t *messagenum*)

Attempt to retrieve the contents of a message from the thread's cached data.

Note:

The thread's cache only has the capacity to store a single message.

Parameters:

messagenum the id of the message to be retrieved.

Returns:

NULL on failure or a managed string containing the message data on success.

Definition at line 78 of file cache.c.

References mail_cache_t::messagenum, st_dupe(), and mail_cache_t::text.

Referenced by mail_load_message().

5.196.2.8 void mail_cache_reset (void)

Reset the thread's mail cache and free any held message.

Returns:

This function returns no value.

Definition at line 97 of file cache.c.

References mail_cache_t::messagenum, mm_free(), st_cleanup, and mail_cache_t::text.

Referenced by imap_session_destroy(), and pop_session_destroy().

5.196.2.9 void mail_cache_set (uint64_t *messagenum*, stringer_t * *text*)

Set the contents of the thread's mail cache.

Parameters:

messagenum the numerical id of the message to be cached. a managed string containing the contents of the specified message to be cached.

Returns:

This function returns no value.

Definition at line 118 of file cache.c.

References CONTIGUOUS, HEAP, log_pedantic, MANAGED_T, mail_cache_t::messagenum, mm_alloc(), mm_free(), st_cleanup, st_dupe_opts(), and mail_cache_t::text.

Referenced by mail_load_message().

5.196.2.10 bool_t mail_cache_start (void)

Initialize the thread-specific data key used for the mail message cache.

Returns:

true on success or false on failure.

Definition at line 33 of file cache.c.

References log_pedantic, and mail_cache_destroy().

Referenced by process_start().

5.196.2.11 void mail_cache_stop (void)

Destroy the thread-specific data key used for the mail message cache.

Returns:

This function returns no value.

Definition at line 47 of file cache.c.

References log_pedantic.

Referenced by process_stop().

5.196.2.12 void mail_cache_thread_stop (void)

Free the thread-specific data for the mail message cache.

Returns:

This function returns no value.

Definition at line 60 of file cache.c.

References mail_cache_destroy().

Referenced by thread_stop().

5.196.2.13 uint64_t mail_copy_message (uint64_t *usernum*, uint64_t *original*, chr_t * *server*, uint32_t *size*, uint64_t *foldernum*, uint32_t *status*, uint64_t *signum*, uint64_t *sigkey*, uint64_t *created*)

store_message.c store_message.c

Parameters:

usernum the numerical id of the user to whom the mail message belongs.

original the numerical id of the mail message to be copied.

server a pointer to a null-terminated string containing the name of the server where the message contents are stored.

size the size, in bytes, of the mail message to be copied.

foldernum the numerical id of the folder to become the parent folder of the message copy.

signum the spam signature for the message.

sigkey the spam key for the message.

created the UNIX timestamp of when the message was created.

Returns:

0 on failure, or the ID of the copy of the mail message in the database on success.

Definition at line 195 of file store_message.c.

References log_error, log_pedantic, mail_create_directory(), mail_db_insert_duplicate_message(), mail_message_path(), ns_free(), tran_commit(), tran_rollback(), and tran_start().

Referenced by imap_message_copier(), and meta_messages_copier().

5.196.2.14 uint32_t mail_count_received (stringer_t * *message*)

counters.c counters.c

Parameters:

message a managed string containing the mail message to be scanned.

Returns:

the number of matching lines found, or 0 on failure.

Definition at line 15 of file counters.c.

References log_pedantic, PLACER, st_cmp_ci_starts(), and st_empty_out().

Referenced by smtp_data().

5.196.2.15 bool_t mail_create_directory (uint64_t *number*, chr_t * *server*)

Create the on-disk directory structure necessary to hold a given message's file data.

Parameters:

number the mail message id.

server the hostname of the server where the message data resides or if NULL, the default server.

Returns:

true on success or false on failure.

Definition at line 66 of file paths.c.

References magma_t::active, log_error, magma, magma_t::root, st_char_get(), st_length_int(), and magma_t::storage.

Referenced by mail_copy_message(), and mail_store_message_data().

5.196.2.16 smtp_message_t* mail_create_message (stringer_t * *text*)

Create an smtp message object out of a buffer of raw data supplied via the smtp DATA command.

Note:

This function will also generate a random message ID.

Parameters:

text a pointer to a managed string containing the smtp data to be parsed.

Returns:

NULL on failure or a pointer to the newly initialized smtp message object wrapping the data on success.

Definition at line 127 of file objects.c.

References smtp_message_t::header_length, smtp_message_t::id, log_pedantic, mail_header_end(), mail_headers(), mm_alloc(), mm_free(), rand_choices(), st_free(), and smtp_message_t::text.

Referenced by smtp_data().

5.196.2.17 bool_t mail_db_delete_message (uint64_t *usernum*, uint64_t *messagenum*, uint32_t *size*, int_t *transaction*)

datatier.c datatier.c

Parameters:

usernum the user id to whom the target mail message belongs.

messagenum the message id of the mail message to be deleted.

size the storage size, in bytes, of the message to be deleted.

transaction the mysql connection id on which to execute the statements.

Returns:

0 on failure or 1 on success.

Definition at line 41 of file datatier.c.

References log_error, mm_wipe(), and stmt_exec_affected_conn().

Referenced by mail_remove_message().

5.196.2.18 void mail_db_hide_message (uint64_t *messagenum*)

Set a message invisible in the database.

Parameters:

messagenum the message id of the mail message to be hidden.

Returns:

This function returns no value.

Definition at line 15 of file datatier.c.

References mm_wipe(), and stmt_exec().

Referenced by mail_load_message().

5.196.2.19 uint64_t mail_db_insert_duplicate_message (uint64_t *usernum*, uint64_t *foldernum*, uint32_t *status*, uint32_t *size*, uint64_t *signum*, uint64_t *sigkey*, uint64_t *created*, int_t *transaction*)

Insert a duplicate entry for a message in the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id ot eh user that owns the message.

foldernum the numerical id of the parent folder containing the message.

status the status flags value for the message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

created the UNIX timestamp of when the message was created.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

NULL on failure, or the ID of the newly inserted message on success.

Definition at line 304 of file datatier.c.

References magma_t::active, ISNULL, log_pedantic, magma, MAIL_MARK_JUNK, mm_wipe(), st_char_get(), st_length_get(), stmt_-exec_conn(), stmt_insert_conn(), and magma_t::storage.

Referenced by mail_copy_message().

5.196.2.20 uint64_t mail_db_insert_message (uint64_t *usernum*, uint64_t *foldernum*, uint32_t *status*, uint32_t *size*, uint64_t *signum*, uint64_t *sigkey*, int_t *transaction*)

Insert a mail message into the database.

Note:

This function will also update the user's storage quota information in the database.

Parameters:

usernum the numerical id of the user to whom the mail message will belong.

foldernum the numerical id of the folder that will be the parent folder of the message.

status the status flags of the mail message.

size the size, in bytes, of the mail message on disk.

signum the spam signature for the message.

sigkey the spam key for the message.

transaction the transaction id for the database operation, in case the caller wants to roll back the transaction.

Returns:

0 on failure or the id of the newly inserted mail message on success.

Definition at line 172 of file datatier.c.

References magma_t::active, ISNULL, log_pedantic, magma, MAIL_MARK_JUNK, mm_wipe(), st_char_get(), st_length_get(), stmt_exec_conn(), stmt_insert_conn(), and magma_t::storage.

Referenced by mail_store_message().

5.196.2.21 int_t mail_db_update_message_folder (uint64_t *usernum*, uint64_t *messagenum*, uint64_t *source*, uint64_t *target*, int64_t *transaction*)

Update a mail message's parent folder in the database. usernum the numerical id of the user to whom the mail message belongs. messagenum the numerical id of the target mail message of the operation. source the numerical id of the parent folder in which the mail message currently resides. target the numerical id of the destination folder which is to be the new parent of the mail message. transaction a transaction id for the database operation, in case the caller needs to roll back changes on failure.

Returns:

-1 on failure, 0 if the target message could not be located in the database, or 1 on success.

Definition at line 100 of file datatier.c.

References log_pedantic, mm_wipe(), mysql_stmt_errno_d, mysql_stmt_error_d, pool_get_obj(), sql_pool, and stmt_exec_affected_conn().

Referenced by mail_move_message().

5.196.2.22 void mail_destroy (mail_message_t * *message*)

Free a mail message and all its underlying data.

Parameters:

message a pointer to the mail message object to be freed.

Returns:

This function returns no value.

Definition at line 32 of file objects.c.

References mail_message_t::from, mail_mime_free(), mail_message_t::mime, mm_free(), st_cleanup, and mail_message_t::text.

Referenced by imap_fetch_body(), imap_fetch_message(), imap_fetch_return_header(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_text(), imap_search_messages(), mail_add_forward_headers(), mail_load_header(), pop_retr(), pop_top(), and portal_endpoint_messages_load().

5.196.2.23 void mail_destroy_header (stringer_t * *header*)

cleanup.c cleanup.c

Parameters:

header a managed string containing the mail header to be freed.

Returns:

This function returns nov alue.

Definition at line 15 of file cleanup.c.

References st_cleanup.

Referenced by imap_fetch_body(), imap_fetch_message(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_text(), and imap_search_messages().

5.196.2.24 void mail_destroy_message (smtp_message_t * *message*)

Destroy an smtp message and free all of its underlying data.

Parameters:

message a pointer to the smtp message to be destroyed.

Returns:

This function returns no value.

Definition at line 15 of file objects.c.

References smtp_message_t::from, smtp_message_t::id, mm_free(), st_cleanup, and smtp_message_t::text.

Referenced by smtp_data(), smtp_session_destroy(), and smtp_session_reset().

5.196.2.25 int_t mail_discover_encoding (stringer_t * *header*)

Get the value of the Content-Transfer-Encoding header in a mail message header.

Note:

Possible return values include MESSAGE_ENCODING_QUOTED_PRINTABL, MESSAGE_ENCODING_BASE64, MESSAGE_ENCODING_8BIT, and MESSAGE_ENCODING_7BIT.

Parameters:

header a managed string containing the mail message header to be parsed.

Returns:

the MESSAGE_ENCODING code of the mail transfer encoding type, or MESSAGE_ENCODING_7BIT by default.

Definition at line 171 of file signatures.c.

References content, mail_header_fetch_all(), MESSAGE_ENCODING_7BIT, MESSAGE_ENCODING_8BIT, MESSAGE_ENCODING_BASE64, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_ENCODING_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_modify_part().

5.196.2.26 size_t mail_discover_insertion_point (stringer_t * *message*, stringer_t * *part*, int_t *type*)

Find the position in a mail message where a custom message can be inserted.

Note:

The part parameter is expected to be a placer pointing into the contents of message. If the encoding type is not html, the insertion point is determined to be at the end of the part. If the encoding type is html, the following rules are followed: 1. Scanning backwards from the end of the message, skip trailing whitespace get the next html tag. 2. If that tag is NOT </html> or </body>, insert the siignature AFTER it. 3. If that tag IS </html> or </body>, insert the signature right before it closes.

Parameters:

message a managed string containing the mail message body to be parsed.

part a managed string (placer) containing the part of the message where the custom message should be inserted.

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

Returns:

the zero-based index of the position in the specified message where the custom message can be inserted.

Definition at line 296 of file signatures.c.

References length, mail_extract_tag(), MESSAGE_TYPE_HTML, PLACER, st_char_get(), st_cmp_ci_eq(), st_data_get(), st_free(), and st_length_get().

Referenced by mail_insert_chunk_base64(), and mail_insert_chunk_text().

5.196.2.27 int_t mail_discover_type (stringer_t * *header*)

Get the value of the Content-Type header in a mail message header.

Note:

Possible return values include MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_UNKOWN, and MESSAGE_TYPE_PLAIN.

Parameters:

header a managed string containing the mail message header to be parsed.

Returns:

the MESSAGE_TYPE code of the mail content type, or MESSAGE_TYPE_PLAIN by default.

Definition at line 120 of file signatures.c.

References content, mail_header_fetch_all(), MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_modify_part().

5.196.2.28 placer_t* mail_domain_get (stringer_t * *address*, placer_t * *output*)

Get the domain portion of an email address.

Parameters:

address a managed string containing the email address to be parsed.

output a pointer to a placer to receive the domain portion of the email address.

Returns:

NULL on failure or a pointer to the output of the domain extraction on success.

Definition at line 16 of file parsing.c.

References tok_get_count_st(), and tok_get_st().

Referenced by smtp_check_authorized_from(), smtp_fetch_inbound(), smtp_rcpt_to(), and spf_check().

5.196.2.29 stringer_t∗ mail_extract_address (stringer_t ∗ *address*)

parsing.c parsing.c

Note:

The preference of this function is first to try to find the email addressed enclosed in <>. No valid email address may be enclosed in () or "".

Parameters:

address a managed string containing the buffer from which the email address will be extracted.

Returns:

NULL on failure or a managed string containing the email address on success.

Definition at line 32 of file parsing.c.

References comment, length, log_pedantic, st_alloc(), st_char_get(), st_data_get(), st_empty_out(), and st_length_set().

Referenced by smtp_data_outbound().

5.196.2.30 stringer_t∗ mail_extract_tag (chr_t ∗ *stream*, size_t *length*)

Extract an html tag from a data buffer, searching backwards.

Warning:

Remember that this function takes the end and not the start of a buffer!

Note:

The extracted tag contains the enclosing brackets and only printable characters (no whitespace).

Parameters:

stream the end of a data buffer containing the html data to be parsed.

length the size, in bytes, of the data buffer to be parsed.

Returns:

NULL on failure, or a managed string containing the printable contents of the nearest html tag on success.

Definition at line 218 of file signatures.c.

References log_pedantic, st_alloc(), st_char_get(), st_free(), and st_length_set().

Referenced by mail_discover_insertion_point().

5.196.2.31 stringer_t* mail_get_boundary (stringer_t * *header*)

Get the boundary string from a message header.

Note:

This function works by parsing the Content-Type header if it exists, falling back to the entire header otherwise. The returned boundary string includes a trailing "--".

Parameters:

header a managed string containing the message header.

Returns:

NULL on failure or a managed strirng containing the boundary string on success.

Definition at line 634 of file signatures.c.

References content, length, log_pedantic, mail_header_fetch_all(), PLACER, st_char_get(), st_cleanup, st_data_get(), st_length_get(), st_-merge, and st_search_ci().

Referenced by mail_modify_part().

5.196.2.32 placer_t* mail_get_chunk (placer_t * *result*, stringer_t * *message*, stringer_t * *boundary*, int_t *chunk*)

Get a specified chunk (mime part) of a multipart mime message.

Parameters:

result a pointer to the placer that will contain the result

message a managed string containing the mime message to be parsed.

boundary a managed string containing the boundary used to split the multipart mime message.

chunk the one-index based chunk to be retrieved from the multipart message

Returns:

NULL on failure or a pointer to the placer containing the specified chunk.

Definition at line 545 of file signatures.c.

References length, log_error, log_pedantic, mm_cmp_cs_eq(), pl_init_by_addr(), PLACER, st_char_get(), st_length_get(), and st_search_-cs().

Referenced by mail_modify_part().

5.196.2.33 size_t mail_header_end (stringer_t * *message*)

Get the number of bytes taken up by a mail header.

Parameters:

message a managed string containing the full smtp mail message.

Returns:

0 on failure, or the number of bytes occupied by the mail header.

Definition at line 56 of file counters.c.

References length, log_pedantic, st_char_get(), and st_length_get().

Referenced by mail_add_forward_headers(), mail_add_outbound_headers(), mail_add_required_headers(), mail_create_message(), mail_-headers(), mail_message(), mail_mod_subject(), naked_message_set(), and smtp_check_filters().

5.196.2.34 stringer_t* mail_header_fetch_all (stringer_t * *header*, stringer_t * *key*)

Get all the values that match a named header line in a message header.

Parameters:

header a managed string containing the message header.

key a managed string containing the header name to be searched for.

Returns:

NULL on failure or a managed string containing all the matching header line values separated by newlines.

Definition at line 147 of file headers.c.

References mm_cmp_ci_eq(), PLACER, st_char_get(), st_empty, st_free(), st_import(), st_length_get(), and st_merge.

Referenced by imap_fetch_body_mime(), imap_search_messages_header(), mail_discover_encoding(), mail_discover_type(), mail_get_boundary(), mail_mime_boundary(), and smtp_check_filters().

5.196.2.35 stringer_t* mail_header_fetch_cleaned (stringer_t * *header*, stringer_t * *key*)

Fetch the value of a specified line from a mail header, performing whitespace and line cleaning.

Note:

This function handles mail header values that span new lines, although the output excludes line breaks and consecutive space characters.

Parameters:

header a managed string containing the full header of the target mail message.

key a managed string containing the name of the desired header name to be extracted, excluding the trailing ":"

Returns:

NULL on failure, or a managed string containing the cleaned value of the specified mail header line on success.

Definition at line 17 of file headers.c.

References PLACER, st_alloc(), st_char_get(), st_cmp_ci_starts(), st_empty, st_length_get(), st_length_set(), and st_trim().

Referenced by imap_fetch_bodystructure(), imap_fetch_envelope(), imap_search_messages_date(), mail_headers(), mail_message(), mail_mime_content_encoding(), mail_mime_content_id(), mail_mime_encoding(), mail_mime_type(), mail_mime_type_group(), mail_mime_type_parameters(), mail_mime_type_sub(), naked_message_set(), portal_endpoint_messages_list(), and portal_message_header().

5.196.2.36 placer_t mail_header_pop (stringer_t * *header*, size_t * *position*)

Pop the next header line from a mail message header.

Parameters:

header a managed string containing the entire mail message header.

position a pointer to a size_t that contains the tracker index into the entire header for the pop operation, and will also receive the new value of the tracker for the subsequent call, when a new header line is located.

Returns:

pl_null() on error or a placer pointing to the next mail message subject line on success.

Definition at line 236 of file headers.c.

References pl_init(), pl_null(), st_char_get(), st_empty, and st_length_get().

Referenced by imap_fetch_body_header(), mail_add_forward_headers(), mail_add_outbound_headers(), and mail_mod_subject().

5.196.2.37 bool_t mail_headers (smtp_message_t * *message*)

Parse an smtp message header and store the To, From, Date, and Subject header values.

Note:

The found header fields will be stored inside the same smtp message object passed by the caller as input.

Parameters:

message a pointer to a partially populated smtp message object that contains the raw message data to be parsed.

Returns:

true on success or false on failure.

Definition at line 318 of file headers.c.

References smtp_message_t::date, smtp_message_t::from, smtp_message_t::header_length, length, log_pedantic, mail_header_end(), mail_header_fetch_cleaned(), mail_store_header(), mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), st_length_get(), smtp_message_t::subject, smtp_message_t::text, and smtp_message_t::to.

Referenced by mail_add_required_headers(), and mail_create_message().

5.196.2.38 stringer_t* mail_insert_chunk_base64 (server_t * *server*, stringer_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *type*, int_t *encoding*)

Insert a spam signature training link into a base64-encoded message part.

See also:

mail_discover_insertion_point()

Note:

This is similar to mail_insert_chunk_text() except the part has to be decoded and then re-encoded after the training link is inserted.

Parameters:

server the server object of the web server where the teacher application is hosted.

message a managed string containing the base64-encoded message body to be parsed.

part a managed string (placer) containing the part of the message where the signature should be inserted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

Returns:

NULL on failure or a managed string containing the base64-encoded message with the inserted signature training link on success.

Definition at line 361 of file signatures.c.

References base64_decode(), base64_encode(), length, log_pedantic, mail_build_signature(), mail_discover_insertion_point(), PLACER, st_char_get(), st_cleanup, st_data_get(), st_free(), st_length_get(), and st_merge.

Referenced by mail_modify_part().

5.196.2.39 stringer_t* mail_insert_chunk_text (server_t * *server*, stringer_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *type*, int_t *encoding*)

Insert a spam signature training link into a plain text message part.

See also:

mail_discover_insertion_point()

Parameters:

server the server object of the web server where the teacher application is hosted.

message a managed string containing the message body to be parsed.

part a managed string (placer) containing the part of the message where the signature should be inserted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

Returns:

NULL on failure or a managed string containing the message with the inserted signature training link on success.

Definition at line 502 of file signatures.c.

References log_pedantic, mail_build_signature(), mail_discover_insertion_point(), PLACER, st_char_get(), st_empty, st_free(), st_length_get(), and st_merge.

Referenced by mail_modify_part().

5.196.2.40 stringer_t* mail_load_header (meta_message_t * *meta*, meta_user_t * *user*, server_t * *server*, bool_t *parse*)

load_message.c load_message.c

Note:

The file data is first unencrypted and decompressed, according to the file header flags. When extracted, the header's Subject line is branded with any applicable labels such as JUNK, INFECTED, SPOOFED, BLACKHOLED, PHISHING.

Parameters:

meta the meta message object of the message to be queried.

user the meta user object of the user that owns the message.

Returns:

NULL on failure or a managed string containing the message's header on success.

Definition at line 237 of file load_message.c.

References mail_message_t::header_length, log_pedantic, mail_destroy(), mail_load_message(), st_char_get(), st_import(), and mail_message_t::text.

Referenced by imap_fetch_return_header(), imap_search_messages_date(), imap_search_messages_header(), and portal_endpoint_messages_list().

5.196.2.41 mail_message_t* mail_load_message (meta_message_t * *meta*, meta_user_t * *user*, server_t * *server*, bool_t *parse*)

Load a stored mail message from disk.

Note:

The mail message will always, at the very least, be compressed using the lzo algorithm; however, on-disk encryption may be enabled. If parsing is enabled, a spam signature training link may be embedded in the message.

Parameters:

meta the meta message object of the message to be loaded from disk.

user the meta user object of the user that owns the requested message.

server the server object of the web server where the spam teacher application is hosted.

parse if true, the header's Subject line is branded with any applicable labels such as JUNK, INFECTED, SPOOFED, BLACKHOLED, PHISHING.

Returns:

NULL on failure or a a mail message object containing the retrieved mail message data on success.

Definition at line 20 of file load_message.c.

References compress_import(), decompress_lzo(), meta_user_t::flags, FMESSAGE_MAGIC_1, FMESSAGE_MAGIC_2, FMESSAGE_OPT_COMPRESSED, FMESSAGE_OPT_ENCRYPTED, meta_user_t::key, log_info, log_pedantic, mail_cache_get(), mail_cache_set(), mail_db_hide_message(), MAIL_MARK_BLACKHOLED, MAIL_MARK_INFECTED, MAIL_MARK_JUNK, MAIL_MARK_PHISHING, MAIL_MARK_SPOOFED, mail_message(), mail_message_path(), mail_mod_subject(), mail_signature_add(), MAIL_STATUS_ENCRYPTED, message_header_t, meta_message_t::messagenum, META_USER_ENCRYPT_DATA, ns_free(), OBJECT_MESSAGES, org_signet, meta_user_t::prime, prime_message_decrypt(), serial_increment(), meta_message_t::server, meta_message_t::sigkey, meta_message_t::signum, st_alloc(), st_char_get(), st_free(), st_length_int(), st_length_set(), meta_message_t::status, mail_message_t::text, meta_user_t::username, and meta_user_t::usernum.

Referenced by imap_fetch_message(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_fetch_return_text(), imap_search_messages_body(), imap_search_messages_text(), mail_load_header(), mail_load_message_top(), pop_retr(), and portal_endpoint_messages_load().

5.196.2.42 mail_message_t* mail_load_message_top (meta_message_t * *meta*, meta_user_t * *user*, server_t * *server*, uint64_t *lines*, bool_t *parse*)

Get the top of a mail message, up to a specified maximum number of lines of content.

See also:

mail_load_message()

Parameters:

meta the meta message object of the message to be loaded from disk.

user the meta user object of the user that owns the requested message.

server the server object of the web server where the spam teacher application is hosted.

lines the maximum number of lines to be retrieved from the loaded message.

parse sets the parse parameter passed to mail_load_message().

Returns:

NULL on failure or a a mail message object containing the retrieved mail message data (truncated if necessary) on success.

Definition at line 278 of file load_message.c.

References length, mail_load_message(), st_char_get(), st_length_get(), st_length_set(), and mail_message_t::text.

Referenced by pop_top().

5.196.2.43 mail_message_t* mail_message (stringer_t * *text*)

objects.c objects.c

Parameters:

text a pointer to the managed string containing the raw (uncompressed) mail data to be parsed.

Returns:

NULL on failure or a pointer to a newly allocated mail message object with the message on success.

Definition at line 54 of file objects.c.

References mail_message_t::date, mail_message_t::from, mail_message_t::header_length, length, log_pedantic, mail_header_end(), mail_header_fetch_cleaned(), mail_store_header(), mm_alloc(), mm_cmp_ci_eq(), mm_free(), PLACER, st_char_get(), st_length_get(), mail_message_t::subject, mail_message_t::text, and mail_message_t::to.

Referenced by mail_add_forward_headers(), and mail_load_message().

5.196.2.44 bool_t mail_message_cleanup (stringer_t ** *message*)

Clean up the body of a message read in via smtp, enforcing magma.smtp.wrap_line_length.

Note:

This function fixes broken line separators by making sure each is followed by
and vice versa. All Return-Path: header lines are also removed. New lines are begun whenever the current length of any line reaches the configuration value set in magma.smtp.wrap_line_length. The trailing dot at the end of the smtp DATA command is also stripped.
If the original message ends with , it will have
appended to it.

Parameters:

message a pointer to a managed string that contains the message input, and will also store the cleaned output on success.

Returns:

true on success or false on failure.

LOW: Splitting lines, particularly headers causes more problems then it fixes, so this code is currently disabled. At some point we should survey other mail systems and see how they handle long lines.

Definition at line 31 of file cleanup.c.

References HEAP, JOINTED, length, log_pedantic, magma, MAPPED_T, mm_cmp_ci_eq(), magma_t::smtp, st_alloc_opts(), st_char_get(), st_free(), st_length_get(), st_length_set(), and magma_t::wrap_line_length.

Referenced by smtp_data().

5.196.2.45 chr_t* mail_message_path (uint64_t *number*, chr_t * *server*)

paths.c paths.c

Parameters:

number the mail message id.

server the hostname of the server where the message data resides or if NULL, the default server.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the absolute file path of the specified message.

Definition at line 35 of file paths.c.

References magma_t::active, log_pedantic, magma, ns_alloc(), ns_free(), magma_t::root, st_char_get(), st_length_int(), and magma_t::storage.

Referenced by mail_copy_message(), mail_load_message(), mail_remove_message(), and mail_store_message_data().

5.196.2.46 stringer_t* mail_mime_boundary (placer_t *header*)

mime.c mime.c

Note:

This function first scans the value of Content-Type for the boundary, and then the rest of the MIME header.

Parameters:

header a placer pointing to the MIME header to be parsed.

Returns:

NULL on failure, or a pointer to a managed string containing the MIME boundary string on success.

Definition at line 621 of file mime.c.

References content, length, log_error, log_pedantic, mail_header_fetch_all(), PLACER, st_char_get(), st_cleanup, st_length_get(), st_merge, and st_search_ci().

Referenced by mail_mime_part().

5.196.2.47 placer_t mail_mime_child (placer_t *body*, stringer_t * *boundary*, uint32_t *child*)

Get a placer pointing to the specified child inside a MIME body.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string to split the MIME content.

child the zero-based index of the MIME child to be located in the body text.

Returns:

pl_null() on failure, or a placer containing the specified MIME child on success.

Definition at line 753 of file mime.c.

References length, log_pedantic, mm_cmp_cs_eq(), pl_empty(), pl_init(), pl_null(), st_char_get(), st_empty, and st_length_get().

Referenced by mail_mime_split().

5.196.2.48 stringer_t* mail_mime_content_encoding (placer_t *header*)

Get the content encoding type from a mime header.

Note:

This function parses the Content-Transfer-Encoding field of the header, returning "7bit" by default.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content encoding type value of the header, with "7bit" as default.

Definition at line 235 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure().

5.196.2.49 stringer_t* mail_mime_content_id (placer_t *header*)

Get the content id from a mime header.

Note:

This function parses the Content-Id field of the header, returning "7bit" by default.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

NULL on failure, or a managed string containing the content id value of the header.

Definition at line 281 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure().

5.196.2.50 uint32_t mail_mime_count (placer_t *body*, stringer_t * *boundary*)

Count the number of instances of a boundary string inside a MIME body.

Note:

The search is terminated if "--" is found right after the boundary string.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string for the MIME content.

Returns:

0 on failure, or the number of times the boundary string was located in the MIME body on success.

Definition at line 698 of file mime.c.

References length, log_pedantic, mm_cmp_cs_eq(), pl_empty(), st_char_get(), st_empty, and st_length_get().

Referenced by mail_mime_split().

5.196.2.51 stringer_t* mail_mime_encode_part (stringer_t * *data*, stringer_t * *filename*, stringer_t * *boundary*)

Encode a MIME part for a provided block of data (file attachment) with the specified filename.

Note:

This function will look up the media type based on the supplied filename, and use that media type as a determination of whether the content is to be encoded as either quoted-printable or base64.

Parameters:

data a pointer to a managed string containing the body of the data to be encoded.

filename a pointer to a managed string containing the filename of the attachment for which the data was provided.

boundary a pointer to a managed string containing the boundary that will be used to separate the individual MIME parts.

Returns:

NULL on failure, or a pointer to a managed string containing the file attachment encoded as a MIME part on success.

Definition at line 1082 of file mime.c.

References base64_encode(), media_type_t::bin, log_pedantic, mail_mime_get_media_type(), media_type_t::name, qp_encode(), st_empty_out(), st_free(), and st_merge.

Referenced by portal_smtp_create_data().

5.196.2.52 int_t mail_mime_encoding (placer_t *header*)

Get the encoding type from a MIME header.

Note:

If no encoding type is specified in the header via Content-Transfer-Encoding, 7bit encoding is assumed.

Parameters:

header a placer containing the MIME header to be examined.

Returns:

the MIME encoding type specified by the header, or MESSAGE_ENCODING_UNKNOWN on failure.

Definition at line 574 of file mime.c.

References mail_header_fetch_cleaned(), MESSAGE_ENCODING_7BIT, MESSAGE_ENCODING_8BIT, MESSAGE_ENCODING_BASE64, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_ENCODING_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_mime_part().

5.196.2.53 void mail_mime_free (mail_mime_t * *mime*)

Free a mail mime object and its underlying data, and recursively free its children parts.

Parameters:

mime a pointer to the mail mime object to be freed.

Returns:

This function returns no value.

Definition at line 888 of file mime.c.

References ar_field_ptr(), ar_free(), ar_length_get(), mail_mime_t::boundary, mail_mime_t::children, mail_mime_free(), mm_free(), and st_cleanup.

Referenced by mail_destroy(), mail_mime_free(), mail_mime_part(), and mail_mime_update().

5.196.2.54 stringer_t* mail_mime_generate_boundary (array_t * *parts*)

Generate a MIME boundary string that is unique to a collection of content.

Parameters:

parts a pointer to an array of managed strings containing the MIME children data to be separated by the boundary.

Returns:

NULL on failure, or a pointer to a managed string containing the generated boundary on success.

Definition at line 1015 of file mime.c.

References ar_field_ptr(), ar_length_get(), log_error, log_pedantic, rand_get_uint64(), st_alloc(), st_char_get(), st_free(), st_length_set(), and st_search_ci().

Referenced by portal_smtp_create_data().

5.196.2.55 media_type_t* mail_mime_get_media_type (chr_t * *extension*)

Get the media type for a given file extension.

Note:

If no direct match is found for the content, "application/octet-stream" will be returned.

Parameters:

extension a pointer to a null-terminated string containing the file extension to be looked up, starting with a period.

Returns:

a pointer to a media type object corresponding to the media type of the specified file extension.

Definition at line 100 of file mime.c.

References mm_cmp_cs_eq(), ns_empty(), and ns_length_get().

Referenced by mail_mime_encode_part().

5.196.2.56 stringer_t* mail_mime_get_smtp_envelope (stringer_t * *from*, inx_t * *tos*, inx_t * *ccs*, inx_t * *bccs*, stringer_t * *subject*, stringer_t * *boundary*, bool_t *attached*)

Get smtp envelope data for an outbound message sent by a webmail client.

Parameters:

from a pointer to a managed string containing the sender's address.

tos a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the To: header.

ccs a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the CC: header.

bccs a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the BCC: header.

subject a pointer to a managed string containing the text of the subject line.

boundary a pointer to a managed string containing a boundary string to be used in multipart messages.

attached if true, the envelope is to be created for a mail with attachments (type "multipart/mixed"); if false, only a single part will be sent for the main email body.

Returns:

NULL on failure or a pointer to a managed string containing the smtp envelope data that will be supplied to an smtp relay server at the beginning of the DATA command.

Definition at line 1152 of file mime.c.

References log_error, log_pedantic, NULLER, portal_smtp_merge_headers(), st_cleanup, st_free(), and st_merge.

Referenced by portal_smtp_create_data().

5.196.2.57 placer_t mail_mime_header (stringer_t ∗ *part*)

Get a placer pointing to a mime header in a mime part.

Parameters:

part a managed string containing the mime part text to be parsed.

Returns:

a placer pointing to the mime header at the start of the specified mime part.

Definition at line 479 of file mime.c.

References length, pl_init(), st_char_get(), st_data_get(), and st_length_get().

Referenced by mail_mime_part().

5.196.2.58 mail_mime_t∗ mail_mime_part (stringer_t ∗ *part*, uint32_t *recursion*)

Parse a block of data into a mail mime object.

Note:

By parsing the specified mime part, this function fills in the content type and encoding of the resulting mail mime object. If the message is multipart, the boundary string is determined and then used to split the body into children; then each child part is passed to mail_mime_part() to be parsed likewise, recursively.

Parameters:

part a managed string containing the mime part data to be parsed.

recursion an incremented recursion level tracker for calling this function, to prevent an overflow from occurring.

Returns:

NULL on failure or a pointer to a newly allocated and updated mail mime object parsed from the part data on success.

Definition at line 921 of file mime.c.

References ar_alloc(), ar_append(), ar_field_st(), ar_free(), ar_length_get(), ARRAY_TYPE_POINTER, mail_mime_t::body, mail_mime_t::boundary, mail_mime_t::children, mail_mime_t::encoding, mail_mime_t::entire, mail_mime_t::header, log_pedantic, mail_mime_boundary(), mail_mime_encoding(), mail_mime_free(), mail_mime_header(), mail_mime_part(), MAIL_MIME_RECURSION_LIMIT, mail_mime_split(), mail_mime_type(), MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_RFC822, MESSAGE_TYPE_MULTI_UNKOWN, mm_alloc(), pl_init(), st_char_get(), st_data_get(), st_empty, st_length_get(), and mail_mime_t::type.

Referenced by mail_mime_part(), and mail_mime_update().

5.196.2.59 array_t∗ mail_mime_split (placer_t *body*, stringer_t ∗ *boundary*)

Split a mime body into an array of children by a boundary string.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string to split the mime content.

Returns:

NULL on failure, or a pointer to an array of mime children on success.

TODO: This is ugly. Because the array gets a placer pointer we need to free it when done. But that means differentiating between these placers and what were usually passed which will likely stack allocated placers. We could probably just change it to a stringer now that its going to st_free(), but that would mean lots of updates all over the place.

Definition at line 845 of file mime.c.

References ar_alloc(), ar_append(), ARRAY_TYPE_STRINGER, FOREIGNDATA, HEAP, JOINTED, log_pedantic, mail_mime_child(), mail_mime_count(), pl_set(), placer_t, PLACER_T, st_alloc_opts(), st_empty, and st_free().

Referenced by mail_mime_part().

5.196.2.60 int_t mail_mime_type (placer_t *header*)

Get the content type from a MIME header.

Note:

If no content type is specified in the header via Content-Type, "text/plain" is assumed.

Parameters:

header a placer containing the MIME header to be examined.

Returns:

the MIME content type specified by the header, or MESSAGE_TYPE_UNKNOWN on failure.

Definition at line 518 of file mime.c.

References mail_header_fetch_cleaned(), MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_-MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_RFC822, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, MESSAGE_TYPE_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_mime_part().

5.196.2.61 stringer_t∗ mail_mime_type_group (placer_t *header*)

Get the value of the Content-Type header from a mime header.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content type value of the header, with "text" as the default.

Definition at line 125 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure(), and portal_message_attachments().

5.196.2.62 array_t* mail_mime_type_parameters (placer_t *header*)

Get an array of the key/value pairs of parameters passed to the value of the mime Content-Type header.

Note:

The parameters of the Content-Type header value will be examined, and each found parameter will result in the addition of TWO managed strings to the returned array: the first containing the parameter key name, and the second with the parameter value.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

NULL on failure, or on success, an array of managed strings structured as the key name followed by the value of each parameter passed in the Content-Type header.

Definition at line 431 of file mime.c.

References ar_alloc(), ar_append(), ar_free(), ar_length_get(), ARRAY_TYPE_STRINGER, mail_header_fetch_cleaned(), mail_mime_type_parameters_key(), mail_mime_type_parameters_value(), PLACER, placer_t, st_free(), tok_get_count_st(), tok_get_st(), and upper_st().

Referenced by imap_fetch_bodystructure().

5.196.2.63 stringer_t* mail_mime_type_parameters_key (stringer_t * *parameter*)

Get the key name of a mime header line parameter.

Parameters:

parameter a managed string containing the complete parameter (key/value pair) of the mime header line.

Returns:

NULL on failure or a managed string containing the mime header parameter key name on success.

Definition at line 325 of file mime.c.

References length, st_char_get(), st_import(), and st_length_get().

Referenced by mail_mime_type_parameters().

5.196.2.64 stringer_t* mail_mime_type_parameters_value (stringer_t * *parameter*)

Get the value of a mime header line parameter.

Parameters:

parameter a managed string containing the complete parameter (key/value pair) of the mime header line.

Returns:

NULL on failure or a managed string containing the mime header parameter value on success.

Definition at line 363 of file mime.c.

References length, st_char_get(), st_import(), and st_length_get().

Referenced by mail_mime_type_parameters().

5.196.2.65 stringer_t* mail_mime_type_sub (placer_t *header*)

Get the subtype of the Content-Type header value from a mime header.

Note:

For example in the case of a Content-Type of 'text/plain', "plain" would be the subtype.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content subtype of the header, with "plain" as the default.

Definition at line 171 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure(), and portal_message_attachments().

5.196.2.66 int_t mail_mime_update (mail_message_t * *message*)

Re-parse a mail message's data as a mime part, freeing any existing mime part(s) that may have already existed.

Parameters:

message the mail message object containing the message data to be parsed.

Returns:

This function always returns 1.

Definition at line 996 of file mime.c.

References mail_mime_free(), mail_mime_part(), mail_message_t::mime, pl_init(), placer_t, st_char_get(), st_length_get(), and mail_message_t::text.

Referenced by imap_fetch_message(), imap_fetch_return_message(), imap_fetch_return_mime(), imap_search_messages_body(), imap_search_messages_text(), and portal_endpoint_messages_load().

5.196.2.67 void mail_mod_subject (stringer_t ** *message*, chr_t * *label*)

Prepend text to a Subject header line inside of a mail message.

Note:

If no Subject line is found in the header of the message, one will be created and inserted with the specified label at the end of the header.

Parameters:

message a pointer to the address of a managed string that contains the mail message header or mail message body, and will receive the value of the resulting managed string that will be allocated to hold the modified contents.

label a null-terminated string that will be prepended to the value of the subject header value.

Returns:

This function returns no value.

Definition at line 389 of file headers.c.

References CONSTANT, log_pedantic, mail_header_end(), mail_header_pop(), pl_empty(), PLACER, placer_t, st_char_get(), st_cmp_ci_starts(), st_data_get(), st_free(), st_length_get(), and st_merge.

Referenced by mail_add_forward_headers(), mail_load_message(), and smtp_check_filters().

5.196.2.68 int_t mail_modify_part (server_t * *server*, mail_message_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *recursion*)

Insert a spam signature training link into a specified part of a mime message.

Warning:

This function may fail to work as expected and still return a value of 1.

Note:

If the mime type is MESSAGE_TYPE_UNKNOWN (binary file), the function returns immediately. If the type is MESSAGE_TYPE_HTML or MESSAGE_TYPE_PLAIN, the training link is inserted normally. For MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_UNKOWN the link is inserted in the first mime part. For MESSAGE_TYPE_MULTI_ALTERNATIVE, the link is inserted into each part, for up to 8 times.

Parameters:

server the server object of the web server where the teacher application is hosted.

message the mail message object of the message to be modified.

part a placer pointing to the specified part of the message to be modified.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

recursion an incremented recursion level tracker for calling this function, to prevent an overflow from occurring.

Returns:

0 on recursion failure, or 1 otherwise.

Definition at line 720 of file signatures.c.

References length, log_pedantic, mail_discover_encoding(), mail_discover_type(), mail_get_boundary(), mail_get_chunk(), mail_insert_chunk_base64(), mail_insert_chunk_text(), mail_modify_part(), MAIL_SIGNATURES_RECURSION_LIMIT, MESSAGE_ENCODING_BASE64, MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, MESSAGE_TYPE_UNKNOWN, PLACER, placer_t, st_char_get(), st_data_get(), st_free(), st_length_get(), mail_message_t::text, and type().

5.196.2.69 int_t mail_move_message (uint64_t *usernum*, uint64_t *messagenum*, uint64_t *source*, uint64_t *target*)

Move a message to a new folder in the database.

Parameters:

usernum the numerical id of the user that owns the message.

messagenum the numerical id of the message to be moved.

source the numerical id of the current parent folder of the specified message.

target the numerical id of the folder to which the specified message will be moved.

Returns:

-1 on error, 0 if the message wasn't found, or 1 on success.

Definition at line 280 of file store_message.c.

References log_error, log_pedantic, mail_db_update_message_folder(), tran_commit(), tran_rollback(), and tran_start().

Referenced by meta_messages_mover().

5.196.2.70 int_t mail_path_finder (chr_t * *string*)

Note:

This function is not called from anywhere in the code and may be subject to removal.

Definition at line 13 of file paths.c.

References length, and ns_length_get().

5.196.2.71 bool_t mail_remove_message (uint64_t *usernum*, uint64_t *messagenum*, uint32_t *size*, chr_t * *server*)

remove_message.c remove_message.c

LOW: When the reliable job queue is working we can handle unlink errors by creating a job entry which will retry the unlink operation at a later time.

Parameters:

usernum the user id to whom the specified mail message belongs.

messagenum the target mail message id.

size the size of the message in bytes, to be assessed against the user quota.

server the name of the server on which the mail message resides.

Returns:

true if the message removal succeeds or false on failure.

Definition at line 20 of file remove_message.c.

References log_pedantic, mail_db_delete_message(), mail_message_path(), ns_free(), tran_commit(), tran_rollback(), and tran_start().

Referenced by imap_folder_remove(), imap_message_expunge(), pop_session_destroy(), portal_endpoint_messages_remove(), and smtp_-rollout().

5.196.2.72 void mail_signature_add (mail_message_t * *message*, server_t * *server*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*)

Insert a spam signature training link into a mail message.

See also:

mail_modify_part()

Parameters:

message the mail message object of the message to be modified.

server the server object of the web server where the teacher application is hosted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.
disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

Returns:

This function returns no value.

Definition at line 846 of file signatures.c.

References log_pedantic, mail_modify_part(), PLACER, st_char_get(), st_length_get(), st_length_int(), and mail_message_t::text.

Referenced by mail_add_forward_headers(), and mail_load_message().

5.196.2.73 placer_t mail_store_header (chr_t * *stream*, size_t *length*)

Return a placer pointing to the trimmed value of a mail header.

Note:

This function merely marks a string residing between leading whitespace and a trailing or
.

Parameters:

stream a pointer to a buffer containing the start of the mail header data.
length the length, in bytes, of the mail header field. a placer containing the trimmed value of the mail header line.

Definition at line 291 of file headers.c.

References pl_init().

Referenced by mail_headers(), and mail_message().

5.196.2.74 uint64_t mail_store_message (uint64_t *usernum*, prime_t * *signet*, uint64_t *foldernum*, uint32_t * *status*, uint64_t *signum*, uint64_t *sigkey*, stringer_t * *message*)

Store a mail message, with its meta-information in the database, and the contents persisted to disk.

Note:

The stored message is always compressed, but only encrypted if the user's public key is suppplied.

Parameters:

usernum the numerical id of the user to which the message belongs.
pubkey if not NULL, a public key that will be used to encrypt the message for the intended user.
foldernum the folder # that will contain the message.
status a pointer to the status flags value for the message, which will be updated if the message is to be encrypted.
signum the spam signature for the message.
sigkey the spam key for the message.
message a managed string containing the raw body of the message.

Returns:

0 on failure, or the newly inserted id of the message in the database on success.

Definition at line 103 of file store_message.c.

References compress_cleanup(), compress_lzo(), compress_total_length(), FMESSAGE_OPT_COMPRESSED, FMESSAGE_OPT_-ENCRYPTED, log_error, log_pedantic, mail_db_insert_message(), MAIL_STATUS_ENCRYPTED, mail_store_message_data(), ns_free(), org_key, PLACER, prime_cleanup(), prime_message_encrypt(), st_cleanup, st_length_int(), tran_commit(), tran_rollback(), and tran_start().

Referenced by imap_append_message(), and smtp_store_message().

5.196.2.75 bool_t mail_store_message_data (uint64_t *messagenum*, uint8_t *flags*, stringer_t * *data*, chr_t ** *pathptr*)

Persist a message's data to disk.

Parameters:

messagenum the numerical id of the message that will be associated with the data.

data a pointer to a buffer containing the message's data.

fflags the status flags to be stored in the message's on-disk file header.

data_len the size, in bytes, of the message's data.

pathptr if not NULL, the address of a pointer to a string that will receive a copy of the message's on-disk data.

Returns:

true if the storage operation succeeded, or false on failure.

Definition at line 19 of file store_message.c.

References FMESSAGE_MAGIC_1, FMESSAGE_MAGIC_2, log_error, mail_create_directory(), mail_message_path(), message_header_t, ns_free(), st_data_get(), and st_length_get().

Functions

- media_type_t * mail_mime_get_media_type (chr_t *extension)
  Get the media type for a given file extension.
- stringer_t * mail_mime_type_group (placer_t header)
  Get the value of the Content-Type header from a mime header.
- stringer_t * mail_mime_type_sub (placer_t header)
  Get the subtype of the Content-Type header value from a mime header.
- stringer_t * mail_mime_content_encoding (placer_t header)
  Get the content encoding type from a mime header.
- stringer_t * mail_mime_content_id (placer_t header)
  Get the content id from a mime header.
- stringer_t * mail_mime_type_parameters_key (stringer_t *parameter)
  Get the key name of a mime header line parameter.
- stringer_t * mail_mime_type_parameters_value (stringer_t *parameter)
  Get the value of a mime header line parameter.
- array_t * mail_mime_type_parameters (placer_t header)
  Get an array of the key/value pairs of parameters passed to the value of the mime Content-Type header.
- placer_t mail_mime_header (stringer_t *part)
  Get a placer pointing to a mime header in a mime part.
- int_t mail_mime_type (placer_t header)
  Get the content type from a MIME header.
- int_t mail_mime_encoding (placer_t header)
  Get the encoding type from a MIME header.
- stringer_t * mail_mime_boundary (placer_t header)
  Get the boundary from a MIME header.
- uint32_t mail_mime_count (placer_t body, stringer_t *boundary)
  Count the number of instances of a boundary string inside a MIME body.
- placer_t mail_mime_child (placer_t body, stringer_t *boundary, uint32_t child)
  Get a placer pointing to the specified child inside a MIME body.
- array_t * mail_mime_split (placer_t body, stringer_t *boundary)
  Split a mime body into an array of children by a boundary string.
- void mail_mime_free (mail_mime_t *mime)

Free a mail mime object and its underlying data, and recursively free its children parts.

- mail_mime_t ∗ mail_mime_part (stringer_t ∗part, uint32_t recursion)

  Parse a block of data into a mail mime object.

- int_t mail_mime_update (mail_message_t ∗message)

  Re-parse a mail message's data as a mime part, freeing any existing mime part(s) that may have already existed.

- stringer_t ∗ mail_mime_generate_boundary (array_t ∗parts)

  Generate a MIME boundary string that is unique to a collection of content.

- stringer_t ∗ mail_mime_encode_part (stringer_t ∗data, stringer_t ∗filename, stringer_t ∗boundary)

  Encode a MIME part for a provided block of data (file attachment) with the specified filename.

- stringer_t ∗ mail_mime_get_smtp_envelope (stringer_t ∗from, inx_t ∗tos, inx_t ∗ccs, inx_t ∗bccs, stringer_t ∗subject, stringer_t ∗boundary, bool_t attached)

  Get smtp envelope data for an outbound message sent by a webmail client.

Variables

- media_type_t media_types [ ]

5.197.1 Function Documentation

5.197.1.1 stringer_t∗ mail_mime_boundary (placer_t *header*)

Get the boundary from a MIME header. mime.c

Note:

This function first scans the value of Content-Type for the boundary, and then the rest of the MIME header.

Parameters:

header a placer pointing to the MIME header to be parsed.

Returns:

NULL on failure, or a pointer to a managed string containing the MIME boundary string on success.

Definition at line 621 of file mime.c.

References content, length, log_error, log_pedantic, mail_header_fetch_all(), PLACER, st_char_get(), st_cleanup, st_length_get(), st_merge, and st_search_ci().

Referenced by mail_mime_part().

5.197.1.2 placer_t mail_mime_child (placer_t *body*, stringer_t ∗ *boundary*, uint32_t *child*)

Get a placer pointing to the specified child inside a MIME body.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string to split the MIME content.

child the zero-based index of the MIME child to be located in the body text.

Returns:

pl_null() on failure, or a placer containing the specified MIME child on success.

Definition at line 753 of file mime.c.

References length, log_pedantic, mm_cmp_cs_eq(), pl_empty(), pl_init(), pl_null(), st_char_get(), st_empty, and st_length_get().

Referenced by mail_mime_split().

5.197.1.3 stringer_t∗ mail_mime_content_encoding (placer_t *header*)

Get the content encoding type from a mime header.

Note:

This function parses the Content-Transfer-Encoding field of the header, returning "7bit" by default.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content encoding type value of the header, with "7bit" as default.

Definition at line 235 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure().

5.197.1.4 stringer_t∗ mail_mime_content_id (placer_t *header*)

Get the content id from a mime header.

Note:

This function parses the Content-Id field of the header, returning "7bit" by default.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

NULL on failure, or a managed string containing the content id value of the header.

Definition at line 281 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure().

5.197.1.5 uint32_t mail_mime_count (placer_t *body*, stringer_t ∗ *boundary*)

Count the number of instances of a boundary string inside a MIME body.

Note:

The search is terminated if "--" is found right after the boundary string.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string for the MIME content.

Returns:

0 on failure, or the number of times the boundary string was located in the MIME body on success.

Definition at line 698 of file mime.c.

References length, log_pedantic, mm_cmp_cs_eq(), pl_empty(), st_char_get(), st_empty, and st_length_get().

Referenced by mail_mime_split().

5.197.1.6 stringer_t* mail_mime_encode_part (stringer_t * *data*, stringer_t * *filename*, stringer_t * *boundary*)

Encode a MIME part for a provided block of data (file attachment) with the specified filename.

Note:

This function will look up the media type based on the supplied filename, and use that media type as a determination of whether the content is to be encoded as either quoted-printable or base64.

Parameters:

data a pointer to a managed string containing the body of the data to be encoded.

filename a pointer to a managed string containing the filename of the attachment for which the data was provided.

boundary a pointer to a managed string containing the boundary that will be used to separate the individual MIME parts.

Returns:

NULL on failure, or a pointer to a managed string containing the file attachment encoded as a MIME part on success.

Definition at line 1082 of file mime.c.

References base64_encode(), media_type_t::bin, log_pedantic, mail_mime_get_media_type(), media_type_t::name, qp_encode(), st_empty_-out(), st_free(), and st_merge.

Referenced by portal_smtp_create_data().

5.197.1.7 int_t mail_mime_encoding (placer_t *header*)

Get the encoding type from a MIME header.

Note:

If no encoding type is specified in the header via Content-Transfer-Encoding, 7bit encoding is assumed.

Parameters:

header a placer containing the MIME header to be examined.

Returns:

the MIME encoding type specified by the header, or MESSAGE_ENCODING_UNKNOWN on failure.

Definition at line 574 of file mime.c.

References mail_header_fetch_cleaned(), MESSAGE_ENCODING_7BIT, MESSAGE_ENCODING_8BIT, MESSAGE_ENCODING_-BASE64, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_ENCODING_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_-char_get(), st_free(), and st_length_get().

Referenced by mail_mime_part().

5.197.1.8 void mail_mime_free (mail_mime_t ∗ *mime*)

Free a mail mime object and its underlying data, and recursively free its children parts.

Parameters:

mime a pointer to the mail mime object to be freed.

Returns:

This function returns no value.

Definition at line 888 of file mime.c.

References ar_field_ptr(), ar_free(), ar_length_get(), mail_mime_t::boundary, mail_mime_t::children, mail_mime_free(), mm_free(), and st_-cleanup.

Referenced by mail_destroy(), mail_mime_free(), mail_mime_part(), and mail_mime_update().

5.197.1.9 stringer_t∗ mail_mime_generate_boundary (array_t ∗ *parts*)

Generate a MIME boundary string that is unique to a collection of content.

Parameters:

parts a pointer to an array of managed strings containing the MIME children data to be separated by the boundary.

Returns:

NULL on failure, or a pointer to a managed string containing the generated boundary on success.

Definition at line 1015 of file mime.c.

References ar_field_ptr(), ar_length_get(), log_error, log_pedantic, rand_get_uint64(), st_alloc(), st_char_get(), st_free(), st_length_set(), and st_search_ci().

Referenced by portal_smtp_create_data().

5.197.1.10 media_type_t∗ mail_mime_get_media_type (chr_t ∗ *extension*)

Get the media type for a given file extension.

Note:

If no direct match is found for the content, "application/octet-stream" will be returned.

Parameters:

extension a pointer to a null-terminated string containing the file extension to be looked up, starting with a period.

Returns:

a pointer to a media type object corresponding to the media type of the specified file extension.

Definition at line 100 of file mime.c.

References mm_cmp_cs_eq(), ns_empty(), and ns_length_get().

Referenced by mail_mime_encode_part().

5.197.1.11 stringer_t* mail_mime_get_smtp_envelope (stringer_t * *from*, inx_t * *tos*, inx_t * *ccs*, inx_t * *bccs*, stringer_t * *subject*, stringer_t * *boundary*, bool_t *attached*)

Get smtp envelope data for an outbound message sent by a webmail client.

Parameters:

from a pointer to a managed string containing the sender's address.

tos a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the To: header.

ccs a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the CC: header.

bccs a pointer to an inx holder containing a collection of managed strings with the email addresses specified in the BCC: header.

subject a pointer to a managed string containing the text of the subject line.

boundary a pointer to a managed string containing a boundary string to be used in multipart messages.

attached if true, the envelope is to be created for a mail with attachments (type "multipart/mixed"); if false, only a single part will be sent for the main email body.

Returns:

NULL on failure or a pointer to a managed string containing the smtp envelope data that will be supplied to an smtp relay server at the beginning of the DATA command.

Definition at line 1152 of file mime.c.

References log_error, log_pedantic, NULLER, portal_smtp_merge_headers(), st_cleanup, st_free(), and st_merge.

Referenced by portal_smtp_create_data().

5.197.1.12 placer_t mail_mime_header (stringer_t * *part*)

Get a placer pointing to a mime header in a mime part.

Parameters:

part a managed string containing the mime part text to be parsed.

Returns:

a placer pointing to the mime header at the start of the specified mime part.

Definition at line 479 of file mime.c.

References length, pl_init(), st_char_get(), st_data_get(), and st_length_get().

Referenced by mail_mime_part().

5.197.1.13 mail_mime_t* mail_mime_part (stringer_t * *part*, uint32_t *recursion*)

Parse a block of data into a mail mime object.

Note:

By parsing the specified mime part, this function fills in the content type and encoding of the resulting mail mime object. If the message is multipart, the boundary string is determined and then used to split the body into children; then each child part is passed to mail_mime_part() to be parsed likewise, recursively.

Parameters:

part a managed string containing the mime part data to be parsed.

recursion an incremented recursion level tracker for calling this function, to prevent an overflow from occurring.

Returns:

NULL on failure or a pointer to a newly allocated and updated mail mime object parsed from the part data on success.

Definition at line 921 of file mime.c.

References ar_alloc(), ar_append(), ar_field_st(), ar_free(), ar_length_get(), ARRAY_TYPE_POINTER, mail_mime_t::body, mail_mime_t::boundary, mail_mime_t::children, mail_mime_t::encoding, mail_mime_t::entire, mail_mime_t::header, log_pedantic, mail_mime_boundary(), mail_mime_encoding(), mail_mime_free(), mail_mime_header(), mail_mime_part(), MAIL_MIME_RECURSION_LIMIT, mail_mime_split(), mail_mime_type(), MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_RFC822, MESSAGE_TYPE_MULTI_UNKOWN, mm_alloc(), pl_init(), st_char_get(), st_data_get(), st_empty, st_length_get(), and mail_mime_t::type.

Referenced by mail_mime_part(), and mail_mime_update().

5.197.1.14 array_t∗ mail_mime_split (placer_t *body*, stringer_t ∗ *boundary*)

Split a mime body into an array of children by a boundary string.

Parameters:

body a placer containing the body text to be parsed.

boundary a pointer to a managed string containing the boundary string to split the mime content.

Returns:

NULL on failure, or a pointer to an array of mime children on success.

TODO: This is ugly. Because the array gets a placer pointer we need to free it when done. But that means differentiating between these placers and what were usually passed which will likely stack allocated placers. We could probably just change it to a stringer now that its going to st_free(), but that would mean lots of updates all over the place.

Definition at line 845 of file mime.c.

References ar_alloc(), ar_append(), ARRAY_TYPE_STRINGER, FOREIGNDATA, HEAP, JOINTED, log_pedantic, mail_mime_child(), mail_mime_count(), pl_set(), placer_t, PLACER_T, st_alloc_opts(), st_empty, and st_free().

Referenced by mail_mime_part().

5.197.1.15 int_t mail_mime_type (placer_t *header*)

Get the content type from a MIME header.

Note:

If no content type is specified in the header via Content-Type, "text/plain" is assumed.

Parameters:

header a placer containing the MIME header to be examined.

Returns:

the MIME content type specified by the header, or MESSAGE_TYPE_UNKNOWN on failure.

Definition at line 518 of file mime.c.

References mail_header_fetch_cleaned(), MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_-MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_RFC822, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, MESSAGE_TYPE_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_mime_part().

5.197.1.16 stringer_t∗ mail_mime_type_group (placer_t *header*)

Get the value of the Content-Type header from a mime header.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content type value of the header, with "text" as the default.

Definition at line 125 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure(), and portal_message_attachments().

5.197.1.17 array_t∗ mail_mime_type_parameters (placer_t *header*)

Get an array of the key/value pairs of parameters passed to the value of the mime Content-Type header.

Note:

The parameters of the Content-Type header value will be examined, and each found parameter will result in the addition of TWO managed strings to the returned array: the first containing the parameter key name, and the second with the parameter value.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

NULL on failure, or on success, an array of managed strings structured as the key name followed by the value of each parameter passed in the Content-Type header.

Definition at line 431 of file mime.c.

References ar_alloc(), ar_append(), ar_free(), ar_length_get(), ARRAY_TYPE_STRINGER, mail_header_fetch_cleaned(), mail_mime_-type_parameters_key(), mail_mime_type_parameters_value(), PLACER, placer_t, st_free(), tok_get_count_st(), tok_get_st(), and upper_st().

Referenced by imap_fetch_bodystructure().

5.197.1.18 stringer_t∗ mail_mime_type_parameters_key (stringer_t ∗ *parameter*)

Get the key name of a mime header line parameter.

Parameters:

parameter a managed string containing the complete parameter (key/value pair) of the mime header line.

Returns:

NULL on failure or a managed string containing the mime header parameter key name on success.

Definition at line 325 of file mime.c.

References length, st_char_get(), st_import(), and st_length_get().

Referenced by mail_mime_type_parameters().

5.197.1.19 stringer_t* mail_mime_type_parameters_value (stringer_t * *parameter*)

Get the value of a mime header line parameter.

Parameters:

parameter a managed string containing the complete parameter (key/value pair) of the mime header line.

Returns:

NULL on failure or a managed string containing the mime header parameter value on success.

Definition at line 363 of file mime.c.

References length, st_char_get(), st_import(), and st_length_get().

Referenced by mail_mime_type_parameters().

5.197.1.20 stringer_t* mail_mime_type_sub (placer_t *header*)

Get the subtype of the Content-Type header value from a mime header.

Note:

For example in the case of a Content-Type of 'text/plain', "plain" would be the subtype.

Parameters:

header a placer pointing to the mime header to be parsed.

Returns:

a managed string containing the content subtype of the header, with "plain" as the default.

Definition at line 171 of file mime.c.

References mail_header_fetch_cleaned(), PLACER, st_char_get(), st_free(), st_import(), and st_length_get().

Referenced by imap_fetch_bodystructure(), and portal_message_attachments().

5.197.1.21 int_t mail_mime_update (mail_message_t * *message*)

Re-parse a mail message's data as a mime part, freeing any existing mime part(s) that may have already existed.

Parameters:

message the mail message object containing the message data to be parsed.

Returns:

This function always returns 1.

Definition at line 996 of file mime.c.

Functions

- void mail_destroy_message (smtp_message_t *message)

  Destroy an smtp message and free all of its underlying data.

- void mail_destroy (mail_message_t *message)

  Free a mail message and all its underlying data.

- mail_message_t * mail_message (stringer_t *text)

  Parse a raw mail data string and return a new mail message object containing the processed message.

- smtp_message_t * mail_create_message (stringer_t *text)

  Create an smtp message object out of a buffer of raw data supplied via the smtp DATA command.

5.198.1 Function Documentation

5.198.1.1 smtp_message_t* mail_create_message (stringer_t * *text*)

Create an smtp message object out of a buffer of raw data supplied via the smtp DATA command.

Note:

This function will also generate a random message ID.

Parameters:

text a pointer to a managed string containing the smtp data to be parsed.

Returns:

NULL on failure or a pointer to the newly initialized smtp message object wrapping the data on success.

Definition at line 127 of file objects.c.

References smtp_message_t::header_length, smtp_message_t::id, log_pedantic, mail_header_end(), mail_headers(), mm_alloc(), mm_free(), rand_choices(), st_free(), and smtp_message_t::text.

Referenced by smtp_data().

5.198.1.2 void mail_destroy (mail_message_t * *message*)

Free a mail message and all its underlying data.

Parameters:

message a pointer to the mail message object to be freed.

Returns:

This function returns no value.

Definition at line 32 of file objects.c.

References mail_message_t::from, mail_mime_free(), mail_message_t::mime, mm_free(), st_cleanup, and mail_message_t::text.

Referenced by imap_fetch_body(), imap_fetch_message(), imap_fetch_return_header(), imap_fetch_return_message(), imap_fetch_return_-mime(), imap_fetch_return_text(), imap_search_messages(), mail_add_forward_headers(), mail_load_header(), pop_retr(), pop_top(), and portal_endpoint_messages_load().

5.198.1.3 void mail_destroy_message (smtp_message_t ∗ *message*)

Destroy an smtp message and free all of its underlying data.

Parameters:

message a pointer to the smtp message to be destroyed.

Returns:

This function returns no value.

Definition at line 15 of file objects.c.

References smtp_message_t::from, smtp_message_t::id, mm_free(), st_cleanup, and smtp_message_t::text.

Referenced by smtp_data(), smtp_session_destroy(), and smtp_session_reset().

5.198.1.4 mail_message_t∗ mail_message (stringer_t ∗ *text*)

Parse a raw mail data string and return a new mail message object containing the processed message. objects.c

Parameters:

text a pointer to the managed string containing the raw (uncompressed) mail data to be parsed.

Returns:

NULL on failure or a pointer to a newly allocated mail message object with the message on success.

Definition at line 54 of file objects.c.

References mail_message_t::date, mail_message_t::from, mail_message_t::header_length, length, log_pedantic, mail_header_end(), mail_-header_fetch_cleaned(), mail_store_header(), mm_alloc(), mm_cmp_ci_eq(), mm_free(), PLACER, st_char_get(), st_length_get(), mail_-message_t::subject, mail_message_t::text, and mail_message_t::to.

Referenced by mail_add_forward_headers(), and mail_load_message().

Functions

- bool_t obj_cache_start (void)

  Initialize the object cache for all active user objects and web sessions.

- void obj_cache_stop (void)

  Stop the object cache and free all active user and web session objects.

- void obj_cache_prune (void)

  The prune function runs every few minutes and scans the object cache and removes any stale objects it finds.

Variables

- object_cache_t objects

5.199.1 Function Documentation

5.199.1.1 void obj_cache_prune (void)

The prune function runs every few minutes and scans the object cache and removes any stale objects it finds.

Note:

If the number of entries is over 4,096, then the prune function will remove entries candidates which have been unused more then 5 minutes. If the index holds more than 2,048, entries older than 30 minutes are pruned, otherwise if the index holds fewer than 2,048 entries, only those objects older than 1 hour are removed. Also, note that the precise interval between scans is somewhat random, because the background thread responsible for running the prune function goes to sleep for a random number of seconds.

Functions

- placer_t * mail_domain_get (stringer_t *address, placer_t *output)
  Get the domain portion of an email address.
- stringer_t * mail_extract_address (stringer_t *address)
  Extract a valid email address from a From: header value.

5.201.1 Function Documentation

5.201.1.1 placer_t* mail_domain_get (stringer_t * *address*, placer_t * *output*)

Get the domain portion of an email address.

Parameters:

address a managed string containing the email address to be parsed.

output a pointer to a placer to receive the domain portion of the email address.

Returns:

NULL on failure or a pointer to the output of the domain extraction on success.

Definition at line 16 of file parsing.c.

References tok_get_count_st(), and tok_get_st().

Referenced by smtp_check_authorized_from(), smtp_fetch_inbound(), smtp_rcpt_to(), and spf_check().

5.201.1.2 stringer_t* mail_extract_address (stringer_t * *address*)

Extract a valid email address from a From: header value. parsing.c

Note:

The preference of this function is first to try to find the email addressed enclosed in <>. No valid email address may be enclosed in () or "".

Parameters:

address a managed string containing the buffer from which the email address will be extracted.

Returns:

NULL on failure or a managed string containing the email address on success.

Definition at line 32 of file parsing.c.

References comment, length, log_pedantic, st_alloc(), st_char_get(), st_data_get(), st_empty_out(), and st_length_set().

```
#include "magma.h"
```

Functions

- int_t mail_path_finder (chr_t *string)
- chr_t * mail_message_path (uint64_t number, chr_t *server)

  Return the fully qualified local file path of a stored mail message for a specified message number and server.

- bool_t mail_create_directory (uint64_t number, chr_t *server)

  Create the on-disk directory structure necessary to hold a given message's file data.

5.202.1 Function Documentation

5.202.1.1 bool_t mail_create_directory (uint64_t *number*, chr_t * *server*)

Create the on-disk directory structure necessary to hold a given message's file data.

Parameters:

number the mail message id.

server the hostname of the server where the message data resides or if NULL, the default server.

Returns:

true on success or false on failure.

Definition at line 66 of file paths.c.

References magma_t::active, log_error, magma, magma_t::root, st_char_get(), st_length_int(), and magma_t::storage.

Referenced by mail_copy_message(), and mail_store_message_data().

5.202.1.2 chr_t* mail_message_path (uint64_t *number*, chr_t * *server*)

Return the fully qualified local file path of a stored mail message for a specified message number and server. paths.c

Parameters:

number the mail message id.

server the hostname of the server where the message data resides or if NULL, the default server.

Returns:

NULL on failure, or a pointer to a null-terminated string containing the absolute file path of the specified message.

Definition at line 35 of file paths.c.

References magma_t::active, log_pedantic, magma, ns_alloc(), ns_free(), magma_t::root, st_char_get(), st_length_int(), and magma_t::storage.

Referenced by mail_copy_message(), mail_load_message(), mail_remove_message(), and mail_store_message_data().

5.202.1.3 int_t mail_path_finder (chr_t * *string*)

Note:

This function is not called from anywhere in the code and may be subject to removal.

Definition at line 13 of file paths.c.

References length, and ns_length_get().

```
#include "magma.h"
```

Functions

- bool_t mail_remove_message (uint64_t usernum, uint64_t messagenum, uint32_t size, chr_t *server)

  Remove a specified mail message from both the database and storage.

5.203.1 Function Documentation

5.203.1.1 bool_t mail_remove_message (uint64_t *usernum*, uint64_t *messagenum*, uint32_t *size*, chr_t * *server*)

Remove a specified mail message from both the database and storage. remove_message.c

LOW: When the reliable job queue is working we can handle unlink errors by creating a job entry which will retry the unlink operation at a later time.

Parameters:

usernum the user id to whom the specified mail message belongs.

messagenum the target mail message id.

size the size of the message in bytes, to be assessed against the user quota.

server the name of the server on which the mail message resides.

Returns:

true if the message removal succeeds or false on failure.

Definition at line 20 of file remove_message.c.

References log_pedantic, mail_db_delete_message(), mail_message_path(), ns_free(), tran_commit(), tran_rollback(), and tran_start().

```

Functions

- stringer_t ∗ mail_build_signature (server_t ∗server, int_t content_type, int_t content_encoding, uint64_t signum, uint64_t sigkey, int_t disposition)

  Build a spam text signature for insertion into a message body.

- int_t mail_discover_type (stringer_t ∗header)

  Get the value of the Content-Type header in a mail message header.

- int_t mail_discover_encoding (stringer_t ∗header)

  Get the value of the Content-Transfer-Encoding header in a mail message header.

- stringer_t ∗ mail_extract_tag (chr_t ∗stream, size_t length)

  Extract an html tag from a data buffer, searching backwards.

- size_t mail_discover_insertion_point (stringer_t ∗message, stringer_t ∗part, int_t type)

  Find the position in a mail message where a custom message can be inserted.

- stringer_t ∗ mail_insert_chunk_base64 (server_t ∗server, stringer_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t type, int_t encoding)

  Insert a spam signature training link into a base64-encoded message part.

- stringer_t ∗ mail_insert_chunk_text (server_t ∗server, stringer_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t type, int_t encoding)

  Insert a spam signature training link into a plain text message part.

- placer_t ∗ mail_get_chunk (placer_t ∗result, stringer_t ∗message, stringer_t ∗boundary, int_t chunk)

  Get a specified chunk (mime part) of a multipart mime message.

- stringer_t ∗ mail_get_boundary (stringer_t ∗header)

  Get the boundary string from a message header.

- int_t mail_modify_part (server_t ∗server, mail_message_t ∗message, stringer_t ∗part, uint64_t signum, uint64_t sigkey, int_t disposition, int_t recursion)

  Insert a spam signature training link into a specified part of a mime message.

- void mail_signature_add (mail_message_t ∗message, server_t ∗server, uint64_t signum, uint64_t sigkey, int_t disposition)

  Insert a spam signature training link into a mail message.

5.204.1 Function Documentation

5.204.1.1 stringer_t∗ mail_build_signature (server_t ∗ *server*, int_t *content_type*, int_t *content_encoding*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*)

Build a spam text signature for insertion into a message body. signatures.c

Parameters:

server the server object of the web server where the teacher application is hosted.

type MESSAGE_TYPE_HTML to generate an html-based signature, or any other value for plain text.

content_encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

Returns:

NULL on failure, or a newly allocated managed string containing the desired mail signature on success.

Definition at line 20 of file signatures.c.

References server_t::domain, length, log_pedantic, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_TYPE_HTML, qp_-encode(), st_alloc(), st_char_get(), st_cleanup, st_free(), st_length_get(), st_merge, st_sprint(), and uint64_digits().

Referenced by mail_insert_chunk_base64(), and mail_insert_chunk_text().

5.204.1.2 int_t mail_discover_encoding (stringer_t ∗ *header*)

Get the value of the Content-Transfer-Encoding header in a mail message header.

Note:

Possible return values include MESSAGE_ENCODING_QUOTED_PRINTABL, MESSAGE_ENCODING_BASE64, MESSAGE_-ENCODING_8BIT, and MESSAGE_ENCODING_7BIT.

Parameters:

header a managed string containing the mail message header to be parsed.

Returns:

the MESSAGE_ENCODING code of the mail transfer encoding type, or MESSAGE_ENCODING_7BIT by default.

Definition at line 171 of file signatures.c.

References content, mail_header_fetch_all(), MESSAGE_ENCODING_7BIT, MESSAGE_ENCODING_8BIT, MESSAGE_ENCODING_-BASE64, MESSAGE_ENCODING_QUOTED_PRINTABLE, MESSAGE_ENCODING_UNKNOWN, mm_cmp_ci_eq(), PLACER, st_-char_get(), st_free(), and st_length_get().

Referenced by mail_modify_part().

5.204.1.3 size_t mail_discover_insertion_point (stringer_t ∗ *message*, stringer_t ∗ *part*, int_t *type*)

Find the position in a mail message where a custom message can be inserted.

Note:

The part parameter is expected to be a placer pointing into the contents of message. If the encoding type is not html, the insertion point is determined to be at the end of the part. If the encoding type is html, the following rules are followed: 1. Scanning backwards from the end of the message, skip trailing whitespace get the next html tag. 2. If that tag is NOT </html> or </body>, insert the siignature AFTER it. 3. If that tag IS </html> or </body>, insert the signature right before it closes.

Parameters:

message a managed string containing the mail message body to be parsed.

part a managed string (placer) containing the part of the message where the custom message should be inserted.

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

Returns:

the zero-based index of the position in the specified message where the custom message can be inserted.

Definition at line 296 of file signatures.c.

References length, mail_extract_tag(), MESSAGE_TYPE_HTML, PLACER, st_char_get(), st_cmp_ci_eq(), st_data_get(), st_free(), and st_length_get().

Referenced by mail_insert_chunk_base64(), and mail_insert_chunk_text().

5.204.1.4 int_t mail_discover_type (stringer_t ∗ *header*)

Get the value of the Content-Type header in a mail message header.

Note:

Possible return values include MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_UNKOWN, and MESSAGE_TYPE_PLAIN.

Parameters:

header a managed string containing the mail message header to be parsed.

Returns:

the MESSAGE_TYPE code of the mail content type, or MESSAGE_TYPE_PLAIN by default.

Definition at line 120 of file signatures.c.

References content, mail_header_fetch_all(), MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, mm_cmp_ci_eq(), PLACER, st_char_get(), st_free(), and st_length_get().

Referenced by mail_modify_part().

5.204.1.5 stringer_t∗ mail_extract_tag (chr_t ∗ *stream*, size_t *length*)

Extract an html tag from a data buffer, searching backwards.

Warning:

Remember that this function takes the end and not the start of a buffer!

Note:

The extracted tag contains the enclosing brackets and only printable characters (no whitespace).

Parameters:

stream the end of a data buffer containing the html data to be parsed.

length the size, in bytes, of the data buffer to be parsed.

Returns:

NULL on failure, or a managed string containing the printable contents of the nearest html tag on success.

Definition at line 218 of file signatures.c.

References log_pedantic, st_alloc(), st_char_get(), st_free(), and st_length_set().

Referenced by mail_discover_insertion_point().

5.204.1.6 stringer_t* mail_get_boundary (stringer_t * *header*)

Get the boundary string from a message header.

Note:

This function works by parsing the Content-Type header if it exists, falling back to the entire header otherwise. The returned boundary string includes a trailing "--".

Parameters:

header a managed string containing the message header.

Returns:

NULL on failure or a managed strirng containing the boundary string on success.

Definition at line 634 of file signatures.c.

References content, length, log_pedantic, mail_header_fetch_all(), PLACER, st_char_get(), st_cleanup, st_data_get(), st_length_get(), st_-merge, and st_search_ci().

Referenced by mail_modify_part().

5.204.1.7 placer_t* mail_get_chunk (placer_t * *result*, stringer_t * *message*, stringer_t * *boundary*, int_t *chunk*)

Get a specified chunk (mime part) of a multipart mime message.

Parameters:

result a pointer to the placer that will contain the result

message a managed string containing the mime message to be parsed.

boundary a managed string containing the boundary used to split the multipart mime message.

chunk the one-index based chunk to be retrieved from the multipart message

Returns:

NULL on failure or a pointer to the placer containing the specified chunk.

Definition at line 545 of file signatures.c.

References length, log_error, log_pedantic, mm_cmp_cs_eq(), pl_init_by_addr(), PLACER, st_char_get(), st_length_get(), and st_search_-cs().

Referenced by mail_modify_part().

5.204.1.8 stringer_t* mail_insert_chunk_base64 (server_t * *server*, stringer_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *type*, int_t *encoding*)

Insert a spam signature training link into a base64-encoded message part.

See also:

mail_discover_insertion_point()

Note:

This is similar to mail_insert_chunk_text() except the part has to be decoded and then re-encoded after the training link is inserted.

Parameters:

server the server object of the web server where the teacher application is hosted.

message a managed string containing the base64-encoded message body to be parsed.

part a managed string (placer) containing the part of the message where the signature should be inserted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

Returns:

NULL on failure or a managed string containing the base64-encoded message with the inserted signature training link on success.

Definition at line 361 of file signatures.c.

References base64_decode(), base64_encode(), length, log_pedantic, mail_build_signature(), mail_discover_insertion_point(), PLACER, st_-char_get(), st_cleanup, st_data_get(), st_free(), st_length_get(), and st_merge.

Referenced by mail_modify_part().

5.204.1.9 stringer_t* mail_insert_chunk_text (server_t * *server*, stringer_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *type*, int_t *encoding*)

Insert a spam signature training link into a plain text message part.

See also:

mail_discover_insertion_point()

Parameters:

server the server object of the web server where the teacher application is hosted.

message a managed string containing the message body to be parsed.

part a managed string (placer) containing the part of the message where the signature should be inserted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

type the encoding type of the message (MESSAGE_TYPE_HTML or other).

encoding if MESSAGE_ENCODING_QUOTED_PRINTABLE, set the encoding type to qp.

Returns:

NULL on failure or a managed string containing the message with the inserted signature training link on success.

Definition at line 502 of file signatures.c.

References log_pedantic, mail_build_signature(), mail_discover_insertion_point(), PLACER, st_char_get(), st_empty, st_free(), st_length_-get(), and st_merge.

Referenced by mail_modify_part().

5.204.1.10 int_t mail_modify_part (server_t * *server*, mail_message_t * *message*, stringer_t * *part*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*, int_t *recursion*)

Insert a spam signature training link into a specified part of a mime message.

Warning:

This function may fail to work as expected and still return a value of 1.

Note:

If the mime type is MESSAGE_TYPE_UNKNOWN (binary file), the function returns immediately. If the type is MESSAGE_TYPE_-HTML or MESSAGE_TYPE_PLAIN, the training link is inserted normally. For MESSAGE_TYPE_MULTI_RELATED, MESSAGE_-TYPE_MULTI_MIXED, MESSAGE_TYPE_MULTI_UNKOWN the link is inserted in the first mime part. For MESSAGE_TYPE_-MULTI_ALTERNATIVE, the link is inserted into each part, for up to 8 times.

Parameters:

server the server object of the web server where the teacher application is hosted.

message the mail message object of the message to be modified.

part a placer pointing to the specified part of the message to be modified.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

recursion an incremented recursion level tracker for calling this function, to prevent an overflow from occurring.

Returns:

0 on recursion failure, or 1 otherwise.

Definition at line 720 of file signatures.c.

References length, log_pedantic, mail_discover_encoding(), mail_discover_type(), mail_get_boundary(), mail_get_chunk(), mail_insert_-chunk_base64(), mail_insert_chunk_text(), mail_modify_part(), MAIL_SIGNATURES_RECURSION_LIMIT, MESSAGE_ENCODING_-BASE64, MESSAGE_TYPE_HTML, MESSAGE_TYPE_MULTI_ALTERNATIVE, MESSAGE_TYPE_MULTI_MIXED, MESSAGE_-TYPE_MULTI_RELATED, MESSAGE_TYPE_MULTI_UNKOWN, MESSAGE_TYPE_PLAIN, MESSAGE_TYPE_UNKNOWN, PLACER, placer_t, st_char_get(), st_data_get(), st_free(), st_length_get(), mail_message_t::text, and type().

5.204.1.11 void mail_signature_add (mail_message_t * *message*, server_t * *server*, uint64_t *signum*, uint64_t *sigkey*, int_t *disposition*)

Insert a spam signature training link into a mail message.

See also:

mail_modify_part()

Parameters:

message the mail message object of the message to be modified.

server the server object of the web server where the teacher application is hosted.

signum the spam signature number referenced by the teacher url.

sigkey the spam signature key for client verification in the teacher app.

disposition if 0, the message disposition is "innocent"; otherwise, the disposition specifies "spam".

Returns:

This function returns no value.

Definition at line 846 of file signatures.c.

References log_pedantic, mail_modify_part(), PLACER, st_char_get(), st_length_get(), st_length_int(), and mail_message_t::text.

Referenced by mail_add_forward_headers(), and mail_load_message().

5.205 src/objects/mail/store_message.c File Reference

```
#include "magma.h"
```

Functions

- bool_t mail_store_message_data (uint64_t messagenum, uint8_t flags, stringer_t *data, chr_t **pathptr)

  Persist a message's data to disk.

- uint64_t mail_store_message (uint64_t usernum, prime_t *signet, uint64_t foldernum, uint32_t *status, uint64_t signum, uint64_t sigkey, stringer_t *message)

  Store a mail message, with its meta-information in the database, and the contents persisted to disk.

- uint64_t mail_copy_message (uint64_t usernum, uint64_t original, chr_t *server, uint32_t size, uint64_t foldernum, uint32_t status, uint64_t signum, uint64_t sigkey, uint64_t created)

  Create a copy of a mail message, with a new entry in the database and a hard link to the message contents on disk.

- int_t mail_move_message (uint64_t usernum, uint64_t messagenum, uint64_t source, uint64_t target)

  Move a message to a new folder in the database.

5.205.1 Function Documentation

5.205.1.1 uint64_t mail_copy_message (uint64_t *usernum*, uint64_t *original*, chr_t * *server*, uint32_t *size*, uint64_t *foldernum*, uint32_t *status*, uint64_t *signum*, uint64_t *sigkey*, uint64_t *created*)

Create a copy of a mail message, with a new entry in the database and a hard link to the message contents on disk. store_message.c

Parameters:

usernum the numerical id of the user to whom the mail message belongs.

original the numerical id of the mail message to be copied.

server a pointer to a null-terminated string containing the name of the server where the message contents are stored.

size the size, in bytes, of the mail message to be copied.

foldernum the numerical id of the folder to become the parent folder of the message copy.

signum the spam signature for the message.

sigkey the spam key for the message.

created the UNIX timestamp of when the message was created.

Returns:

0 on failure, or the ID of the copy of the mail message in the database on success.

Definition at line 195 of file store_message.c.

References log_error, log_pedantic, mail_create_directory(), mail_db_insert_duplicate_message(), mail_message_path(), ns_free(), tran_commit(), tran_rollback(), and tran_start().

Referenced by imap_message_copier(), and meta_messages_copier().

5.205.1.2 int_t mail_move_message (uint64_t *usernum*, uint64_t *messagenum*, uint64_t *source*, uint64_t *target*)

Move a message to a new folder in the database.

Parameters:

usernum the numerical id of the user that owns the message.

messagenum the numerical id of the message to be moved.

source the numerical id of the current parent folder of the specified message.

target the numerical id of the folder to which the specified message will be moved.

Returns:

-1 on error, 0 if the message wasn't found, or 1 on success.

Definition at line 280 of file store_message.c.

References log_error, log_pedantic, mail_db_update_message_folder(), tran_commit(), tran_rollback(), and tran_start().

Referenced by meta_messages_mover().

5.205.1.3 uint64_t mail_store_message (uint64_t *usernum*, prime_t * *signet*, uint64_t *foldernum*, uint32_t * *status*, uint64_t *signum*, uint64_t *sigkey*, stringer_t * *message*)

Store a mail message, with its meta-information in the database, and the contents persisted to disk.

Note:

The stored message is always compressed, but only encrypted if the user's public key is suppplied.

Parameters:

usernum the numerical id of the user to which the message belongs.

pubkey if not NULL, a public key that will be used to encrypt the message for the intended user.

foldernum the folder # that will contain the message.

status a pointer to the status flags value for the message, which will be updated if the message is to be encrypted.

signum the spam signature for the message.

sigkey the spam key for the message.

message a managed string containing the raw body of the message.

Returns:

0 on failure, or the newly inserted id of the message in the database on success.

Definition at line 103 of file store_message.c.

References compress_cleanup(), compress_lzo(), compress_total_length(), FMESSAGE_OPT_COMPRESSED, FMESSAGE_OPT_-ENCRYPTED, log_error, log_pedantic, mail_db_insert_message(), MAIL_STATUS_ENCRYPTED, mail_store_message_data(), ns_free(), org_key, PLACER, prime_cleanup(), prime_message_encrypt(), st_cleanup, st_length_int(), tran_commit(), tran_rollback(), and tran_start().

Referenced by imap_append_message(), and smtp_store_message().

5.205.1.4 bool_t mail_store_message_data (uint64_t *messagenum*, uint8_t *flags*, stringer_t * *data*, chr_t ** *pathptr*)

Persist a message's data to disk.

Parameters:

messagenum the numerical id of the message that will be associated with the data.

data a pointer to a buffer containing the message's data.

fflags the status flags to be stored in the message's on-disk file header.

data_len the size, in bytes, of the message's data.

pathptr if not NULL, the address of a pointer to a string that will receive a copy of the message's on-disk data.

Returns:

true if the storage operation succeeded, or false on failure.

Definition at line 19 of file store_message.c.

References FMESSAGE_MAGIC_1, FMESSAGE_MAGIC_2, log_error, mail_create_directory(), mail_message_path(), message_header_t, ns_free(), st_data_get(), and st_length_get().

Definition at line 12 of file messages.h.

5.206.3 Function Documentation

5.206.3.1 struct __attribute__ ((packed)) [read]

LOW: Update the Messages table columns so they match the tank mail message header fields. Store individual header/body lengths and the compressed/uncompressed hash values; then update the message type to store and use the new information.

Definition at line 108 of file messages.h.

5.206.3.2 message_t* message_alloc (uint64_t *messagenum*, uint64_t *created*, uint64_t *signature*, uint64_t *key*, uint64_t *flags*, stringer_t * *server*, size_t *size*)

messages.c messages.c

Parameters:

messagenum the numerical message id of the new message.

created the message creation timestamp.

signature the message's spam filter signature number.

key the message's spam filter access key.

flags the message's flags value.

server a managed string containing the name of the server where the message will be stored.

size the size, in bytes, of the raw message data.

Returns:

NULL on failure, or the newly allocated message object on success.

Definition at line 60 of file messages.c.

References align(), FOREIGNDATA, JOINTED, log_pedantic, message_t, mm_alloc(), mm_copy(), mm_free(), PLACER_T, placer_t, rwlock_init(), st_data_get(), st_length_get(), and STACK.

Referenced by meta_data_fetch_folder_messages().

5.206.3.3 void message_free (message_t ∗ *message*)

Free a message object and its underlying data.

Returns:

This function returns no value.

Definition at line 39 of file messages.c.

References mm_cleanup, rwlock_destroy(), and st_cleanup.

Referenced by message_folder_alloc(), and meta_data_fetch_folder_messages().

5.206.3.4 inx_t∗ messages_update (uint64_t *usernum*)

Fetch all of a user's message folders and their child messages from the database.

Parameters:

usernum the numerical id of the target user.

Returns:

NULL on failure or an inx object holding all the retrieved and populated message folder objects on success.

Definition at line 96 of file messages.c.

References inx_cleanup(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), log_pedantic, M_-FOLDER_MESSAGES, magma_folder_fetch(), and meta_data_fetch_folder_messages().

Referenced by meta_update_message_folders().

5.206.3.5 bool_t meta_data_fetch_folder_messages (uint64_t *usernum*, message_folder_t ∗ *folder*)

datatier.c datatier.c

Parameters:

usernum the numerical id of the user that owns the folder.

folder a pointer to the message folder object to be populated.

Returns:

true on success or false on failure.

Definition at line 16 of file datatier.c.

References inx_append(), log_error, log_pedantic, M_TYPE_UINT64, message_alloc(), message_free(), message_t, mm_wipe(), PLACER, res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by messages_update().

5.206.3.6 void meta_data_fetch_message_tags (meta_message_t ∗ *message*)

Fetch the tags for a specified message from the database.

Note:

The results of the operation will be stored in the specified meta message object's "tags" member.

Parameters:

message the meta message object for which the tags will be looked up.

Returns:

This function returns no value.

Definition at line 77 of file datatier.c.

References ar_alloc(), ar_append(), ARRAY_TYPE_STRINGER, meta_message_t::messagenum, mm_wipe(), res_field_string(), res_row_count(), res_row_next(), res_table_free(), stmt_get_result(), and meta_message_t::tags.

Referenced by meta_data_fetch_messages(), and portal_endpoint_messages_tag().

5.206.3.7 bool_t meta_data_fetch_messages (meta_user_t ∗ *user*)

Fetch all of a user's stored messages from the database and attach them to the meta user object.

Note:

Any of the user's existing messages will be destroyed first to allow for updates.

Parameters:

user the meta user object whose mail messages will be retrieved.

Returns:

true on success or false on failure.

TODO: Do we still need this once the refactorization is complete?

Definition at line 115 of file datatier.c.

References meta_message_t::created, meta_message_t::foldernum, inx_alloc(), inx_append(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_truncate(), log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, MAIL_STATUS_TAGGED, meta_message_t::messagenum, meta_user_t::messages, meta_data_fetch_message_tags(), meta_message_free(), mm_alloc(), mm_copy(), mm_free(), mm_wipe(), res_field_block(), res_field_length(), res_field_uint32(), res_field_uint64(), res_row_next(), res_table_free(), meta_message_t::server, meta_message_t::sigkey, meta_message_t::signum, meta_message_t::size, meta_message_t::status, stmt_get_result(), multi_t::type, multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by meta_messages_login_update(), and meta_messages_update().

5.206.3.8 meta_message_t* meta_message_by_number (inx_t * *messages*, uint64_t *number*)

meta.c meta.c

Parameters:

messages a pointer to the messages collection to be searched.

number the number of the message to be retrieved.

Returns:

NULL on failure, or a pointer to the meta message object of the matching mail message.

Definition at line 54 of file meta.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, and inx_cursor_value_next().

5.206.3.9 meta_message_t* meta_message_dupe (meta_message_t * *message*)

Duplicate a meta message object (along with a deep copy of its tags).

Parameters:

message the meta message object to be cloned.

Returns:

NULL on failure or a pointer to the duplicated meta message object on success.

Definition at line 33 of file meta.c.

References ar_dupe(), mm_dupe(), and meta_message_t::tags.

Referenced by imap_duplicate_messages(), imap_message_copier(), imap_search_messages(), and meta_messages_copier().

5.206.3.10 void meta_message_free (meta_message_t * *message*)

Free a meta message object (and its tags).

Returns:

This function returns no value.

Definition at line 14 of file meta.c.

References ar_free(), mm_free(), and meta_message_t::tags.

Referenced by imap_duplicate_messages(), imap_search_messages(), and meta_data_fetch_messages().

5.206.3.11 bool_t meta_messages_copier (meta_user_t * *user*, meta_message_t * *message*, uint64_t *target*, uint64_t * *outnum*, bool_t *sequences*, META_LOCK_STATUS *locked*)

Parameters:

Make a copy of a mail message, in the database and in memory.

See also:

mail_copy_message()

Note:

The message copy will not have the deleted, hidden, or recent flags set in the database, but it will have the recent flag set in memory.

Parameters:

user a pointer to the meta user object to whom the message belong.

message the meta message object of the message to be copied.

target the numerical id of the folder to which the message will be copied.

outnum a pointer to an unsigned 64-bit integer that will receive the value of the numerical id of the message copy.

sequences if true, resequence the message folders after the copy has been made.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true on success or false on failure.

Definition at line 238 of file meta.c.

References meta_message_t::created, meta_user_t::folders, inx_insert(), log_error, log_pedantic, M_TYPE_UINT64, mail_copy_message(), MAIL_STATUS_DELETED, MAIL_STATUS_HIDDEN, MAIL_STATUS_RECENT, meta_message_t::messagenum, meta_user_t::messages, meta_message_dupe(), meta_messages_update_sequences(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), mm_free(), meta_message_t::server, meta_message_t::sigkey, meta_message_t::signum, meta_message_t::size, meta_message_t::status, status, multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by portal_endpoint_messages_copy().

5.206.3.12 bool_t meta_messages_login_update (meta_user_t ∗ *user*, META_LOCK_STATUS *locked*)

Build a user's messages collection if it is empty, or needs to be refreshed (see note).

Note:

This function will fetch and sequence the user's messages from the database if the meta user object has no messages, or if the user has one or fewer pop sessions open and the messages serial number was stale.

Parameters:

user a pointer to the meta user object of the user requesting the messages update.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true if no update was necessary or if the update was successful, or false otherwise.

Definition at line 125 of file meta.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_messages(), meta_messages_update_sequences(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by pop_pass().

5.206.3.13 int_t meta_messages_mover (meta_user_t ∗ *user*, meta_message_t ∗ *message*, uint64_t *target*, bool_t *lookup*, bool_t *sequences*, META_LOCK_STATUS *locked*)

Parameters:

Move a mail message to another folder.

See also:

mail_move_message()

Note:

The message will receive a copy of the recent flag in memory.

Parameters:

user a pointer to the meta user object to whom the message belong.

message the meta message object of the message to be moved.

target the numerical id of the folder to which the message will be copied.

lookup if set, verify the existence of the moved message in the user's messages.

sequences if true, resequence the message folders after the copy has been made.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true on success or false on failure.

BUG: Currently we preserve the original message number which means when the target folder sequences are updated the moved message can appear anywhere in the list (since its based on message number). Inserting messages into the sequence list in this fashion will probably break clients. We may want to duplicate the row which would generate a new message number causing the newly added message to appear at the end of the folder listing. On the other hand POP ignores folders completely, so maybe it won't be quite so bad.

Definition at line 316 of file meta.c.

Referenced by portal_endpoint_messages_move().

5.206.3.14 int_t meta_messages_update (meta_user_t ∗ *user*, META_LOCK_STATUS *locked*)

Refresh and resquence a user's message collection if it is stale.

Note:

The user's messages will only be updated if they are empty or if they are out of sync and the user has no open pop sessions.

See also:

meta_data_fetch_messages()

Parameters:

user a pointer to the meta user object requesting the messages update.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

-1 on failure, or 1 on success.

Definition at line 179 of file meta.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_messages(), meta_messages_update_sequences(), META_-NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_-increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by imap_session_update(), meta_get(), and sess_update().

5.206.3.15 void meta_messages_update_sequences (inx_t * *folders*, inx_t * *messages*)

Update the sequence numbers of a series of messages, each re-indexed by their containing folder.

Note:

All messages will be sequenced incrementally per folder, starting with a value of 1.

Parameters:

folders an inx holder containing all of the user's meta folder records.

messages an inx folder containing all the messages to be re-sequenced.

Returns:

This function returns no value.

Definition at line 83 of file meta.c.

5.208.1 Function Documentation

5.208.1.1 meta_message_t* meta_message_by_number (inx_t * *messages*, uint64_t *number*)

Retrieve a message by number. meta.c

Parameters:

messages a pointer to the messages collection to be searched.

number the number of the message to be retrieved.

Returns:

NULL on failure, or a pointer to the meta message object of the matching mail message.

Definition at line 54 of file meta.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, and inx_cursor_value_next().

5.208.1.2 meta_message_t* meta_message_dupe (meta_message_t * *message*)

Duplicate a meta message object (along with a deep copy of its tags).

Parameters:

message the meta message object to be cloned.

Returns:

NULL on failure or a pointer to the duplicated meta message object on success.

Definition at line 33 of file meta.c.

References ar_dupe(), mm_dupe(), and meta_message_t::tags.

Referenced by imap_duplicate_messages(), imap_message_copier(), imap_search_messages(), and meta_messages_copier().

5.208.1.3 void meta_message_free (meta_message_t ∗ *message*)

Free a meta message object (and its tags).

Returns:

This function returns no value.

Definition at line 14 of file meta.c.

References ar_free(), mm_free(), and meta_message_t::tags.

Referenced by imap_duplicate_messages(), imap_search_messages(), and meta_data_fetch_messages().

5.208.1.4 bool_t meta_messages_copier (meta_user_t ∗ *user*, meta_message_t ∗ *message*, uint64_t *target*, uint64_t ∗ *outnum*, bool_t *sequences*, META_LOCK_STATUS *locked*)

Parameters:

Make a copy of a mail message, in the database and in memory.

See also:

mail_copy_message()

Note:

The message copy will not have the deleted, hidden, or recent flags set in the database, but it will have the recent flag set in memory.

Parameters:

user a pointer to the meta user object to whom the message belong.

message the meta message object of the message to be copied.

target the numerical id of the folder to which the message will be copied.

outnum a pointer to an unsigned 64-bit integer that will receive the value of the numerical id of the message copy.

sequences if true, resequence the message folders after the copy has been made.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true on success or false on failure.

Definition at line 238 of file meta.c.

References meta_message_t::created, meta_user_t::folders, inx_insert(), log_error, log_pedantic, M_TYPE_UINT64, mail_copy_message(), MAIL_STATUS_DELETED, MAIL_STATUS_HIDDEN, MAIL_STATUS_RECENT, meta_message_t::messagenum, meta_user_t::messages, meta_message_dupe(), meta_messages_update_sequences(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), mm_free(), meta_message_t::server, meta_message_t::sigkey, meta_message_t::signum, meta_message_t::size, meta_message_t::status, status, multi_t::u64, meta_user_t::usernum, and multi_t::val.

Referenced by portal_endpoint_messages_copy().

5.208.1.5 bool_t meta_messages_login_update (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Build a user's messages collection if it is empty, or needs to be refreshed (see note).

Note:

This function will fetch and sequence the user's messages from the database if the meta user object has no messages, or if the user has one or fewer pop sessions open and the messages serial number was stale.

Parameters:

user a pointer to the meta user object of the user requesting the messages update.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true if no update was necessary or if the update was successful, or false otherwise.

Definition at line 125 of file meta.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_messages(), meta_messages_update_sequences(), META_-NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_-increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by pop_pass().

5.208.1.6 int_t meta_messages_mover (meta_user_t * *user*, meta_message_t * *message*, uint64_t *target*, bool_t *lookup*, bool_t *sequences*, META_LOCK_STATUS *locked*)

Parameters:

Move a mail message to another folder.

See also:

mail_move_message()

Note:

The message will receive a copy of the recent flag in memory.

Parameters:

user a pointer to the meta user object to whom the message belong.

message the meta message object of the message to be moved.

target the numerical id of the folder to which the message will be copied.

lookup if set, verify the existence of the moved message in the user's messages.

sequences if true, resequence the message folders after the copy has been made.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

true on success or false on failure.

BUG: Currently we preserve the original message number which means when the target folder sequences are updated the moved message can appear anywhere in the list (since its based on message number). Inserting messages into the sequence list in this fashion will probably break clients. We may want to duplicate the row which would generate a new message number causing the newly added message to appear at the end of the folder listing. On the other hand POP ignores folders completely, so maybe it won't be quite so bad.

Definition at line 316 of file meta.c.

Referenced by portal_endpoint_messages_move().

5.208.1.7 int_t meta_messages_update (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Refresh and resquence a user's message collection if it is stale.

Note:

The user's messages will only be updated if they are empty or if they are out of sync and the user has no open pop sessions.

See also:

meta_data_fetch_messages()

Parameters:

user a pointer to the meta user object requesting the messages update.

locked if set to META_NEED_LOCK, lock the specified meta user object for the duration of the request.

Returns:

-1 on failure, or 1 on success.

Definition at line 179 of file meta.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_messages(), meta_messages_update_sequences(), META_-NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_-increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by imap_session_update(), meta_get(), and sess_update().

5.208.1.8 void meta_messages_update_sequences (inx_t * *folders*, inx_t * *messages*)

Update the sequence numbers of a series of messages, each re-indexed by their containing folder.

Note:

All messages will be sequenced incrementally per folder, starting with a value of 1.

Parameters:

folders an inx holder containing all of the user's meta folder records.

messages an inx folder containing all the messages to be re-sequenced.

Returns:

This function returns no value.

Definition at line 83 of file meta.c.

```
#include "magma.h"
```

Functions

- void meta_free (meta_user_t *user)

  Free a meta user object.

- meta_user_t * meta_alloc (void)

  Allocate and initialize a meta user object.

- int_t meta_get (uint64_t usernum, stringer_t *username, stringer_t *salt, stringer_t *master, stringer_t *verification, META_PROTOCOL protocol, META_GET get, meta_user_t **output)

  Lookup user and return their meta user object.

5.209.1 Function Documentation

5.209.1.1 meta_user_t* meta_alloc (void)

Allocate and initialize a meta user object. meta.c

Returns:

NULL on failure, or a pointer to the newly allocated meta user object on success.

Definition at line 47 of file meta.c.

References meta_user_t::lock, log_pedantic, mm_alloc(), mm_free(), mm_wipe(), mutex_init(), meta_user_t::refs, rwlock_attr_destroy(), rwlock_attr_init(), rwlock_attr_setkind(), rwlock_destroy(), and rwlock_init().

Referenced by meta_inx_find().

5.209.1.2 void meta_free (meta_user_t * *user*)

Free a meta user object.

Parameters:

user a pointer to the meta user object to be destroyed.

Returns:

This function returns no value.

Definition at line 17 of file meta.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, inx_cleanup(), meta_user_t::key, meta_user_t::lock, meta_user_t::mail, meta_user_t::message_folders, meta_user_t::messages, mm_free(), mutex_destroy(), meta_user_t::prime, prime_cleanup(), meta_user_t::realm, meta_user_t::refs, rwlock_destroy(), meta_user_t::signet, st_cleanup, meta_user_t::username, and meta_user_t::verification.

Referenced by meta_inx_find(), and obj_cache_start().

5.209.1.3 int_t meta_get (uint64_t *usernum*, stringer_t * *username*, stringer_t * *salt*, stringer_t * *master*, stringer_t * *verification*, META_PROTOCOL *protocol*, META_GET *get*, meta_user_t ** *output*)

Lookup user and return their meta user object.

Note:

If the user is not found in the local session cache, the session will be constructed using the database, and then cached.

Parameters:

usernum the numeric identifier for the user account.

username the official username stored in the database.

salt the user specific salt value.

master the user account's master encryption key which will be used to unlock the private storage key.

verification the verification token.

protocol a set of protocol specifying the protocol used by the calling function. Values can be META_PROT_NONE, META_PROT_-SMTP, META_PROT_POP, META_PROT_IMAP, META_PROT_WEB, or META_PROT_GENERIC.

get a set of protocol specifying the data to be retrieved (META_GET_NONE, META_GET_MESSAGES, META_GET_FOLDERS, or META_GET_CONTACTS)

output the address of a meta user object that will store a pointer to the result of the lookup.

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 112 of file meta.c.

Functions

- meta_alert_t ∗ alert_alloc (uint64_t alertnum, stringer_t ∗type, stringer_t ∗message, uint64_t created)

  Allocate and initialize a new user alert message object.

5.210.1 Function Documentation

5.210.1.1 meta_alert_t∗ alert_alloc (uint64_t *alertnum*, stringer_t ∗ *type*, stringer_t ∗ *message*, uint64_t *created*)

Allocate and initialize a new user alert message object. alerts.c

Parameters:

alertnum the numerical id of the user alert.

type a pointer to a managed string containing the type of the alert (e.g. "warning" or "alert").

message a pointer to a managed string containing the alert message.

created the UTC timecode for when the alert message was created.

Returns:

NULL on error or a pointer to the newly initialized user alert message object on success.

Definition at line 18 of file alerts.c.

```

Functions

- meta_alias_t ∗ alias_alloc (uint64_t aliasnum, stringer_t ∗address, stringer_t ∗display, int_t selected, uint64_t created)

  Allocate and initialize a new user alias object.

5.211.1 Function Documentation

5.211.1.1 meta_alias_t∗ alias_alloc (uint64_t *aliasnum*, stringer_t ∗ *address*, stringer_t ∗ *display*, int_t *selected*, uint64_t *created*)

Allocate and initialize a new user alias object. alias.c

Parameters:

aliasnum the numerical identifier of the user alias.

address a managed string containing the email address associated with the alias.

display a managed string containing the display name associated with the alias.

selected a flag specifying whether this alias is the default selection for the user.

created a UNIX timestamp for the creation of this alias.

Returns:

NULL on failure, or a pointer to the newly initialized user alias object on success.

Definition at line 19 of file alias.c.

Functions

- int _crypto_init (void)
  Initialize the cryptographic subsystem.
- void _crypto_shutdown (void)
  Shutdown the cryptographic subsystem.
- int _verify_ec_signature (unsigned char const ∗hash, size_t hlen, unsigned char const ∗sig, size_t slen, EC_KEY ∗key)
  Verify that an elliptic curve signature for a given hashed data buffer is valid.
- int _verify_ec_sha_signature (unsigned char const ∗data, size_t dlen, unsigned int shabits, unsigned char const ∗sig, size_t slen, EC_-KEY ∗key)
  Verify that a signature for a given data buffer is valid.
- unsigned char ∗ _ec_sign_data (unsigned char const ∗hash, size_t hlen, EC_KEY ∗key, size_t ∗siglen)
  Sign a body of data using the ECDSA algorithm.
- unsigned char ∗ _ec_sign_sha_data (unsigned char const ∗data, size_t dlen, unsigned int shabits, EC_KEY ∗key, size_t ∗siglen)
  Sign a SHA-hashed body of data using the ECDSA algorithm.
- unsigned char ∗ _serialize_ec_pubkey (EC_KEY ∗key, size_t ∗outsize)
  Serialize an EC public key to be shared.
- EC_KEY ∗ _deserialize_ec_pubkey (unsigned char const ∗buf, size_t blen)
  Deserialize an EC public key stored in binary format.
- unsigned char ∗ _serialize_ec_privkey (EC_KEY ∗key, size_t ∗outsize)
  Serialize an EC private key into a data buffer.
- EC_KEY ∗ _deserialize_ec_privkey (unsigned char const ∗buf, size_t blen)

Deserialize an EC private key stored in binary format.

- EC_KEY * _load_ec_privkey (char const *filename)

  Load an EC private key from a file.

- EC_KEY * _load_ec_pubkey (char const *filename)

  Load an EC public key from a file.

- EC_KEY * _generate_ec_keypair (void)

  Generate an EC key pair.

- void _free_ec_key (EC_KEY *key)

  Free an EC keypair.

- ED25519_KEY * _generate_ed25519_keypair (void)

  Generate an ed25519 key pair.

- int _ed25519_sign_data (unsigned char const *data, size_t dlen, ED25519_KEY *key, ed25519_signature sigbuf)

  Take an ed25519 signature of a data buffer.

- int _ed25519_verify_sig (unsigned char const *data, size_t dlen, ED25519_KEY *key, ed25519_signature sigbuf)

  Verify an ed25519 signature taken over a data buffer.

- void _free_ed25519_key (ED25519_KEY *key)

  Free an ed25519 keypair.

- void _free_ed25519_key_chain (ED25519_KEY **keys)

  Free a list of ed25519 keypairs.

- ED25519_KEY * _load_ed25519_privkey (char const *filename)

  Load an ed25519 private key from a file.

- ED25519_KEY * _deserialize_ed25519_pubkey (unsigned char const *serial_pubkey)

  Deserializes an ed25519 public key into a public-only ED25519_KEY structure that can only be used for signature verification, not signing.

- ED25519_KEY * _deserialize_ed25519_privkey (unsigned char const *serial_privkey)

  Deserializes an ed25519 private key into a ED25519_KEY structure.

- void * _ecies_env_derivation (void const *input, size_t ilen, void *output, size_t *olen)
- int _compute_aes256_kek (EC_KEY *public_key, EC_KEY *private_key, unsigned char *keybuf)

  Compute a derived AES-256 key from the intersection of a public EC key and a private EC key.

- int _get_random_bytes (void *buf, size_t len)

  Fill a buffer with a sequence of (securely) random bytes.

- int _encrypt_aes_256 (unsigned char *outbuf, unsigned char const *data, size_t dlen, unsigned char const *key, unsigned char const *iv)

  Encrypt a data buffer using an AES-256 key (in CBC mode).

- int _decrypt_aes_256 (unsigned char *outbuf, unsigned char const *data, size_t dlen, unsigned char const *key, unsigned char const *iv)

  Decrypt a data buffer using an AES-256 key (in CBC mode).

5.213.1 Function Documentation

5.213.1.1 int _compute_aes256_kek (EC_KEY * *public_key*, EC_KEY * *private_key*, unsigned char * *keybuf*)

Compute a derived AES-256 key from the intersection of a public EC key and a private EC key.

Definition at line 720 of file crypto.c.

References _ecies_env_derivation(), _secure_wipe(), EC_KEY_get0_public_key_d, ECDH_compute_key_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, and SHA_512_SIZE.

5.213.1.2 int _crypto_init (void)

Initialize the cryptographic subsystem.

Returns:

-1 if any part of the initialization process failed, or 0 on success.

Definition at line 28 of file crypto.c.

References EC_ENCRYPT_CURVE, EC_GROUP_new_by_curve_name_d, ERR_UNSPEC, EVP_get_digestbyname_d, OBJ_nid2sn_d, OPENSSL_add_all_algorithms_noconf_d, PUSH_ERROR_OPENSSL, RET_ERROR_INT, SSL_library_init_d, and SSL_load_error_strings_d.

5.213.1.3 void _crypto_shutdown (void)

Shutdown the cryptographic subsystem.

Definition at line 52 of file crypto.c.

References EC_GROUP_clear_free_d, ERR_free_strings_d, and EVP_cleanup_d.

5.213.1.4 int _decrypt_aes_256 (unsigned char * *outbuf*, unsigned char const * *data*, size_t *dlen*, unsigned char const * *key*, unsigned char const * *iv*)

Decrypt a data buffer using an AES-256 key (in CBC mode).

Parameters:

outbuf a pointer to the output buffer that will receive the decrypted data. NOTE: the size of this buffer must be successfully negotiated by the caller.

data a pointer to the data buffer to be decrypted.

dlen the size, in bytes, of the data buffer to be decrypted.

key a pointer to the 32-byte buffer holding the AES-256 decryption key for the operation.

iv a pointer to the 32-byte initialization vector to be used for the decryption process.

Returns:

the number of bytes successfully decrypted on success, or -1 on failure.

Definition at line 849 of file crypto.c.

References AES_256_PADDING_SIZE, ERR_BAD_PARAM, ERR_UNSPEC, EVP_aes_256_cbc_d, EVP_CIPHER_CTX_free_d, EVP_CIPHER_CTX_new_d, EVP_CIPHER_CTX_set_padding_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, PUSH_ERROR_OPENSSL, and RET_ERROR_INT.

5.213.1.5 EC_KEY* _deserialize_ec_privkey (unsigned char const * *buf*, size_t *blen*)

Deserialize an EC private key stored in binary format.

Parameters:

buf a pointer to the buffer holding the EC private key in binary format.

blen the length, in bytes, of the buffer holding the EC private key.

Returns:

a pointer to the deserialized EC private key on success, or NULL on failure.

Definition at line 341 of file crypto.c.

References bufptr, ERR_BAD_PARAM, PLACER, RET_ERROR_PTR, and secp256k1_private_set().

5.213.1.6 EC_KEY* _deserialize_ec_pubkey (unsigned char const * *buf*, size_t *blen*)

Deserialize an EC public key stored in binary format.

Parameters:

buf a pointer to the buffer holding the EC public key in binary format.

blen the length, in bytes, of the buffer holding the EC public key.

Returns:

a pointer to the deserialized EC public key on success, or NULL on failure.

Definition at line 271 of file crypto.c.

References EC_GROUP_new_by_curve_name_d, EC_KEY_free_d, EC_KEY_new_d, EC_KEY_set_group_d, ERR_BAD_PARAM, ERR_UNSPEC, o2i_ECPublicKey_d, PUSH_ERROR_OPENSSL, and RET_ERROR_PTR.

Referenced by _load_ec_pubkey().

5.213.1.7 ED25519_KEY* _deserialize_ed25519_privkey (unsigned char const * *serial_privkey*)

Deserializes an ed25519 private key into a ED25519_KEY structure.

Parameters:

serial_privkey Serialized ed25519 private key.

Returns:

Pointer to the ED25119_KEY structure.

Definition at line 683 of file crypto.c.

References ED25519_KEY_SIZE, ed25519_publickey_donna(), ERR_BAD_PARAM, ERR_NOMEM, ED25519_KEY::private_key, ED25519_KEY::public_key, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.213.1.8 ED25519_KEY* _deserialize_ed25519_pubkey (unsigned char const * *serial_pubkey*)

Deserializes an ed25519 public key into a public-only ED25519_KEY structure that can only be used for signature verification, not signing.

Parameters:

serial_pubkey Serialized ed25519 public key.

Returns:

Pointer to ED25519_KEY structure.

Definition at line 657 of file crypto.c.

References ED25519_KEY_SIZE, ERR_BAD_PARAM, ERR_NOMEM, ED25519_KEY::public_key, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.213.1.9 unsigned char* _ec_sign_data (unsigned char const * *hash*, size_t *hlen*, EC_KEY * *key*, size_t * *siglen*)

Sign a body of data using the ECDSA algorithm.

Parameters:

hash a pointer to the hashed data buffer to be signed.

hlen the length, in bytes, of the hashed data to be signed.

key the EC key which will have its private portion used to sign the supplied data.

siglen a pointer to a variable that will receive the length of the data signature buffer on success.

Returns:

NULL on failure, or a pointer to the newly allocated signature data buffer on success.

Definition at line 158 of file crypto.c.

References ECDSA_do_sign_d, ECDSA_SIG_free_d, ERR_BAD_PARAM, ERR_UNSPEC, i2d_ECDSA_SIG_d, PUSH_ERROR_-OPENSSL, and RET_ERROR_PTR.

Referenced by _ec_sign_sha_data().

5.213.1.10 unsigned char* _ec_sign_sha_data (unsigned char const * *data*, size_t *dlen*, unsigned int *shabits*, EC_KEY * *key*, size_t * *siglen*)

Sign a SHA-hashed body of data using the ECDSA algorithm.

Parameters:

data a pointer to the data buffer to be signed.

dlen the length, in bytes, of the data buffer to be signed.

shabits the number of bits for the desired SHA hash (160, 256, or 512).

key the EC key which will have its private portion used to sign the supplied data.

siglen a pointer to a variable that will receive the length of the data signature buffer on success.

Returns:

NULL on failure, or a pointer to the newly allocated signature data buffer on success.

Definition at line 204 of file crypto.c.

References _compute_sha_hash(), _ec_sign_data(), ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_PTR, and SHA_512_SIZE.

5.213.1.11 void* _ecies_env_derivation (void const * *input*, size_t *ilen*, void * *output*, size_t * *olen*)

Note:

This function was taken from providers/cryptography/openssl.c

Definition at line 706 of file crypto.c.

References EVP_Digest_d.

Referenced by _compute_aes256_kek().

5.213.1.12 int _ed25519_sign_data (unsigned char const * *data*, size_t *dlen*, ED25519_KEY * *key*, ed25519_signature *sigbuf*)

Take an ed25519 signature of a data buffer.

Returns:

0 on success or -1 on failure.

Definition at line 529 of file crypto.c.

References ed25519_sign_donna(), ERR_BAD_PARAM, ED25519_KEY::private_key, ED25519_KEY::public_key, and RET_ERROR_INT.

5.213.1.13 int _ed25519_verify_sig (unsigned char const * *data*, size_t *dlen*, ED25519_KEY * *key*, ed25519_signature *sigbuf*)

Verify an ed25519 signature taken over a data buffer.

Returns:

1 if the signature matched the buffer, 0 if it did not, or -1 on failure.

Definition at line 545 of file crypto.c.

References ed25519_sign_open_donna(), ERR_BAD_PARAM, ED25519_KEY::public_key, and RET_ERROR_INT.

Referenced by _verify_dx_certificate().

5.213.1.14 int _encrypt_aes_256 (unsigned char * *outbuf*, unsigned char const * *data*, size_t *dlen*, unsigned char const * *key*, unsigned char const * *iv*)

Encrypt a data buffer using an AES-256 key (in CBC mode).

Parameters:

outbuf a pointer to the output buffer that will receive the encrypted data. NOTE: the size of this buffer must be successfully negotiated by the caller.

data a pointer to the data buffer to be encrypted.

dlen the size, in bytes, of the data buffer to be encrypted.

key a pointer to the 32-byte buffer holding the AES-256 encryption key for the operation.

iv a pointer to the 32-byte initialization vector to be used for the encryption process.

Returns:

the number of bytes successfully encrypted on success, or -1 on failure.

Definition at line 784 of file crypto.c.

References AES_256_PADDING_SIZE, ERR_BAD_PARAM, ERR_UNSPEC, EVP_aes_256_cbc_d, EVP_CIPHER_CTX_free_d, EVP_CIPHER_CTX_new_d, EVP_CIPHER_CTX_set_padding_d, EVP_EncryptFinal_ex_d, EVP_EncryptInit_ex_d, EVP_EncryptUpdate_d, PUSH_ERROR_OPENSSL, and RET_ERROR_INT.

5.213.1.15 void _free_ec_key (EC_KEY ∗ *key*)

Free an EC keypair.

Parameters:

key a pointer to the EC keypair to be freed.

Definition at line 484 of file crypto.c.

References EC_KEY_free_d.

5.213.1.16 void _free_ed25519_key (ED25519_KEY ∗ *key*)

Free an ed25519 keypair.

Parameters:

key a pointer to the ed25519 keypair to be freed.

Definition at line 567 of file crypto.c.

References _secure_wipe().

Referenced by _free_ed25519_key_chain().

5.213.1.17 void _free_ed25519_key_chain (ED25519_KEY ∗∗ *keys*)

Free a list of ed25519 keypairs.

Parameters:

keys a pointer to a NULL terminated list of ed25519 keypair to be freed.

Definition at line 582 of file crypto.c.

References _free_ed25519_key().

5.213.1.18 EC_KEY∗ _generate_ec_keypair (void)

Generate an EC key pair.

Returns:

a newly allocated and generated EC key pair on success, or NULL on failure.

Definition at line 446 of file crypto.c.

References secp256k1_generate().

5.213.1.19 ED25519_KEY∗ _generate_ed25519_keypair (void)

Generate an ed25519 key pair.

Returns:

a newly allocated and generated ed25519 key pair on success, or NULL on failure.

Definition at line 500 of file crypto.c.

References _secure_wipe(), ed25519_publickey_donna(), ERR_NOMEM, ERR_UNSPEC, ED25519_KEY::private_key, ED25519_KEY::public_key, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RAND_bytes_d, and RET_ERROR_PTR.

5.213.1.20 int _get_random_bytes (void * *buf*, size_t *len*)

Fill a buffer with a sequence of (securely) random bytes.

Parameters:

buf a pointer to the buffer to be filled with random bytes.

len the length, in bytes, of the buffer to be filled.

Returns:

0 on success or -1 on failure.

Definition at line 752 of file crypto.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RAND_bytes_d, and RET_ERROR_INT.

5.213.1.21 EC_KEY* _load_ec_privkey (char const * *filename*)

Load an EC private key from a file.

Parameters:

filename the name of the filename from which the key should be loaded

Returns:

a pointer to the deserialized private key from the the file.

Definition at line 369 of file crypto.c.

References _b64decode(), _read_pem_data(), _secure_wipe(), ERR_BAD_PARAM, ERR_UNSPEC, PLACER, RET_ERROR_PTR, and secp256k1_private_set().

5.213.1.22 EC_KEY* _load_ec_pubkey (char const * *filename*)

Load an EC public key from a file.

Parameters:

filename the name of the file from which the key should be loaded

Returns:

a pointer to the deserialized public key from the the file.

Definition at line 409 of file crypto.c.

References _b64decode(), _deserialize_ec_pubkey(), _read_pem_data(), _secure_wipe(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_-ERROR_PTR.

5.213.1.23 ED25519_KEY* _load_ed25519_privkey (char const * *filename*)

Load an ed25519 private key from a file.

Parameters:

filename the path of the armored file from which the ed25519 private key will be loaded.

Returns:

a pointer to a newly allocated ed25519 keypair on success, or NULL on failure.

Definition at line 604 of file crypto.c.

References _b64decode(), _read_pem_data(), _secure_wipe(), ED25519_KEY_SIZE, ed25519_publickey_donna(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, ED25519_KEY::private_key, ED25519_KEY::public_key, PUSH_ERROR_SYSCALL, and RET_-ERROR_PTR.

5.213.1.24 unsigned char* _serialize_ec_privkey (EC_KEY * *key*, size_t * *outsize*)

Serialize an EC private key into a data buffer.

Parameters:

key a pointer to the EC key pair to have its private key serialized.

outsize a pointer to a variable that will receive the length of the serialized key on success.

Returns:

a pointer to the serialized EC private key on success, or NULL on failure.

Definition at line 309 of file crypto.c.

References ERR_BAD_PARAM, ERR_UNSPEC, mm_alloc(), PLACER, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, and secp256k1_private_get().

5.213.1.25 unsigned char* _serialize_ec_pubkey (EC_KEY * *key*, size_t * *outsize*)

Serialize an EC public key to be shared.

Parameters:

key a pointer to the EC key pair to have its public key serialized.

outsize a pointer to a variable that will receive the length of the serialized key on success.

Returns:

a pointer to the serialized EC public key on success, or NULL on failure.

Definition at line 232 of file crypto.c.

References ERR_BAD_PARAM, ERR_UNSPEC, MANAGEDBUF, mm_alloc(), PUSH_ERROR_OPENSSL, RET_ERROR_PTR, secp256k1_public_get(), st_data_get(), and st_length_get().

5.213.1.26 int _verify_ec_sha_signature (unsigned char const * *data*, size_t *dlen*, unsigned int *shabits*, unsigned char const * *sig*, size_t *slen*, EC_KEY * *key*)

Verify that a signature for a given data buffer is valid.

Parameters:

data a pointer to the data buffer used to generate the signature.

dlen the length, in bytes, of the data buffer.

shabits the number of bits for the desired SHA hash (160, 256, or 512).

sig a pointer to the signature buffer to be verified against the input data.

slen the length, in bytes, of the signature buffer.

key the EC key which will have its public portion used to verify the signature of the supplied data.

Returns:

-1 on general failure, 0 if the signature did not match the data, or 1 if it did.

Definition at line 125 of file crypto.c.

References _compute_sha_hash(), _verify_ec_signature(), ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_INT, and SHA_512_SIZE.

5.213.1.27 int _verify_ec_signature (unsigned char const ∗ *hash*, size_t *hlen*, unsigned char const ∗ *sig*, size_t *slen*, EC_KEY ∗ *key*)

Verify that an elliptic curve signature for a given hashed data buffer is valid.

Parameters:

hash a pointer to the hashed data buffer used to generate the signature.

hlen the length, in bytes, of the hashed data buffer.

sig a pointer to the signature buffer to be verified against the input data.

slen the length, in bytes, of the signature buffer.

key the EC key which will have its public portion used to verify the signature of the supplied hashed data.

Returns:

-1 on general failure, 0 if the signature did not match the hashed data, or 1 if it did.

Definition at line 81 of file crypto.c.

References d2i_ECDSA_SIG_d, ECDSA_do_verify_d, ECDSA_SIG_free_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_-OPENSSL, and RET_ERROR_INT.

Referenced by _verify_ec_sha_signature().

```
#include "magma.h"
```

Functions

- void meta_inx_remove (uint64_t usernum, META_PROTOCOL protocol)

  Lock a user's object in the cache and decrement their reference counter.

- meta_user_t ∗ meta_inx_find (uint64_t usernum, META_PROTOCOL protocol)

  indexes.c

5.215.1 Function Documentation

5.215.1.1 meta_user_t∗ meta_inx_find (uint64_t *usernum*, META_PROTOCOL *protocol*)

indexes.c

Definition at line 40 of file indexes.c.

References inx_find(), inx_insert(), inx_lock_write(), inx_unlock(), M_TYPE_UINT64, object_cache_t::meta, meta_alloc(), meta_free(), meta_user_ref_add(), objects, and meta_user_t::usernum.

Referenced by meta_get().

5.215.1.2 void meta_inx_remove (uint64_t *usernum*, META_PROTOCOL *protocol*)

Lock a user's object in the cache and decrement their reference counter.

See also:

meta_user_ref_dec()

Parameters:

username a managed string containing the name of the user to be adjusted.

protocol specifies the protocol bound to the reference counter to be decremented (META_PROT_WEB, META_PROT_IMAP, etc.)

Returns:

This function returns no value.

Definition at line 17 of file indexes.c.

References inx_find(), inx_lock_read(), inx_unlock(), M_TYPE_UINT64, object_cache_t::meta, meta_user_ref_dec(), and objects.

Referenced by imap_login(), imap_session_destroy(), meta_get(), pop_pass(), pop_session_destroy(), portal_endpoint_auth(), and sess_-destroy().

5.216 src/objects/meta/locking.c File Reference

```
#include "magma.h"
```

Functions

- void meta_user_rlock (meta_user_t *user)

  Acquire a read lock for a meta user object.

- void meta_user_wlock (meta_user_t *user)

  Acquire a write lock for a meta user object.

- void meta_user_unlock (meta_user_t *user)

  Release the lock for a meta user object.

5.216.1 Function Documentation

5.216.1.1 void meta_user_rlock (meta_user_t * *user*)

Acquire a read lock for a meta user object. locking.c

Parameters:

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 15 of file locking.c.

References meta_user_t::lock, and rwlock_lock_read().

Referenced by imap_close(), imap_examine(), imap_expunge(), imap_fetch(), imap_list(), imap_login(), imap_lsub(), imap_search_messages(), imap_status(), pop_last(), pop_list(), pop_retr(), pop_stat(), pop_top(), pop_uidl(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_folders_tags(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), and portal_endpoint_messages_tag().

5.216.1.2 void meta_user_unlock (meta_user_t * *user*)

Release the lock for a meta user object.

Parameters:

user a pointer to the meta user object to be unlocked.

Returns:

This function returns no value.

Definition at line 47 of file locking.c.

References meta_user_t::lock, and rwlock_unlock().

Referenced by imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_list(), imap_login(), imap_lsub(), imap_rename(), imap_search_messages(), imap_select(), imap_session_destroy(), imap_session_update(), imap_status(), imap_store(), imap_subscribe(), meta_get(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), pop_dele(), pop_last(), pop_list(), pop_pass(), pop_retr(), pop_session_destroy(), pop_session_reset(), pop_stat(), pop_top(), pop_uidl(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_endpoint_folders_tags(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_list(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.216.1.3 void meta_user_wlock (meta_user_t * *user*)

Acquire a write lock for a meta user object.

Parameters:

user a pointer to the meta user object to be locked.

Returns:

This function returns no value.

Definition at line 31 of file locking.c.

References meta_user_t::lock, and rwlock_lock_write().

Referenced by imap_append(), imap_close(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_expunge(), imap_fetch(), imap_rename(), imap_select(), imap_session_destroy(), imap_session_update(), imap_store(), imap_subscribe(), meta_get(), meta_messages_copier(), meta_messages_login_update(), meta_messages_mover(), meta_messages_update(), meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_keys(), meta_update_message_folders(), meta_update_realms(), meta_update_user(), pop_dele(), pop_pass(), pop_session_destroy(), pop_session_reset(), portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), portal_endpoint_messages_tag(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.217 src/objects/meta/references.c File Reference

```
#include "magma.h"
```

Functions

- void meta_user_ref_add (meta_user_t *user, META_PROTOCOL protocol)
  Increment a meta user's reference counter for a specified protocol and update the activity timestamp.
- void meta_user_ref_dec (meta_user_t *user, META_PROTOCOL protocol)
  Decrement a user's reference counter for the specified protocol and update the activity timestamp.
- uint64_t meta_user_ref_protocol_total (meta_user_t *user, META_PROTOCOL protocol)
  Get the total reference count for the user object over the specified protocol.
- uint64_t meta_user_ref_total (meta_user_t *user)
  Get the total reference count for a user object, over all of the supported protocols.
- time_t meta_user_ref_stamp (meta_user_t *user)
  Get the activity timestamp for a meta user object.

5.217.1 Function Documentation

5.217.1.1 void meta_user_ref_add (meta_user_t * *user*, META_PROTOCOL *protocol*)

Increment a meta user's reference counter for a specified protocol and update the activity timestamp. references.c

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session.

Returns:

This function returns no value.

Definition at line 20 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, meta_user_t::stamp, and meta_user_t::web.

Referenced by meta_inx_find().

5.217.1.2 void meta_user_ref_dec (meta_user_t * *user*, META_PROTOCOL *protocol*)

Decrement a user's reference counter for the specified protocol and update the activity timestamp.

Note:

META_PROTOCOL_GENERIC can be specified for non-specific, protocol independent accounting purposes.

Parameters:

user a pointer to the meta user object to be adjusted.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

This function returns no value.

Definition at line 60 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_-PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, meta_user_t::stamp, and meta_user_t::web.

Referenced by meta_inx_remove(), and portal_endpoint_logout().

5.217.1.3 uint64_t meta_user_ref_protocol_total (meta_user_t ∗ *user*, META_PROTOCOL *protocol*)

Get the total reference count for the user object over the specified protocol.

Parameters:

user a pointer to the meta user object to be examined.

protocol the protocol identifier for the session using the META_PROTOCOL enumerator.

Returns:

the total number of references held by the user.

Definition at line 98 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, log_pedantic, META_PROTOCOL_GENERIC, META_-PROTOCOL_IMAP, META_PROTOCOL_POP, META_PROTOCOL_SMTP, META_PROTOCOL_WEB, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, and meta_user_t::web.

Referenced by pop_pass().

5.217.1.4 time_t meta_user_ref_stamp (meta_user_t ∗ *user*)

Get the activity timestamp for a meta user object.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

a timestamp containing the last time the meta user object's reference count changed.

Definition at line 161 of file references.c.

References meta_user_t::lock, mutex_lock(), mutex_unlock(), meta_user_t::refs, and meta_user_t::stamp.

Referenced by obj_cache_prune().

5.217.1.5 uint64_t meta_user_ref_total (meta_user_t ∗ *user*)

Get the total reference count for a user object, over all of the supported protocols.

Parameters:

user a pointer to the meta user object to be examined.

Returns:

the total number of references held by the user.

Definition at line 134 of file references.c.

References meta_user_t::generic, meta_user_t::imap, meta_user_t::lock, mutex_lock(), mutex_unlock(), meta_user_t::pop, meta_user_t::refs, meta_user_t::smtp, and meta_user_t::web.

Referenced by obj_cache_prune().

```
#include "magma.h"
```

Functions

- void meta_user_serial_set (meta_user_t *user, uint64_t object, uint64_t serial)

  Set an object serial number for a given meta user structure.

- uint64_t meta_user_serial_get (meta_user_t *user, uint64_t object)

  Get an object serial number for a given meta object.

- bool_t meta_user_serial_check (meta_user_t *user, uint64_t object)

  Check an object's serial number to see if it is up-to-date.

5.218.1 Function Documentation

5.218.1.1 bool_t meta_user_serial_check (meta_user_t * *user*, uint64_t *object*)

Check an object's serial number to see if it is up-to-date. serials.c

Note:

The object's serial number will be incremented regardless of whether it is consistent with the cache.

Parameters:

user the meta user object to whom the object belongs.

object the serial object to be checked for changes.

Returns:

0 if the object did not to be refreshed, or 1 if it doesn't match the internal checkpoint and should be updated.

Definition at line 86 of file serials.c.

References meta_user_serial_get(), meta_user_serial_set(), serial_get(), serial_increment(), and meta_user_t::usernum.

Referenced by portal_endpoint_messages_tag(), and sess_serial_check().

5.218.1.2 uint64_t meta_user_serial_get (meta_user_t * *user*, uint64_t *object*)

Get an object serial number for a given meta object.

Parameters:

user the meta user structure to be examined.

object the object to query for the serial number.

Returns:

the serial number value of the specified object, or 0 on failure. LOW: Swap the object and user params so the interface matches the serial_get/set functions.

Definition at line 53 of file serials.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, meta_user_t::messages, OBJECT_ALIASES, OBJECT_-CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, meta_user_t::serials, and meta_user_t::user.

Referenced by meta_update_aliases(), meta_update_user(), and meta_user_serial_check().

5.218.1.3 void meta_user_serial_set (meta_user_t * *user*, uint64_t *object*, uint64_t *serial*)

Set an object serial number for a given meta user structure.

Parameters:

user the meta user object to be adjusted.

object the object to receive the new serial number.

serial the new serial number to be set.

Returns:

This function returns no value.

Definition at line 20 of file serials.c.

References meta_user_t::aliases, meta_user_t::contacts, meta_user_t::folders, meta_user_t::messages, OBJECT_ALIASES, OBJECT_-CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, meta_user_t::serials, and meta_user_t::user.

Referenced by meta_update_aliases(), meta_update_user(), and meta_user_serial_check().

#include "magma.h"
```

Functions

- stringer_t * serial_prefix (uint64_t type)

  Return a textual prefix describing an object type.

- uint64_t serial_get (uint64_t type, uint64_t num)

  Get the serial number (checkpoint value) for an object from memcached.

- uint64_t serial_increment (uint64_t type, uint64_t num)

  Increment the serial number for an object in memcached.

- uint64_t serial_reset (uint64_t type, uint64_t num)

  Reset the serial number to 1 for an object in memcached.

Variables

- stringer_t * serial_prefix_strings [ ]

5.219.1 Function Documentation

5.219.1.1 uint64_t serial_get (uint64_t *type*, uint64_t *num*)

Get the serial number (checkpoint value) for an object from memcached. serials.c

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the serial number of the requested object.

Definition at line 62 of file serials.c.

5.219.1.2 uint64_t serial_increment (uint64_t *type*, uint64_t *num*)

Increment the serial number for an object in memcached.

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the new serial number of the requested object.

Definition at line 86 of file serials.c.

References cache_increment(), log_pedantic, serial_prefix(), st_aprint(), st_char_get(), st_free(), and st_length_int().

Referenced by contact_move(), imap_append_message(), imap_close(), imap_create(), imap_delete(), imap_expunge(), imap_fetch(), imap_-message_copier(), imap_rename(), imap_store(), mail_load_message(), meta_messages_login_update(), meta_messages_update(), meta_-update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_message_folders(), meta_update_user(), meta_user_serial_-check(), pop_session_destroy(), portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), smtp_rollout(), smtp_store_message(), and user_config_edit().

5.219.1.3 stringer_t* serial_prefix (uint64_t *type*)

Return a textual prefix describing an object type.

Parameters:

type the serial object type: OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS.

Returns:

a managed string containing a description of the object type, or NULL on failure.

Definition at line 24 of file serials.c.

References log_pedantic, OBJECT_ALIASES, OBJECT_CONFIG, OBJECT_CONTACTS, OBJECT_FOLDERS, OBJECT_MESSAGES, OBJECT_USER, and serial_prefix_strings.

Referenced by serial_get(), serial_increment(), and serial_reset().

5.219.1.4 uint64_t serial_reset (uint64_t *type*, uint64_t *num*)

Reset the serial number to 1 for an object in memcached.

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the new value of the cached serial number (1) on success.

Definition at line 110 of file serials.c.

References cache_set(), CONSTANT, log_pedantic, serial_prefix(), st_aprint(), st_char_get(), st_free(), and st_length_int().

5.219.2 Variable Documentation

5.219.2.1 stringer_t* serial_prefix_strings[ ]

Initial value:

```
{
  CONSTANT("user"),
  CONSTANT("config"),
  CONSTANT("folders"),
  CONSTANT("messages"),
  CONSTANT("contacts"),

}
```

Definition at line 10 of file serials.c.

Functions

- int_t meta_update_realms (meta_user_t *user, stringer_t *salt, stringer_t *master, META_LOCK_STATUS locked)

  Fetches the user realm keys and extracts the different components.

- int_t meta_update_keys (meta_user_t *user, META_LOCK_STATUS locked)

  Fetches the user signet and private key. Relies on the mail realm to decrypt the values.

- int_t meta_update_user (meta_user_t *user, META_LOCK_STATUS locked)

  Build a user's meta information from specified data parameters.

- int_t meta_update_aliases (meta_user_t *user, META_LOCK_STATUS locked)

  Pulls the list of user mailboxes and their display names from the database.

- int_t meta_update_contacts (meta_user_t *user, META_LOCK_STATUS locked)

  Update a user's contacts if necessary.

- int_t meta_update_folders (meta_user_t *user, META_LOCK_STATUS locked)

  Update a user's message folders if necessary.

- int_t meta_update_message_folders (meta_user_t *user, META_LOCK_STATUS locked)

  Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

5.220.1 Function Documentation

5.220.1.1 int_t meta_update_aliases (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Pulls the list of user mailboxes and their display names from the database. updaters.c

Parameters:

user a pointer to the meta object that is to be populated.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

Definition at line 261 of file updaters.c.

References meta_user_t::aliases, meta_data_fetch_mailbox_aliases(), META_NEED_LOCK, meta_user_serial_get(), meta_user_serial_set(), meta_user_unlock(), meta_user_wlock(), OBJECT_ALIASES, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get(), and sess_update().

5.220.1.2 int_t meta_update_contacts (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Update a user's contacts if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

user a pointer to the meta user object that will have its message folders updated.

locked if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 310 of file updaters.c.

References meta_user_t::contacts, contacts_update(), inx_free(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get(), and sess_update().

5.220.1.3 int_t meta_update_folders (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Update a user's message folders if necessary.

Note:

This function will try to retrieve the folders from the cache, if possible, or fall back to the database.

Parameters:

user a pointer to the meta user object that will have its message folders updated.

locked if META_NEED_LOCK is specified, the meta user object will be locked for operation.

Returns:

-1 on failure or 1 on success.

Definition at line 367 of file updaters.c.

References meta_user_t::folders, meta_user_t::messages, meta_data_fetch_folders(), meta_messages_update_sequences(), META_NEED_-LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, meta_user_t::pop, meta_user_t::refs, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by imap_session_update(), meta_get(), and sess_update().

5.220.1.4 int_t meta_update_keys (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Fetches the user signet and private key. Relies on the mail realm to decrypt the values.

Parameters:

user a pointer to the meta object that is to be populated.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-2 if there is a problem unscrambling the private key, -1 for a system error, 0 for success, and 1 if the keys were created.

Definition at line 113 of file updaters.c.

References BINARY, meta_user_t::key, log_pedantic, meta_user_t::mail, meta_crypto_keys_create(), meta_data_fetch_keys(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), NONE, meta_user_t::prime, prime_key_decrypt(), prime_set(), key_pair_t::private, key_pair_t::public, meta_user_t::realm, meta_user_t::signet, st_char_get(), st_cleanup, st_length_int(), st_populated, tran_commit(), tran_rollback(), tran_start(), meta_user_t::username, and meta_user_t::usernum.

Referenced by meta_get().

5.220.1.5 int_t meta_update_message_folders (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Refresh a user's message folders if stale, or retrieve them from the database if they are not in memory.

See also:

messages_update()

Parameters:

user a pointer to the meta user object requesting the folders.

locked if META_LOCKED, lock the meta user object for the duration of the request.

Returns:

-1 on failure, or 1 on success.

Definition at line 419 of file updaters.c.

References meta_user_t::folders, inx_free(), meta_user_t::message_folders, messages_update(), META_NEED_LOCK, meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), serial_increment(), meta_user_t::serials, and meta_user_t::usernum.

Referenced by meta_get().

5.220.1.6 int_t meta_update_realms (meta_user_t * *user*, stringer_t * *salt*, stringer_t * *master*, META_LOCK_STATUS *locked*)

Fetches the user realm keys and extracts the different components.

Parameters:

user a pointer to the meta object that is to be populated.

master the user master key value.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-2 if there is a problem extracting the key values, -1 for a system error, 0 for success, and 1 if the keys were created.

****/

****/

Referenced by meta_get().

5.220.1.7 int_t meta_update_user (meta_user_t * *user*, META_LOCK_STATUS *locked*)

Build a user's meta information from specified data parameters.

Note:

The user object will be pulled from the cache, if possible, or it falls back to a database lookup using the user number and the verification token.

Parameters:

user a pointer to the meta object that is to be populated.

usernum the user number.

verification the verification token for the specified user number.

locked the meta lock status of the operation (if META_NEED_LOCK is supplied, the meta user object will be locked for the duration of the function.

Returns:

-1 on error, 0 on success, 1 for an authentication issue.

Definition at line 211 of file updaters.c.

References meta_data_fetch_user(), META_NEED_LOCK, meta_user_serial_get(), meta_user_serial_set(), meta_user_unlock(), meta_user_wlock(), OBJECT_USER, serial_get(), serial_increment(), meta_user_t::serials, st_populated, meta_user_t::user, meta_user_t::username, meta_user_t::usernum, and meta_user_t::verification.

Data Structures

- struct object_cache_t

Enumerations

- enum {
  OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES,
  OBJECT_CONTACTS, OBJECT_ALIASES }

Functions

- int_t lock_get (stringer_t *key)
  locks.c
- void lock_release (stringer_t *key)
  Release a named lock, with synchronization provided via memcached.
- int_t user_lock (uint64_t usernum)
  Acquire a lock in the magma.user keyspace.
- void user_unlock (uint64_t usernum)
  Unlock a lock in the magma.user keyspace.
- bool_t obj_cache_start (void)
  objects.c
- void obj_cache_prune (void)
  The prune function runs every few minutes and scans the object cache and removes any stale objects it finds.
- void obj_cache_stop (void)
  Stop the object cache and free all active user and web session objects.
- uint64_t serial_get (uint64_t type, uint64_t num)
  serials.c

- uint64_t serial_increment (uint64_t type, uint64_t num)

  Increment the serial number for an object in memcached.

- uint64_t serial_reset (uint64_t type, uint64_t num)

  Reset the serial number to 1 for an object in memcached.

Variables

- object_cache_t objects

5.221.1 Enumeration Type Documentation

5.221.1.1 anonymous enum

Enumerator:

OBJECT_USER
OBJECT_CONFIG
OBJECT_FOLDERS
OBJECT_MESSAGES
OBJECT_CONTACTS
OBJECT_ALIASES

Definition at line 21 of file objects.h.

5.221.2 Function Documentation

5.221.2.1 int_t lock_get (stringer_t * *key*)

locks.c locks.c

See also:

cache_silent_add()

Note:

The lock will be held for a maximum of 10 minutes, and failed locking attempts will be retried periodically for a maxmimum of 1 minute before returing failure.

Parameters:

key a managed string containing the name of the lock to be acquired.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

Definition at line 21 of file locks.c.

References cache_silent_add(), lock, log_pedantic, MAGMA_LOCK_EXPIRATION, MAGMA_LOCK_TIMEOUT, MANAGEDBUF, PLACER, st_char_get(), st_empty, st_length_int(), and st_sprint().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_reply(), and user_lock().

5.221.2.2 void lock_release (stringer_t * *key*)

Release a named lock, with synchronization provided via memcached.

See also:

cache_delete()

Note:

The lock will be held for 10 seconds, and locking attempts will occur periodically for 60 seconds prior to failure.

Parameters:

key a managed string containing the name of the lock to be released.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

LOW: At some point we should add logic to check whether this cluster node even owns the lock before blindly deleting the lock.

Definition at line 61 of file locks.c.

References cache_delete(), lock, log_pedantic, MANAGEDBUF, st_char_get(), st_empty, st_length_int(), and st_sprint().

Referenced by api_endpoint_auth(), imap_login(), pop_pass(), portal_endpoint_auth(), smtp_auth_login(), smtp_auth_plain(), smtp_reply(), and user_unlock().

5.221.2.3 void obj_cache_prune (void)

The prune function runs every few minutes and scans the object cache and removes any stale objects it finds.

Note:

If the number of entries is over 4,096, then the prune function will remove entries candidates which have been unused more then 5 minutes. If the index holds more than 2,048, entries older than 30 minutes are pruned, otherwise if the index holds fewer than 2,048 entries, only those objects older than 1 hour are removed. Also, note that the precise interval between scans is somewhat random, because the background thread responsible for running the prune function goes to sleep for a random number of seconds.

Definition at line 64 of file objects.c.

5.221.2.4 bool_t obj_cache_start (void)

objects.c objects.c

Returns:

true on success or false on failure.

Definition at line 19 of file objects.c.

References inx_alloc(), log_critical, M_INX_LOCK_MANUAL, M_INX_TREE, object_cache_t::meta, meta_free(), sess_destroy(), and object_cache_t::sessions.

Referenced by process_start().

5.221.2.5 void obj_cache_stop (void)

Stop the object cache and free all active user and web session objects.

Returns:

This function returns no value.

Definition at line 38 of file objects.c.

References inx_free(), object_cache_t::meta, and object_cache_t::sessions.

Referenced by process_stop().

5.221.2.6 uint64_t serial_get (uint64_t *type*, uint64_t *num*)

serials.c serials.c

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the serial number of the requested object.

Definition at line 62 of file serials.c.

References cache_increment(), log_pedantic, serial_prefix(), st_aprint(), st_char_get(), st_free(), and st_length_int().

Referenced by imap_append_message(), imap_close(), imap_create(), imap_delete(), imap_expunge(), imap_fetch(), imap_message_-copier(), imap_rename(), imap_session_update(), imap_store(), meta_messages_login_update(), meta_messages_update(), meta_update_-aliases(), meta_update_contacts(), meta_update_folders(), meta_update_message_folders(), meta_update_user(), meta_user_serial_check(), portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), user_config_create(), and user_config_update().

5.221.2.7 uint64_t serial_increment (uint64_t *type*, uint64_t *num*)

Increment the serial number for an object in memcached.

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the new serial number of the requested object.

Definition at line 86 of file serials.c.

References cache_increment(), log_pedantic, serial_prefix(), st_aprint(), st_char_get(), st_free(), and st_length_int().

Referenced by contact_move(), imap_append_message(), imap_close(), imap_create(), imap_delete(), imap_expunge(), imap_fetch(), imap_-message_copier(), imap_rename(), imap_store(), mail_load_message(), meta_messages_login_update(), meta_messages_update(), meta_-update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_message_folders(), meta_update_user(), meta_user_serial_-check(), pop_session_destroy(), portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), smtp_rollout(), smtp_store_message(), and user_config_edit().

5.221.2.8 uint64_t serial_reset (uint64_t *type*, uint64_t *num*)

Reset the serial number to 1 for an object in memcached.

Parameters:

type the serial type to be queried (OBJECT_USER, OBJECT_CONFIG, OBJECT_FOLDERS, OBJECT_MESSAGES, or OBJECT_-CONTACTS).

num the specific object identifier.

Returns:

0 on failure or the new value of the cached serial number (1) on success.

Definition at line 110 of file serials.c.

References cache_set(), CONSTANT, log_pedantic, serial_prefix(), st_aprint(), st_char_get(), st_free(), and st_length_int().

5.221.2.9 int_t user_lock (uint64_t *usernum*)

Acquire a lock in the magma.user keyspace.

Parameters:

usernum the numerical id of the user for whom the lock will be acquired.

Returns:

-1 on general failure, 0 on memcached failure, or 1 on success.

Definition at line 82 of file locks.c.

References lock_get(), MANAGEDBUF, and st_sprint().

Referenced by imap_close(), imap_copy(), imap_expunge(), smtp_rollout(), and smtp_store_message().

5.221.2.10 void user_unlock (uint64_t *usernum*)

Unlock a lock in the magma.user keyspace.

Parameters:

usernum the numerical id of the user for whom the lock will be unlocked.

Returns:

This function returns no value.

Definition at line 98 of file locks.c.

References lock_release(), MANAGEDBUF, and st_sprint().

Referenced by imap_close(), imap_copy(), imap_expunge(), smtp_rollout(), and smtp_store_message().

```
#include "magma.h"
```

Functions

- uint64_t sess_key (void)

  Generate a random 12 digit 64-bit web session key.

- uint64_t sess_number (void)

  Reserve a unique web session identifier.

- void sess_destroy (session_t *sess)

  Destroy a web session and its associated data.

- void sess_ref_add (session_t *sess)

  Increment the web session's reference counter and update its timestamp.

- void sess_ref_dec (session_t *sess)

  Decrement the web session's reference counter and update its timestamp.

- uint64_t sess_ref_total (session_t *sess)

  Get the reference count of a web session.

- time_t sess_ref_stamp (session_t *sess)

  Get the timestamp for a web session's reference counter.

- void sess_refresh_flush (session_t *sess)

  Update a web session's refresh stamp and prevent redundant refreshing of a web session.

- time_t sess_refresh_stamp (session_t *sess)

  Get the timestamp for the last time the session was refreshed.

- bool_t sess_refresh_check (session_t *sess)

  Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.

- stringer_t * sess_token (session_t *sess)

  Securely generate a unique zbase32-encoded token for a session.

- void sess_update (session_t *sess)

  Update a session's underlying data and its refresh timestamp.

- void sess_trigger (session_t *sess)

  Set a web session's trigger so it will be refreshed as soon as possible.

- void sess_release (session_t *sess)

  Release a web session.

- void sess_release_attachment (attachment_t *attachment)

  Free an attachment object.

- void sess_release_composition (composition_t *comp)

Free a composition object.

- void sess_serial_check (session_t *sess, uint64_t object)

  Queue a web session refresh if there is stale data.

- session_t * sess_create (connection_t *con, stringer_t *path, stringer_t *application)

  Create a new session for a given web connection.

- int_t sess_get (connection_t *con, stringer_t *application, stringer_t *path, stringer_t *token)

  Try to retrieve the session associated with a client connection's supplied cookie.

Variables

- struct {
  uint64_t number
  pthread_mutex_t lock
  } sessions

5.222.1 Function Documentation

5.222.1.1 session_t* sess_create (connection_t * *con*, stringer_t * *path*, stringer_t * *application*)

Create a new session for a given web connection. sessions.c

Note:

The session stores the following data points: remote IP address, request path, application name, the specified http hostname, the remote client's user agent string, the server's host number, a unique session id, the server's current timestamp, a randomly- generated session key for authentication, and an encrypted token for the session returned to the user as a cookie.

Parameters:

con a pointer to the connection underlying the web session.

path a pointer to a managed string containing the pathname of the generating request (should be "/portal/camel").

application a pointer to a managed string containing the name of the parent application of the session (should be "portal").

Returns:

NULL on failure or a pointer to a newly allocated session object for the specified connection.

Definition at line 371 of file sessions.c.

References session_t::agent, session_t::application, session_t::compositions, con_addr(), con_secure(), CONTIGUOUS, HEAP, magma_t::host, session_t::host, connection_t::http, session_t::httponly, inx_alloc(), inx_insert(), session_t::ip, ip_copy(), session_t::key, session_t::lock, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, magma, MANAGED_T, MEMORYBUF, mm_alloc(), mm_free(), session_t::number, magma_t::number, objects, session_t::path, session_t::request, session_t::secure, sess_destroy(), sess_key(), sess_number(), sess_ref_add(), sess_ref_dec(), sess_release_composition(), sess_token(), object_cache_t::sessions, st_dupe_opts(), session_t::stamp, session_t::token, multi_t::u64, multi_t::val, and session_t::warden.

Referenced by json_api_dispatch(), and portal_endpoint().

5.222.1.2 void sess_destroy (session_t * *sess*)

Destroy a web session and its associated data.

Parameters:

sess a pointer to the web session to be destroyed.

Returns:

This function returns no value.

Definition at line 59 of file sessions.c.

References session_t::agent, session_t::application, session_t::compositions, session_t::host, inx_cleanup(), session_t::lock, meta_inx_remove(), META_PROTOCOL_WEB, mm_free(), mutex_destroy(), session_t::path, session_t::request, st_cleanup, session_t::token, session_t::user, meta_user_t::usernum, and session_t::warden.

Referenced by obj_cache_start(), and sess_create().

5.222.1.3 int_t sess_get (connection_t * *con*, stringer_t * *application*, stringer_t * *path*, stringer_t * *token*)

Try to retrieve the session associated with a client connection's supplied cookie.

Parameters:

con a pointer to the connection object sending the cookie.

application a managed string containing the application associated with the session.

path a managed string containing the path associated with the session.

token the encrypted user token retrieved from the supplied http cookie.

Returns:

1 if the cookie was found and valid, or one of the following values on failure: 0 = Session not found. -1 = Server error. -2 = Invalid token. -3 = Security violation / incorrect user-agent. -4 = Security violation / incorrect session key. -5 = Security violation / incorrect source address. -6 = Session terminated by logout. -7 = Session timed out.

Most session attributes need simple equality comparison, except for timeout checking. Make sure not to validate against a stale session that should have already timed out (which will have to be determined dynamically).

Definition at line 434 of file sessions.c.

References con_addr(), con_secure(), deprecated_scramble_decrypt(), deprecated_scramble_import(), magma_t::http, connection_t::http, inx_delete(), inx_find(), inx_lock_read(), inx_unlock(), ip_addr_eq(), log_error, log_pedantic, M_TYPE_UINT64, magma, MEMORYBUF, number, objects, magma_t::secure, sess_ref_add(), sess_ref_dec(), sess_refresh_stamp(), sess_update(), object_cache_t::sessions, magma_t::sessions, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_data_get(), st_free(), st_length_int(), multi_t::u64, multi_t::val, and zbase32_decode().

Referenced by http_parse_context().

5.222.1.4 uint64_t sess_key (void)

Generate a random 12 digit 64-bit web session key.

Returns:

the randomly generated web session key as an unsigned 64 bit integer.

Definition at line 22 of file sessions.c.

References log_pedantic, rand_get_uint64(), and uint64_digits().

Referenced by sess_create().

5.222.1.5 uint64_t sess_number (void)

Reserve a unique web session identifier.

Returns:

a number containing a unique web session identifier.

Definition at line 43 of file sessions.c.

References mutex_lock(), mutex_unlock(), and sessions.

Referenced by sess_create().

5.222.1.6 void sess_ref_add (session_t * *sess*)

Increment the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 87 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, session_t::stamp, and session_t::web.

Referenced by sess_create(), and sess_get().

5.222.1.7 void sess_ref_dec (session_t * *sess*)

Decrement the web session's reference counter and update its timestamp.

Parameters:

sess a pointer to the web session to be updated.

Returns:

This function returns no value.

Definition at line 112 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, session_t::stamp, and session_t::web.

Referenced by sess_create(), sess_get(), and sess_release().

5.222.1.8 time_t sess_ref_stamp (session_t * *sess*)

Get the timestamp for a web session's reference counter.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the last-modified UTC timestamp value of the specified web session.

Definition at line 162 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, and session_t::stamp.

Referenced by obj_cache_prune().

5.222.1.9 uint64_t sess_ref_total (session_t * *sess*)

Get the reference count of a web session.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the total number of references to the specified web session.

Definition at line 137 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refs, and session_t::web.

Referenced by obj_cache_prune().

5.222.1.10 bool_t sess_refresh_check (session_t * *sess*)

Check to see if a web session is ready to be refreshed, and if so, disarm its trigger and update its refresh stamp.

Note:

The caller needs to make immediate use of this function's return value because the refresh trigger will be cleared if it was previously set. Any session longer than 2 minutes will be marked as ready for refresh.

Parameters:

a pointer to the web session to be queried.

Returns:

true if the web session is ready to be refreshed, or false if it is not.

Definition at line 217 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, session_t::stamp, and session_t::trigger.

Referenced by sess_release().

5.222.1.11 void sess_refresh_flush (session_t * *sess*)

Update a web session's refresh stamp and prevent redundant refreshing of a web session.

Parameters:

sess a pointer to the web session to be touched.

Returns:

This function returns no value.

Definition at line 180 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, session_t::stamp, and session_t::trigger.

Referenced by sess_update().

5.222.1.12 time_t sess_refresh_stamp (session_t * *sess*)

Get the timestamp for the last time the session was refreshed.

Parameters:

sess a pointer to the web session to be queried.

Returns:

the last-refreshed UTC timestamp value of the specified web session.

Definition at line 197 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, and session_t::stamp.

Referenced by sess_get().

5.222.1.13 void sess_release (session_t * *sess*)

Release a web session.

Note:

If the web session should have been refreshed, it will be refreshed before the reference counter is decremented.

Parameters:

sess a pointer to the web session to be released.

Returns:

This function returns no value.

Definition at line 302 of file sessions.c.

References requeue(), sess_ref_dec(), sess_refresh_check(), and sess_update().

Referenced by http_session_reset().

5.222.1.14 void sess_release_attachment (attachment_t * *attachment*)

Free an attachment object.

Note:

This is an inx helper function.

Parameters:

attachment a pointer to the attachment object to be destroyed.

Returns:

This function returns no value.

Definition at line 321 of file sessions.c.

References attachment_t::filedata, attachment_t::filename, mm_free(), and st_cleanup.

Referenced by portal_endpoint_attachments_add(), and portal_endpoint_messages_compose().

5.222.1.15 void sess_release_composition (composition_t * *comp*)

Free a composition object.

Note:

This is an inx helper function.

Parameters:

comp a pointer to the composition object to be destroyed.

Returns:

This function returns no value.

Definition at line 337 of file sessions.c.

References composition_t::attachments, inx_cleanup(), and mm_free().

Referenced by portal_endpoint_messages_compose(), and sess_create().

5.222.1.16 void sess_serial_check (session_t * *sess*, uint64_t *object*)

Queue a web session refresh if there is stale data.

Parameters:

sess a pointer to the web session to be queried.

object the value of the object in the cache to be checked (can include OBJECT_CONTACTS and OBJECT_FOLDERS).

Definition at line 352 of file sessions.c.

References meta_user_serial_check(), sess_trigger(), and session_t::user.

Referenced by portal_endpoint_contacts_add(), portal_endpoint_contacts_copy(), portal_endpoint_contacts_edit(), portal_endpoint_contacts_move(), portal_endpoint_contacts_remove(), portal_folder_contacts_add(), portal_folder_contacts_remove(), portal_folder_mail_add(), and portal_folder_mail_remove().

5.222.1.17 stringer_t* sess_token (session_t * *sess*)

Securely generate a unique zbase32-encoded token for a session.

Parameters:

sess a pointer to the input web session.

Returns:

a managed string containing the generated web session token.

Definition at line 241 of file sessions.c.

References deprecated_scramble_encrypt(), deprecated_scramble_free(), deprecated_scramble_total_length(), session_t::host, session_t::key, log_pedantic, magma, session_t::number, PLACER, magma_t::secure, magma_t::sessions, st_cleanup, st_merge, session_t::stamp, session_t::warden, and zbase32_encode().

Referenced by sess_create().

5.222.1.18 void sess_trigger (session_t * *sess*)

Set a web session's trigger so it will be refreshed as soon as possible.

Parameters:

sess a pointer to the web session to be refreshed.

Returns:

This function returns no value.

Definition at line 285 of file sessions.c.

References session_t::lock, mutex_lock(), mutex_unlock(), session_t::refresh, and session_t::trigger.

Referenced by portal_endpoint_folders_rename(), portal_endpoint_messages_copy(), portal_endpoint_messages_flag(), portal_endpoint_messages_move(), portal_endpoint_messages_remove(), and sess_serial_check().

5.222.1.19 void sess_update (session_t * *sess*)

Update a session's underlying data and its refresh timestamp.

Note:

This function ensures the session's associated meta user data, mail folders and messages, and contact folders and contact entries are all current.

Parameters:

sess a pointer to the session object to be updated.

Returns:

This function returns no value.

Definition at line 264 of file sessions.c.

References meta_messages_update(), META_NEED_LOCK, meta_update_aliases(), meta_update_contacts(), meta_update_folders(), meta_update_user(), sess_refresh_flush(), and session_t::user.

Referenced by sess_get(), and sess_release().

```

Functions

- void http_session_reset (connection_t *con)

  Reset a client http connection to its original, uninitialized state.

- void http_session_destroy (connection_t *con)

  Destroy an http client connection.

5.223.1 Function Documentation

5.223.1.1 void http_session_destroy (connection_t * *con*)

Destroy an http client connection. sessions.c

Parameters:

con the connection object to have its http session destroyed.

Returns:

This function returns no value.

Definition at line 77 of file sessions.c.

References http_session_reset().

Referenced by con_destroy().

5.223.1.2 void http_session_reset (connection_t * *con*)

Reset a client http connection to its original, uninitialized state.

Parameters:

con the connection object to have its http session state reset.

Returns:

This function returns no value.

Definition at line 15 of file sessions.c.

References connection_t::http, HTTP_CLOSE, HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_NEUTRAL, HTTP_MERGED, HTTP_METHOD_NONE, HTTP_PORTAL, HTTP_READY, inx_cleanup(), json_decref_d, sess_release(), and st_cleanup.

#include "magma.h"
```

Functions

- void register_session_free (register_session_t *session)

  Destroy a registration session and all its associated data.

- register_session_t * register_session_generate (void)

  Generate a new registration session.

- register_session_t * register_session_get (connection_t *con, stringer_t *name)

  Retrieve a registration session by a data key supplied in the user's http POST request.

- bool_t register_session_cache (connection_t *con, register_session_t *session)

  Save a registration session's state into the cache.

5.227.1 Function Documentation

5.227.1.1 bool_t register_session_cache (connection_t * *con*, register_session_t * *session*)

Save a registration session's state into the cache. sessions.c

Note:

The session is stored under the parent key "lavad.register.session."

Parameters:

con a pointer to the client connection underlying the user session.

session a pointer to the registration session to be persisted.

Returns:

false on failure or true if the session was cached successfully.

Definition at line 105 of file sessions.c.

References cache_set(), con_addr_presentation(), data, register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, MANAGEDBUF, register_session_t::name, NULLER, register_session_t::password, register_session_t::plan, serialize_st(), serialize_uint16(), serialize_uint64(), st_char_get(), st_cleanup, st_free(), st_length_int(), register_session_t::username, and register_session_t::usernum.

Referenced by register_process().

5.227.1.2 void register_session_free (register_session_t * *session*)

Destroy a registration session and all its associated data.

Returns:

This function returns no value.

Definition at line 14 of file sessions.c.

References register_session_t::hvf_input, register_session_t::hvf_value, mm_free(), register_session_t::name, register_session_t::password, st_cleanup, and register_session_t::username.

Referenced by register_process(), register_session_generate(), and register_session_get().

5.227.1.3 register_session_t* register_session_generate (void)

Generate a new registration session.

Returns:

NULL on failure, or a pointer to a new randomly named session on success.

Definition at line 35 of file sessions.c.

References log_pedantic, mm_alloc(), register_session_t::name, rand_choices(), and register_session_free().

Referenced by register_process().

5.227.1.4 register_session_t* register_session_get (connection_t * *con*, stringer_t * *name*)

Retrieve a registration session by a data key supplied in the user's http POST request.

Note:

The session is stored under the parent key "lavad.register.session."

Parameters:

con the client connection underlying the user request.

name a managed string containing the registration session identifier.

Returns:

NULL on failure, or a pointer to the user's registration session on success.

Definition at line 59 of file sessions.c.

References cache_get(), con_addr_presentation(), serialization_t::data, data, deserialize_st(), deserialize_uint16(), deserialize_uint64(), register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, MANAGEDBUF, mm_alloc(), mm_wipe(), register_session_t::name, NULLER, register_session_t::password, register_session_t::plan, register_session_free(), st_char_get(), st_dupe(), st_free(), st_length_int(), register_session_t::username, and register_session_t::usernum.

5.228 src/objects/warehouse/domains.c File Reference

```
#include "magma.h"
```

Functions

- void domain_stop (void)
  Free the global list of domains.
- bool_t domain_start (void)
  Fetch and store the list of configured domains from the database.
- domain_t ∗ domain_alloc (stringer_t ∗domain, int_t restricted, int_t mailboxes, int_t wildcard, int_t dkim, int_t spf)
  Allocate and initialize a new domain object.
- int_t domain_mailboxes (stringer_t ∗domain)
  Determine whether mailboxes are hosted locally for a specified domain.
- int_t domain_restricted (stringer_t ∗domain)
  Determine whether a specified domain is restricted to authenticated users.
- int_t domain_wildcard (stringer_t ∗domain)
  Determine whether a specified domain has wildcards enabled.
- int_t domain_dkim (stringer_t ∗domain)
  TODO: Eliminate dkim+spf and replace them with a 'sign' flag.
- int_t domain_spf (stringer_t ∗domain)
  Determine whether SPF has been configured for a specified domain.

Variables

- inx_t ∗ domains = NULL

5.228.1 Function Documentation

5.228.1.1 domain_t∗ domain_alloc (stringer_t ∗ *domain*, int_t *restricted*, int_t *mailboxes*, int_t *wildcard*, int_t *dkim*, int_t *spf*)

Allocate and initialize a new domain object. domains.c

Parameters:

domain a pointer to a managed string containing the name of the specified domain.
restricted if set, indicate that the domain is restricted to authenticated users only.
mailboxes if set, indicate that mailboxes are hosted locally for the domain.
wildcard if set, indicate that wildcards are enabled for the domain.
dkim if set, indicate that outbound messages for the domain should be signed via DKIM.
spf if set, indicate that SPF is configured for the domaini.

Returns:

NULL on failure or a pointer to the newly initialized domain object on success.

Definition at line 47 of file domains.c.

References align(), domain_t, FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_-length_get(), and STACK.

Referenced by warehouse_fetch_domains().

5.228.1.2 int_t domain_dkim (stringer_t * *domain*)

TODO: Eliminate dkim+spf and replace them with a 'sign' flag. Determine whether outbound messages should be signed via DKIM for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if DKIM signing is disabled, or 1 if outbound messages should be signed via DKIM for the domain.

Definition at line 131 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.228.1.3 int_t domain_mailboxes (stringer_t * *domain*)

Determine whether mailboxes are hosted locally for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain was not found, 0 if the domain is foreign, or 1 if the mailbox is hosted locally for the domain.

Definition at line 76 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.228.1.4 int_t domain_restricted (stringer_t * *domain*)

Determine whether a specified domain is restricted to authenticated users.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain was not found, 0 if restricted relay is disabled, or 1 if the domain is restricted to authenticated users only.

Definition at line 94 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.228.1.5 int_t domain_spf (stringer_t * *domain*)

Determine whether SPF has been configured for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if SPF is disabled, or 1 if SPF is actively configured for the domain.

Definition at line 149 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.228.1.6 bool_t domain_start (void)

Fetch and store the list of configured domains from the database.

Returns:

true if the domain retrieval was successful, or false on error.

Definition at line 28 of file domains.c.

References warehouse_fetch_domains().

Referenced by warehouse_start().

5.228.1.7 void domain_stop (void)

Free the global list of domains.

Returns:

This function returns no value.

Definition at line 16 of file domains.c.

References inx_cleanup().

Referenced by warehouse_stop().

5.228.1.8 int_t domain_wildcard (stringer_t * *domain*)

Determine whether a specified domain has wildcards enabled.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if wildcards are disabled, or 1 if the domain has wildcards enabled.

Definition at line 112 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

Referenced by smtp_check_authorized_from(), and smtp_fetch_inbound().

5.229.1 Function Documentation

5.229.1.1 int_t pattern_check (stringer_t * *message*)

Check to see if any of the entries in the patterns list are found in a body of text. patterns.c

Parameters:

message a managed string containing the raw data of the text to be searched.

Returns:

-2 on pattern match, -1 if an error occurs, or 1 if none of the patterns in the patterns list were detected.

Definition at line 19 of file patterns.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), mutex_lock(), mutex_unlock(), patterns_mutex, st_search_ci(), and stats_adjust_by_name().

Referenced by portal_outbound_checks(), and smtp_data_outbound().

5.229.1.2 bool_t pattern_start (void)

Initialize the patterns list.

Returns:

This function will always return true.

Definition at line 109 of file patterns.c.

References pattern_update().

Referenced by warehouse_start().

5.229.1.3 void pattern_stop (void)

Destroy the patterns list.

Returns:

This function returns no value.

Definition at line 94 of file patterns.c.

References inx_cleanup(), mutex_lock(), mutex_unlock(), and patterns_mutex.

Referenced by warehouse_stop().

5.229.1.4 void pattern_update (void)

Update the patterns list from the database, but no more frequently than once daily.

Returns:

This function returns no value.

Definition at line 62 of file patterns.c.

References inx_cleanup(), mutex_lock(), mutex_unlock(), patterns_mutex, patterns_stamp, time_datestamp(), and warehouse_fetch_-patterns().

5.231.1 Function Documentation

5.231.1.1 struct __attribute__ ((packed)) [read]

HIGH: Create an interface for loading SSL/TLS and DKIM certificates from the database. HIGH: Create an interface for checking whether an address or IP is trusted.

Definition at line 14 of file warehouse.h.

5.231.1.2 domain_t* domain_alloc (stringer_t * *domain*, int_t *restricted*, int_t *mailboxes*, int_t *wildcard*, int_t *dkim*, int_t *spf*)

domains.c domains.c

Parameters:

domain a pointer to a managed string containing the name of the specified domain.

restricted if set, indicate that the domain is restricted to authenticated users only.

mailboxes if set, indicate that mailboxes are hosted locally for the domain.

wildcard if set, indicate that wildcards are enabled for the domain.

dkim if set, indicate that outbound messages for the domain should be signed via DKIM.

spf if set, indicate that SPF is configured for the domaini.

Returns:

NULL on failure or a pointer to the newly initialized domain object on success.

Definition at line 47 of file domains.c.

References align(), domain_t, FOREIGNDATA, JOINTED, log_pedantic, mm_alloc(), mm_copy(), PLACER_T, placer_t, st_data_get(), st_length_get(), and STACK.

Referenced by warehouse_fetch_domains().

5.231.1.3 int_t domain_dkim (stringer_t * *domain*)

TODO: Eliminate dkim+spf and replace them with a 'sign' flag. Determine whether outbound messages should be signed via DKIM for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if DKIM signing is disabled, or 1 if outbound messages should be signed via DKIM for the domain.

Definition at line 131 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.231.1.4 int_t domain_mailboxes (stringer_t * *domain*)

Determine whether mailboxes are hosted locally for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain was not found, 0 if the domain is foreign, or 1 if the mailbox is hosted locally for the domain.

Definition at line 76 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.231.1.5 int_t domain_restricted (stringer_t * *domain*)

Determine whether a specified domain is restricted to authenticated users.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain was not found, 0 if restricted relay is disabled, or 1 if the domain is restricted to authenticated users only.

Definition at line 94 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.231.1.6 int_t domain_spf (stringer_t * *domain*)

Determine whether SPF has been configured for a specified domain.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if SPF is disabled, or 1 if SPF is actively configured for the domain.

Definition at line 149 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

5.231.1.7 bool_t domain_start (void)

Fetch and store the list of configured domains from the database.

Returns:

true if the domain retrieval was successful, or false on error.

Definition at line 28 of file domains.c.

References warehouse_fetch_domains().

Referenced by warehouse_start().

5.231.1.8 void domain_stop (void)

Free the global list of domains.

Returns:

This function returns no value.

Definition at line 16 of file domains.c.

References inx_cleanup().

Referenced by warehouse_stop().

5.231.1.9 int_t domain_wildcard (stringer_t * *domain*)

Determine whether a specified domain has wildcards enabled.

Parameters:

domain a pointer to a managed string containing the name of the domain to be queried.

Returns:

-1 on failure or if the domain wasn't found, 0 if wildcards are disabled, or 1 if the domain has wildcards enabled.

Definition at line 112 of file domains.c.

References domain_t, inx_find(), and M_TYPE_STRINGER.

Referenced by smtp_check_authorized_from(), and smtp_fetch_inbound().

5.231.1.10 int_t pattern_check (stringer_t * *message*)

patterns.c patterns.c

Parameters:

message a managed string containing the raw data of the text to be searched.

Returns:

-2 on pattern match, -1 if an error occurs, or 1 if none of the patterns in the patterns list were detected.

Definition at line 19 of file patterns.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), mutex_lock(), mutex_unlock(), patterns_mutex, st_search_ci(), and stats_adjust_by_name().

5.233.3 Function Documentation

5.233.3.1 void* dkim_memory_alloc (void * *closure*, size_t *nbytes*)

A memory allocation routine stub for dkim.

Note:

This function is passed to dkim_init().

Parameters:

closure a void pointer to a memory closure passed to dkim_sign() and dkim_verify().

nbytes the size, in bytes, of the memory block to be allocated.

Returns:

a pointer to a newly allocated block of memory of specified size.

Definition at line 59 of file dkim.c.

References mm_alloc().

Referenced by dkim_start().

5.233.3.2 void dkim_memory_free (void ∗ *closure*, void ∗ *ptr*)

A memory free routine stub for dkim.

Note:

This function is passed to dkim_init().

Parameters:

closure a void pointer to a memory closure passed to dkim_sign() and dkim_verify().

ptr a pointer to the block of memory to be released.

Returns:

This function returns no value.

Definition at line 71 of file dkim.c.

References mm_free().

Referenced by dkim_start().

5.233.3.3 stringer_t∗ dkim_signature_create (stringer_t ∗ *id*, stringer_t ∗ *message*)

Generate a DKIM signature for a message.

Note:

For this function to work, the magma.dkim.enabled configuration option must be set. This function also updates the provider.dkim.signed statistic.

Parameters:

id a managed string containing a printable string id for this message.

message a managed string containing the mail message data.

Returns:

NULL on failure or if magma.dkim.enabled is false; otherwise, a managed string containing a DKIM-Signature header built using the dkim signature that was generated for the input message.

Definition at line 139 of file dkim.c.

References CONTIGUOUS, magma_t::dkim, dkim_chunk_d, dkim_engine, dkim_eom_d, dkim_free_d, dkim_geterror_d, dkim_-getresultstr_d, dkim_getsighdrx_d, DKIM_PROCESS_ALL, dkim_sign_d, magma_t::domain, magma_t::enabled, HEAP, magma_t::key, log_pedantic, magma, NULLER_T, magma_t::selector, st_alloc_opts(), st_cleanup, st_data_get(), st_length_get(), st_merge, st_populated, st_uchar_get(), stats_adjust_by_name(), and status.

Referenced by mail_add_forward_headers(), mail_add_outbound_headers(), smtp_bounce(), and smtp_reply().

5.233.3.4 int_t dkim_signature_verify (stringer_t ∗ *id*, stringer_t ∗ *message*)

dkim.c dkim.c

Note:

This function also updates the provider.dkim.∗ statistics.

Parameters:

id a managed string containing a printable string id for this message.

message a managed string containing the mail message data.

Returns:

1 if the dkim verification was successful, or < 0 otherwise. -1: General internal or dkim-related failure occurred, or no signature was present. -2: The signature was bad or the signing key was revoked or key retrieval failed (try again later).

Definition at line 207 of file dkim.c.

References dkim_chunk_d, dkim_engine, dkim_eom_d, dkim_free_d, dkim_getresultstr_d, dkim_verify_d, log_pedantic, st_data_get(), st_length_get(), stats_adjust_by_name(), and status.

Referenced by smtp_accept_message().

5.233.3.5 bool_t dkim_start (void)

Start the dkim engine.

Returns:

false on failure or true on success.

Definition at line 81 of file dkim.c.

References magma_t::dkim, dkim_engine, dkim_init_d, dkim_memory_alloc(), dkim_memory_free(), magma_t::enabled, file_load(), file_world_accessible(), magma_t::key, log_critical, log_pedantic, magma, ssl_verify_privkey(), st_char_get(), st_free(), and st_length_int().

Referenced by process_start().

5.233.3.6 void dkim_stop (void)

Stop the dkim engine.

Returns:

This function returns no value.

Definition at line 120 of file dkim.c.

References dkim_close_d, and dkim_engine.

Referenced by process_stop().

5.233.3.7 int_t dspam_check (uint64_t *usernum*, stringer_t * *message*, stringer_t ** *signature*)

dspam.c HIGH: Return a result structure with the disposition, confidence, probability and signature data. Then store the analysis result with the message. Either in the DB or by adding a custom header to the message. Return codes should become 0 for success, or a negative integer for errors. Add statistical updates to check and train functions. Result: result=\"%s\"; class=\"%s\"; probability=01.4f; confidence=02.2f; signature=lu; key=lu; Layman's terms: How spammy is this message

Definition at line 54 of file dspam.c.

5.233.3.8 bool_t dspam_start (void)

Definition at line 38 of file dspam.c.

References dspam_init_driver_d.

Referenced by process_start().

5.233.3.9 void dspam_stop (void)

Definition at line 45 of file dspam.c.

References dspam_shutdown_driver_d.

Referenced by process_stop().

5.233.3.10 bool_t dspam_train (uint64_t *usernum*, int_t *disposition*, stringer_t * *signature*)

Note:

The disposition parameter marks whether or not the signature is currently marked as junk. So training the signature means that it will toggle its status.

Parameters:

usernum the numerical id of the user making the spam training request.

disposition if 0, dspam will mark the signature as junk; otherwise, mark as OK.

signature a managed string containing the spam signature to be trained.

Returns:

true on success or false on failure.

Definition at line 173 of file dspam.c.

References dspam_attach_d, dspam_create_d, dspam_destroy_d, dspam_detach_d, dspam_process_d, log_info, log_pedantic, MAGMA_SPOOL_DATA, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), spool_path(), sql_ping(), st_char_get(), st_free(), st_length_get(), and stmt_rebuild().

Referenced by teacher_process().

5.233.3.11 bool_t lib_load_clamav (void)

clamav.c clamav.c

Returns:

false on failure or true on success.

Definition at line 459 of file clamav.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.233.3.12 bool_t lib_load_dkim (void)

Initialize the dkim library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 27 of file dkim.c.

References dkim_getsighdrx_d, dkim_libversion_d, dkim_version, lib_symbols(), and M_BIND.

Referenced by lib_load().

5.233.3.13 bool_t lib_load_dspam (void)

Initialize the dspam library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 24 of file dspam.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.233.3.14 bool_t lib_load_spf (void)

spf.c spf.c

Returns:

false on failure or true on success.

Definition at line 27 of file spf.c.

References lib_symbols(), M_BIND, SPF_get_lib_version_d, and spf_version.

Referenced by lib_load().

5.233.3.15 const char* lib_version_clamav (void)

Returns the version of ClamAV that was loaded at runtime.

Returns:

The ClamAV version as a constant string.

Definition at line 451 of file clamav.c.

References cl_retver_d.

Referenced by lib_load().

5.233.3.16 const chr_t* lib_version_dkim (void)

Return the version string of the dkim library.

Returns:

a pointer to a character string containing the dkim library version information.

Definition at line 19 of file dkim.c.

References dkim_version.

Referenced by lib_load().

5.233.3.17 chr_t* lib_version_dspam (void)

Return the version string of the dspam library.

Returns:

a pointer to a character string containing the dspam library version information.

Definition at line 16 of file dspam.c.

References dspam_version_d.

Referenced by lib_load().

5.233.3.18 const chr_t* lib_version_spf (void)

Return the version string of the spf library.

Returns:

a pointer to a character string containing the spf library version information.

Definition at line 19 of file spf.c.

References spf_version.

Referenced by lib_load().

5.233.3.19 int_t spf_check (void * *ip*, stringer_t * *helo*, stringer_t * *mailfrom*)

Validate an smtp request via spf.

Parameters:

ip an ip address object containing the ip address of the connection to be checked.

helo a managed string containing the client supplied HELO request value.

mailfrom a managed string containing the client supplied MAIL FROM request value. TODO: We really need to change these return values to account for 0

Returns:

-2 on spf check fail, -1 on other failure, and 1 on spf pass.

Definition at line 112 of file spf.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, mail_domain_get(), PL_RESERVED, placer_t, pool_get_obj(), pool_pull(), pool_release(), SPF_request_free_d, SPF_request_new_d, SPF_request_query_mailfrom_d, SPF_request_set_env_from_d, SPF_request_set_helo_dom_d, SPF_request_set_ipv4_d, SPF_request_set_ipv6_d, SPF_response_free_d, SPF_response_reason_d, SPF_response_result_d, SPF_strerror_d, SPF_strreason_d, SPF_strresult_d, st_char_get(), st_empty, st_length_int(), and stats_adjust_by_name().

Referenced by smtp_rcpt_to().

5.233.3.20 bool_t spf_start (void)

Initialize the pool of spf server connections.

Returns:

false on failure or true on success.

Definition at line 52 of file spf.c.

References magma_t::iface, log_pedantic, magma, pool_alloc(), pool_set_obj(), magma_t::spf, and SPF_server_new_d.

Referenced by process_start().

5.233.3.21 void spf_stop (void)

Destroy the spf connection pool.

Returns:

This function returns no value.

Definition at line 84 of file spf.c.

References magma_t::iface, magma, pool_free(), pool_get_obj(), magma_t::spf, and SPF_server_free_d.

Referenced by process_stop().

5.233.3.22 int virus_check (stringer_t ∗ *data*)

Virus scan a block of data.

Parameters:

data a managed string containing the block of data to be scanned.

Returns:

1 if the message passed the scan, or < 0 on failure. -1: general failure, or the virus scanner was not enabled. -2: the data matches a worm, trojan, or virus. -3: the data matches a phishing attempt.

Definition at line 361 of file clamav.c.

References cl_scandesc_d, cl_strerror_d, CONSTANT, magma_t::iface, log_error, log_pedantic, magma, MAGMA_SPOOL_SCAN, ns_-length_get(), PLACER, spool_mktemp(), st_cmp_ci_starts(), st_data_get(), st_length_get(), stats_increment_by_name(), magma_t::virus, virus_engine, and virus_lock.

Referenced by portal_outbound_checks(), smtp_accept_message(), and smtp_data_outbound().

5.233.3.23 struct cl_engine∗ virus_engine_create (uint64_t ∗ *signatures*) `[read]`

Generates a new ClamAV engine context.

Parameters:

signatures An optional pointer which will be used to record the number of signatures loaded.

Returns:

Returns a pointer to the newly created context or NULL if an error occurs.

Definition at line 86 of file clamav.c.

References cl_engine_compile_d, cl_engine_free_d, cl_engine_new_d, cl_engine_set_num_d, cl_engine_set_str_d, cl_load_d, cl_strerror_d, magma_t::iface, log_error, magma, st_char_get(), magma_t::virus, and virus_spool.

Referenced by virus_engine_refresh(), and virus_start().

5.233.3.24 void virus_engine_destroy (struct cl_engine ** *target*)

Destroy a ClamAV engine context.

Parameters:

target the address of a pointer to a ClamAV engine context to be freed and reset.

Returns:

This function returns no value.

Definition at line 73 of file clamav.c.

References cl_engine_free_d, and log_check.

Referenced by virus_engine_refresh(), and virus_stop().

5.233.3.25 int virus_engine_refresh (void)

Checks the virus database directory for new signatures. If new signatures are detected an updated ClamAV engine context is created.

Returns:

Returns 1 if the engine context is updated, 0 if no updates are necessary and -1 in the event of an error.

Definition at line 291 of file clamav.c.

References cl_statchkdir_d, cl_statfree_d, cl_statinidir_d, magma_t::iface, log_error, log_info, magma, mm_wipe(), stats_increment_by_name(), stats_set_by_name(), magma_t::virus, virus_engine, virus_engine_create(), virus_engine_destroy(), virus_lock, virus_sigs, virus_sigs_total(), and virus_stat.

Referenced by process_maint().

5.233.3.26 uint64_t virus_sigs_loaded (void)

Get the number of virus signatures loaded by the ClamAV engine context.

Returns:

the number of virus signatures loaded by the ClamAV engine context.

Definition at line 39 of file clamav.c.

References virus_lock, and virus_sigs.

5.233.3.27 uint64_t virus_sigs_total (void)

Get the number of official signatures available inside the ClamAV signature directory.

See also:

magma.iface.virus.signatures

Returns:

the number of official signatures available inside the ClamAV signature directory, or 0 on failure.

Definition at line 55 of file clamav.c.

References cl_countsigs_d, cl_strerror_d, magma_t::iface, log_error, magma, and magma_t::virus.

Referenced by virus_engine_refresh(), and virus_start().

5.233.3.28 bool_t virus_start (void)

Initializes the global ClamAV engine context and configures it appropriately.

Returns:

Returns true if the ClamAV engine was loaded correctly.

Definition at line 196 of file clamav.c.

References cl_init_d, cl_statfree_d, cl_statinidir_d, cl_strerror_d, magma_t::iface, log_critical, log_pedantic, magma, MAGMA_SPOOL_-SCAN, mm_wipe(), magma_t::spool, spool_check(), spool_path(), st_char_get(), st_length_int(), stats_increment_by_name(), stats_set_by_-name(), magma_t::virus, virus_engine, virus_engine_create(), virus_sigs, virus_sigs_total(), virus_spool, and virus_stat.

Referenced by process_start().

5.233.3.29 void virus_stop (void)

Shut down the ClamAV library and free all its data and temporary files.

Returns:

This function returns no value.

Definition at line 249 of file clamav.c.

References cl_shutdown_d, cl_statfree_d, magma_t::iface, magma, st_free(), stats_set_by_name(), magma_t::virus, virus_engine, virus_-engine_destroy(), virus_sigs, virus_spool, and virus_stat.

Referenced by process_stop().

- pthread_rwlock_t virus_lock = PTHREAD_RWLOCK_INITIALIZER

5.234.1 Function Documentation

5.234.1.1 bool_t lib_load_clamav (void)

Loads the external functions needed by the ClamAV interface. clamav.c

Returns:

false on failure or true on success.

Definition at line 459 of file clamav.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.234.1.2 const char* lib_version_clamav (void)

Returns the version of ClamAV that was loaded at runtime.

Returns:

The ClamAV version as a constant string.

Definition at line 451 of file clamav.c.

References cl_retver_d.

Referenced by lib_load().

5.234.1.3 int virus_check (stringer_t * *data*)

Virus scan a block of data.

Parameters:

data a managed string containing the block of data to be scanned.

Returns:

1 if the message passed the scan, or < 0 on failure. -1: general failure, or the virus scanner was not enabled. -2: the data matches a worm, trojan, or virus. -3: the data matches a phishing attempt.

Definition at line 361 of file clamav.c.

References cl_scandesc_d, cl_strerror_d, CONSTANT, magma_t::iface, log_error, log_pedantic, magma, MAGMA_SPOOL_SCAN, ns_-length_get(), PLACER, spool_mktemp(), st_cmp_ci_starts(), st_data_get(), st_length_get(), stats_increment_by_name(), magma_t::virus, virus_engine, and virus_lock.

Referenced by portal_outbound_checks(), smtp_accept_message(), and smtp_data_outbound().

5.234.1.4 struct cl_engine* virus_engine_create (uint64_t * *signatures*) `[read]`

Generates a new ClamAV engine context.

Parameters:

signatures An optional pointer which will be used to record the number of signatures loaded.

Returns:

Returns a pointer to the newly created context or NULL if an error occurs.

Definition at line 86 of file clamav.c.

References cl_engine_compile_d, cl_engine_free_d, cl_engine_new_d, cl_engine_set_num_d, cl_engine_set_str_d, cl_load_d, cl_strerror_d, magma_t::iface, log_error, magma, st_char_get(), magma_t::virus, and virus_spool.

Referenced by virus_engine_refresh(), and virus_start().

5.234.1.5 void virus_engine_destroy (struct cl_engine ** *target*)

Destroy a ClamAV engine context.

Parameters:

target the address of a pointer to a ClamAV engine context to be freed and reset.

Returns:

This function returns no value.

Definition at line 73 of file clamav.c.

References cl_engine_free_d, and log_check.

Referenced by virus_engine_refresh(), and virus_stop().

5.234.1.6 int virus_engine_refresh (void)

Checks the virus database directory for new signatures. If new signatures are detected an updated ClamAV engine context is created.

Returns:

Returns 1 if the engine context is updated, 0 if no updates are necessary and -1 in the event of an error.

Definition at line 291 of file clamav.c.

References cl_statchkdir_d, cl_statfree_d, cl_statinidir_d, magma_t::iface, log_error, log_info, magma, mm_wipe(), stats_increment_by_name(), stats_set_by_name(), magma_t::virus, virus_engine, virus_engine_create(), virus_engine_destroy(), virus_lock, virus_sigs, virus_sigs_total(), and virus_stat.

Referenced by process_maint().

5.234.1.7 uint64_t virus_sigs_loaded (void)

Get the number of virus signatures loaded by the ClamAV engine context.

Returns:

the number of virus signatures loaded by the ClamAV engine context.

Definition at line 39 of file clamav.c.

References virus_lock, and virus_sigs.

5.234.1.8 uint64_t virus_sigs_total (void)

Get the number of official signatures available inside the ClamAV signature directory.

See also:

magma.iface.virus.signatures

Returns:

the number of official signatures available inside the ClamAV signature directory, or 0 on failure.

Definition at line 55 of file clamav.c.

References cl_countsigs_d, cl_strerror_d, magma_t::iface, log_error, magma, and magma_t::virus.

Referenced by virus_engine_refresh(), and virus_start().

5.234.1.9 bool_t virus_start (void)

Initializes the global ClamAV engine context and configures it appropriately.

Returns:

Returns true if the ClamAV engine was loaded correctly.

Definition at line 196 of file clamav.c.

References cl_init_d, cl_statfree_d, cl_statinidir_d, cl_strerror_d, magma_t::iface, log_critical, log_pedantic, magma, MAGMA_SPOOL_-SCAN, mm_wipe(), magma_t::spool, spool_check(), spool_path(), st_char_get(), st_length_int(), stats_increment_by_name(), stats_set_by_-name(), magma_t::virus, virus_engine, virus_engine_create(), virus_sigs, virus_sigs_total(), virus_spool, and virus_stat.

Referenced by process_start().

5.234.1.10 void virus_stop (void)

Shut down the ClamAV library and free all its data and temporary files.

Returns:

This function returns no value.

Definition at line 249 of file clamav.c.

References cl_shutdown_d, cl_statfree_d, magma_t::iface, magma, st_free(), stats_set_by_name(), magma_t::virus, virus_engine, virus_-engine_destroy(), virus_sigs, virus_spool, and virus_stat.

Referenced by process_stop().

5.234.2 Variable Documentation

5.234.2.1 struct cl_engine* virus_engine = NULL

The virus engine context pointer.

Definition at line 28 of file clamav.c.

Referenced by virus_check(), virus_engine_refresh(), virus_start(), and virus_stop().

5.234.2.2 pthread_rwlock_t virus_lock = PTHREAD_RWLOCK_INITIALIZER

The virus engine read/write lock.

Definition at line 33 of file clamav.c.

Referenced by virus_check(), virus_engine_refresh(), and virus_sigs_loaded().

5.234.2.3 unsigned int virus_sigs = 0

The number of signatures loaded by the virus engine.

Definition at line 23 of file clamav.c.

Referenced by virus_engine_refresh(), virus_sigs_loaded(), virus_start(), and virus_stop().

5.234.2.4 stringer_t* virus_spool = NULL

The virus engine spool directory.

Definition at line 13 of file clamav.c.

Referenced by virus_engine_create(), virus_start(), and virus_stop().

5.234.2.5 struct cl_stat virus_stat

The status of the signatures directory.

Definition at line 18 of file clamav.c.

Referenced by virus_engine_refresh(), virus_start(), and virus_stop().

5.235 src/providers/checkers/dkim.c File Reference

```

Defines

- #define DKIM_PROCESS_ALL -1L

Functions

- const chr_t ∗ lib_version_dkim (void)

  Return the version string of the dkim library.

- bool_t lib_load_dkim (void)

  Initialize the dkim library and bind dynamically to the exported functions that are required.

- void ∗ dkim_memory_alloc (void ∗closure, size_t nbytes)

  A memory allocation routine stub for dkim.

- void dkim_memory_free (void ∗closure, void ∗ptr)

  A memory free routine stub for dkim.

- bool_t dkim_start (void)

  Start the dkim engine.

- void dkim_stop (void)

  Stop the dkim engine.

- stringer_t ∗ dkim_signature_create (stringer_t ∗id, stringer_t ∗message)

  Generate a DKIM signature for a message.

- int_t dkim_signature_verify (stringer_t ∗id, stringer_t ∗message)

  Perform dkim verification of a signed message.

Variables

- chr_t dkim_version [8]
- DKIM_LIB ∗ dkim_engine = NULL

5.235.1 Define Documentation

5.235.1.1 #define DKIM_PROCESS_ALL -1L

Definition at line 13 of file dkim.c.

Referenced by dkim_signature_create().

5.235.2 Function Documentation

5.235.2.1 void∗ dkim_memory_alloc (void ∗ *closure*, size_t *nbytes*)

A memory allocation routine stub for dkim.

Note:

This function is passed to dkim_init().

Parameters:

closure a void pointer to a memory closure passed to dkim_sign() and dkim_verify().

nbytes the size, in bytes, of the memory block to be allocated.

Returns:

a pointer to a newly allocated block of memory of specified size.

Definition at line 59 of file dkim.c.

References mm_alloc().

Referenced by dkim_start().

5.235.2.2 void dkim_memory_free (void ∗ *closure*, void ∗ *ptr*)

A memory free routine stub for dkim.

Note:

This function is passed to dkim_init().

Parameters:

closure a void pointer to a memory closure passed to dkim_sign() and dkim_verify().

ptr a pointer to the block of memory to be released.

Returns:

This function returns no value.

Definition at line 71 of file dkim.c.

References mm_free().

Referenced by dkim_start().

5.235.2.3 stringer_t∗ dkim_signature_create (stringer_t ∗ *id*, stringer_t ∗ *message*)

Generate a DKIM signature for a message.

Note:

For this function to work, the magma.dkim.enabled configuration option must be set. This function also updates the provider.dkim.signed statistic.

Parameters:

id a managed string containing a printable string id for this message.

message a managed string containing the mail message data.

Returns:

NULL on failure or if magma.dkim.enabled is false; otherwise, a managed string containing a DKIM-Signature header built using the dkim signature that was generated for the input message.

Definition at line 139 of file dkim.c.

References CONTIGUOUS, magma_t::dkim, dkim_chunk_d, dkim_engine, dkim_eom_d, dkim_free_d, dkim_geterror_d, dkim_getresultstr_d, dkim_getsighdrx_d, DKIM_PROCESS_ALL, dkim_sign_d, magma_t::domain, magma_t::enabled, HEAP, magma_t::key, log_pedantic, magma, NULLER_T, magma_t::selector, st_alloc_opts(), st_cleanup, st_data_get(), st_length_get(), st_merge, st_populated, st_uchar_get(), stats_adjust_by_name(), and status.

Referenced by mail_add_forward_headers(), mail_add_outbound_headers(), smtp_bounce(), and smtp_reply().

5.235.2.4 int_t dkim_signature_verify (stringer_t ∗ *id*, stringer_t ∗ *message*)

Perform dkim verification of a signed message. dkim.c

Note:

This function also updates the provider.dkim.∗ statistics.

Parameters:

id a managed string containing a printable string id for this message.

message a managed string containing the mail message data.

Returns:

1 if the dkim verification was successful, or < 0 otherwise. -1: General internal or dkim-related failure occurred, or no signature was present. -2: The signature was bad or the signing key was revoked or key retrieval failed (try again later).

Definition at line 207 of file dkim.c.

References dkim_chunk_d, dkim_engine, dkim_eom_d, dkim_free_d, dkim_getresultstr_d, dkim_verify_d, log_pedantic, st_data_get(), st_length_get(), stats_adjust_by_name(), and status.

Referenced by smtp_accept_message().

5.235.2.5 bool_t dkim_start (void)

Start the dkim engine.

Returns:

false on failure or true on success.

Definition at line 81 of file dkim.c.

References magma_t::dkim, dkim_engine, dkim_init_d, dkim_memory_alloc(), dkim_memory_free(), magma_t::enabled, file_load(), file_world_accessible(), magma_t::key, log_critical, log_pedantic, magma, ssl_verify_privkey(), st_char_get(), st_free(), and st_length_int().

Referenced by process_start().

5.235.2.6 void dkim_stop (void)

Stop the dkim engine.

Returns:

This function returns no value.

Definition at line 120 of file dkim.c.

References dkim_close_d, and dkim_engine.

Referenced by process_stop().

5.235.2.7 bool_t lib_load_dkim (void)

Initialize the dkim library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 27 of file dkim.c.

References dkim_getsighdrx_d, dkim_libversion_d, dkim_version, lib_symbols(), and M_BIND.

Referenced by lib_load().

5.235.2.8 const chr_t* lib_version_dkim (void)

Return the version string of the dkim library.

Returns:

a pointer to a character string containing the dkim library version information.

Definition at line 19 of file dkim.c.

References dkim_version.

Referenced by lib_load().

5.236.1.2 bool_t dspam_start (void)

Definition at line 38 of file dspam.c.

References dspam_init_driver_d.

Referenced by process_start().

5.236.1.3 void dspam_stop (void)

Definition at line 45 of file dspam.c.

References dspam_shutdown_driver_d.

Referenced by process_stop().

5.236.1.4 bool_t dspam_train (uint64_t *usernum*, int_t *disposition*, stringer_t * *signature*)

Note:

The disposition parameter marks whether or not the signature is currently marked as junk. So training the signature means that it will toggle its status.

Parameters:

usernum the numerical id of the user making the spam training request.

disposition if 0, dspam will mark the signature as junk; otherwise, mark as OK.

signature a managed string containing the spam signature to be trained.

Returns:

true on success or false on failure.

Definition at line 173 of file dspam.c.

References dspam_attach_d, dspam_create_d, dspam_destroy_d, dspam_detach_d, dspam_process_d, log_info, log_pedantic, MAGMA_-SPOOL_DATA, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), spool_path(), sql_ping(), st_char_get(), st_free(), st_length_-get(), and stmt_rebuild().

Referenced by teacher_process().

5.236.1.5 bool_t lib_load_dspam (void)

Initialize the dspam library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 24 of file dspam.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.236.1.6 chr_t* lib_version_dspam (void)

Return the version string of the dspam library.

Returns:

a pointer to a character string containing the dspam library version information.

Definition at line 16 of file dspam.c.

References dspam_version_d.

Referenced by lib_load().

```
#include "magma.h"
```

Functions

- const chr_t ∗ lib_version_spf (void)
  Return the version string of the spf library.
- bool_t lib_load_spf (void)
  Initialize the spf library and bind dynamically to the exported functions that are required.
- bool_t spf_start (void)
  Initialize the pool of spf server connections.
- void spf_stop (void)
  Destroy the spf connection pool.
- int_t spf_check (void ∗ip, stringer_t ∗helo, stringer_t ∗mailfrom)
  Validate an smtp request via spf.

Variables

- pool_t ∗ spf_pool = NULL
- chr_t spf_version [8]

5.237.1 Function Documentation

5.237.1.1 bool_t lib_load_spf (void)

Initialize the spf library and bind dynamically to the exported functions that are required. spf.c

Returns:

false on failure or true on success.

Definition at line 27 of file spf.c.

References lib_symbols(), M_BIND, SPF_get_lib_version_d, and spf_version.

Referenced by lib_load().

5.237.1.2 const chr_t∗ lib_version_spf (void)

Return the version string of the spf library.

Returns:

a pointer to a character string containing the spf library version information.

Definition at line 19 of file spf.c.

References spf_version.

Referenced by lib_load().

5.237.1.3 int_t spf_check (void * *ip*, stringer_t * *helo*, stringer_t * *mailfrom*)

Validate an smtp request via spf.

Parameters:

ip an ip address object containing the ip address of the connection to be checked.

helo a managed string containing the client supplied HELO request value.

mailfrom a managed string containing the client supplied MAIL FROM request value. TODO: We really need to change these return values to account for 0

Returns:

-2 on spf check fail, -1 on other failure, and 1 on spf pass.

Definition at line 112 of file spf.c.

References ip_t::family, ip_t::ip4, ip_t::ip6, log_pedantic, mail_domain_get(), PL_RESERVED, placer_t, pool_get_obj(), pool_pull(), pool_release(), SPF_request_free_d, SPF_request_new_d, SPF_request_query_mailfrom_d, SPF_request_set_env_from_d, SPF_request_set_helo_dom_d, SPF_request_set_ipv4_d, SPF_request_set_ipv6_d, SPF_response_free_d, SPF_response_reason_d, SPF_response_result_d, SPF_strerror_d, SPF_strreason_d, SPF_strresult_d, st_char_get(), st_empty, st_length_int(), and stats_adjust_by_name().

Referenced by smtp_rcpt_to().

5.237.1.4 bool_t spf_start (void)

Initialize the pool of spf server connections.

Returns:

false on failure or true on success.

Definition at line 52 of file spf.c.

References magma_t::iface, log_pedantic, magma, pool_alloc(), pool_set_obj(), magma_t::spf, and SPF_server_new_d.

Referenced by process_start().

5.237.1.5 void spf_stop (void)

Destroy the spf connection pool.

Returns:

This function returns no value.

Definition at line 84 of file spf.c.

References magma_t::iface, magma, pool_free(), pool_get_obj(), magma_t::spf, and SPF_server_free_d.

Referenced by process_stop().

5.237.2 Variable Documentation

5.237.2.1 pool_t* spf_pool = NULL

Definition at line 12 of file spf.c.

5.237.2.2 chr_t spf_version[8]

Definition at line 13 of file spf.c.

Referenced by lib_load_spf(), and lib_version_spf().

5.238 src/providers/compress/bzip.c File Reference

```
#include "magma.h"
```

Functions

- const char ∗ lib_version_bzip (void)

  Return the version string of the bzip library.

- bool_t lib_load_bzip (void)

  Initialize the bzip library and bind dynamically to the exported functions that are required.

- stringer_t ∗ decompress_bzip (compress_t ∗compressed)

  Decompress data using the bzip engine.

- compress_t ∗ compress_bzip (stringer_t ∗input)

  Compress data using the bzip engine.

Variables

- char bzip_version [16]

5.238.1 Function Documentation

5.238.1.1 compress_t∗ compress_bzip (stringer_t ∗ *input*)

Compress data using the bzip engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the head of the compressed data on success.

Definition at line 100 of file bzip.c.

References BZ2_bzBuffToBuffCompress_d, compress_alloc(), compress_body_data(), COMPRESS_ENGINE_BZIP, compress_free(), compress_head_t, decompress_bzip(), hash_adler32(), log_info, st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), and tank_store().

5.238.1.2 stringer_t∗ decompress_bzip (compress_t ∗ *compressed*)

Decompress data using the bzip engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 61 of file bzip.c.

References BZ2_bzBuffToBuffDecompress_d, compress_body_data(), COMPRESS_ENGINE_BZIP, compress_head_t, hash_adler32(), log_info, st_alloc(), st_data_get(), st_free(), and st_length_set().

Referenced by compress_bzip(), engine_decompress(), and tank_load().

5.238.1.3 bool_t lib_load_bzip (void)

Initialize the bzip library and bind dynamically to the exported functions that are required. bzip.c

Returns:

true on success or false on failure.

Definition at line 24 of file bzip.c.

References BZ2_bzlibVersion_d, bzip_version, lib_symbols(), log_pedantic, M_BIND, and ns_length_int().

Referenced by lib_load().

5.238.1.4 const char* lib_version_bzip (void)

Return the version string of the bzip library.

Returns:

a pointer to a character string containing the bzip library version information.

Definition at line 16 of file bzip.c.

References bzip_version.

Referenced by lib_load().

5.238.2 Variable Documentation

5.238.2.1 char bzip_version[16]

Definition at line 10 of file bzip.c.

Referenced by lib_load_bzip(), and lib_version_bzip().

5.239 src/providers/compress/compress.c File Reference

```
#include "magma.h"
```

Functions

- size_t compress_block_length (void)
  Get the compression engine's (LZO1X-1) block size.
- uint64_t compress_total_length (compress_t *buffer)
  Return the total length of a compressed header and body.
- uint64_t compress_orig_hash (compress_t *buffer)
  Get the hash value of a compressed buffer's original data.
- uint64_t compress_orig_length (compress_t *buffer)
  Get the original length of a compressed buffer's data.
- uint64_t compress_body_hash (compress_t *buffer)
  Get the hash value of a compressed buffer's (compressed) body.
- uint64_t compress_body_length (compress_t *buffer)
  Return the length of a compressed buffer's body.
- void * compress_body_data (compress_t *buffer)
  Return the compressed body of data associated with a compressed header.
- size_t compress_body_offset (void)
  Get the offset to the compressed body from the compressed header.
- compress_t * compress_import (stringer_t *s)
  Parse and validate a managed string with compressed data and return a compressed header.
- compress_t * compress_alloc (size_t length)
  Allocate a new compressed object.
- void compress_free (compress_t *buffer)
  Free a compressed object.
- void compress_cleanup (compress_t *buffer)
  A checked cleanup function which can be used free a compressed object.

5.239.1 Function Documentation

5.239.1.1 compress_t* compress_alloc (size_t *length*)

Allocate a new compressed object. compress.c

Parameters:

length the size, in bytes, of the data after compression.

Returns:

a pointer to the head of the newly allocated compressed object.

Definition at line 140 of file compress.c.

References compress_head_t, and mm_alloc().

Referenced by compress_bzip(), compress_lzo(), and compress_zlib().

5.239.1.2 size_t compress_block_length (void)

Get the compression engine's (LZO1X-1) block size.

Note:

In the future this might get stored in the compression header and/or change depending on the engine being used.

Returns:

the size, in bytes, of the compression engine's block size.

Definition at line 15 of file compress.c.

5.239.1.3 void∗ compress_body_data (compress_t ∗ *buffer*)

Return the compressed body of data associated with a compressed header.

Parameters:

buffer the input compressed header.

Returns:

a pointer to the body (start) of the compressed data.

Definition at line 81 of file compress.c.

References compress_head_t.

Referenced by compress_bzip(), compress_import(), compress_lzo(), compress_zlib(), decompress_bzip(), decompress_lzo(), and decompress_zlib().

5.239.1.4 uint64_t compress_body_hash (compress_t ∗ *buffer*)

Get the hash value of a compressed buffer's (compressed) body.

Parameters:

buffer a pointer to the header of the compressed data.

Returns:

the hash value of the (compressed) of the compressed data.

Definition at line 58 of file compress.c.

References compress_head_t.

5.239.1.5 uint64_t compress_body_length (compress_t * *buffer*)

Return the length of a compressed buffer's body.

Returns:

the total length in bytes of the compressed data body, excluding the compressed header.

Definition at line 69 of file compress.c.

References compress_head_t.

Referenced by compress_total_length(), and tank_store().

5.239.1.6 size_t compress_body_offset (void)

Get the offset to the compressed body from the compressed header.

Parameters:

the size, in bytes, of the offset from the start of the compressed data body from the start of the compressed header.

Definition at line 90 of file compress.c.

References compress_head_t.

5.239.1.7 void compress_cleanup (compress_t * *buffer*)

A checked cleanup function which can be used free a compressed object.

Parameters:

buffer a pointer to the head of the compressed object to be freed.

Returns:

This function returns no value.

Definition at line 161 of file compress.c.

References mm_free().

Referenced by mail_store_message().

5.239.1.8 void compress_free (compress_t * *buffer*)

Free a compressed object.

Parameters:

buffer a pointer to the head of the compressed object to be freed.

Returns:

This function returns no value.

Definition at line 150 of file compress.c.

References mm_free().

Referenced by compress_bzip(), compress_lzo(), compress_zlib(), and tank_store().

5.239.1.9 compress_t* compress_import (stringer_t * *s*)

Parse and validate a managed string with compressed data and return a compressed header.

Parameters:

s the managed string containing the compressed data.

Returns:

NULL on general failure or if the Adler 32 hash doesn't match, or a pointer to the data's compressed header on success.

Definition at line 100 of file compress.c.

References compress_body_data(), compress_head_t, hash_adler32(), log_pedantic, st_data_get(), st_empty, and st_length_get().

Referenced by mail_load_message().

5.239.1.10 uint64_t compress_orig_hash (compress_t * *buffer*)

Get the hash value of a compressed buffer's original data.

Parameters:

buffer a pointer to the head of the compressed data.

Returns:

the hash value of the original (uncompressed) data.

Definition at line 34 of file compress.c.

References compress_head_t.

5.239.1.11 uint64_t compress_orig_length (compress_t * *buffer*)

Get the original length of a compressed buffer's data.

Parameters:

buffer a pointer to the head of the compressed data.

Returns:

the original length of the (uncompressed) data.

Definition at line 46 of file compress.c.

References compress_head_t.

5.239.1.12 uint64_t compress_total_length (compress_t * *buffer*)

Return the total length of a compressed header and body.

Returns:

the total length, in bytes, of the compressed header and body.

Definition at line 24 of file compress.c.

References compress_body_length(), and compress_head_t.

Referenced by mail_store_message(), and tank_store().

5.240 src/providers/compress/compress.h File Reference

Typedefs

- typedef stringer_t compress_t

Enumerations

- enum { COMPRESS_ENGINE_LZO = 1, COMPRESS_ENGINE_ZLIB = 2, COMPRESS_ENGINE_BZIP = 4 }

Functions

- struct __attribute__ ((packed))
- bool_t lib_load_bzip (void)

  bzip.c

- const char * lib_version_bzip (void)

  Return the version string of the bzip library.

- compress_t * compress_bzip (stringer_t *input)

  Compress data using the bzip engine.

- stringer_t * decompress_bzip (compress_t *compressed)

  Decompress data using the bzip engine.

- compress_t * compress_alloc (size_t length)

  compress.c

- size_t compress_block_length (void)

  Get the compression engine's (LZO1X-1) block size.

- void * compress_body_data (compress_t *buffer)

  Return the compressed body of data associated with a compressed header.

- uint64_t compress_body_hash (compress_t *buffer)

  Get the hash value of a compressed buffer's (compressed) body.

- uint64_t compress_body_length (compress_t *buffer)

  Return the length of a compressed buffer's body.

- size_t compress_body_offset (void)

  Get the offset to the compressed body from the compressed header.

- void compress_free (compress_t *buffer)

  Free a compressed object.

- compress_t * compress_import (stringer_t *s)

  Parse and validate a managed string with compressed data and return a compressed header.

- uint64_t compress_orig_hash (compress_t *buffer)

  Get the hash value of a compressed buffer's original data.

- uint64_t compress_orig_length (compress_t *buffer)

  Get the original length of a compressed buffer's data.

- uint64_t compress_total_length (compress_t *buffer)

  Return the total length of a compressed header and body.

- void compress_cleanup (compress_t *buffer)

  A checked cleanup function which can be used free a compressed object.

- compress_t * engine_compress (uint8_t engine, stringer_t *s)

  engine.c

- stringer_t * engine_decompress (compress_t *buffer)
- bool_t lib_load_lzo (void)

  lzo.c

- compress_t * compress_lzo (stringer_t *input)

  Compress data using the lzo engine.

- const char * lib_version_lzo (void)

  Return the version string of the lzo library.

- stringer_t * decompress_block_lzo (stringer_t *block)

  Decompress a single block of data using the lzo engine.

- stringer_t * decompress_lzo (compress_t *compressed)

  Decompress data using the lzo engine.

- bool_t lib_load_zlib (void)

  zlib.c

- const char * lib_version_zlib (void)

  Return the version string of zlib.

- compress_t * compress_zlib (stringer_t *input)

  Compress a block of data using the zlib engine.

- stringer_t * decompress_zlib (compress_t *compressed)

  Decompress a block of data using the zlib engine.

Variables

- enum { ... } COMPRESS_ENGINE
- compress_head_t

5.240.1.1 typedef stringer_t compress_t

Definition at line 33 of file compress.h.

5.240.2 Enumeration Type Documentation

5.240.2.1 anonymous enum

Enumerator:

COMPRESS_ENGINE_LZO

COMPRESS_ENGINE_ZLIB

COMPRESS_ENGINE_BZIP

Definition at line 11 of file compress.h.

5.240.3 Function Documentation

5.240.3.1 struct __attribute__ ((packed)) [read]

Definition at line 17 of file compress.h.

References length.

5.240.3.2 compress_t* compress_alloc (size_t *length*)

compress.c compress.c

Parameters:

length the size, in bytes, of the data after compression.

Returns:

a pointer to the head of the newly allocated compressed object.

Definition at line 140 of file compress.c.

References compress_head_t, and mm_alloc().

Referenced by compress_bzip(), compress_lzo(), and compress_zlib().

5.240.3.3 size_t compress_block_length (void)

Get the compression engine's (LZO1X-1) block size.

Note:

In the future this might get stored in the compression header and/or change depending on the engine being used.

Returns:

the size, in bytes, of the compression engine's block size.

Definition at line 15 of file compress.c.

5.240.3.4 void* compress_body_data (compress_t * *buffer*)

Return the compressed body of data associated with a compressed header.

Parameters:

buffer the input compressed header.

Returns:

a pointer to the body (start) of the compressed data.

Definition at line 81 of file compress.c.

References compress_head_t.

Referenced by compress_bzip(), compress_import(), compress_lzo(), compress_zlib(), decompress_bzip(), decompress_lzo(), and decompress_zlib().

5.240.3.5 uint64_t compress_body_hash (compress_t ∗ *buffer*)

Get the hash value of a compressed buffer's (compressed) body.

Parameters:

buffer a pointer to the header of the compressed data.

Returns:

the hash value of the (compressed) of the compressed data.

Definition at line 58 of file compress.c.

References compress_head_t.

5.240.3.6 uint64_t compress_body_length (compress_t ∗ *buffer*)

Return the length of a compressed buffer's body.

Returns:

the total length in bytes of the compressed data body, excluding the compressed header.

Definition at line 69 of file compress.c.

References compress_head_t.

Referenced by compress_total_length(), and tank_store().

5.240.3.7 size_t compress_body_offset (void)

Get the offset to the compressed body from the compressed header.

Parameters:

the size, in bytes, of the offset from the start of the compressed data body from the start of the compressed header.

Definition at line 90 of file compress.c.

References compress_head_t.

5.240.3.8 compress_t∗ compress_bzip (stringer_t ∗ *input*)

Compress data using the bzip engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the head of the compressed data on success.

Definition at line 100 of file bzip.c.

References BZ2_bzBuffToBuffCompress_d, compress_alloc(), compress_body_data(), COMPRESS_ENGINE_BZIP, compress_free(), compress_head_t, decompress_bzip(), hash_adler32(), log_info, st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), and tank_store().

5.240.3.9 void compress_cleanup (compress_t ∗ *buffer*)

A checked cleanup function which can be used free a compressed object.

Parameters:

buffer a pointer to the head of the compressed object to be freed.

Returns:

This function returns no value.

Definition at line 161 of file compress.c.

References mm_free().

Referenced by mail_store_message().

5.240.3.10 void compress_free (compress_t ∗ *buffer*)

Free a compressed object.

Parameters:

buffer a pointer to the head of the compressed object to be freed.

Returns:

This function returns no value.

Definition at line 150 of file compress.c.

References mm_free().

Referenced by compress_bzip(), compress_lzo(), compress_zlib(), and tank_store().

5.240.3.11 compress_t∗ compress_import (stringer_t ∗ *s*)

Parse and validate a managed string with compressed data and return a compressed header.

Parameters:

s the managed string containing the compressed data.

Returns:

NULL on general failure or if the Adler 32 hash doesn't match, or a pointer to the data's compressed header on success.

Definition at line 100 of file compress.c.

References compress_body_data(), compress_head_t, hash_adler32(), log_pedantic, st_data_get(), st_empty, and st_length_get().

Referenced by mail_load_message().

5.240.3.12 compress_t* compress_lzo (stringer_t * *input*)

Compress data using the lzo engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the head of the compressed data on success.

Definition at line 132 of file lzo.c.

References compress_alloc(), compress_body_data(), COMPRESS_ENGINE_LZO, compress_free(), compress_head_t, decompress_lzo(), hash_adler32(), log_info, lzo1x_1_compress_d, mm_alloc(), mm_free(), st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), mail_store_message(), and tank_store().

5.240.3.13 uint64_t compress_orig_hash (compress_t * *buffer*)

Get the hash value of a compressed buffer's original data.

Parameters:

buffer a pointer to the head of the compressed data.

Returns:

the hash value of the original (uncompressed) data.

Definition at line 34 of file compress.c.

References compress_head_t.

5.240.3.14 uint64_t compress_orig_length (compress_t * *buffer*)

Get the original length of a compressed buffer's data.

Parameters:

buffer a pointer to the head of the compressed data.

Returns:

the original length of the (uncompressed) data.

Definition at line 46 of file compress.c.

References compress_head_t.

5.240.3.15 uint64_t compress_total_length (compress_t ∗ *buffer*)

Return the total length of a compressed header and body.

Returns:

the total length, in bytes, of the compressed header and body.

Definition at line 24 of file compress.c.

References compress_body_length(), and compress_head_t.

Referenced by mail_store_message(), and tank_store().

5.240.3.16 compress_t∗ compress_zlib (stringer_t ∗ *input*)

Compress a block of data using the zlib engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the compressed data header on success..

Definition at line 83 of file zlib.c.

References compress2_d, compress_alloc(), compress_body_data(), COMPRESS_ENGINE_ZLIB, compress_free(), compress_head_t, compressBound_d, decompress_zlib(), hash_adler32(), log_info, st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), and tank_store().

5.240.3.17 stringer_t∗ decompress_block_lzo (stringer_t ∗ *block*)

Decompress a single block of data using the lzo engine.

Parameters:

block a managed string containing the block of compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 46 of file lzo.c.

References log_info, lzo1x_decompress_safe_d, st_alloc(), st_data_get(), st_free(), st_length_get(), and st_length_set().

5.240.3.18 stringer_t∗ decompress_bzip (compress_t ∗ *compressed*)

Decompress data using the bzip engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 61 of file bzip.c.

References BZ2_bzBuffToBuffDecompress_d, compress_body_data(), COMPRESS_ENGINE_BZIP, compress_head_t, hash_adler32(), log_info, st_alloc(), st_data_get(), st_free(), and st_length_set().

Referenced by compress_bzip(), engine_decompress(), and tank_load().

5.240.3.19 stringer_t∗ decompress_lzo (compress_t ∗ *compressed*)

Decompress data using the lzo engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 86 of file lzo.c.

References compress_body_data(), COMPRESS_ENGINE_LZO, compress_head_t, hash_adler32(), log_info, lzo1x_decompress_safe_d, st_alloc(), st_data_get(), st_free(), and st_length_set().

Referenced by compress_lzo(), engine_decompress(), mail_load_message(), and tank_load().

5.240.3.20 stringer_t∗ decompress_zlib (compress_t ∗ *compressed*)

Decompress a block of data using the zlib engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure (e.g. corruption), or a managed string containing the uncompressed data on success.

Functions

- bool_t lib_load_lzo (void)
  Initialize the lzo library and bind dynamically to the exported functions that are required.
- const char ∗ lib_version_lzo (void)
  Return the version string of the lzo library.
- stringer_t ∗ decompress_block_lzo (stringer_t ∗block)
  Decompress a single block of data using the lzo engine.
- stringer_t ∗ decompress_lzo (compress_t ∗compressed)
  Decompress data using the lzo engine.
- compress_t ∗ compress_lzo (stringer_t ∗input)
  Compress data using the lzo engine.

5.242.1 Function Documentation

5.242.1.1 compress_t∗ compress_lzo (stringer_t ∗ *input*)

Compress data using the lzo engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the head of the compressed data on success.

Definition at line 132 of file lzo.c.

References compress_alloc(), compress_body_data(), COMPRESS_ENGINE_LZO, compress_free(), compress_head_t, decompress_lzo(), hash_adler32(), log_info, lzo1x_1_compress_d, mm_alloc(), mm_free(), st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), mail_store_message(), and tank_store().

5.242.1.2 stringer_t∗ decompress_block_lzo (stringer_t ∗ *block*)

Decompress a single block of data using the lzo engine.

Parameters:

block a managed string containing the block of compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 46 of file lzo.c.

References log_info, lzo1x_decompress_safe_d, st_alloc(), st_data_get(), st_free(), st_length_get(), and st_length_set().

5.242.1.3 stringer_t* decompress_lzo (compress_t * *compressed*)

Decompress data using the lzo engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure, or a managed string containing the uncompressed data on success.

Definition at line 86 of file lzo.c.

References compress_body_data(), COMPRESS_ENGINE_LZO, compress_head_t, hash_adler32(), log_info, lzo1x_decompress_safe_d, st_alloc(), st_data_get(), st_free(), and st_length_set().

Referenced by compress_lzo(), engine_decompress(), mail_load_message(), and tank_load().

5.242.1.4 bool_t lib_load_lzo (void)

Initialize the lzo library and bind dynamically to the exported functions that are required. lzo.c

Returns:

true on success or false on failure.

Definition at line 15 of file lzo.c.

References __lzo_init_v2_d, lib_symbols(), log_critical, and M_BIND.

Referenced by lib_load().

5.242.1.5 const char* lib_version_lzo (void)

Return the version string of the lzo library.

Returns:

a pointer to a character string containing the lzo library version information.

Definition at line 37 of file lzo.c.

References lzo_version_string_d.

Referenced by lib_load().

5.243.1 Function Documentation

5.243.1.1 compress_t∗ compress_zlib (stringer_t ∗ *input*)

Compress a block of data using the zlib engine.

Parameters:

input a managed string containing the data to be compressed.

Returns:

NULL on failure, or a pointer to the compressed data header on success..

Definition at line 83 of file zlib.c.

References compress2_d, compress_alloc(), compress_body_data(), COMPRESS_ENGINE_ZLIB, compress_free(), compress_head_t, compressBound_d, decompress_zlib(), hash_adler32(), log_info, st_data_get(), st_free(), and st_length_get().

Referenced by engine_compress(), and tank_store().

5.243.1.2 stringer_t∗ decompress_zlib (compress_t ∗ *compressed*)

Decompress a block of data using the zlib engine.

Parameters:

compressed a pointer to the head of the compressed data.

Returns:

NULL on failure (e.g. corruption), or a managed string containing the uncompressed data on success.

Definition at line 44 of file zlib.c.

References compress_body_data(), COMPRESS_ENGINE_ZLIB, compress_head_t, hash_adler32(), log_info, st_alloc(), st_data_get(), st_-free(), st_length_set(), and uncompress_d.

Referenced by compress_zlib(), engine_decompress(), and tank_load().

5.243.1.3 bool_t lib_load_zlib (void)

Initialize the zlib library and bind dynamically to the exported functions that are required. zlib.c

Returns:

true on success or false on failure.

Definition at line 26 of file zlib.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.243.1.4 const char∗ lib_version_zlib (void)

Return the version string of zlib.

Returns:

a pointer to a character string containing the zlib version information.

Definition at line 18 of file zlib.c.

References zlibVersion_d.

Referenced by lib_load().

Functions

- int_t cache_add (stringer_t *key, stringer_t *object, time_t expiration)
  cache.c
- int_t cache_append (stringer_t *key, stringer_t *object, time_t expiration)
  Append data to the value of a cached keye on a memcached server.
- uint64_t cache_decrement (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)
  Decrement the value stored with a key inside memcached, using the specified offset.
- int_t cache_delete (stringer_t *key)
  Delete a key from memcached immediately.
- void cache_flush (void)
- stringer_t * cache_get (stringer_t *key)
  Retrieve data from memcached by key.
- uint64_t cache_get_u64 (stringer_t *key)
  Retrieve a 64 bit value from memcached by key.
- uint64_t cache_increment (stringer_t *key, uint64_t offset, uint64_t initial, time_t expiration)
  Increment the value stored with a key by memcached by a specified offset.
- int_t cache_set (stringer_t *key, stringer_t *object, time_t expiration)
  Set a value in memcached by key.
- int_t cache_set_u64 (stringer_t *key, uint64_t value, time_t expiration)
  Set a 64 bit value in memcached by key.
- int_t cache_silent_add (stringer_t *key, stringer_t *object, time_t expiration)
  Add a new key/value pair to the memcached server, but suppress any error messages.
- bool_t cache_start (void)
- void cache_stop (void)
  Destroy the memcached client pool and all active connections.
- bool_t lib_load_cache (void)
  Initialize the memcached library and bind dynamically to the exported functions that are required.
- const char * lib_version_cache (void)
  Return the version string of the memcached library.
- bool_t serialize_sz (stringer_t **data, size_t number)
  Serialization.
- bool_t serialize_ssz (stringer_t **data, ssize_t number)

Serialize an ssize_t into a managed string.

- bool_t serialize_int16 (stringer_t **data, int16_t number)
  Serialize a signed 16-bit integer into a managed string.
- bool_t serialize_int32 (stringer_t **data, int32_t number)
  Serialize a signed 32-bit integer into a managed string.
- bool_t serialize_int64 (stringer_t **data, int64_t number)
  Serialize a signed 64-bit integer into a managed string.
- bool_t serialize_st (stringer_t **data, stringer_t *string)
  Serialize the contents of a managed string into another managed string.
- bool_t serialize_uint64 (stringer_t **data, int64_t number)
  Serialize an unsigned 64-bit integer into a managed string.
- bool_t serialize_uint16 (stringer_t **data, uint16_t number)
  Serialize an unsigned 16-bit integer into a managed string.
- bool_t serialize_uint32 (stringer_t **data, uint32_t number)
  Serialize an unsigned 32-bit integer into a managed string.
- bool_t serialize_ns (stringer_t **data, char *string, size_t length)
  Serialize a block of memory into a managed string.
- int_t deserialize_count_digits (chr_t *data, size_t remaining)
  Count the number of bytes before a semicolon or non-numeric character is found.
- bool_t deserialize_sz (serialization_t *serial, size_t *number)
  Deserialize an size_t from a serialized object, and update its position.
- bool_t deserialize_ssz (serialization_t *serial, ssize_t *number)
  Deserialize an ssize_t from a serialized object, and update its position.
- bool_t deserialize_int32 (serialization_t *serial, int_t *number)
  Deserialize a signed 32-bit integer from a serialized object, and update its position.
- bool_t deserialize_int64 (serialization_t *serial, long int *number)
- bool_t deserialize_st (serialization_t *serial, stringer_t **string)
  Deserialize a managed string from a serialized object, and update its position.
- bool_t deserialize_int16 (serialization_t *serial, short int *number)
- bool_t deserialize_uint32 (serialization_t *serial, uint32_t *number)
  Deserialize an unsigned 32-bit integer from a serialized object, and update its position.
- bool_t deserialize_uint64 (serialization_t *serial, uint64_t *number)
  Deserialize an unsigned 64-bit integer from a serialized object, and update its position.
- bool_t deserialize_ns (serialization_t *serial, chr_t **string, size_t *length)
  Deserialize a null-terminated string from a serialized object, and update its position.
- bool_t deserialize_uint16 (serialization_t *serial, short unsigned int *number)

5.244.1 Function Documentation

5.244.1.1 int_t cache_add (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

cache.c cache.c

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 278 of file cache.c.

References log_info, memcached_add_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_-get(), st_empty, st_length_get(), and st_length_int().

5.244.1.2 int_t cache_append (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Append data to the value of a cached keye on a memcached server.

Parameters:

key a managed string with the name of the target memcached key.

object a managed string containing the value of the data being appended to the original key.

expiration an expiration time, in seconds, for the modified cached data.

Definition at line 323 of file cache.c.

References log_info, memcached_add_d, memcached_append_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by stamp_counter_increment().

5.244.1.3 uint64_t cache_decrement (stringer_t * *key*, uint64_t *offset*, uint64_t *initial*, time_t *expiration*)

Decrement the value stored with a key inside memcached, using the specified offset.

See also:

memcached_decrement_with_initial()

Note:

If the expiration valuse is MEMCACHED_EXPIRATION_NOT_ADD the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be decremented.

initial the initial value to seed the key with it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly decremented value associated with the key, or the initial value, on success.

Definition at line 415 of file cache.c.

References log_pedantic, memcached_decrement_with_initial_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by imap_login(), pop_pass(), smtp_auth_login(), and smtp_auth_plain().

5.244.1.4 int_t cache_delete (stringer_t ∗ *key*)

Delete a key from memcached immediately.

Note:

memcached_delete()

Parameters:

key the name of the key to be deleted from the memcached server.

Returns:

0 on failure, or MEMCACHED_SUCCESS on success.

Definition at line 353 of file cache.c.

References log_info, memcached_delete_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_-get(), st_empty, st_length_get(), and st_length_int().

Referenced by lock_release().

5.244.1.5 void cache_flush (void)

Definition at line 124 of file cache.c.

References log_info, memcached_flush_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), and pool_release().

5.244.1.6 stringer_t∗ cache_get (stringer_t ∗ *key*)

Retrieve data from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or a pointer to a managed string containing the cached data on success.

Definition at line 145 of file cache.c.

References data, length, log_info, memcached_get_d, memcached_strerror_d, mm_free(), PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_import(), st_length_get(), and st_length_int().

Referenced by register_session_get(), smtp_check_greylist(), smtp_fetch_autoreply(), stamp_counter_check(), and teacher_data_get().

5.244.1.7 uint64_t cache_get_u64 (stringer_t ∗ *key*)

Retrieve a 64 bit value from memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

Returns:

NULL on failure, or the 64 bit value cached data on success.

Definition at line 185 of file cache.c.

References data, length, log_info, memcached_get_d, memcached_strerror_d, mm_free(), PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by contact_abuse_checks(), register_abuse_checks(), and smtp_reply().

5.244.1.8 uint64_t cache_increment (stringer_t * *key*, uint64_t *offset*, uint64_t *initial*, time_t *expiration*)

Increment the value stored with a key by memcached by a specified offset.

See also:

memcached_increment_with_initial()

Note:

If the expiration valuse is MEMCACHED_EXPIRATION_NOT_ADD the key won't be added, but the initial value will be used as the return value.

Parameters:

key a managed string containing the name of the memcached key to be adjusted.

offset the offset by which the specified key's value should be incremented.

initial the initial value to seed the key if it does not already exist.

expiration the time, in seconds, when the cached key will expire.

Returns:

0 on failure, or the newly incremented value associated with the key, or the initial value, on success.

Definition at line 381 of file cache.c.

References log_pedantic, memcached_increment_with_initial_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by api_endpoint_auth(), contact_abuse_increment_history(), imap_login(), pop_pass(), portal_endpoint_auth(), register_abuse_-increment_history(), serial_get(), serial_increment(), smtp_auth_login(), and smtp_auth_plain().

5.244.1.9 int_t cache_set (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Set a value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

object a managed string containing the new data to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

0 on failure, or 1 on success.

Definition at line 231 of file cache.c.

References log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by register_session_cache(), serial_reset(), smtp_check_greylist(), smtp_fetch_autoreply(), and teacher_data_save().

5.244.1.10 int_t cache_set_u64 (stringer_t * *key*, uint64_t *value*, time_t *expiration*)

Set a 64 bit value in memcached by key.

Parameters:

key a managed string containing a key to be passed to memcached.

value the new value to be associated with the supplied key.

expiration the expiration time of the cached data.

Returns:

NULL on failure, or the retrieved unsigned 64 bit cached data on success.

Definition at line 255 of file cache.c.

References log_info, memcached_set_d, memcached_strerror_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, st_length_get(), and st_length_int().

Referenced by smtp_reply().

5.244.1.11 int_t cache_silent_add (stringer_t * *key*, stringer_t * *object*, time_t *expiration*)

Add a new key/value pair to the memcached server, but suppress any error messages.

Parameters:

key a managed string with the name of the key to be added to the cache.

object a managed string containing the initial value of the new key.

expiration an expiration time, in seconds, for the newly cached data.

Definition at line 301 of file cache.c.

References memcached_add_d, PL_RESERVED, pool_get_obj(), pool_pull(), pool_release(), st_char_get(), st_empty, and st_length_get().

Referenced by lock_get().

5.244.1.12 bool_t cache_start (void)

Definition at line 45 of file cache.c.

References magma_t::cache, magma_t::iface, log_critical, magma, MAGMA_CACHE_INSTANCES, memcached_behavior_set_d, memcached_create_d, memcached_free_d, memcached_server_add_with_weight_d, memcached_strerror_d, pool_alloc(), and pool_set_obj().

Referenced by process_start().

5.244.1.13 void cache_stop (void)

Destroy the memcached client pool and all active connections.

Returns:

This function returns no value.

Definition at line 104 of file cache.c.

References magma_t::cache, magma_t::iface, magma, memcached_free_d, pool_free(), and pool_get_obj().

Referenced by process_stop().

5.244.1.14 int_t deserialize_count_digits (chr_t * *data*, size_t *remaining*) [inline]

Count the number of bytes before a semicolon or non-numeric character is found.

Parameters:

data a pointer to a null-terminated string to be scanned.

remaining the maximum number of characters to be scanned.

Returns:

-1 if no match is found, or the length, in bytes, of the data preceding the matched character.

Definition at line 16 of file deserialization.c.

Referenced by deserialize_int16(), deserialize_int32(), deserialize_int64(), deserialize_uint16(), deserialize_uint32(), and deserialize_uint64().

5.244.1.15 bool_t deserialize_int16 (serialization_t * *serial*, short int * *number*)

5.244.1.16 bool_t deserialize_int32 (serialization_t * *serial*, int_t * *number*)

Deserialize a signed 32-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to a signed 32-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 138 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), int32_conv_bl(), length, log_pedantic, serialization_t::position, st_char_get(), and st_length_get().

Referenced by teacher_data_get().

5.244.1.17 bool_t deserialize_int64 (serialization_t * *serial*, long int * *number*)

Referenced by deserialize_ssz().

5.244.1.18 bool_t deserialize_ns (serialization_t * *serial*, chr_t ** *string*, size_t * *length*)

Deserialize a null-terminated string from a serialized object, and update its position.

Note:

A null-terminated string is stored as a 64 bit length field, followed by the string contents.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

string a pointer to the address of a null-terminated string that will receive the de-serialized data at the serialized object's current position.

length a pointer to a size_t that will receive the length of the de-serialized null-terminated string on success.

Returns:

true on success or false on failure..

Definition at line 352 of file deserialization.c.

References bytes, serialization_t::data, deserialize_sz(), log_pedantic, mm_copy(), ns_alloc(), serialization_t::position, st_char_get(), and st_length_get().

5.244.1.19 bool_t deserialize_ssz (serialization_t ∗ *serial*, ssize_t ∗ *number*)

Deserialize an ssize_t from a serialized object, and update its position.

See also:

deserialize_int64

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an ssize_t variable which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 48 of file deserialization.c.

References deserialize_int64().

5.244.1.20 bool_t deserialize_st (serialization_t ∗ *serial*, stringer_t ∗∗ *string*)

Deserialize a managed string from a serialized object, and update its position.

Note:

A managed string is stored as a 64 bit length field, followed by opaque data.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to the address of a managed string, will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure..

Definition at line 299 of file deserialization.c.

References serialization_t::data, deserialize_sz(), length, log_pedantic, mm_copy(), serialization_t::position, st_alloc(), st_char_get(), st_length_get(), and st_length_set().

Referenced by register_session_get(), and teacher_data_get().

5.244.1.21 bool_t deserialize_sz (serialization_t * *serial*, size_t * *number*)

Deserialize an size_t from a serialized object, and update its position.

See also:

deserialize_uint64

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an size_t variable which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 37 of file deserialization.c.

References deserialize_uint64().

Referenced by deserialize_ns(), and deserialize_st().

5.244.1.22 bool_t deserialize_uint16 (serialization_t * *serial*, short unsigned int * *number*)

Referenced by register_session_get().

5.244.1.23 bool_t deserialize_uint32 (serialization_t * *serial*, uint32_t * *number*)

Deserialize an unsigned 32-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an unsigned 32-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 98 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), length, log_pedantic, serialization_t::position, st_char_get(), st_length_get(), and uint32_conv_bl().

5.244.1.24 bool_t deserialize_uint64 (serialization_t * *serial*, uint64_t * *number*)

Deserialize an unsigned 64-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an unsigned 64-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 58 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), length, log_pedantic, serialization_t::position, st_char_get(), st_length_get(), and uint64_conv_bl().

Referenced by deserialize_sz(), register_session_get(), and teacher_data_get().

5.244.1.25 bool_t lib_load_cache (void)

Initialize the memcached library and bind dynamically to the exported functions that are required.

Returns:

true on success or false on failure.

Definition at line 16 of file cache.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.244.1.26 const char* lib_version_cache (void)

Return the version string of the memcached library.

Returns:

a pointer to a character string containing the memcached library version information.

Definition at line 37 of file cache.c.

References memcached_lib_version_d.

Referenced by lib_load().

5.244.1.27 bool_t serialize_int16 (stringer_t ** *data*, int16_t *number*)

Serialize a signed 16-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 16-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 39 of file serialization.c.

References int16_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

5.244.1.28 bool_t serialize_int32 (stringer_t ** *data*, int32_t *number*)

Serialize a signed 32-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 32-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 111 of file serialization.c.

References int32_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by teacher_data_save().

5.244.1.29 bool_t serialize_int64 (stringer_t ** *data*, int64_t *number*)

Serialize a signed 64-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 64-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 182 of file serialization.c.

References int64_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by serialize_ssz().

5.244.1.30 bool_t serialize_ns (stringer_t ** *data*, char * *string*, size_t *length*)

Serialize a block of memory into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

string a pointer to the start of the memory block to be serialized.

length the length, in bytes, of the memory block to be serialized.

Returns:

1 if the block of memory was serialized and stored successfully, or -1 on failure.

Definition at line 302 of file serialization.c.

References mm_copy(), serialize_sz(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

5.244.1.31 bool_t serialize_ssz (stringer_t ∗∗ *data*, ssize_t *number*)

Serialize an ssize_t into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the ssize_t to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 28 of file serialization.c.

References serialize_int64().

5.244.1.32 bool_t serialize_st (stringer_t ∗∗ *data*, stringer_t ∗ *string*)

Serialize the contents of a managed string into another managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

string a pointer to a managed string containing the data to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 254 of file serialization.c.

References length, mm_copy(), serialize_sz(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by register_session_cache(), and teacher_data_save().

5.244.1.33 bool_t serialize_sz (stringer_t ** *data*, size_t *number*)

Serialization. Serialization.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the size_t to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 17 of file serialization.c.

References serialize_uint64().

Referenced by serialize_ns(), and serialize_st().

5.244.1.34 bool_t serialize_uint16 (stringer_t ** *data*, uint16_t *number*)

Serialize an unsigned 16-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 16-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 75 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint16_digits().

Referenced by register_session_cache().

5.244.1.35 bool_t serialize_uint32 (stringer_t ** *data*, uint32_t *number*)

Serialize an unsigned 32-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 32-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 147 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint32_digits().

5.244.1.36 bool_t serialize_uint64 (stringer_t ∗∗ *data*, int64_t *number*)

Serialize an unsigned 64-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 64-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 218 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint64_digits().

Referenced by register_session_cache(), serialize_sz(), and teacher_data_save().

Functions

- int_t deserialize_count_digits (chr_t *data, size_t remaining)
  Count the number of bytes before a semicolon or non-numeric character is found.
- bool_t deserialize_sz (serialization_t *serial, size_t *number)
  Deserialize an size_t from a serialized object, and update its position.
- bool_t deserialize_ssz (serialization_t *serial, ssize_t *number)
  Deserialize an ssize_t from a serialized object, and update its position.
- bool_t deserialize_uint64 (serialization_t *serial, uint64_t *number)
  Deserialize an unsigned 64-bit integer from a serialized object, and update its position.
- bool_t deserialize_uint32 (serialization_t *serial, uint32_t *number)
  Deserialize an unsigned 32-bit integer from a serialized object, and update its position.
- bool_t deserialize_int32 (serialization_t *serial, int_t *number)
  Deserialize a signed 32-bit integer from a serialized object, and update its position.
- bool_t deserialize_int64 (serialization_t *serial, long *number)
  Deserialize a signed 64-bit integer from a serialized object, and update its position.
- bool_t deserialize_int16 (serialization_t *serial, short *number)
  Deserialize a signed 16 bit integer from a serialized object, and update its position.
- bool_t deserialize_uint16 (serialization_t *serial, unsigned short *number)
  Deserialize an unsigned 16 bit integer from a serialized object, and update its position.
- bool_t deserialize_st (serialization_t *serial, stringer_t **string)
  Deserialize a managed string from a serialized object, and update its position.
- bool_t deserialize_ns (serialization_t *serial, chr_t **string, size_t *length)
  Deserialize a null-terminated string from a serialized object, and update its position.

5.245.1 Function Documentation

5.245.1.1 int_t deserialize_count_digits (chr_t * *data*, size_t *remaining*) [inline]

Count the number of bytes before a semicolon or non-numeric character is found.

Parameters:

data a pointer to a null-terminated string to be scanned.

remaining the maximum number of characters to be scanned.

Returns:

-1 if no match is found, or the length, in bytes, of the data preceding the matched character.

Definition at line 16 of file deserialization.c.

Referenced by deserialize_int16(), deserialize_int32(), deserialize_int64(), deserialize_uint16(), deserialize_uint32(), and deserialize_-uint64().

5.245.1.2 bool_t deserialize_int16 (serialization_t * *serial*, short * *number*)

Deserialize a signed 16 bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to a signed 16-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 218 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), int16_conv_bl(), length, log_pedantic, serialization_t::position, st_char_get(), and st_length_get().

5.245.1.3 bool_t deserialize_int32 (serialization_t * *serial*, int_t * *number*)

Deserialize a signed 32-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to a signed 32-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 138 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), int32_conv_bl(), length, log_pedantic, serialization_t::position, st_char_get(), and st_length_get().

Referenced by teacher_data_get().

5.245.1.4 bool_t deserialize_int64 (serialization_t * *serial*, long * *number*)

Deserialize a signed 64-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to a signed 64-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 178 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), int64_conv_bl(), length, log_pedantic, serialization_t::position, st_char_get(), and st_length_get().

5.245.1.5 bool_t deserialize_ns (serialization_t * *serial*, chr_t ** *string*, size_t * *length*)

Deserialize a null-terminated string from a serialized object, and update its position.

Note:

A null-terminated string is stored as a 64 bit length field, followed by the string contents.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

string a pointer to the address of a null-terminated string that will receive the de-serialized data at the serialized object's current position.

length a pointer to a size_t that will receive the length of the de-serialized null-terminated string on success.

Returns:

true on success or false on failure..

Definition at line 352 of file deserialization.c.

References bytes, serialization_t::data, deserialize_sz(), log_pedantic, mm_copy(), ns_alloc(), serialization_t::position, st_char_get(), and st_length_get().

5.245.1.6 bool_t deserialize_ssz (serialization_t * *serial*, ssize_t * *number*)

Deserialize an ssize_t from a serialized object, and update its position.

See also:

deserialize_int64

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an ssize_t variable which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 48 of file deserialization.c.

References deserialize_int64().

5.245.1.7 bool_t deserialize_st (serialization_t * *serial*, stringer_t ** *string*)

Deserialize a managed string from a serialized object, and update its position.

Note:

A managed string is stored as a 64 bit length field, followed by opaque data.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to the address of a managed string, will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure..

Definition at line 299 of file deserialization.c.

References serialization_t::data, deserialize_sz(), length, log_pedantic, mm_copy(), serialization_t::position, st_alloc(), st_char_get(), st_length_get(), and st_length_set().

Referenced by register_session_get(), and teacher_data_get().

5.245.1.8 bool_t deserialize_sz (serialization_t * *serial*, size_t * *number*)

Deserialize an size_t from a serialized object, and update its position.

See also:

deserialize_uint64

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an size_t variable which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 37 of file deserialization.c.

References deserialize_uint64().

Referenced by deserialize_ns(), and deserialize_st().

5.245.1.9 bool_t deserialize_uint16 (serialization_t * *serial*, unsigned short * *number*)

Deserialize an unsigned 16 bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an unsigned 16-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure..

Definition at line 258 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), length, log_pedantic, serialization_t::position, st_char_get(), st_length_get(), and uint16_conv_bl().

5.245.1.10 bool_t deserialize_uint32 (serialization_t * *serial*, uint32_t * *number*)

Deserialize an unsigned 32-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an unsigned 32-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 98 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), length, log_pedantic, serialization_t::position, st_char_get(), st_length_get(), and uint32_conv_bl().

5.245.1.11 bool_t deserialize_uint64 (serialization_t * *serial*, uint64_t * *number*)

Deserialize an unsigned 64-bit integer from a serialized object, and update its position.

Parameters:

serial a pointer to a serialized object from which the data will be extracted.

number a pointer to an unsigned 64-bit integer which will receive the de-serialized data at the serialized object's current position.

Returns:

true on success or false on failure.

Definition at line 58 of file deserialization.c.

References serialization_t::data, deserialize_count_digits(), length, log_pedantic, serialization_t::position, st_char_get(), st_length_get(), and uint64_conv_bl().

Referenced by deserialize_sz(), register_session_get(), and teacher_data_get().

  Serialize an unsigned 64-bit integer into a managed string.
- bool_t serialize_st (stringer_t **data, stringer_t *string)
  Serialize the contents of a managed string into another managed string.
- bool_t serialize_ns (stringer_t **data, char *string, size_t length)
  Serialize a block of memory into a managed string.

5.246.1 Function Documentation

5.246.1.1 bool_t serialize_int16 (stringer_t ** *data*, int16_t *number*)

Serialize a signed 16-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 16-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 39 of file serialization.c.

References int16_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

5.246.1.2 bool_t serialize_int32 (stringer_t ** *data*, int32_t *number*)

Serialize a signed 32-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 32-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 111 of file serialization.c.

References int32_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by teacher_data_save().

5.246.1.3 bool_t serialize_int64 (stringer_t ** *data*, int64_t *number*)

Serialize a signed 64-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the signed 64-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 182 of file serialization.c.

References int64_digits(), length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by serialize_ssz().

5.246.1.4 bool_t serialize_ns (stringer_t ** *data*, char * *string*, size_t *length*)

Serialize a block of memory into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

string a pointer to the start of the memory block to be serialized.

length the length, in bytes, of the memory block to be serialized.

Returns:

1 if the block of memory was serialized and stored successfully, or -1 on failure.

Definition at line 302 of file serialization.c.

References mm_copy(), serialize_sz(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

5.246.1.5 bool_t serialize_ssz (stringer_t ∗∗ *data*, ssize_t *number*)

Serialize an ssize_t into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the ssize_t to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 28 of file serialization.c.

References serialize_int64().

5.246.1.6 bool_t serialize_st (stringer_t ∗∗ *data*, stringer_t ∗ *string*)

Serialize the contents of a managed string into another managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

string a pointer to a managed string containing the data to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 254 of file serialization.c.

References length, mm_copy(), serialize_sz(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), and st_realloc().

Referenced by register_session_cache(), and teacher_data_save().

5.246.1.7 bool_t serialize_sz (stringer_t ** *data*, size_t *number*)

Serialize a size_t into a managed string. Serialization.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the size_t to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 17 of file serialization.c.

References serialize_uint64().

Referenced by serialize_ns(), and serialize_st().

5.246.1.8 bool_t serialize_uint16 (stringer_t ** *data*, uint16_t *number*)

Serialize an unsigned 16-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 16-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 75 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint16_digits().

Referenced by register_session_cache().

5.246.1.9 bool_t serialize_uint32 (stringer_t ** *data*, uint32_t *number*)

Serialize an unsigned 32-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 32-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 147 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint32_digits().

5.246.1.10 bool_t serialize_uint64 (stringer_t ∗∗ *data*, int64_t *number*)

Serialize an unsigned 64-bit integer into a managed string.

Note:

This function will reallocate the output managed string if necessary, and append the serialized data, updating the length field to reflect the changes.

Parameters:

data a pointer to the address of a managed string to receive the output, which will be allocated for the caller if NULL is passed.

number the value of the unsigned 64-bit integer to be serialized.

Returns:

true if the specified value was serialized and stored successfully, or false on failure.

Definition at line 218 of file serialization.c.

References length, st_alloc(), st_avail_get(), st_char_get(), st_length_get(), st_length_set(), st_realloc(), and uint64_digits().

Referenced by register_session_cache(), serialize_sz(), and teacher_data_save().

```
#include "magma.h"
```

Functions

- cipher_t ∗ cipher_name (stringer_t ∗name)
  Look up a cipher type by name.
- cipher_t ∗ cipher_id (int_t id)
  Look up a cipher type by its nid.
- int_t cipher_numeric_id (cipher_t ∗c)
  Return the numerical ID (nid) of a specified cipher.
- int_t cipher_key_length (cipher_t ∗c)
  Determine the key length of a specified cipher.
- int_t cipher_vector_length (cipher_t ∗c)
  Determine the IV length of a specified cipher.
- int_t cipher_block_length (cipher_t ∗c)
  Determine the block length of a specified cipher.

5.247.1 Function Documentation

5.247.1.1 int_t cipher_block_length (cipher_t ∗ *c*)

Determine the block length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's block length in bytes.

Definition at line 94 of file ciphers.c.

References EVP_CIPHER_block_size_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

5.247.1.2 cipher_t∗ cipher_id (int_t *id*)

Look up a cipher type by its nid. ciphers.c

Parameters:

id the numerical ID (nid) of the specified cipher.

Returns:

NULL on failure, or the relevant cipher data structure on success.

Definition at line 30 of file ciphers.c.

References EVP_get_cipherbyname_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), scramble_decrypt(), and scramble_encrypt().

5.247.1.3 int_t cipher_key_length (cipher_t ∗ *c*)

Determine the key length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's key length in bytes.

Definition at line 62 of file ciphers.c.

References EVP_CIPHER_key_length_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_symmetric_key(), and symmetric_key().

5.247.1.4 cipher_t∗ cipher_name (stringer_t ∗ *name*)

Look up a cipher type by name.

Parameters:

name a descriptive name of the cipher to be looked up.

Returns:

NULL on failure, or the relevant cipher data structure on success.

Definition at line 15 of file ciphers.c.

References EVP_get_cipherbyname_d, log_pedantic, st_char_get(), st_empty, and st_length_int().

5.247.1.5 int_t cipher_numeric_id (cipher_t ∗ *c*)

Return the numerical ID (nid) of a specified cipher.

Parameters:

c the input cipher type.

Returns:

NID_undef on failure, or the nid of the specified cipher.

Definition at line 46 of file ciphers.c.

References EVP_CIPHER_nid_d, and log_pedantic.

Referenced by deprecated_scramble_encrypt(), and scramble_encrypt().

5.247.1.6 int_t cipher_vector_length (cipher_t * *c*)

Determine the IV length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's IV length in bytes.

Definition at line 78 of file ciphers.c.

References EVP_CIPHER_iv_length_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_symmetric_vector(), and symmetric_vector().

```
#include "magma.h"
```

Functions

- uint64_t deprecated_cryptex_envelope_length (cryptex_t *cryptex)
  Get the length of a cryptex envelope.
- uint64_t deprecated_cryptex_hmac_length (cryptex_t *cryptex)
  Get the length of a cryptex HMAC.
- uint64_t deprecated_cryptex_body_length (cryptex_t *cryptex)
  Get the length of a cryptex object's encrypted data body.
- uint64_t deprecated_cryptex_original_length (cryptex_t *cryptex)
  Get the original length of a cryptex object's data buffer.
- uint64_t deprecated_cryptex_total_length (cryptex_t *cryptex)
  Determine the total length of the data underlying a cryptex object.
- void * deprecated_cryptex_envelope_data (cryptex_t *cryptex)
  Get a pointer to the envelope data of a cryptex object.
- void * deprecated_cryptex_hmac_data (cryptex_t *cryptex)
  Get a pointer to the HMAC data of a cryptex object.
- void * deprecated_cryptex_body_data (cryptex_t *cryptex)
  Get a pointer to the encrypted data body of a cryptex object.
- void * deprecated_cryptex_alloc (uint64_t envelope, uint64_t hmac, uint64_t original, uint64_t body)
  Allocate a new cryptex object.
- void deprecated_cryptex_free (cryptex_t *cryptex)
  Free a cryptex object.

5.248.1 Function Documentation

5.248.1.1 void* deprecated_cryptex_alloc (uint64_t *envelope*, uint64_t *hmac*, uint64_t *original*, uint64_t *body*)

Allocate a new cryptex object.

Definition at line 108 of file cryptex.c.

References cryptex_head_t, log_pedantic, and mm_alloc().

Referenced by deprecated_ecies_encrypt().

5.248.1.2 void* deprecated_cryptex_body_data (cryptex_t * *cryptex*)

Get a pointer to the encrypted data body of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's encrypted data body.

Definition at line 97 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.248.1.3 uint64_t deprecated_cryptex_body_length (cryptex_t ∗ *cryptex*)

Get the length of a cryptex object's encrypted data body. cryptex.c

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex encrypted data body.

Definition at line 39 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.248.1.4 void∗ deprecated_cryptex_envelope_data (cryptex_t ∗ *cryptex*)

Get a pointer to the envelope data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's envelope data.

Definition at line 75 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.248.1.5 uint64_t deprecated_cryptex_envelope_length (cryptex_t ∗ *cryptex*)

Get the length of a cryptex envelope.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex envelope.

Definition at line 15 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt().

5.248.1.6 void deprecated_cryptex_free (cryptex_t * *cryptex*)

Free a cryptex object.

Parameters:

cryptex the cryptex object to be freed.

Returns:

This function returns no value.

Definition at line 132 of file cryptex.c.

Referenced by deprecated_ecies_encrypt().

5.248.1.7 void* deprecated_cryptex_hmac_data (cryptex_t * *cryptex*)

Get a pointer to the HMAC data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's hmac data.

Definition at line 85 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.248.1.8 uint64_t deprecated_cryptex_hmac_length (cryptex_t * *cryptex*)

Get the length of a cryptex HMAC.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex HMAC.

Definition at line 27 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.248.1.9 uint64_t deprecated_cryptex_original_length (cryptex_t * *cryptex*)

Get the original length of a cryptex object's data buffer.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex object's original data.

Definition at line 51 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt().

5.248.1.10 uint64_t deprecated_cryptex_total_length (cryptex_t * *cryptex*)

Determine the total length of the data underlying a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

the total length of the associated cryptex data in bytes.

Definition at line 63 of file cryptex.c.

References cryptex_head_t.

5.249 src/providers/deprecated/cryptex.c File Reference

```
#include "magma.h"
#include "deprecated.h"
```

Functions

- uint64_t cryptex_envelope_length (cryptex_t *cryptex)

  Get the length of a cryptex envelope.

- uint64_t cryptex_hmac_length (cryptex_t *cryptex)

  Get the length of a cryptex HMAC.

- uint64_t cryptex_body_length (cryptex_t *cryptex)

  Get the length of a cryptex object's encrypted data body.

- uint64_t cryptex_original_length (cryptex_t *cryptex)

  Get the original length of a cryptex object's data buffer.

- uint64_t cryptex_total_length (cryptex_t *cryptex)

  Determine the total length of the data underlying a cryptex object.

- void * cryptex_envelope_data (cryptex_t *cryptex)

  Get a pointer to the envelope data of a cryptex object.

- void * cryptex_hmac_data (cryptex_t *cryptex)

  Get a pointer to the HMAC data of a cryptex object.

- void * cryptex_body_data (cryptex_t *cryptex)

  Get a pointer to the encrypted data body of a cryptex object.

- void * cryptex_alloc (uint64_t envelope, uint64_t hmac, uint64_t original, uint64_t body)

  Allocate a new cryptex object.

- void cryptex_free (cryptex_t *cryptex)

  Free a cryptex object.

5.249.1 Function Documentation

5.249.1.1 void* cryptex_alloc (uint64_t *envelope*, uint64_t *hmac*, uint64_t *original*, uint64_t *body*)

Allocate a new cryptex object.

Definition at line 109 of file cryptex.c.

References cryptex_head_t, log_pedantic, and mm_alloc().

Referenced by ecies_encrypt().

5.249.1.2 void* cryptex_body_data (cryptex_t * *cryptex*)

Get a pointer to the encrypted data body of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's encrypted data body.

Definition at line 98 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.249.1.3 uint64_t cryptex_body_length (cryptex_t * *cryptex*)

Get the length of a cryptex object's encrypted data body. cryptex.c

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex encrypted data body.

Definition at line 40 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.249.1.4 void* cryptex_envelope_data (cryptex_t * *cryptex*)

Get a pointer to the envelope data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's envelope data.

Definition at line 76 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.249.1.5 uint64_t cryptex_envelope_length (cryptex_t * *cryptex*)

Get the length of a cryptex envelope.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex envelope.

Definition at line 16 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt().

5.249.1.6 void cryptex_free (cryptex_t * *cryptex*)

Free a cryptex object.

Parameters:

cryptex the cryptex object to be freed.

Returns:

This function returns no value.

Definition at line 133 of file cryptex.c.

Referenced by ecies_encrypt().

5.249.1.7 void* cryptex_hmac_data (cryptex_t * *cryptex*)

Get a pointer to the HMAC data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's hmac data.

Definition at line 86 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.249.1.8 uint64_t cryptex_hmac_length (cryptex_t * *cryptex*)

Get the length of a cryptex HMAC.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex HMAC.

Definition at line 28 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.249.1.9 uint64_t cryptex_original_length (cryptex_t * *cryptex*)

Get the original length of a cryptex object's data buffer.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex object's original data.

Definition at line 52 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt().

5.249.1.10 uint64_t cryptex_total_length (cryptex_t * *cryptex*)

Determine the total length of the data underlying a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

the total length of the associated cryptex data in bytes.

Definition at line 64 of file cryptex.c.

References cryptex_head_t.

- stringer_t * deprecated_hmac_sha256 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * deprecated_hmac_sha384 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * deprecated_hmac_sha512 (stringer_t *s, stringer_t *key, stringer_t *output)
- bool_t lib_load_openssl (void)

  openssl.c

- const char * lib_version_openssl (void)

  Return the version string of the OpenSSL library.

- DH * ssl_dh2048_exchange_callback (SSL *ssl, int is_export, int keylength)
- DH * ssl_dh4096_exchange_callback (SSL *ssl, int is_export, int keylength)
- int ssl_dh_generate_callback (int p, int n, BN_GENCB *cb)
- EC_KEY * ssl_ecdh_exchange_callback (SSL *ssl, int is_export, int keylength)

  Callback handler for the EC Diffie-Hellman parameter generation process necessary for PFS.

- char * ssl_error_string (chr_t *buffer, int_t length)

Get a textual representation of the last OpenSSL error message.

- void ssl_locking_callback (int mode, int n, const char *file, int line)

  The locking function callback necessary for all multi-threaded applications using OpenSSL.

- bool_t ssl_start (void)

  Initialize the OpenSSL facility.

- void ssl_stop (void)

  Stop the openssl library and cleanup all associated data structures.

- unsigned long ssl_thread_id_callback (void)

  The thread id callback necessary for all multi-threaded applications using OpenSSL.

- void ssl_thread_stop (void)

  Free the calling thread's SSL error queue.

- bool_t ssl_verify_privkey (const char *keyfile)

  Verify that the filename contains a valid private key in PEM format.

- int_t tls_bits (TLS *tls)

  tls.c

- stringer_t * tls_cipher (TLS *tls, stringer_t *output)

  Return the name of the TLS cipher suite assoicated with a connection.

- void * tls_client_alloc (int_t sockd)

  Establish an TLS client wrapper around a socket descriptor.

- int tls_continue (TLS *tls, int result, int syserror)

  Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

- stringer_t * tls_error (TLS *tls, int_t code, stringer_t *output)

  Consolidate the complicated logic associated with handling SSL_read/SSL_write calls which result in 0, or a negative number.

- void tls_free (TLS *tls)

  Shutdown and free an TLS connection.

- int tls_print (TLS *tls, const char *format, va_list args)

  Write formatted data to an TLS connection.

- int tls_read (TLS *tls, void *buffer, int length, bool_t block)

  Read data from a TLS connection.

- TLS * tls_server_alloc (void *server, int sockd, int flags)

  Create a TLS session for a file descriptor, and accept the client TLS/SSL handshake.

- bool_t tls_server_create (void *server, uint_t security_level)

  Setup an TLS CTX for a server.

- void tls_server_destroy (void *server)

  Destroy an TLS context associated with a server.

- int tls_status (TLS *tls)

  Checks whether a TLS connection has been shut down or not.

- chr_t * tls_suite (TLS *tls)

  Provide the SSL/TLS/DTLS cipher suite as a string constant.

- chr_t * tls_version (TLS *tls)

  Provide the SSL/TLS/DTLS version as a string constant.

- int tls_write (TLS *tls, const void *buffer, int length, bool_t block)

  Write data to an open TLS connection.

- bool_t rand_start (void)

  random.c

- bool_t rand_thread_start (void)
- int16_t rand_get_int16 (void)
- int32_t rand_get_int32 (void)
- int64_t rand_get_int64 (void)

  Generate a random signed 64 bit number.

- int8_t rand_get_int8 (void)
- size_t rand_write (stringer_t *s)

  Fill a managed string with random data.

- stringer_t * rand_choices (chr_t *choices, size_t len, stringer_t *output)

  Get a random string of data of a specified size, populated with characters from a chosen set.

- uint16_t rand_get_uint16 (void)

  Generate a random unsigned 16 bit number.

- uint32_t rand_get_uint32 (void)

  Generate a random unsigned 32 bit number.

- uint64_t rand_get_uint64 (void)

  Generate a random unsigned 64 bit number.

- uint8_t rand_get_uint8 (void)

  Generate a random unsigned 8 bit number.

- void rand_stop (void)
- scramble_t * deprecated_scramble_alloc (size_t length)

  scramble.c

- void * deprecated_scramble_body_data (scramble_t *buffer)

  Get a pointer to the start of the encrypted data from a scrambled data header.

- uint64_t deprecated_scramble_body_hash (scramble_t *buffer)

  Get a hash of a scrambled object's (encrypted) body data.

- uint64_t deprecated_scramble_body_length (scramble_t *buffer)

  Get the length of a scrambled object's (encrypted) body data.

- stringer_t * deprecated_scramble_decrypt (stringer_t *key, scramble_t *input)
  Un-scramble a block of data using an decryption key.
- scramble_t * deprecated_scramble_encrypt (stringer_t *key, stringer_t *input)
  Scramble a block of data using an encryption key.
- void deprecated_scramble_free (scramble_t *buffer)
  Free a scrambled data block.
- void deprecated_scramble_cleanup (scramble_t *buffer)
  Performed a checked free of a scramble buffer.
- scramble_t * deprecated_scramble_import (stringer_t *s)
  Return a managed string as a scrambled buffer, after validation.
- uint64_t deprecated_scramble_orig_length (scramble_t *buffer)
  Get the length of the original (unencrypted) data underlying a scrambled object.
- uint64_t deprecated_scramble_total_length (scramble_t *buffer)
  Get the total length of a scrambled object.
- void * deprecated_scramble_vector_data (scramble_t *buffer)
  Get a pointer to the start of the IV from a scrambled data header.
- uint64_t deprecated_scramble_vector_length (scramble_t *buffer)
  Get the length of a scrambled object's IV.
- stringer_t * deprecated_symmetric_decrypt (cipher_t *cipher, stringer_t *vector, stringer_t *key, stringer_t *input)
  symmetric.c
- stringer_t * deprecated_symmetric_encrypt (cipher_t *cipher, stringer_t *vector, stringer_t *key, stringer_t *input)
  HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.
- stringer_t * deprecated_symmetric_key (cipher_t *cipher, stringer_t *key, stringer_t *output)
  Derive a symmetric key from a user's password.
- stringer_t * deprecated_symmetric_vector (cipher_t *cipher, stringer_t *output)
  Generate an IV data suitable for the specified cipher.
- DH * dh_exchange_2048 (SSL *ssl, int is_export, int keylength)
  parameters.c
- DH * dh_exchange_4096 (SSL *ssl, int is_export, int keylength)
  Callback handler for the Diffie-Hellman parameter generation process necessary for PFS.
- DH * dh_params_2048 (void)
- DH * dh_params_4096 (void)
- void dh_params_generate (void)
  TODO: Spawn a thread at startup to generate the keys, and block the dh_exchange functions below from returning until its done.
- int dh_params_generate_callback (int p, int n, BN_GENCB *cb)
  The DH param generation callback.
- DH * dh_static_2048 (SSL *ssl, int is_export, int keylength)
- DH * dh_static_4096 (SSL *ssl, int is_export, int keylength)

Variables

5.250.1 Define Documentation

5.250.1.1 #define BN_num_bytes_d(a) ((BN_num_bits_d(a)+7)/8)

Definition at line 12 of file cryptography.h.

Referenced by deprecated_ecies_key_private_bin(), ecies_key_private_bin(), and secp256k1_private_get().

5.250.1.2 #define ECIES_CIPHER NID_aes_256_cbc

Definition at line 24 of file cryptography.h.

Referenced by deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_ecies_start(), ecies_decrypt(), ecies_encrypt(), and ecies_start().

5.250.1.3 #define ECIES_CURVE NID_sect571k1

Definition at line 23 of file cryptography.h.

Referenced by deprecated_ecies_key_alloc(), deprecated_ecies_start(), ecies_key_alloc(), and ecies_start().

5.250.1.4 #define ECIES_ENVELOPE NID_sha512

Definition at line 25 of file cryptography.h.

Referenced by deprecated_ecies_start(), and ecies_start().

5.250.1.5 #define ECIES_HMAC NID_sha512

Definition at line 22 of file cryptography.h.

Referenced by deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_ecies_start(), ecies_decrypt(), ecies_encrypt(), and ecies_start().

5.250.1.6 #define MAGMA_CIPHERS_GENERIC "HIGH:MEDIUM"

Definition at line 19 of file cryptography.h.

Referenced by tls_server_create().

5.250.1.7 #define MAGMA_CIPHERS_HIGH "ECDHE-ECDSA-AES256-GCM-SHA384:ECDHE-ECDSA-CHACHA20-POLY1305:ECDHE-RSA-AES256-GCM-SHA384:ECDHE-RSA-CHACHA20-POLY1305"

Definition at line 16 of file cryptography.h.

Referenced by tls_server_create().

5.250.1.8 #define MAGMA_CIPHERS_LOW "EECDH+ECDSA+AESGCM:EECDH+aRSA+AESGCM:EECDH+ECDSA+SHA384:EECDH+ECDSA+SHA256:EECI SHA:!SEED"

Definition at line 18 of file cryptography.h.

5.250.1.9 #define MAGMA_CIPHERS_MEDIUM "EECDH+ECDSA+AESGCM:EECDH+aRSA+AESGCM:EECDH+ECDSA+SHA384:EECDH+ECDSA+SHA256:E SHA:!SEED"

Definition at line 17 of file cryptography.h.

Referenced by tls_server_create().

5.250.1.10 #define OPENSSL_free_d(addr) CRYPTO_free_d(addr)

Definition at line 13 of file cryptography.h.

Referenced by deprecated_ecies_key_private_hex(), deprecated_ecies_key_public_hex(), ecies_key_private_hex(), and ecies_key_public_hex().

5.250.2 Typedef Documentation

5.250.2.1 typedef void∗ cipher_t

Definition at line 62 of file cryptography.h.

5.250.2.2 typedef char∗ cryptex_t

Definition at line 63 of file cryptography.h.

5.250.2.3 typedef void∗ digest_t

Definition at line 61 of file cryptography.h.

5.250.2.4 typedef stringer_t scramble_t

Definition at line 64 of file cryptography.h.

5.250.2.5 typedef void TLS

Definition at line 70 of file cryptography.h.

5.250.3 Enumeration Type Documentation

5.250.3.1 enum ECIES_KEY_TYPE

Enumerator:

ECIES_PRIVATE_HEX

ECIES_PRIVATE_BINARY

ECIES_PUBLIC_HEX

ECIES_PUBLIC_BINARY

Definition at line 27 of file cryptography.h.

5.250.4 Function Documentation

5.250.4.1 struct __attribute__ ((packed)) [read]

Definition at line 44 of file cryptography.h.

References length.

5.250.4.2 int_t cipher_block_length (cipher_t * *c*)

Determine the block length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's block length in bytes.

Definition at line 94 of file ciphers.c.

References EVP_CIPHER_block_size_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

5.250.4.3 cipher_t* cipher_id (int_t *id*)

ciphers.c ciphers.c

Parameters:

id the numerical ID (nid) of the specified cipher.

Returns:

NULL on failure, or the relevant cipher data structure on success.

Definition at line 30 of file ciphers.c.

References EVP_get_cipherbyname_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), scramble_decrypt(), and scramble_encrypt().

5.250.4.4 int_t cipher_key_length (cipher_t * *c*)

Determine the key length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's key length in bytes.

Definition at line 62 of file ciphers.c.

References EVP_CIPHER_key_length_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_symmetric_key(), and symmetric_key().

5.250.4.5 cipher_t∗ cipher_name (stringer_t ∗ *name*)

Look up a cipher type by name.

Parameters:

name a descriptive name of the cipher to be looked up.

Returns:

NULL on failure, or the relevant cipher data structure on success.

Definition at line 15 of file ciphers.c.

References EVP_get_cipherbyname_d, log_pedantic, st_char_get(), st_empty, and st_length_int().

5.250.4.6 int_t cipher_numeric_id (cipher_t ∗ *c*)

Return the numerical ID (nid) of a specified cipher.

Parameters:

c the input cipher type.

Returns:

NID_undef on failure, or the nid of the specified cipher.

Definition at line 46 of file ciphers.c.

References EVP_CIPHER_nid_d, and log_pedantic.

Referenced by deprecated_scramble_encrypt(), and scramble_encrypt().

5.250.4.7 int_t cipher_vector_length (cipher_t ∗ *c*)

Determine the IV length of a specified cipher.

Parameters:

c the input cipher type.

Returns:

-1 on failure, or the cipher's IV length in bytes.

Definition at line 78 of file ciphers.c.

References EVP_CIPHER_iv_length_d, EVP_CIPHER_nid_d, log_pedantic, and OBJ_nid2sn_d.

Referenced by deprecated_symmetric_vector(), and symmetric_vector().

5.250.4.8 void∗ deprecated_cryptex_alloc (uint64_t *envelope*, uint64_t *hmac*, uint64_t *original*, uint64_t *body*)

Allocate a new cryptex object.

Definition at line 108 of file cryptex.c.

References cryptex_head_t, log_pedantic, and mm_alloc().

Referenced by deprecated_ecies_encrypt().

5.250.4.9 void∗ deprecated_cryptex_body_data (cryptex_t ∗ *cryptex*)

Get a pointer to the encrypted data body of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's encrypted data body.

Definition at line 97 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.10 uint64_t deprecated_cryptex_body_length (cryptex_t ∗ *cryptex*)

cryptex.c cryptex.c

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex encrypted data body.

Definition at line 39 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.11 void∗ deprecated_cryptex_envelope_data (cryptex_t ∗ *cryptex*)

Get a pointer to the envelope data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's envelope data.

Definition at line 75 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.12 uint64_t deprecated_cryptex_envelope_length (cryptex_t * *cryptex*)

Get the length of a cryptex envelope.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex envelope.

Definition at line 15 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt().

5.250.4.13 void deprecated_cryptex_free (cryptex_t * *cryptex*)

Free a cryptex object.

Parameters:

cryptex the cryptex object to be freed.

Returns:

This function returns no value.

Definition at line 132 of file cryptex.c.

Referenced by deprecated_ecies_encrypt().

5.250.4.14 void* deprecated_cryptex_hmac_data (cryptex_t * *cryptex*)

Get a pointer to the HMAC data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's hmac data.

Definition at line 85 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.15 uint64_t deprecated_cryptex_hmac_length (cryptex_t * *cryptex*)

Get the length of a cryptex HMAC.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex HMAC.

Definition at line 27 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.16 uint64_t deprecated_cryptex_original_length (cryptex_t ∗ *cryptex*)

Get the original length of a cryptex object's data buffer.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex object's original data.

Definition at line 51 of file cryptex.c.

References cryptex_head_t.

Referenced by deprecated_ecies_decrypt().

5.250.4.17 uint64_t deprecated_cryptex_total_length (cryptex_t ∗ *cryptex*)

Determine the total length of the data underlying a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

the total length of the associated cryptex data in bytes.

Definition at line 63 of file cryptex.c.

References cryptex_head_t.

5.250.4.18 uchr_t∗ deprecated_ecies_decrypt (stringer_t ∗ *key*, ECIES_KEY_TYPE *key_type*, cryptex_t ∗ *cryptex*, size_t ∗ *length*)

ecies.c ecies.c

Parameters:

key the ECIES private key in the specified format.

key_type the encoding type of the ECIES private key (ECIES_PRIVATE_BINARY or ECIES_PRIVATE_HEX).

cryptex a pointer to the head of the cryptex object with the encrypted data.

length a pointer to a size_t variable which will receive the final length of the unencrypted data.

Returns:

NULL on failure, or a pointer to a memory address containing the decrypted data on success..

Definition at line 578 of file ecies.c.

References deprecated_cryptex_body_data(), deprecated_cryptex_body_length(), deprecated_cryptex_envelope_data(), deprecated_cryptex_envelope_length(), deprecated_cryptex_hmac_data(), deprecated_cryptex_hmac_length(), deprecated_cryptex_original_length(), deprecated_ecies_envelope_derivation(), deprecated_ecies_key_private(), deprecated_ecies_key_public(), EC_KEY_free_d, EC_KEY_get0_public_key_d, ECDH_compute_key_d, ECIES_CIPHER, ECIES_HMAC, ECIES_PRIVATE_BINARY, ECIES_PRIVATE_HEX, ECIES_PUBLIC_BINARY, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_init_d, EVP_CIPHER_CTX_set_padding_d, EVP_CIPHER_key_length_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_info, MEMORYBUF, mm_alloc(), OBJ_nid2sn_d, pl_init(), ssl_error_string(), and st_empty_out().

5.250.4.19 cryptex_t* deprecated_ecies_encrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, unsigned char * *data*, size_t *length*)

Encrypt a block of data using an ECIES public key.

Parameters:

key the ECIES public key in the specified format.

key_type the encoding type of the ECIES public key (ECIES_PUBLIC_BINARY or ECIES_PUBLIC_HEX).

data a pointer to the block of data to be encrypted.

length the length, in bytes, of the data to be encrypted.

Returns:

NULL on failure, or a pointer to the header of the cryptex object containing the encrypted data on success..

Definition at line 407 of file ecies.c.

Definition at line 89 of file ecies.c.

References EC_GROUP_free_d, EC_GROUP_new_by_curve_name_d, EC_GROUP_precompute_mult_d, EC_GROUP_set_point_conversion_form_d, log_error, MEMORYBUF, and ssl_error_string().

Referenced by deprecated_ecies_start().

5.250.4.22 EC_KEY* deprecated_ecies_key_alloc (void)

Allocate a new ECIES key pair from the curve defined by ECIES_CURVE.

See also:

NID_sect571k1

Returns:

NULL on failure, or a pointer to the newly allocated key pair.

Definition at line 58 of file ecies.c.

References EC_KEY_free_d, EC_KEY_new_by_curve_name_d, EC_KEY_new_d, EC_KEY_set_conv_form_d, EC_KEY_set_group_d, ECIES_CURVE, ecies_curve_group, log_info, MEMORYBUF, and ssl_error_string().

Referenced by deprecated_ecies_key_create(), deprecated_ecies_key_private(), and deprecated_ecies_key_public().

5.250.4.23 EC_KEY∗ deprecated_ecies_key_create (void)

Generate a random ECIES key pair.

Returns:

NULL on failure, or a new random ECIES key pair on success.

Definition at line 112 of file ecies.c.

References deprecated_ecies_key_alloc(), EC_KEY_free_d, EC_KEY_generate_key_d, log_info, MEMORYBUF, and ssl_error_string().

Referenced by deprecated_ecies_encrypt().

5.250.4.24 void deprecated_ecies_key_free (EC_KEY ∗ *key*)

Free an ECIES key pair.

Returns:

This function returns no value.

Definition at line 47 of file ecies.c.

References EC_KEY_free_d.

5.250.4.25 EC_KEY∗ deprecated_ecies_key_private (uint64_t *format*, placer_t *data*)

Definition at line 199 of file ecies.c.

References BN_bin2bn_d, BN_free_d, BN_hex2bn_d, deprecated_ecies_key_alloc(), EC_KEY_free_d, EC_KEY_set_private_key_d, ECIES_PRIVATE_BINARY, ECIES_PRIVATE_HEX, log_info, MEMORYBUF, number, pl_char_get(), pl_data_get(), pl_length_get(), and ssl_error_string().

Referenced by deprecated_ecies_decrypt().

5.250.4.26 uchr_t∗ deprecated_ecies_key_private_bin (EC_KEY ∗ *key*, size_t ∗ *olen*)

Return an ECIES private key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw private key.

Definition at line 359 of file ecies.c.

References BN_bn2bin_d, BN_num_bytes_d, EC_KEY_get0_private_key_d, log_info, MEMORYBUF, mm_sec_alloc(), mm_sec_free(), and ssl_error_string().

5.250.4.27 stringer_t∗ deprecated_ecies_key_private_hex (EC_KEY ∗ *key*)

Return an ECIES private key as a hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted private key as a managed string.

Definition at line 325 of file ecies.c.

References BN_bn2hex_d, CONTIGUOUS, EC_KEY_get0_private_key_d, log_pedantic, MANAGED_T, MEMORYBUF, ns_length_get(), ns_wipe(), OPENSSL_free_d, SECURE, ssl_error_string(), and st_import_opts().

Referenced by deprecated_ecies_decrypt(), and deprecated_ecies_encrypt().

5.250.4.29 uchr_t∗ deprecated_ecies_key_public_bin (EC_KEY ∗ *key*, size_t ∗ *olen*)

Return an ECIES public key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw public key.

Definition at line 288 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2oct_d, log_info, MEMORYBUF, mm_alloc(), mm_free(), and ssl_error_string().

5.250.4.30 stringer_t∗ deprecated_ecies_key_public_hex (EC_KEY ∗ *key*)

Return an ECIES public key as a null-terminated hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted public key as a null-terminated string.

Definition at line 255 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2hex_d, log_info, MEMORYBUF, ns_length_get(), OPENSSL_free_d, ssl_error_string(), and st_import().

Referenced by process_start().

5.250.4.32 void deprecated_ecies_stop (void)

Destroy all initialized ECIES curve group information.

Returns:

This function returns no value.

Definition at line 30 of file ecies.c.

References EC_GROUP_free_d, and ecies_curve_group.

Referenced by process_stop().

5.250.4.33 stringer_t* deprecated_hmac_digest (digest_t * *digest*, stringer_t * *s*, stringer_t * *key*, stringer_t * *output*)

hmac.c hmac.c

Parameters:

digest Digest to be used with the HMAC.

s Input data.

key Key used in HMAC.

output Stringer containing buffer for output.

Returns:

The managed string containing the resulting HMAC or NULL if an error occurs.

Definition at line 20 of file hmac.c.

5.250.4.43 scramble_t* deprecated_scramble_alloc (size_t *length*)

scramble.c scramble.c

Parameters:

length the length, in bytes, of the scrambled data buffer (should include the IV and encrypted body length).

Returns:

a pointer to a newly allocated scrambled data header.

Definition at line 143 of file scramble.c.

References mm_alloc(), and scramble_head_t.

Referenced by deprecated_scramble_encrypt().

5.250.4.44 void* deprecated_scramble_body_data (scramble_t * *buffer*)

Get a pointer to the start of the encrypted data from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated encrypted data body.

Definition at line 81 of file scramble.c.

References deprecated_scramble_vector_length(), and scramble_head_t.

Referenced by deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), and deprecated_scramble_import().

5.250.4.45 uint64_t deprecated_scramble_body_hash (scramble_t * *buffer*)

Get a hash of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the 64-bit bash of the specified scrambled object's body data.

Definition at line 33 of file scramble.c.

References scramble_head_t.

5.250.4.46 uint64_t deprecated_scramble_body_length (scramble_t * *buffer*)

Get the length of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's body data.

Definition at line 57 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_total_length().

5.250.4.47 void deprecated_scramble_cleanup (scramble_t * *buffer*)

Performed a checked free of a scramble buffer.

See also:

scramble_free

Parameters:

block the scramble buffer to be freed.

Returns:

This function returns no value.

Definition at line 166 of file scramble.c.

References mm_free().

5.250.4.48 stringer_t* deprecated_scramble_decrypt (stringer_t * *key*, scramble_t * *input*)

Un-scramble a block of data using an decryption key.

Parameters:

key a managed string containing the symmetric decryption key.

input a pointer to the scrambled data header to be decrypted.

Returns:

NULL on failure, or a managed string containing the verified decrypted data.

Definition at line 239 of file scramble.c.

References cipher_id(), deprecated_scramble_body_data(), deprecated_scramble_body_length(), deprecated_scramble_vector_data(), deprecated_scramble_vector_length(), deprecated_symmetric_decrypt(), deprecated_symmetric_key(), hash_adler32(), log_info, log_pedantic, MANAGEDBUF, PLACER, scramble_head_t, st_free(), and st_length_get().

Referenced by sess_get().

5.250.4.49 scramble_t* deprecated_scramble_encrypt (stringer_t * *key*, stringer_t * *input*)

Scramble a block of data using an encryption key.

Note:

This function is configured to use AES 256 in CBC mode.

Parameters:

key a managed string containing the symmetric encryption key.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a scrambled data header containing the encrypted data and its metadata.

Definition at line 182 of file scramble.c.

References cipher_id(), cipher_numeric_id(), deprecated_scramble_alloc(), deprecated_scramble_body_data(), deprecated_scramble_-vector_data(), deprecated_symmetric_encrypt(), deprecated_symmetric_key(), deprecated_symmetric_vector(), hash_adler32(), log_-pedantic, MANAGEDBUF, mm_copy(), scramble_head_t, st_data_get(), st_free(), and st_length_get().

Referenced by sess_token().

5.250.4.50 void deprecated_scramble_free (scramble_t ∗ *buffer*)

Free a scrambled data block.

Parameters:

buffer a pointer to the scrambled data header to be freed.

Returns:

This function returns no value.

Definition at line 153 of file scramble.c.

References mm_free().

Referenced by sess_token().

5.250.4.51 scramble_t∗ deprecated_scramble_import (stringer_t ∗ *s*)

Return a managed string as a scrambled buffer, after validation.

Note:

The returned pointer is inside the existing stringer, so it doesn't need be freed.

Parameters:

s a managed string containing the serialized scrambled data.

Returns:

NULL on failure, or a pointer to the scrambled data header on success.

Definition at line 102 of file scramble.c.

References deprecated_scramble_body_data(), hash_adler32(), log_pedantic, scramble_head_t, st_data_get(), st_empty, and st_length_get().

Referenced by sess_get().

5.250.4.52 uint64_t deprecated_scramble_orig_length (scramble_t ∗ *buffer*)

Get the length of the original (unencrypted) data underlying a scrambled object.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's original data.

Definition at line 45 of file scramble.c.

References scramble_head_t.

5.250.4.53 uint64_t deprecated_scramble_total_length (scramble_t ∗ *buffer*)

Get the total length of a scrambled object. TODO: Create a scramble_export() function, and/or alter the import interfaces to make using managed strings easier. ie. the import/export functions could provide wrappers around dsecrypt/encrypt which return strings instead of scramble objects. HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the total length, in bytes, of the scrambled object.

Definition at line 19 of file scramble.c.

References deprecated_scramble_body_length(), deprecated_scramble_vector_length(), and scramble_head_t.

Referenced by sess_token().

5.250.4.54 void∗ deprecated_scramble_vector_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the IV from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated IV block.

Definition at line 91 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_encrypt().

5.250.4.55 uint64_t deprecated_scramble_vector_length (scramble_t ∗ *buffer*)

Get the length of a scrambled object's IV.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's IV.

Definition at line 69 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_body_data(), deprecated_scramble_decrypt(), and deprecated_scramble_total_length().

5.250.4.56 stringer_t* deprecated_symmetric_decrypt (cipher_t * *cipher*, stringer_t * *vector*, stringer_t * *key*, stringer_t * *input*)

symmetric.c

Definition at line 128 of file symmetric.c.

5.250.4.57 stringer_t* deprecated_symmetric_encrypt (cipher_t * *cipher*, stringer_t * *vector*, stringer_t * *key*, stringer_t * *input*)

HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.
Encrypt a block of data using a symmetric cipher.

Parameters:

cipher the cipher type being used to encrypt the data.

vector the IV used for the encryption operation.

key the symmetric encryption key used to encrypt the data.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a managed string containing the encrypted data.

Definition at line 20 of file symmetric.c.

References EVP_CIPHER_CTX_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_-init_d, EVP_CIPHER_CTX_iv_length_d, EVP_CIPHER_CTX_key_length_d, EVP_CIPHER_flags_d, EVP_EncryptFinal_ex_d, EVP_-EncryptInit_ex_d, EVP_EncryptUpdate_d, log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_free(), and st_length_set().

Referenced by deprecated_scramble_encrypt().

5.250.4.58 stringer_t* deprecated_symmetric_key (cipher_t * *cipher*, stringer_t * *key*, stringer_t * *output*)

Derive a symmetric key from a user's password.

Note:

Depending on the length of the password, either SHA1, SHA224, or SHA256 may be used as the hashing algorithm.
If output is passed as NULL, a new managed string will be allocated to hold the output of the operation.

Parameters:

cipher the specified cipher type.

key the user's password, as a managed string.

output the output managed string to receive the digested password. Can be NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the key.

Definition at line 288 of file symmetric.c.

References cipher_key_length(), hash_sha1(), hash_sha224(), hash_sha256(), st_length_get(), st_length_set(), st_output(), and st_valid_-tracked().

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_encrypt().

5.250.4.59 stringer_t* deprecated_symmetric_vector (cipher_t * *cipher*, stringer_t * *output*)

Generate an IV data suitable for the specified cipher.

Note:

If output is NULL, a new managed string will be allocated and returned by the function.

Parameters:

cipher the cipher type to be used.

output the managed string that will store the IV data.

Returns:

NULL on failure, or a pointer to the managed string that contains the IV data.

Definition at line 251 of file symmetric.c.

References cipher_vector_length(), log_pedantic, PLACER, rand_write(), st_data_get(), st_free(), st_length_set(), st_output(), and st_valid_-tracked().

Referenced by deprecated_scramble_encrypt().

5.250.4.60 DH* dh_exchange_2048 (SSL * *ssl*, int *is_export*, int *keylength*)

parameters.c parameters.c

Parameters:

ssl the SSL session for which the callback was triggered.

is_export We ignore this parameter, as we don't support insecure cipher suites.

keylength the length, in bits, of the DH key to be generated is also ignored.

Returns:

a pointer to a Diffie-Hellman structure with a 2048 bit prime which is used for the session key, or NULL on failure.

Definition at line 270 of file parameters.c.

References dh2048, DH_check_d, DH_free_d, DH_generate_parameters_ex_d, DH_new_d, dh_params_generate_callback(), dhparam_lock, log_error, log_pedantic, MEMORYBUF, mutex_lock(), mutex_unlock(), ssl_error_string(), and status.

Referenced by tls_server_create().

5.250.4.61 DH* dh_exchange_4096 (SSL * *ssl*, int *is_export*, int *keylength*)

Callback handler for the Diffie-Hellman parameter generation process necessary for PFS.

Parameters:

ssl the SSL session for which the callback was triggered.

is_export We ignore this parameter, as we don't support insecure cipher suites.

keylength the length, in bits, of the DH key to be generated is also ignored.

Returns:

a pointer to a Diffie-Hellman structure with a 4096 bit prime which is used for the session key, or NULL on failure.

Definition at line 338 of file parameters.c.

References dh4096, DH_check_d, DH_free_d, DH_generate_parameters_ex_d, DH_new_d, dh_params_generate_callback(), dhparam_lock, log_error, log_pedantic, MEMORYBUF, mutex_lock(), mutex_unlock(), ssl_error_string(), and status.

Return the version string of the OpenSSL library.

Returns:

a pointer to a character string containing the libopenssl version information.

Definition at line 20 of file openssl.c.

References ssl_version.

Referenced by lib_load().

5.250.4.82 stringer_t* rand_choices (chr_t * *choices*, size_t *len*, stringer_t * *output*)

Get a random string of data of a specified size, populated with characters from a chosen set.

Parameters:

choices a pointer to a null-terminated string containing a pool of characters from which the contents of the random data will be selected.

len the length, in bytes, of the random string that will be returned to the caller.

Returns:

NULL on failure or a pointer to a managed string containing len bytes of random data on success.

Definition at line 23 of file random.c.

References log_pedantic, ns_length_get(), RAND_bytes_d, st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_destination(), and st_valid_tracked().

5.250.4.99 char∗ ssl_error_string (chr_t ∗ *buffer*, int_t *length*)

Get a textual representation of the last OpenSSL error message.

Parameters:

buffer a buffer that will receive the last OpenSSL error message.

length the size, in bytes, of the buffer that will contain the last OpenSSL error message.

Returns:

NULL on failure, or a pointer to the buffer where the last OpenSSL error message has been stored.

Definition at line 294 of file openssl.c.

References ERR_error_string_n_d, ERR_get_error_d, and log_pedantic.

5.250.4.100 void ssl_locking_callback (int *mode*, int *n*, const char ∗ *file*, int *line*)

The locking function callback necessary for all multi-threaded applications using OpenSSL.

See also:

CRYPTO_set_locking_callback()

Parameters:

mode a bitmask specifying the requested openssl locking operation (CRYPTO_LOCK, CRYPTO_WRITE, CRYPTO_READ, or CRYPTO_UNLOCK).

n the zero-based index of the lock that is the target of the requested operation.

file a null-terminated string containing the filename of the function setting the lock, for debugging purposes.

line the line number of the function setting the lock, for debugging purposes.

Returns:

This function returns no value.

Definition at line 222 of file openssl.c.

References mutex_lock(), mutex_unlock(), and ssl_locks.

Referenced by ssl_start().

5.250.4.101 bool_t ssl_start (void)

Initialize the OpenSSL facility.

Note:

First, this function initializes the mutexes necessary for the locking function callback that openssl uses for shared data structures in multi-threaded applications. Next, the DKIM key is retrieved if the magma.dkim.enabled configuration variable is set.

Returns:

true if openssl was initialized successfully, or false on failure.

Definition at line 114 of file openssl.c.

References CRYPTO_num_locks_d, CRYPTO_set_id_callback_d, CRYPTO_set_locked_mem_functions_d, CRYPTO_set_locking_callback_d, dhparam_lock, log_critical, mm_alloc(), mm_sec_alloc(), mm_sec_free(), mutex_init(), OPENSSL_add_all_algorithms_noconf_d, SSL_library_init_d, SSL_load_error_strings_d, ssl_locking_callback(), ssl_locks, and ssl_thread_id_callback().

Referenced by process_start().

5.250.4.102 void ssl_stop (void)

Stop the openssl library and cleanup all associated data structures.

Returns:

This function returns no values.

Definition at line 164 of file openssl.c.

References ASN1_STRING_TABLE_cleanup_d, BIO_sock_cleanup_d, COMP_zlib_cleanup_d, CONF_modules_unload_d, CRYPTO_-cleanup_all_ex_data_d, CRYPTO_num_locks_d, CRYPTO_set_id_callback_d, CRYPTO_set_locking_callback_d, dhparam_lock, EC_-KEY_free_d, ecdh1024, ecdh512, ENGINE_cleanup_d, ERR_free_strings_d, ERR_remove_thread_state_d, EVP_cleanup_d, mm_free(), mutex_destroy(), OBJ_cleanup_d, OBJ_NAME_cleanup_d, sk_pop_free_d, and ssl_locks.

Referenced by process_stop().

5.250.4.103 unsigned long ssl_thread_id_callback (void)

The thread id callback necessary for all multi-threaded applications using OpenSSL.

See also:

CRYPTO_set_id_callback()

Returns:

the id of the calling thread.

Definition at line 247 of file openssl.c.

References thread_get_thread_id().

Referenced by ssl_start().

5.250.4.104 void ssl_thread_stop (void)

Free the calling thread's SSL error queue.

See also:

ssl_thread_stop()

Returns:

This function returns no value.

Definition at line 208 of file openssl.c.

References ERR_remove_thread_state_d.

Referenced by thread_stop().

5.250.4.105 bool_t ssl_verify_privkey (const char * *keyfile*)

Verify that the filename contains a valid private key in PEM format.

Parameters:

keyfile the pathname of the private key.

Returns:

true if the the key is valid, or false if it is not.

Definition at line 314 of file openssl.c.

References log_pedantic, MEMORYBUF, SSL_CTX_free_d, SSL_CTX_new_d, SSL_CTX_use_PrivateKey_file_d, ssl_error_string(), and SSLv23_client_method_d.

Referenced by dkim_start().

5.250.4.106 int_t tls_bits (TLS ∗ *tls*)

tls.c tls.c

See also:

SSL_CIPHER_get_bits()

Definition at line 353 of file tls.c.

References SSL_CIPHER_get_bits_d, and SSL_get_current_cipher_d.

5.250.4.107 stringer_t∗ tls_cipher (TLS ∗ *tls*, stringer_t ∗ *output*)

Return the name of the TLS cipher suite assoicated with a connection.

See also:

SSL_CIPHER_get_name()

Parameters:

tls the TLS connection being inspected.

output a managed string to receive the encoded output; if passed as NULL, an output buffer will be allocated which must be freed by the caller.

Returns:

a pointer to the result, or NULL if an error occurs.

Definition at line 325 of file tls.c.

References NULLER, PLACER, SSL_CIPHER_get_name_d, SSL_get_current_cipher_d, SSL_get_version_d, st_cmp_cs_eq(), st_output(), and st_sprint().

Referenced by client_read(), client_read_line(), and client_write().

5.250.4.108 void∗ tls_client_alloc (int_t *sockd*)

Establish an TLS client wrapper around a socket descriptor.

Parameters:

sockd the file descriptor of the socket to have its transport security level upgraded.

Returns:

NULL on failure or a pointer to the SSL handle of the file descriptor if SSL negotiation was successful.

LOW: Add requisite config options and sandbox resources to verify server TLS certificates.

Definition at line 224 of file tls.c.

References BIO_new_socket_d, ERR_clear_error_d, log_pedantic, MEMORYBUF, SSL_connect_d, SSL_CTX_ctrl_d, SSL_CTX_free_d, SSL_CTX_new_d, SSL_CTX_set_verify_d, ssl_error_string(), SSL_free_d, SSL_get_error_d, SSL_new_d, SSL_set_bio_d, SSL_set_connect_state_d, and SSLv23_client_method_d.

Referenced by client_secure().

5.250.4.109 int tls_continue (TLS * *tls*, int *result*, int *syserror*)

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 480 of file tls.c.

References ERR_error_string_n_d, ERR_get_error_d, errno_name(), log_pedantic, MEMORYBUF, SSL_get_error_d, and status.

Referenced by tls_read(), and tls_write().

5.250.4.110 stringer_t* tls_error (TLS * *tls*, int_t *code*, stringer_t * *output*)

Consolidate the complicated logic associated with handling SSL_read/SSL_write calls which result in 0, or a negative number.

Definition at line 420 of file tls.c.

References ERR_error_string_n_d, ERR_get_error_d, log_pedantic, MEMORYBUF, SSL_get_error_d, st_output(), and st_sprint().

Referenced by client_read(), client_read_line(), and client_write().

5.250.4.111 void tls_free (TLS * *tls*)

Shutdown and free an TLS connection.

Parameters:

TLS the TLS connection to be shut down.

Returns:

This function returns no value.

Definition at line 300 of file tls.c.

References ERR_remove_thread_state_d, log_pedantic, SSL_free_d, and SSL_shutdown_d.

Referenced by client_close(), con_destroy(), and protocol_secure().

5.250.4.112 int tls_print (TLS * *tls*, const char * *format*, va_list *args*)

Write formatted data to an TLS connection.

Parameters:

tls the SSL connection to which the data will be written.

format a format string specifying the data to be written to the SSL connection.

va_list a variable argument list containing the data parameters associated with the format string.

Returns:

-1 on error, or the number of bytes written to the SSL connection.

Definition at line 609 of file tls.c.

References bytes, length, mm_alloc(), mm_free(), status, and tls_write().

5.250.4.113 int tls_read (TLS * *tls*, void * *buffer*, int *length*, bool_t *block*)

Read data from a TLS connection.

Parameters:

tls the TLS connection from which the data will be read.

buffer a pointer to the buffer where the read data will be stored.

length the length, in bytes, of the amount of data to be read.

block a boolean variable specifying whether the read operation should block.

Returns:

-1 on failure, 0 if the connection has been closed, or the number of bytes read from the connection on success.

Definition at line 540 of file tls.c.

References ERR_clear_error_d, log_pedantic, SSL_read_d, and tls_continue().

Referenced by client_read(), client_read_line(), con_read(), and con_read_line().

5.250.4.114 TLS* tls_server_alloc (void * *server*, int *sockd*, int *flags*)

Create a TLS session for a file descriptor, and accept the client TLS/SSL handshake.

See also:

SSL_accept()
BIO_new_socket()

Parameters:

server a server object which contains the underlying SSL context.

sockd the file descriptor of the TCP connection to be made SSL-ready.

flags passed to BIO_new_socket(), determines whether the socket is shut down when the BIO is freed.

Definition at line 158 of file tls.c.

References BIO_new_socket_d, server_t::context, ERR_clear_error_d, log_pedantic, MEMORYBUF, SSL_accept_d, ssl_error_string(), SSL_free_d, SSL_get_error_d, SSL_new_d, SSL_set_accept_state_d, SSL_set_bio_d, and server_t::tls.

Referenced by imap_starttls(), pop_starttls(), protocol_secure(), and smtp_starttls().

5.250.4.115 bool_t tls_server_create (void * *server*, uint_t *security_level*)

Setup an TLS CTX for a server.

Note:

The server is passed as a void pointer because the provider layer doesn't comprehend protocol specific server instances.

Parameters:

server_t the TLS context will be assigned to the provided server context.

security_level an integer which will be used to control how the TLS context is configured: 0 = accept any type of SSL or TLS protocol version, and offer broad cipher support. 1 = require TLSv1 and above, refuse SSLv2 and SSLv3 connections, use any reasonably secure cipher. (reccomended) 2 = require TLSv1 and above, refuse SSLv2 and SSLv3 connections, only use ciphers which provide forward secrecy. 3 = require TLSv1.2 and limit the cipher list to ECDHE-RSA-AES256-GCM-SHA384 or ECDHE-RSA-CHACHA20-POLY1305 as required by the specifications.

Definition at line 24 of file tls.c.

References server_t::certificate, server_t::context, magma_t::cryptography, dh_exchange_2048(), dh_exchange_4096(), dh_static_2048(), dh_static_4096(), magma_t::iface, log_critical, magma, MAGMA_CIPHERS_GENERIC, MAGMA_CIPHERS_HIGH, MAGMA_CIPHERS_MEDIUM, SSL_CTX_check_private_key_d, SSL_CTX_ctrl_d, SSL_CTX_new_d, SSL_CTX_set_cipher_list_d, SSL_CTX_set_tmp_dh_callback_d, SSL_CTX_set_tmp_ecdh_callback_d, SSL_CTX_set_verify_d, SSL_CTX_use_certificate_chain_file_d, SSL_CTX_use_PrivateKey_file_d, ssl_ecdh_exchange_callback(), SSLv23_server_method_d, and server_t::tls.

Referenced by servers_encryption_start().

5.250.4.116 void tls_server_destroy (void ∗ *server*)

Destroy an TLS context associated with a server.

Parameters:

server the server to be deactivated.

Returns:

This function returns no value.

Definition at line 135 of file tls.c.

References server_t::context, log_pedantic, SSL_CTX_free_d, and server_t::tls.

Referenced by servers_encryption_stop().

5.250.4.117 int tls_status (TLS ∗ *tls*)

Checks whether a TLS connection has been shut down or not.

See also:

SSL_get_shutdown()

Parameters:

tls the TLS connection to be shut down.

Returns:

0 if the connection is alive and well, or SSL_SENT_SHUTDOWN/SSL_RECEIVED_SHUTDOWN

Definition at line 405 of file tls.c.

References SSL_get_shutdown_d.

Referenced by client_status(), and con_status().

5.250.4.118 chr_t∗ tls_suite (TLS ∗ *tls*)

Provide the SSL/TLS/DTLS cipher suite as a string constant.

See also:

SSL_CIPHER_get_name()

Note:

The RFC version of the TLS cipher suite is available through the SSL_CIPHER_standard_name() function.

Definition at line 387 of file tls.c.

References SSL_CIPHER_get_name_d, and SSL_get_current_cipher_d.

5.250.4.119 chr_t* tls_version (TLS * *tls*)

Provide the SSL/TLS/DTLS version as a string constant.

See also:

SSL_get_version()

Definition at line 369 of file tls.c.

References NULLER, PLACER, SSL_get_current_cipher_d, SSL_get_version_d, and st_cmp_cs_eq().

5.250.4.120 int tls_write (TLS * *tls*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TLS connection.

Parameters:

tls the TLS connection to which the data will be written.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

Returns:

-1 on error, or the number of bytes written to the TLS connection.

Definition at line 576 of file tls.c.

References ERR_clear_error_d, log_pedantic, SSL_write_d, and tls_continue().

Referenced by client_write(), con_write_bl(), and tls_print().

Referenced by encrypted_chunk_set().

5.251.1.5 placer_t aes_cipher_key (stringer_t * *key*)

aes.c aes.c

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a place holder with the cipher key portion, or NULL if the supplied key was invalid.

Definition at line 58 of file aes.c.

References AES_KEY_LEN, AES_TAG_LEN, AES_VECTOR_LEN, log_error, pl_init(), pl_null(), placer_t, PRIME_OBJECT_KEY_LEN, st_data_get(), st_empty, and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), and aes_chunk_encrypt().

5.251.1.6 placer_t aes_tag_shard (stringer_t * *key*)

Extract the portion of the key used for the tag shard.

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a placeholder with the tag shard, or NULL if the supplied key was invalid.

Definition at line 100 of file aes.c.

References AES_TAG_LEN, AES_VECTOR_LEN, log_error, pl_init(), pl_null(), placer_t, PRIME_OBJECT_KEY_LEN, st_data_get(), st_empty, and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), and aes_chunk_encrypt().

5.251.1.7 placer_t aes_vector_shard (stringer_t * *key*)

Extract the portion of the key used for the vector shard.

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a place holder with the vector shard, or NULL if the supplied key was invalid.

Definition at line 79 of file aes.c.

5.253.1.1 uchr_t* deprecated_ecies_decrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, cryptex_t * *cryptex*, size_t * *length*)

Decrypt a block of data using an ECIES private key. ecies.c

Parameters:

key the ECIES private key in the specified format.

key_type the encoding type of the ECIES private key (ECIES_PRIVATE_BINARY or ECIES_PRIVATE_HEX).

cryptex a pointer to the head of the cryptex object with the encrypted data.

length a pointer to a size_t variable which will receive the final length of the unencrypted data.

Returns:

NULL on failure, or a pointer to a memory address containing the decrypted data on success..

Definition at line 578 of file ecies.c.

References deprecated_cryptex_body_data(), deprecated_cryptex_body_length(), deprecated_cryptex_envelope_data(), deprecated_cryptex_envelope_length(), deprecated_cryptex_hmac_data(), deprecated_cryptex_hmac_length(), deprecated_cryptex_original_length(), deprecated_ecies_envelope_derivation(), deprecated_ecies_key_private(), deprecated_ecies_key_public(), EC_KEY_free_d, EC_KEY_get0_public_key_d, ECDH_compute_key_d, ECIES_CIPHER, ECIES_HMAC, ECIES_PRIVATE_BINARY, ECIES_PRIVATE_HEX, ECIES_PUBLIC_BINARY, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_init_d, EVP_CIPHER_CTX_set_padding_d, EVP_CIPHER_key_length_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_info, MEMORYBUF, mm_alloc(), OBJ_nid2sn_d, pl_init(), ssl_error_string(), and st_empty_out().

5.253.1.2 cryptex_t* deprecated_ecies_encrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, unsigned char * *data*, size_t *length*)

Encrypt a block of data using an ECIES public key.

Parameters:

key the ECIES public key in the specified format.

key_type the encoding type of the ECIES public key (ECIES_PUBLIC_BINARY or ECIES_PUBLIC_HEX).

data a pointer to the block of data to be encrypted.

length the length, in bytes, of the data to be encrypted.

Returns:

NULL on failure, or a pointer to the header of the cryptex object containing the encrypted data on success..

Definition at line 407 of file ecies.c.

Functions

- bool_t ecies_start (void)
- void ecies_stop (void)

  Destroy all initialized ECIES curve group information.

- void ecies_key_free (EC_KEY *key)

  Free an ECIES key pair.

- EC_KEY * ecies_key_alloc (void)

  Allocate a new ECIES key pair from the curve defined by ECIES_CURVE.

- EC_GROUP * ecies_group (uint64_t curve, bool_t precompute)
- EC_KEY * ecies_key_create (void)

  Generate a random ECIES key pair.

- EC_KEY * ecies_key_public (uint64_t format, placer_t data)
- EC_KEY * ecies_key_private (uint64_t format, placer_t data)
- stringer_t * ecies_key_public_hex (EC_KEY *key)

  Return an ECIES public key as a null-terminated hex string.

- uchr_t * ecies_key_public_bin (EC_KEY *key, size_t *olen)

  Return an ECIES public key as binary data.

- stringer_t * ecies_key_private_hex (EC_KEY *key)

  Return an ECIES private key as a hex string.

- uchr_t * ecies_key_private_bin (EC_KEY *key, size_t *olen)

  Return an ECIES private key as binary data.

- void * ecies_envelope_derivation (const void *input, size_t ilen, void *output, size_t *olen)
- cryptex_t * ecies_encrypt (stringer_t *key, ECIES_KEY_TYPE key_type, unsigned char *data, size_t length)

  Encrypt a block of data using an ECIES public key.

- uchr_t * ecies_decrypt (stringer_t *key, ECIES_KEY_TYPE key_type, cryptex_t *cryptex, size_t *length)

  Decrypt a block of data using an ECIES private key.

5.254.1 Function Documentation

5.254.1.1 uchr_t* ecies_decrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, cryptex_t * *cryptex*, size_t * *length*)

Decrypt a block of data using an ECIES private key. ecies.c

Parameters:

key the ECIES private key in the specified format.

key_type the encoding type of the ECIES private key (ECIES_PRIVATE_BINARY or ECIES_PRIVATE_HEX).

cryptex a pointer to the head of the cryptex object with the encrypted data.

length a pointer to a size_t variable which will receive the final length of the unencrypted data.

Returns:

NULL on failure, or a pointer to a memory address containing the decrypted data on success..

Definition at line 579 of file ecies.c.

References cryptex_body_data(), cryptex_body_length(), cryptex_envelope_data(), cryptex_envelope_length(), cryptex_hmac_data(), cryptex_hmac_length(), cryptex_original_length(), EC_KEY_free_d, EC_KEY_get0_public_key_d, ECDH_compute_key_d, ECIES_CIPHER, ecies_envelope_derivation(), ECIES_HMAC, ecies_key_private(), ecies_key_public(), ECIES_PRIVATE_BINARY, ECIES_PRIVATE_HEX, ECIES_PUBLIC_BINARY, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_init_d, EVP_CIPHER_CTX_set_padding_d, EVP_CIPHER_key_length_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_info, MEMORYBUF, mm_alloc(), OBJ_nid2sn_d, pl_init(), ssl_error_string(), and st_empty_out().

5.254.1.2 cryptex_t* ecies_encrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, unsigned char * *data*, size_t *length*)

Encrypt a block of data using an ECIES public key.

Parameters:

key the ECIES public key in the specified format.

key_type the encoding type of the ECIES public key (ECIES_PUBLIC_BINARY or ECIES_PUBLIC_HEX).

data a pointer to the block of data to be encrypted.

length the length, in bytes, of the data to be encrypted.

Returns:

NULL on failure, or a pointer to the header of the cryptex object containing the encrypted data on success..

Definition at line 408 of file ecies.c.

Definition at line 90 of file ecies.c.

References EC_GROUP_free_d, EC_GROUP_new_by_curve_name_d, EC_GROUP_precompute_mult_d, EC_GROUP_set_point_-conversion_form_d, log_error, MEMORYBUF, and ssl_error_string().

Referenced by ecies_start().

5.254.1.5 EC_KEY∗ ecies_key_alloc (void)

Allocate a new ECIES key pair from the curve defined by ECIES_CURVE.

See also:

NID_sect571k1

Returns:

NULL on failure, or a pointer to the newly allocated key pair.

Definition at line 59 of file ecies.c.

References EC_KEY_free_d, EC_KEY_new_by_curve_name_d, EC_KEY_new_d, EC_KEY_set_conv_form_d, EC_KEY_set_group_d, ECIES_CURVE, ecies_curve_group, log_info, MEMORYBUF, and ssl_error_string().

Referenced by ecies_key_create(), ecies_key_private(), and ecies_key_public().

5.254.1.6 EC_KEY∗ ecies_key_create (void)

Generate a random ECIES key pair.

Returns:

NULL on failure, or a new random ECIES key pair on success.

Definition at line 113 of file ecies.c.

References EC_KEY_free_d, EC_KEY_generate_key_d, ecies_key_alloc(), log_info, MEMORYBUF, and ssl_error_string().

Referenced by ecies_encrypt().

5.254.1.7 void ecies_key_free (EC_KEY ∗ *key*)

Free an ECIES key pair.

Returns:

This function returns no value.

Definition at line 48 of file ecies.c.

References EC_KEY_free_d.

5.254.1.8 EC_KEY∗ ecies_key_private (uint64_t *format*, placer_t *data*)

Definition at line 200 of file ecies.c.

Referenced by ecies_decrypt().

5.254.1.9 uchr_t* ecies_key_private_bin (EC_KEY * *key*, size_t * *olen*)

Return an ECIES private key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw private key.

Definition at line 360 of file ecies.c.

References BN_bn2bin_d, BN_num_bytes_d, EC_KEY_get0_private_key_d, log_info, MEMORYBUF, mm_sec_alloc(), mm_sec_free(), and ssl_error_string().

5.254.1.10 stringer_t* ecies_key_private_hex (EC_KEY * *key*)

Return an ECIES private key as a hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted private key as a managed string.

Definition at line 326 of file ecies.c.

References BN_bn2hex_d, CONTIGUOUS, EC_KEY_get0_private_key_d, log_pedantic, MANAGED_T, MEMORYBUF, ns_length_get(), ns_wipe(), OPENSSL_free_d, SECURE, ssl_error_string(), and st_import_opts().

5.254.1.11 EC_KEY* ecies_key_public (uint64_t *format*, placer_t *data*)

Definition at line 132 of file ecies.c.

References EC_KEY_check_key_d, EC_KEY_free_d, EC_KEY_get0_group_d, EC_KEY_set_public_key_d, EC_POINT_free_d, EC_POINT_hex2point_d, EC_POINT_new_d, EC_POINT_oct2point_d, ecies_key_alloc(), ECIES_PUBLIC_BINARY, ECIES_PUBLIC_HEX, log_info, MEMORYBUF, pl_char_get(), pl_data_get(), pl_length_get(), and ssl_error_string().

Referenced by ecies_decrypt(), and ecies_encrypt().

5.254.1.12 uchr_t* ecies_key_public_bin (EC_KEY * *key*, size_t * *olen*)

Return an ECIES public key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw public key.

Definition at line 289 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2oct_d, log_info, MEMORYBUF, mm_alloc(), mm_free(), and ssl_error_string().

5.254.1.13 stringer_t* ecies_key_public_hex (EC_KEY * *key*)

Return an ECIES public key as a null-terminated hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted public key as a null-terminated string.

Definition at line 256 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2hex_d, log_info, MEMORYBUF, ns_length_get(), OPENSSL_free_d, ssl_error_string(), and st_import().

5.254.1.14 bool_t ecies_start (void)

Definition at line 16 of file ecies.c.

References ECIES_CIPHER, ecies_cipher_evp, ECIES_CURVE, ecies_curve_group, ECIES_ENVELOPE, ecies_envelope_evp, ecies_group(), ECIES_HMAC, ecies_hmac_evp, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, log_error, and OBJ_nid2sn_d.

5.254.1.15 void ecies_stop (void)

Destroy all initialized ECIES curve group information.

Returns:

This function returns no value.

Definition at line 31 of file ecies.c.

References EC_GROUP_free_d, and ecies_curve_group.

Functions

- const char ∗ lib_version_openssl (void)

  Return the version string of the OpenSSL library.

- bool_t lib_load_openssl (void)

  Initialize the OpenSSL library and bind dynamically to the exported functions that are required.

- bool_t ssl_start (void)

  Initialize the OpenSSL facility.

- void ssl_stop (void)

  Stop the openssl library and cleanup all associated data structures.

- void ssl_thread_stop (void)

  Free the calling thread's SSL error queue.

- void ssl_locking_callback (int mode, int n, const char ∗file, int line)

  The locking function callback necessary for all multi-threaded applications using OpenSSL.

- unsigned long ssl_thread_id_callback (void)

  The thread id callback necessary for all multi-threaded applications using OpenSSL.

- EC_KEY ∗ ssl_ecdh_exchange_callback (SSL ∗ssl, int is_export, int keylength)

  Callback handler for the EC Diffie-Hellman parameter generation process necessary for PFS.

- char ∗ ssl_error_string (chr_t ∗buffer, int_t length)

  Get a textual representation of the last OpenSSL error message.

- bool_t ssl_verify_privkey (const char ∗keyfile)

  Verify that the filename contains a valid private key in PEM format.

Variables

- char ssl_version [16]
- DH ∗ dh2048
- DH ∗ dh4096

- pthread_mutex_t dhparam_lock
- EC_KEY ∗ ecdh512 = NULL
- EC_KEY ∗ ecdh1024 = NULL

5.258.1 Function Documentation

5.258.1.1 bool_t lib_load_openssl (void)

Initialize the OpenSSL library and bind dynamically to the exported functions that are required. openssl.c

Returns:

true on success or false on failure.

Definition at line 29 of file openssl.c.

References lib_symbols(), M_BIND, ns_length_get(), pl_char_get(), pl_length_int(), placer_t, ssl_version, SSL_version_str_d, and tok_get_ns().

Referenced by lib_load().

5.258.1.2 const char* lib_version_openssl (void)

Return the version string of the OpenSSL library.

Returns:

a pointer to a character string containing the libopenssl version information.

Definition at line 20 of file openssl.c.

References ssl_version.

Referenced by lib_load().

5.258.1.3 EC_KEY* ssl_ecdh_exchange_callback (SSL * *ssl*, int *is_export*, int *keylength*)

Callback handler for the EC Diffie-Hellman parameter generation process necessary for PFS.

Parameters:

ssl the SSL session for which the callback was triggered.

is_export around here all we export is freedom.

keylength the length, in bits, of the ECCH key to be generated.

Returns:

a pointer to a ECDH key of proper size with parameters generated, or NULL on failure.

Definition at line 259 of file openssl.c.

References EC_GROUP_set_point_conversion_form_d, EC_KEY_get0_group_d, EC_KEY_new_by_curve_name_d, ecdh1024, ecdh512, and log_error.

Referenced by tls_server_create().

5.258.1.4 char* ssl_error_string (chr_t * *buffer*, int_t *length*)

Get a textual representation of the last OpenSSL error message.

Parameters:

buffer a buffer that will receive the last OpenSSL error message.

length the size, in bytes, of the buffer that will contain the last OpenSSL error message.

Returns:

NULL on failure, or a pointer to the buffer where the last OpenSSL error message has been stored.

Definition at line 294 of file openssl.c.

References ERR_error_string_n_d, ERR_get_error_d, and log_pedantic.

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), aes_chunk_encrypt(), deprecated_ecies_decrypt(), deprecated_ecies_encrypt(), deprecated_ecies_group(), deprecated_ecies_key_alloc(), deprecated_ecies_key_create(), deprecated_ecies_key_private(), deprecated_ecies_key_private_bin(), deprecated_ecies_key_private_hex(), deprecated_ecies_key_public(), deprecated_ecies_key_public_bin(), deprecated_ecies_key_public_hex(), deprecated_symmetric_decrypt(), dh_exchange_2048(), dh_exchange_4096(), dh_params_generate(), digest_id(), digest_length_output(), digest_name(), ecies_decrypt(), ecies_encrypt(), ecies_group(), ecies_key_alloc(), ecies_key_create(), ecies_key_private(), ecies_key_private_bin(), ecies_key_private_hex(), ecies_key_public(), ecies_key_public_bin(), ecies_key_public_hex(), ed25519_sign(), ed25519_verify(), hash_digest(), prime_start(), rand_get_int16(), rand_get_int32(), rand_get_int64(), rand_get_int8(), rand_get_uint16(), rand_get_uint32(), rand_get_uint64(), rand_get_uint8(), secp256k1_alloc(), secp256k1_compute_kek(), secp256k1_generate(), secp256k1_private_get(), secp256k1_private_set(), secp256k1_public_get(), secp256k1_public_set(), ssl_verify_privkey(), stacie_decrypt(), stacie_derive_key(), stacie_derive_seed(), stacie_derive_token(), stacie_realm_key(), symmetric_decrypt(), tls_client_alloc(), and tls_server_alloc().

5.258.1.5 void ssl_locking_callback (int *mode*, int *n*, const char * *file*, int *line*)

The locking function callback necessary for all multi-threaded applications using OpenSSL.

See also:

CRYPTO_set_locking_callback()

Parameters:

mode a bitmask specifying the requested openssl locking operation (CRYPTO_LOCK, CRYPTO_WRITE, CRYPTO_READ, or CRYPTO_UNLOCK).

n the zero-based index of the lock that is the target of the requested operation.

file a null-terminated string containing the filename of the function setting the lock, for debugging purposes.

line the line number of the function setting the lock, for debugging purposes.

Returns:

This function returns no value.

Definition at line 222 of file openssl.c.

References mutex_lock(), mutex_unlock(), and ssl_locks.

Referenced by ssl_start().

5.258.1.6 bool_t ssl_start (void)

Initialize the OpenSSL facility.

Note:

First, this function initializes the mutexes necessary for the locking function callback that openssl uses for shared data structures in multi-threaded applications. Next, the DKIM key is retrieved if the magma.dkim.enabled configuration variable is set.

Returns:

true if openssl was initialized successfully, or false on failure.

Definition at line 114 of file openssl.c.

References CRYPTO_num_locks_d, CRYPTO_set_id_callback_d, CRYPTO_set_locked_mem_functions_d, CRYPTO_set_locking_-callback_d, dhparam_lock, log_critical, mm_alloc(), mm_sec_alloc(), mm_sec_free(), mutex_init(), OPENSSL_add_all_algorithms_-noconf_d, SSL_library_init_d, SSL_load_error_strings_d, ssl_locking_callback(), ssl_locks, and ssl_thread_id_callback().

Referenced by process_start().

5.258.1.7 void ssl_stop (void)

Stop the openssl library and cleanup all associated data structures.

Returns:

This function returns no values.

Definition at line 164 of file openssl.c.

References ASN1_STRING_TABLE_cleanup_d, BIO_sock_cleanup_d, COMP_zlib_cleanup_d, CONF_modules_unload_d, CRYPTO_-cleanup_all_ex_data_d, CRYPTO_num_locks_d, CRYPTO_set_id_callback_d, CRYPTO_set_locking_callback_d, dhparam_lock, EC_-KEY_free_d, ecdh1024, ecdh512, ENGINE_cleanup_d, ERR_free_strings_d, ERR_remove_thread_state_d, EVP_cleanup_d, mm_free(), mutex_destroy(), OBJ_cleanup_d, OBJ_NAME_cleanup_d, sk_pop_free_d, and ssl_locks.

Referenced by process_stop().

5.258.1.8 unsigned long ssl_thread_id_callback (void)

The thread id callback necessary for all multi-threaded applications using OpenSSL.

See also:

CRYPTO_set_id_callback()

Returns:

the id of the calling thread.

Definition at line 247 of file openssl.c.

References thread_get_thread_id().

Referenced by ssl_start().

5.258.1.9 void ssl_thread_stop (void)

Free the calling thread's SSL error queue.

See also:

ssl_thread_stop()

Returns:

This function returns no value.

Definition at line 208 of file openssl.c.

References ERR_remove_thread_state_d.

Referenced by thread_stop().

5.258.1.10 bool_t ssl_verify_privkey (const char * *keyfile*)

Verify that the filename contains a valid private key in PEM format.

Parameters:

keyfile the pathname of the private key.

Returns:

true if the the key is valid, or false if it is not.

Definition at line 314 of file openssl.c.

References log_pedantic, MEMORYBUF, SSL_CTX_free_d, SSL_CTX_new_d, SSL_CTX_use_PrivateKey_file_d, ssl_error_string(), and SSLv23_client_method_d.

- DH ∗ dh4096 = NULL

5.259.1 Function Documentation

5.259.1.1 DH∗ dh_exchange_2048 (SSL ∗ *ssl*, int *is_export*, int *keylength*)

Callback handler for the Diffie-Hellman parameter generation process necessary for PFS. parameters.c

Parameters:

ssl the SSL session for which the callback was triggered.

is_export We ignore this parameter, as we don't support insecure cipher suites.

keylength the length, in bits, of the DH key to be generated is also ignored.

Returns:

a pointer to a Diffie-Hellman structure with a 2048 bit prime which is used for the session key, or NULL on failure.

Definition at line 270 of file parameters.c.

References dh2048, DH_check_d, DH_free_d, DH_generate_parameters_ex_d, DH_new_d, dh_params_generate_callback(), dhparam_lock, log_error, log_pedantic, MEMORYBUF, mutex_lock(), mutex_unlock(), ssl_error_string(), and status.

Referenced by tls_server_create().

5.259.1.2 DH∗ dh_exchange_4096 (SSL ∗ *ssl*, int *is_export*, int *keylength*)

Callback handler for the Diffie-Hellman parameter generation process necessary for PFS.

Parameters:

ssl the SSL session for which the callback was triggered.

is_export We ignore this parameter, as we don't support insecure cipher suites.

keylength the length, in bits, of the DH key to be generated is also ignored.

Returns:

a pointer to a Diffie-Hellman structure with a 4096 bit prime which is used for the session key, or NULL on failure.

Definition at line 338 of file parameters.c.

5.260.1 Function Documentation

5.260.1.1 stringer_t∗ rand_choices (chr_t ∗ *choices*, size_t *len*, stringer_t ∗ *output*)

Get a random string of data of a specified size, populated with characters from a chosen set.

Parameters:

choices a pointer to a null-terminated string containing a pool of characters from which the contents of the random data will be selected.

len the length, in bytes, of the random string that will be returned to the caller.

Returns:

NULL on failure or a pointer to a managed string containing len bytes of random data on success.

Definition at line 23 of file random.c.

References log_pedantic, ns_length_get(), RAND_bytes_d, st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_destination(), and st_valid_tracked().

5.260.1.2 int16_t rand_get_int16 (void)

Definition at line 248 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

5.260.1.3 int32_t rand_get_int32 (void)

Definition at line 227 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

5.260.1.4 int64_t rand_get_int64 (void)

Generate a random signed 64 bit number.

Note:

This function attempts to generate random data securely, but falls back on the pseudo-random number generator.

Returns:

the newly generated signed 64 bit integer.

See also:

RAND_bytes()

Definition at line 204 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

Referenced by portal_message_source().

5.260.1.5 int8_t rand_get_int8 (void)

Definition at line 269 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

5.260.1.6 uint16_t rand_get_uint16 (void)

Generate a random unsigned 16 bit number.

Note:

This function attempts to generate random data securely, but falls back on the pseudo-random number generator.

Returns:

the newly generated unsigned 16 bit integer.

See also:

RAND_bytes()

Definition at line 159 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

5.260.1.7 uint32_t rand_get_uint32 (void)

Generate a random unsigned 32 bit number.

Note:

This function attempts to generate random data securely, but falls back on the pseudo-random number generator.

Returns:

the newly generated unsigned 32 bit integer.

See also:

RAND_bytes()

Definition at line 137 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

Referenced by process_maint(), register_captcha_generate(), register_captcha_random_font(), register_captcha_write_noise(), and smtp_client_connect().

5.260.1.8 uint64_t rand_get_uint64 (void)

Generate a random unsigned 64 bit number.

Note:

This function attempts to generate random data securely, but falls back on the pseudo-random number generator.

Returns:

the newly generated unsigned 64 bit integer.

See also:

RAND_bytes()

Definition at line 113 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

Referenced by mail_mime_generate_boundary(), sess_key(), smtp_store_spamsig(), and spool_mktemp().

5.260.1.9 uint8_t rand_get_uint8 (void)

Generate a random unsigned 8 bit number.

Note:

This function attempts to generate random data securely, but falls back on the pseudo-random number generator.

Returns:

the newly generated unsigned 8 bit integer.

See also:

RAND_bytes()

Definition at line 181 of file random.c.

References buflen, bufptr, log_pedantic, RAND_bytes_d, rand_ctx, and ssl_error_string().

5.260.1.10 bool_t rand_start (void)

Initialize random number generation services and seed the generator. random.c

Note:

The default seed source for cryptographically secure generation routines is the system device /dev/random.

Returns:

false on failure, true on success.

Definition at line 308 of file random.c.

References magma_t::cryptography, magma_t::iface, magma, rand_ctx, RAND_load_file_d, RAND_status_d, and thread_get_thread_id().

Referenced by process_start().

Definition at line 292 of file random.c.

References magma_t::cryptography, magma_t::iface, magma, rand_ctx, and thread_get_thread_id().

5.260.1.13 size_t rand_write (stringer_t * *s*)

Fill a managed string with random data.

Note:

This function generates random data using the cryptographically strong OpenSSL function RAND_bytes().

Parameters:

s the input managed string.

Returns:

0 on failure, or the total number of bytes written to the managed string.

See also:

RAND_bytes()

Definition at line 76 of file random.c.

```

Functions

- uint64_t deprecated_scramble_total_length (scramble_t *buffer)
  Get the total length of a scrambled object.
- uint64_t deprecated_scramble_body_hash (scramble_t *buffer)
  Get a hash of a scrambled object's (encrypted) body data.
- uint64_t deprecated_scramble_orig_length (scramble_t *buffer)
  Get the length of the original (unencrypted) data underlying a scrambled object.
- uint64_t deprecated_scramble_body_length (scramble_t *buffer)
  Get the length of a scrambled object's (encrypted) body data.
- uint64_t deprecated_scramble_vector_length (scramble_t *buffer)
  Get the length of a scrambled object's IV.
- void * deprecated_scramble_body_data (scramble_t *buffer)
  Get a pointer to the start of the encrypted data from a scrambled data header.
- void * deprecated_scramble_vector_data (scramble_t *buffer)
  Get a pointer to the start of the IV from a scrambled data header.
- scramble_t * deprecated_scramble_import (stringer_t *s)
  Return a managed string as a scrambled buffer, after validation.
- scramble_t * deprecated_scramble_alloc (size_t length)
  Allocate a new scrambled data block.
- void deprecated_scramble_free (scramble_t *buffer)
  Free a scrambled data block.
- void deprecated_scramble_cleanup (scramble_t *buffer)
  Performed a checked free of a scramble buffer.
- scramble_t * deprecated_scramble_encrypt (stringer_t *key, stringer_t *input)
  Scramble a block of data using an encryption key.
- stringer_t * deprecated_scramble_decrypt (stringer_t *key, scramble_t *input)
  Un-scramble a block of data using an decryption key.

5.261.1 Function Documentation

5.261.1.1 scramble_t* deprecated_scramble_alloc (size_t *length*)

Allocate a new scrambled data block. scramble.c

Parameters:

length the length, in bytes, of the scrambled data buffer (should include the IV and encrypted body length).

Returns:

a pointer to a newly allocated scrambled data header.

Definition at line 143 of file scramble.c.

References mm_alloc(), and scramble_head_t.

Referenced by deprecated_scramble_encrypt().

5.261.1.2 void∗ deprecated_scramble_body_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the encrypted data from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated encrypted data body.

Definition at line 81 of file scramble.c.

References deprecated_scramble_vector_length(), and scramble_head_t.

Referenced by deprecated_scramble_decrypt(), deprecated_scramble_encrypt(), and deprecated_scramble_import().

5.261.1.3 uint64_t deprecated_scramble_body_hash (scramble_t ∗ *buffer*)

Get a hash of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the 64-bit bash of the specified scrambled object's body data.

Definition at line 33 of file scramble.c.

References scramble_head_t.

5.261.1.4 uint64_t deprecated_scramble_body_length (scramble_t ∗ *buffer*)

Get the length of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's body data.

Definition at line 57 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_total_length().

5.261.1.5 void deprecated_scramble_cleanup (scramble_t * *buffer*)

Performed a checked free of a scramble buffer.

See also:

scramble_free

Parameters:

block the scramble buffer to be freed.

Returns:

This function returns no value.

Definition at line 166 of file scramble.c.

References mm_free().

5.261.1.6 stringer_t* deprecated_scramble_decrypt (stringer_t * *key*, scramble_t * *input*)

Un-scramble a block of data using an decryption key.

Parameters:

key a managed string containing the symmetric decryption key.
input a pointer to the scrambled data header to be decrypted.

Returns:

NULL on failure, or a managed string containing the verified decrypted data.

Definition at line 239 of file scramble.c.

References cipher_id(), deprecated_scramble_body_data(), deprecated_scramble_body_length(), deprecated_scramble_vector_data(), deprecated_scramble_vector_length(), deprecated_symmetric_decrypt(), deprecated_symmetric_key(), hash_adler32(), log_info, log_pedantic, MANAGEDBUF, PLACER, scramble_head_t, st_free(), and st_length_get().

Referenced by sess_get().

5.261.1.7 scramble_t* deprecated_scramble_encrypt (stringer_t * *key*, stringer_t * *input*)

Scramble a block of data using an encryption key.

Note:

This function is configured to use AES 256 in CBC mode.

Parameters:

key a managed string containing the symmetric encryption key.
input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a scrambled data header containing the encrypted data and its metadata.

Definition at line 182 of file scramble.c.

References cipher_id(), cipher_numeric_id(), deprecated_scramble_alloc(), deprecated_scramble_body_data(), deprecated_scramble_vector_data(), deprecated_symmetric_encrypt(), deprecated_symmetric_key(), deprecated_symmetric_vector(), hash_adler32(), log_pedantic, MANAGEDBUF, mm_copy(), scramble_head_t, st_data_get(), st_free(), and st_length_get().

Referenced by sess_token().

5.261.1.8 void deprecated_scramble_free (scramble_t * *buffer*)

Free a scrambled data block.

Parameters:

buffer a pointer to the scrambled data header to be freed.

Returns:

This function returns no value.

Definition at line 153 of file scramble.c.

References mm_free().

Referenced by sess_token().

5.261.1.9 scramble_t* deprecated_scramble_import (stringer_t * *s*)

Return a managed string as a scrambled buffer, after validation.

Note:

The returned pointer is inside the existing stringer, so it doesn't need be freed.

Parameters:

s a managed string containing the serialized scrambled data.

Returns:

NULL on failure, or a pointer to the scrambled data header on success.

Definition at line 102 of file scramble.c.

References deprecated_scramble_body_data(), hash_adler32(), log_pedantic, scramble_head_t, st_data_get(), st_empty, and st_length_get().

Referenced by sess_get().

5.261.1.10 uint64_t deprecated_scramble_orig_length (scramble_t * *buffer*)

Get the length of the original (unencrypted) data underlying a scrambled object.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's original data.

Definition at line 45 of file scramble.c.

References scramble_head_t.

5.261.1.11 uint64_t deprecated_scramble_total_length (scramble_t * *buffer*)

Get the total length of a scrambled object. TODO: Create a scramble_export() function, and/or alter the import interfaces to make using managed strings easier. ie. the import/export functions could provide wrappers around dsecrypt/encrypt which return strings instead of scramble objects. HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the total length, in bytes, of the scrambled object.

Definition at line 19 of file scramble.c.

References deprecated_scramble_body_length(), deprecated_scramble_vector_length(), and scramble_head_t.

Referenced by sess_token().

5.261.1.12 void∗ deprecated_scramble_vector_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the IV from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated IV block.

Definition at line 91 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_encrypt().

5.261.1.13 uint64_t deprecated_scramble_vector_length (scramble_t ∗ *buffer*)

Get the length of a scrambled object's IV.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's IV.

Definition at line 69 of file scramble.c.

References scramble_head_t.

Referenced by deprecated_scramble_body_data(), deprecated_scramble_decrypt(), and deprecated_scramble_total_length().

5.262 src/providers/deprecated/scramble.c File Reference

```
#include "magma.h"
#include "deprecated.h"
```

Functions

- uint64_t scramble_total_length (scramble_t *buffer)
  Get the total length of a scrambled object.
- uint64_t scramble_body_hash (scramble_t *buffer)
  Get a hash of a scrambled object's (encrypted) body data.
- uint64_t scramble_orig_length (scramble_t *buffer)
  Get the length of the original (unencrypted) data underlying a scrambled object.
- uint64_t scramble_body_length (scramble_t *buffer)
  Get the length of a scrambled object's (encrypted) body data.
- uint64_t scramble_vector_length (scramble_t *buffer)
  Get the length of a scrambled object's IV.
- void * scramble_body_data (scramble_t *buffer)
  Get a pointer to the start of the encrypted data from a scrambled data header.
- void * scramble_vector_data (scramble_t *buffer)
  Get a pointer to the start of the IV from a scrambled data header.
- scramble_t * scramble_import (stringer_t *s)
  Return a managed string as a scrambled buffer, after validation.
- scramble_t * scramble_alloc (size_t length)
  Allocate a new scrambled data block.
- void scramble_free (scramble_t *buffer)
  Free a scrambled data block.
- void scramble_cleanup (scramble_t *buffer)
  Performed a checked free of a scramble buffer.
- scramble_t * scramble_encrypt (stringer_t *key, stringer_t *input)
  Scramble a block of data using an encryption key.
- stringer_t * scramble_decrypt (stringer_t *key, scramble_t *input)
  Un-scramble a block of data using an decryption key.

5.262.1 Function Documentation

5.262.1.1 scramble_t* scramble_alloc (size_t *length*)

Allocate a new scrambled data block. scramble.c

Parameters:

length the length, in bytes, of the scrambled data buffer (should include the IV and encrypted body length).

Returns:

a pointer to a newly allocated scrambled data header.

Definition at line 143 of file scramble.c.

References mm_alloc(), and scramble_head_t.

Referenced by scramble_encrypt().

5.262.1.2 void∗ scramble_body_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the encrypted data from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated encrypted data body.

Definition at line 82 of file scramble.c.

References scramble_head_t, and scramble_vector_length().

Referenced by scramble_decrypt(), scramble_encrypt(), and scramble_import().

5.262.1.3 uint64_t scramble_body_hash (scramble_t ∗ *buffer*)

Get a hash of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the 64-bit bash of the specified scrambled object's body data.

Definition at line 34 of file scramble.c.

References scramble_head_t.

5.262.1.4 uint64_t scramble_body_length (scramble_t ∗ *buffer*)

Get the length of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's body data.

Definition at line 58 of file scramble.c.

References scramble_head_t.

Referenced by scramble_decrypt(), and scramble_total_length().

5.262.1.5 void scramble_cleanup (scramble_t * *buffer*)

Performed a checked free of a scramble buffer.

See also:

scramble_free

Parameters:

block the scramble buffer to be freed.

Returns:

This function returns no value.

Definition at line 166 of file scramble.c.

References mm_free().

5.262.1.6 stringer_t* scramble_decrypt (stringer_t * *key*, scramble_t * *input*)

Un-scramble a block of data using an decryption key.

Parameters:

key a managed string containing the symmetric decryption key.

input a pointer to the scrambled data header to be decrypted.

Returns:

NULL on failure, or a managed string containing the verified decrypted data.

Definition at line 239 of file scramble.c.

References cipher_id(), hash_adler32(), log_info, log_pedantic, MANAGEDBUF, PLACER, scramble_body_data(), scramble_body_length(), scramble_head_t, scramble_vector_data(), scramble_vector_length(), st_free(), st_length_get(), symmetric_decrypt(), and symmetric_key().

5.262.1.7 scramble_t* scramble_encrypt (stringer_t * *key*, stringer_t * *input*)

Scramble a block of data using an encryption key.

Note:

This function is configured to use AES 256 in CBC mode.

Parameters:

key a managed string containing the symmetric encryption key.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a scrambled data header containing the encrypted data and its metadata.

Definition at line 182 of file scramble.c.

References cipher_id(), cipher_numeric_id(), hash_adler32(), log_pedantic, MANAGEDBUF, mm_copy(), scramble_alloc(), scramble_body_data(), scramble_head_t, scramble_vector_data(), st_data_get(), st_free(), st_length_get(), symmetric_encrypt(), symmetric_key(), and symmetric_vector().

5.262.1.8 void scramble_free (scramble_t * *buffer*)

Free a scrambled data block.

Parameters:

buffer a pointer to the scrambled data header to be freed.

Returns:

This function returns no value.

Definition at line 153 of file scramble.c.

References mm_free().

5.262.1.9 scramble_t* scramble_import (stringer_t * *s*)

Return a managed string as a scrambled buffer, after validation.

Note:

The returned pointer is inside the existing stringer, so it doesn't need be freed.

Parameters:

s a managed string containing the serialized scrambled data.

Returns:

NULL on failure, or a pointer to the scrambled data header on success.

Definition at line 103 of file scramble.c.

References hash_adler32(), log_pedantic, scramble_body_data(), scramble_head_t, st_data_get(), st_empty, and st_length_get().

5.262.1.10 uint64_t scramble_orig_length (scramble_t * *buffer*)

Get the length of the original (unencrypted) data underlying a scrambled object.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's original data.

Definition at line 46 of file scramble.c.

References scramble_head_t.

5.262.1.11 uint64_t scramble_total_length (scramble_t * *buffer*)

Get the total length of a scrambled object. TODO: Create a scramble_export() function, and/or alter the import interfaces to make using managed strings easier. ie. the import/export functions could provide wrappers around dsecrypt/encrypt which return strings instead of scramble objects. HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the total length, in bytes, of the scrambled object.

Definition at line 20 of file scramble.c.

References scramble_body_length(), scramble_head_t, and scramble_vector_length().

5.262.1.12 void∗ scramble_vector_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the IV from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated IV block.

Definition at line 92 of file scramble.c.

References scramble_head_t.

Referenced by scramble_decrypt(), and scramble_encrypt().

5.262.1.13 uint64_t scramble_vector_length (scramble_t ∗ *buffer*)

Get the length of a scrambled object's IV.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's IV.

Definition at line 70 of file scramble.c.

References scramble_head_t.

Referenced by scramble_body_data(), scramble_decrypt(), and scramble_total_length().

  symmetric.c
- stringer_t ∗ deprecated_symmetric_vector (cipher_t ∗cipher, stringer_t ∗output)
  Generate an IV data suitable for the specified cipher.
- stringer_t ∗ deprecated_symmetric_key (cipher_t ∗cipher, stringer_t ∗key, stringer_t ∗output)
  Derive a symmetric key from a user's password.

5.263.1 Function Documentation

5.263.1.1 stringer_t∗ deprecated_symmetric_decrypt (cipher_t ∗ *cipher*, stringer_t ∗ *vector*, stringer_t ∗ *key*, stringer_t ∗ *input*)

symmetric.c

Definition at line 128 of file symmetric.c.

References EVP_CIPHER_CTX_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_-init_d, EVP_CIPHER_CTX_iv_length_d, EVP_CIPHER_CTX_key_length_d, EVP_CIPHER_flags_d, EVP_DecryptFinal_ex_d, EVP_-DecryptInit_ex_d, EVP_DecryptUpdate_d, log_pedantic, MEMORYBUF, ssl_error_string(), st_alloc(), st_data_get(), st_empty_out(), st_-free(), and st_length_set().

Referenced by deprecated_scramble_decrypt().

5.263.1.2 stringer_t∗ deprecated_symmetric_encrypt (cipher_t ∗ *cipher*, stringer_t ∗ *vector*, stringer_t ∗ *key*, stringer_t ∗ *input*)

HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory. Encrypt a block of data using a symmetric cipher.

Parameters:

cipher the cipher type being used to encrypt the data.

vector the IV used for the encryption operation.

key the symmetric encryption key used to encrypt the data.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a managed string containing the encrypted data.

Definition at line 20 of file symmetric.c.

References EVP_CIPHER_CTX_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_-init_d, EVP_CIPHER_CTX_iv_length_d, EVP_CIPHER_CTX_key_length_d, EVP_CIPHER_flags_d, EVP_EncryptFinal_ex_d, EVP_-EncryptInit_ex_d, EVP_EncryptUpdate_d, log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_free(), and st_length_set().

Referenced by deprecated_scramble_encrypt().

5.263.1.3 stringer_t* deprecated_symmetric_key (cipher_t * *cipher*, stringer_t * *key*, stringer_t * *output*)

Derive a symmetric key from a user's password.

Note:

Depending on the length of the password, either SHA1, SHA224, or SHA256 may be used as the hashing algorithm.
If output is passed as NULL, a new managed string will be allocated to hold the output of the operation.

Parameters:

cipher the specified cipher type.

key the user's password, as a managed string.

output the output managed string to receive the digested password. Can be NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the key.

Definition at line 288 of file symmetric.c.

References cipher_key_length(), hash_sha1(), hash_sha224(), hash_sha256(), st_length_get(), st_length_set(), st_output(), and st_valid_tracked().

Referenced by deprecated_scramble_decrypt(), and deprecated_scramble_encrypt().

5.263.1.4 stringer_t* deprecated_symmetric_vector (cipher_t * *cipher*, stringer_t * *output*)

Generate an IV data suitable for the specified cipher.

Note:

If output is NULL, a new managed string will be allocated and returned by the function.

Parameters:

cipher the cipher type to be used.

output the managed string that will store the IV data.

Returns:

NULL on failure, or a pointer to the managed string that contains the IV data.

Definition at line 251 of file symmetric.c.

References cipher_vector_length(), log_pedantic, PLACER, rand_write(), st_data_get(), st_free(), st_length_set(), st_output(), and st_valid_tracked().

```
#include "magma.h"
```

Functions

- bool_t tls_server_create (void *server, uint_t security_level)

  Setup an TLS CTX for a server.

- void tls_server_destroy (void *server)

  Destroy an TLS context associated with a server.

- TLS * tls_server_alloc (void *server, int sockd, int flags)

  Create a TLS session for a file descriptor, and accept the client TLS/SSL handshake.

- void * tls_client_alloc (int_t sockd)

  Establish an TLS client wrapper around a socket descriptor.

- void tls_free (TLS *tls)

  Shutdown and free an TLS connection.

- stringer_t * tls_cipher (TLS *tls, stringer_t *output)

  Return the name of the TLS cipher suite assoicated with a connection.

- int_t tls_bits (TLS *tls)

  Provide the number of secret bits, and thus strength, of the TLS connection cipher suite.

- chr_t * tls_version (TLS *tls)

  Provide the SSL/TLS/DTLS version as a string constant.

- chr_t * tls_suite (TLS *tls)

  Provide the SSL/TLS/DTLS cipher suite as a string constant.

- int tls_status (TLS *tls)

  Checks whether a TLS connection has been shut down or not.

- stringer_t * tls_error (TLS *tls, int_t code, stringer_t *output)

  Consolidate the complicated logic associated with handling SSL_read/SSL_write calls which result in 0, or a negative number.

- int tls_continue (TLS *tls, int result, int syserror)

  Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

- int tls_read (TLS *tls, void *buffer, int length, bool_t block)

  Read data from a TLS connection.

- int tls_write (TLS *tls, const void *buffer, int length, bool_t block)

  Write data to an open TLS connection.

- int tls_print (TLS *tls, const char *format, va_list args)

  Write formatted data to an TLS connection.

5.265.1 Function Documentation

5.265.1.1 int_t tls_bits (TLS * *tls*)

Provide the number of secret bits, and thus strength, of the TLS connection cipher suite. tls.c

See also:

SSL_CIPHER_get_bits()

Definition at line 353 of file tls.c.

References SSL_CIPHER_get_bits_d, and SSL_get_current_cipher_d.

5.265.1.2 stringer_t* tls_cipher (TLS * *tls*, stringer_t * *output*)

Return the name of the TLS cipher suite assoicated with a connection.

See also:

SSL_CIPHER_get_name()

Parameters:

tls the TLS connection being inspected.

output a managed string to receive the encoded output; if passed as NULL, an output buffer will be allocated which must be freed by the caller.

Returns:

a pointer to the result, or NULL if an error occurs.

Definition at line 325 of file tls.c.

References NULLER, PLACER, SSL_CIPHER_get_name_d, SSL_get_current_cipher_d, SSL_get_version_d, st_cmp_cs_eq(), st_output(), and st_sprint().

Referenced by client_read(), client_read_line(), and client_write().

5.265.1.3 void* tls_client_alloc (int_t *sockd*)

Establish an TLS client wrapper around a socket descriptor.

Parameters:

sockd the file descriptor of the socket to have its transport security level upgraded.

Returns:

NULL on failure or a pointer to the SSL handle of the file descriptor if SSL negotiation was successful.

LOW: Add requisite config options and sandbox resources to verify server TLS certificates.

Definition at line 224 of file tls.c.

References BIO_new_socket_d, ERR_clear_error_d, log_pedantic, MEMORYBUF, SSL_connect_d, SSL_CTX_ctrl_d, SSL_CTX_free_d, SSL_CTX_new_d, SSL_CTX_set_verify_d, ssl_error_string(), SSL_free_d, SSL_get_error_d, SSL_new_d, SSL_set_bio_d, SSL_set_connect_state_d, and SSLv23_client_method_d.

Referenced by client_secure().

5.265.1.4 int tls_continue (TLS * *tls*, int *result*, int *syserror*)

Return -1 if the connection is invalid, 0 if the operation should be retried, or a positive number indicating the number of bytes processed.

Definition at line 480 of file tls.c.

References ERR_error_string_n_d, ERR_get_error_d, errno_name(), log_pedantic, MEMORYBUF, SSL_get_error_d, and status.

Referenced by tls_read(), and tls_write().

5.265.1.5 stringer_t* tls_error (TLS * *tls*, int_t *code*, stringer_t * *output*)

Consolidate the complicated logic associated with handling SSL_read/SSL_write calls which result in 0, or a negative number.

Definition at line 420 of file tls.c.

References ERR_error_string_n_d, ERR_get_error_d, log_pedantic, MEMORYBUF, SSL_get_error_d, st_output(), and st_sprint().

Referenced by client_read(), client_read_line(), and client_write().

5.265.1.6 void tls_free (TLS * *tls*)

Shutdown and free an TLS connection.

Parameters:

TLS the TLS connection to be shut down.

Returns:

This function returns no value.

Definition at line 300 of file tls.c.

References ERR_remove_thread_state_d, log_pedantic, SSL_free_d, and SSL_shutdown_d.

Referenced by client_close(), con_destroy(), and protocol_secure().

5.265.1.7 int tls_print (TLS * *tls*, const char * *format*, va_list *args*)

Write formatted data to an TLS connection.

Parameters:

tls the SSL connection to which the data will be written.

format a format string specifying the data to be written to the SSL connection.

va_list a variable argument list containing the data parameters associated with the format string.

Returns:

-1 on error, or the number of bytes written to the SSL connection.

Definition at line 609 of file tls.c.

References bytes, length, mm_alloc(), mm_free(), status, and tls_write().

5.265.1.8 int tls_read (TLS * *tls*, void * *buffer*, int *length*, bool_t *block*)

Read data from a TLS connection.

Parameters:

tls the TLS connection from which the data will be read.

buffer a pointer to the buffer where the read data will be stored.

length the length, in bytes, of the amount of data to be read.

block a boolean variable specifying whether the read operation should block.

Returns:

-1 on failure, 0 if the connection has been closed, or the number of bytes read from the connection on success.

Definition at line 540 of file tls.c.

References ERR_clear_error_d, log_pedantic, SSL_read_d, and tls_continue().

Referenced by client_read(), client_read_line(), con_read(), and con_read_line().

5.265.1.9 TLS∗ tls_server_alloc (void ∗ *server*, int *sockd*, int *flags*)

Create a TLS session for a file descriptor, and accept the client TLS/SSL handshake.

See also:

SSL_accept()
BIO_new_socket()

Parameters:

server a server object which contains the underlying SSL context.

sockd the file descriptor of the TCP connection to be made SSL-ready.

flags passed to BIO_new_socket(), determines whether the socket is shut down when the BIO is freed.

Definition at line 158 of file tls.c.

References BIO_new_socket_d, server_t::context, ERR_clear_error_d, log_pedantic, MEMORYBUF, SSL_accept_d, ssl_error_string(), SSL_free_d, SSL_get_error_d, SSL_new_d, SSL_set_accept_state_d, SSL_set_bio_d, and server_t::tls.

Referenced by imap_starttls(), pop_starttls(), protocol_secure(), and smtp_starttls().

5.265.1.10 bool_t tls_server_create (void ∗ *server*, uint_t *security_level*)

Setup an TLS CTX for a server.

Note:

The server is passed as a void pointer because the provider layer doesn't comprehend protocol specific server instances.

Parameters:

server_t the TLS context will be assigned to the provided server context.

security_level an integer which will be used to control how the TLS context is configured: 0 = accept any type of SSL or TLS protocol version, and offer broad cipher support. 1 = require TLSv1 and above, refuse SSLv2 and SSLv3 connections, use any reasonably secure cipher. (reccomended) 2 = require TLSv1 and above, refuse SSLv2 and SSLv3 connections, only use ciphers which provide forward secrecy. 3 = require TLSv1.2 and limit the cipher list to ECDHE-RSA-AES256-GCM-SHA384 or ECDHE-RSA-CHACHA20-POLY1305 as required by the specifications.

Definition at line 24 of file tls.c.

References server_t::certificate, server_t::context, magma_t::cryptography, dh_exchange_2048(), dh_exchange_4096(), dh_static_2048(), dh_static_4096(), magma_t::iface, log_critical, magma, MAGMA_CIPHERS_GENERIC, MAGMA_CIPHERS_HIGH, MAGMA_-CIPHERS_MEDIUM, SSL_CTX_check_private_key_d, SSL_CTX_ctrl_d, SSL_CTX_new_d, SSL_CTX_set_cipher_list_d, SSL_CTX_-set_tmp_dh_callback_d, SSL_CTX_set_tmp_ecdh_callback_d, SSL_CTX_set_verify_d, SSL_CTX_use_certificate_chain_file_d, SSL_-CTX_use_PrivateKey_file_d, ssl_ecdh_exchange_callback(), SSLv23_server_method_d, and server_t::tls.

Referenced by servers_encryption_start().

5.265.1.11 void tls_server_destroy (void ∗ *server*)

Destroy an TLS context associated with a server.

Parameters:

server the server to be deactivated.

Returns:

This function returns no value.

Definition at line 135 of file tls.c.

References server_t::context, log_pedantic, SSL_CTX_free_d, and server_t::tls.

Referenced by servers_encryption_stop().

5.265.1.12 int tls_status (TLS ∗ *tls*)

Checks whether a TLS connection has been shut down or not.

See also:

SSL_get_shutdown()

Parameters:

tls the TLS connection to be shut down.

Returns:

0 if the connection is alive and well, or SSL_SENT_SHUTDOWN/SSL_RECEIVED_SHUTDOWN

Definition at line 405 of file tls.c.

References SSL_get_shutdown_d.

Referenced by client_status(), and con_status().

5.265.1.13 chr_t∗ tls_suite (TLS ∗ *tls*)

Provide the SSL/TLS/DTLS cipher suite as a string constant.

See also:

SSL_CIPHER_get_name()

Note:

The RFC version of the TLS cipher suite is available through the SSL_CIPHER_standard_name() function.

Definition at line 387 of file tls.c.

References SSL_CIPHER_get_name_d, and SSL_get_current_cipher_d.

5.265.1.14 chr_t* tls_version (TLS * *tls*)

Provide the SSL/TLS/DTLS version as a string constant.

See also:

SSL_get_version()

Definition at line 369 of file tls.c.

References NULLER, PLACER, SSL_get_current_cipher_d, SSL_get_version_d, and st_cmp_cs_eq().

5.265.1.15 int tls_write (TLS * *tls*, const void * *buffer*, int *length*, bool_t *block*)

Write data to an open TLS connection.

Parameters:

tls the TLS connection to which the data will be written.

buffer a pointer to the buffer containing the data to be written.

length the length, in bytes, of the data to be written.

Returns:

-1 on error, or the number of bytes written to the TLS connection.

Definition at line 576 of file tls.c.

References ERR_clear_error_d, log_pedantic, SSL_write_d, and tls_continue().

Referenced by client_write(), con_write_bl(), and tls_print().

5.266 src/providers/database/database.h File Reference

Defines

- #define ISNULL(b) (my_bool ∗)&((my_bool){ b })

Typedefs

- typedef char table_t
- typedef char row_t

Functions

- bool_t lib_load_mysql (void)

  mysql.c

- const char ∗ lib_version_mysql ()

  Return the version string of libmysql.

- const char ∗ serv_charset_mysql (void)
- const char ∗ serv_schema_mysql (void)
- const char ∗ serv_type_mysql (void)

  Determine whether the mysql library in use is embedded or not.

- const char ∗ serv_version_mysql (void)

  Return the server version string of the mysql database.

- uint_t sql_errno (MYSQL ∗mysql)

  Get the last error number for a mysql connection.

- const chr_t ∗ sql_error (MYSQL ∗mysql)

  Get a human-readable error message for a mysql connection.

- MYSQL ∗ sql_open (bool_t silent)

  Open up a new mysql connection to the configured database server.

- int_t sql_ping (uint32_t connection)

  Ping the MySQL server via the provided connection. If the underlying TCP/IP socket has timed out, the ping function will will cause the MySQL client library to reestablish the connection. Because a new connection is created the collection of prepared statements will need to be reinitialized.

- bool_t sql_start (void)

  Load up the mysql subsystem.

- void sql_stop (void)

  Shutdown and free the pool of mysql connections.

- bool_t sql_thread_start (void)

  Initialize mysql thread specific variables for the calling thread.

- void sql_thread_stop (void)

  Prepare the thread for exiting to destroy mysql thread specific variables.

- int64_t sql_query (stringer_t *query)

  query.c

- int64_t sql_query_conn (stringer_t *query, uint32_t connection)

  Execute a mysql statement.

- bool_t res_field_bool (row_t *row, uint64_t field)

  results.c

- bool_t res_row_store (uint64_t num, table_t *table, MYSQL_BIND *binding)
- double_t res_field_double (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a double.

- float_t res_field_float (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a float.

- int16_t res_field_int16 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 16-bit integer.

- int32_t res_field_int32 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 32-bit integer.

- int64_t res_field_int64 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 64-bit integer.

- int8_t res_field_int8 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 8-bit integer.

- row_t * res_row_get (table_t *table, uint64_t row)

  Retrieve a row from a database results table by index.

- row_t * res_row_next (table_t *table)

  Return the next row in the database results table and advance the cursor.

- size_t res_field_length (row_t *row, uint64_t field)

  Get the length of a specified field in a database result row.

- stringer_t * res_field_string (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as managed string.

- table_t * res_stmt_store (MYSQL_STMT *stmt)
- table_t * res_table_alloc (uint64_t rows, uint64_t fields)
- row_t * res_field_generic (row_t *row, uint64_t field, size_t typesize)
- uint16_t res_field_uint16 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 16-bit integer.

- uint32_t res_field_uint32 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 32-bit integer.

- uint64_t res_bind_create (MYSQL_STMT *stmt, MYSQL_BIND **result)
- uint64_t res_field_count (table_t *table)

  Return the number of fields stored in the database results table.

- uint64_t res_field_uint64 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 64-bit integer.

- uint64_t res_row_count (table_t *table)

  Return the number of rows in the MySQL results table.

- uint8_t res_field_uint8 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 8-bit integer.

- void * res_field_block (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as generic pointer.

- void res_bind_free (MYSQL_STMT *stmt, MYSQL_BIND *binding, uint64_t number)

  Free a prepared MySQL statement result set binding.

- void res_row_set (row_t *row, chr_t *buffer)

  Set the buffer location for a database result row.

- void res_table_free (table_t *table)

  Free a MySQL results table.

- bool_t stmt_bind_param (MYSQL_STMT *group, MYSQL_BIND *bind)

  stmts.c

- void stmt_close (MYSQL_STMT *local)
- uint_t stmt_errno (MYSQL_STMT *local)

  Get the error number associated with a mysql statement.

- const chr_t * stmt_error (MYSQL_STMT *local)
- bool_t stmt_exec (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a prepared mysql statement.

- int64_t stmt_exec_affected (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a statement on a specified mysql connection and return the number of affected rows.

- int64_t stmt_exec_affected_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a statement on a specified mysql connection and return the number of affected rows.

- bool_t stmt_exec_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a prepared mysql statement over a specified connection.

- table_t * stmt_get_result (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a prepared mysql statement and return the result.

- table_t * stmt_get_result_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a prepared mysql statement on a specified connection and return the result.

- uint64_t stmt_insert (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a mysql prepared INSERT or UPDATE statement.

- uint64_t stmt_insert_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a mysql prepared INSERT or UPDATE statement on a specified connection.

- MYSQL_STMT * stmt_open (MYSQL *mysql)

  Initialize a mysql prepared statement.

- bool_t stmt_prepare (MYSQL_STMT *group, const char *query, unsigned long length)
- bool_t stmt_rebuild (uint32_t connection)
- MYSQL_STMT * stmt_reset (MYSQL_STMT **group, uint32_t connection)
- bool_t stmt_start (void)

  Initialize the global array of mysql prepared statements.

- void stmt_stop (void)
- int64_t tran_commit (int64_t transaction)

  transaction.c

- int64_t tran_rollback (int64_t transaction)

  Rollback a pending transaction in the mysql database.

- int64_t tran_start (void)

  Pull a connection from the SQL pool and start a transaction.

Variables

- pool_t * sql_pool

5.266.1.1 #define ISNULL(b) (my_bool *)&((my_bool){ b })

Definition at line 63 of file database.h.

Referenced by contact_update(), mail_db_insert_duplicate_message(), and mail_db_insert_message().

5.266.2 Typedef Documentation

5.266.2.1 typedef char row_t

Definition at line 60 of file database.h.

5.266.2.2 typedef char table_t

Definition at line 59 of file database.h.

5.266.3 Function Documentation

5.266.3.1 bool_t lib_load_mysql (void)

mysql.c mysql.c

Returns:

true on success or false on failure.

Definition at line 494 of file mysql.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.266.3.2 const char∗ lib_version_mysql (void)

Return the version string of libmysql.

Returns:

a pointer to a character string containing the libmysql version information.

Definition at line 471 of file mysql.c.

References mysql_get_client_version_d, and sql.

Referenced by lib_load().

5.266.3.3 uint64_t res_bind_create (MYSQL_STMT ∗ *stmt*, MYSQL_BIND ∗∗ *result*)

Definition at line 348 of file results.c.

References length, log_info, mm_alloc(), mysql_fetch_field_d, mysql_free_result_d, mysql_num_fields_d, mysql_stmt_error_d, mysql_-stmt_result_metadata_d, and res_bind_free().

Referenced by res_stmt_store().

5.266.3.4 void res_bind_free (MYSQL_STMT ∗ *stmt*, MYSQL_BIND ∗ *binding*, uint64_t *number*)

Free a prepared MySQL statement result set binding.

Parameters:

stmt the input prepared MySQL statement.

binding the binding for the result set.

number the number of fields in the result set.

Returns:

This function does not return a value.

Definition at line 290 of file results.c.

References length, mm_cleanup, mm_free(), and mysql_stmt_bind_result_d.

Referenced by res_bind_create(), and res_stmt_store().

5.266.3.5 void∗ res_field_block (row_t ∗ *row*, uint64_t *field*)

Get the value of a specified field in a database result row as generic pointer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a generic pointer, or NULL on failure.

Definition at line 43 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), config_load_database_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), smtp_check_receive_quota(), smtp_fetch_inbound(), user_config_fetch(), and warehouse_fetch_domains().

5.266.3.6 bool_t res_field_bool (row_t * *row*, uint64_t *field*)

results.c results.c

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a boolean, or false on failure.

Definition at line 216 of file results.c.

References res_field_generic().

5.266.3.7 uint64_t res_field_count (table_t * *table*)

Return the number of fields stored in the database results table.

Parameters:

table the input database results table.

Returns:

0 on failure, or the number of table fields on success.

Definition at line 415 of file results.c.

References log_info.

Referenced by res_row_store().

5.266.3.8 double_t res_field_double (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a double.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a double, or 0 on failure.

Definition at line 86 of file results.c.

References res_field_generic().

5.266.3.9 float_t res_field_float (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a float.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a float, or 0 on failure.

Definition at line 99 of file results.c.

References res_field_generic().

5.266.3.10 row_t* res_field_generic (row_t * *row*, uint64_t *field*, size_t *typesize*)

Definition at line 10 of file results.c.

References log_info.

Referenced by res_field_block(), res_field_bool(), res_field_double(), res_field_float(), res_field_int16(), res_field_int32(), res_field_int64(), res_field_int8(), res_field_uint16(), res_field_uint32(), res_field_uint64(), and res_field_uint8().

5.266.3.11 int16_t res_field_int16 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 16-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 16-bit integer, or 0 on failure.

Definition at line 190 of file results.c.

References res_field_generic().

5.266.3.12 int32_t res_field_int32 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 32-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 32-bit integer, or 0 on failure.

Definition at line 177 of file results.c.

References res_field_generic().

5.266.3.13 int64_t res_field_int64 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 64-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 64-bit integer, or 0 on failure.

Definition at line 164 of file results.c.

References res_field_generic().

5.266.3.14 int8_t res_field_int8 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 8-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 8-bit integer, or 0 on failure.

Definition at line 203 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), meta_data_fetch_user(), smtp_fetch_authorization(), smtp_fetch_inbound(), teacher_data_fetch(), and warehouse_fetch_domains().

5.266.3.15 size_t res_field_length (row_t * *row*, uint64_t *field*)

Get the length of a specified field in a database result row.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the length of the specified result row, or 0 on failure.

Definition at line 229 of file results.c.

References log_info.

Referenced by auth_data_fetch(), config_load_database_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), smtp_check_receive_quota(), smtp_fetch_inbound(), user_config_fetch(), and warehouse_fetch_domains().

5.266.3.16 stringer_t* res_field_string (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as managed string.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a managed string, or NULL on failure.

Definition at line 56 of file results.c.

References length, log_info, and st_import().

Referenced by auth_data_fetch(), meta_data_fetch_all_tags(), meta_data_fetch_message_tags(), meta_data_fetch_user(), register_data_-fetch_blocklist(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_rollout(), teacher_data_fetch(), and warehouse_fetch_patterns().

5.266.3.17 uint16_t res_field_uint16 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 16-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 16-bit integer, or 0 on failure.

Definition at line 138 of file results.c.

References res_field_generic().

5.266.3.18 uint32_t res_field_uint32 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 32-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 32-bit integer, or 0 on failure.

Definition at line 125 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), magma_folder_fetch(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_-messages(), smtp_fetch_authorization(), smtp_fetch_inbound(), and smtp_rollout().

5.266.3.19 uint64_t res_field_uint64 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 64-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 64-bit integer, or 0 on failure.

Definition at line 112 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), config_fetch_host_number(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_acknowledge_alert(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_inbound(), smtp_rollout(), statistics_refresh(), teacher_data_fetch(), and user_config_fetch().

5.266.3.20 uint8_t res_field_uint8 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 8-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 8-bit integer, or 0 on failure.

Definition at line 151 of file results.c.

References res_field_generic().

Referenced by meta_data_fetch_mailbox_aliases(), and meta_data_fetch_shard().

5.266.3.21 uint64_t res_row_count (table_t * *table*)

Return the number of rows in the MySQL results table.

Note:

The row count is provided for a one-indexed table.

Parameters:

table the input MySQL results table.

Returns:

0 on error, or the row count on success.

Definition at line 432 of file results.c.

References log_info.

Referenced by auth_data_fetch(), config_load_database_settings(), meta_data_fetch_message_tags(), res_row_store(), smtp_check_authorized_from(), and smtp_fetch_inbound().

5.266.3.22 row_t* res_row_get (table_t * *table*, uint64_t *row*)

Retrieve a row from a database results table by index.

Note:

This function operates on a 0-indexed table.

Parameters:

table the input database results table. row the row # to be fetched.

Returns:

NULL on failure, or a pointer to a result row on success.

Definition at line 469 of file results.c.

References log_info.

Referenced by config_load_database_settings(), res_row_next(), and res_row_store().

5.266.3.23 row_t* res_row_next (table_t * *table*)

Return the next row in the database results table and advance the cursor.

Parameters:

table the input mysql results table.

Returns:

a pointer to the next result row in the table.

Definition at line 490 of file results.c.

References count, and res_row_get().

Referenced by auth_data_fetch(), config_fetch_host_number(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_acknowledge_alert(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), register_data_check_username(), register_data_fetch_blocklist(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_rollout(), statistics_refresh(), teacher_data_fetch(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.266.3.24 void res_row_set (row_t * *row*, chr_t * *buffer*)

Set the buffer location for a database result row.

Parameters:

row the input database result row.

buffer the buffer to be assigned to the target row.

Returns:

This function returns no value.

Definition at line 449 of file results.c.

References log_info.

Referenced by res_row_store().

5.266.3.25 bool_t res_row_store (uint64_t *num*, table_t * *table*, MYSQL_BIND * *binding*)

Definition at line 510 of file results.c.

References length, log_info, mm_alloc(), mm_copy(), res_field_count(), res_row_count(), res_row_get(), and res_row_set().

5.266.3.27 table_t* res_table_alloc (uint64_t *rows*, uint64_t *fields*)

Definition at line 316 of file results.c.

References log_info, and mm_alloc().

Referenced by res_stmt_store().

5.266.3.28 void res_table_free (table_t * *table*)

Free a MySQL results table.

Parameters:

table the MySQL results table to be freed.

Returns:

This function does not return a value.

Definition at line 250 of file results.c.

References log_info, and mm_free().

Referenced by auth_data_fetch(), config_fetch_host_number(), config_load_database_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_acknowledge_alert(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), register_data_check_username(), register_data_fetch_blocklist(), res_stmt_store(), smtp_check_authorized_from(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_rollout(), statistics_refresh(), teacher_data_fetch(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.266.3.29 const char* serv_charset_mysql (void)

Definition at line 415 of file mysql.c.

References mm_wipe(), mysql_character_set_name_d, mysql_close_d, sql, and sql_open().

Referenced by lib_load().

5.266.3.30 const char* serv_schema_mysql (void)

Definition at line 431 of file mysql.c.

References mm_wipe(), mysql_close_d, sql, and sql_open().

Referenced by lib_load().

5.266.3.31 const char∗ serv_type_mysql (void)

Determine whether the mysql library in use is embedded or not.

Returns:

sql.type_embed ("Embedded") or sql.type_serv ("MySQL");

Definition at line 401 of file mysql.c.

References mysql_embedded_d, and sql.

Referenced by lib_load().

5.266.3.32 const char∗ serv_version_mysql (void)

Return the server version string of the mysql database.

Returns:

a pointer to a character string containing the mysql server version information.

Definition at line 451 of file mysql.c.

References mm_wipe(), mysql_close_d, mysql_get_server_info_d, sql, and sql_open().

Referenced by lib_load().

5.266.3.33 uint_t sql_errno (MYSQL ∗ *mysql*)

Get the last error number for a mysql connection.

Parameters:

mysql a pointer to the MYSQL object of the connection to be queried.

Returns:

0 on failure, or the last mysql error message for the connection on success.

Definition at line 163 of file mysql.c.

References mysql_errno_d.

Referenced by stmt_close().

5.266.3.34 const chr_t∗ sql_error (MYSQL ∗ *mysql*)

Get a human-readable error message for a mysql connection.

Parameters:

mysql a pointer to the MYSQL object of the connection to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the error message on success.

Definition at line 177 of file mysql.c.

References mysql_errno_d, and mysql_error_d.

Referenced by sql_open(), sql_ping(), sql_query_conn(), stmt_close(), stmt_open(), tran_commit(), tran_rollback(), and tran_start().

5.266.3.35 MYSQL∗ sql_open (bool_t *silent*)

Open up a new mysql connection to the configured database server.

Note:

The reconnect option will automatically be set on all new mysql connections.

Parameters:

silent if true, suppress logging of failure messages for this function.

Returns:

NULL on failure, or a pointer to a MSQL objection for the newly established connection on success.

Definition at line 216 of file mysql.c.

References magma_t::database, magma_t::iface, log_critical, magma, mysql_close_d, mysql_init_d, mysql_options_d, mysql_real_connect_d, and sql_error().

Referenced by serv_charset_mysql(), serv_schema_mysql(), serv_version_mysql(), and sql_start().

5.266.3.36 int_t sql_ping (uint32_t *connection*)

Ping the MySQL server via the provided connection. If the underlying TCP/IP socket has timed out, the ping function will will cause the MySQL client library to reestablish the connection. Because a new connection is created the collection of prepared statements will need to be reinitialized.

Warning:

If the connection timed out, the ping will trigger a reconnect, which invalidates the prepared statement references.

```
{.c}
if (sql_ping(connection) < 0 || !stmt_rebuild(connection)) { log_error("Invalid
     database connection."; return; }
```

Parameters:

connection The specific connection inside the pool that should be used for the ping.

Returns:

Returns 1 if the library performed an automatic reconnect, 0 if the connection is active, and -1 if the reconnect failed.

Definition at line 296 of file mysql.c.

References log_error, mysql_ping_d, mysql_thread_id_d, pool_get_obj(), and sql_error().

Referenced by dspam_check(), dspam_train(), and stmt_reset().

5.266.3.37 int64_t sql_query (stringer_t ∗ *query*)

query.c query.c

See also:

sql_query_conn()

Parameters:

query the mysql statement to be executed.

Returns:

0 on success, or non-zero on failure.

Definition at line 35 of file query.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and sql_query_conn().

5.266.3.38 int64_t sql_query_conn (stringer_t * *query*, uint32_t *connection*)

Execute a mysql statement.

See also:

mysql_real_query()

Parameters:

query the mysql statement to be executed.

connection a connection id for the underlying mysql session.

Returns:

0 on success, or a non-zero number on error.

Definition at line 17 of file query.c.

References log_pedantic, mysql_real_query_d, pool_get_obj(), sql_error(), sql_pool, st_char_get(), st_data_get(), st_length_get(), and st_length_int().

Referenced by sql_query(), tran_commit(), tran_rollback(), and tran_start().

5.266.3.39 bool_t sql_start (void)

Load up the mysql subsystem.

Note:

This function will check that all necessary database parameters have been supplied, and that the supplied mysql library version is thread safe and initialized. It will also initialize the pool of database connections, and

Returns:

true on success or false on failure.

Definition at line 324 of file mysql.c.

References magma_t::database, magma_t::iface, log_critical, magma, mysql_server_init_d, mysql_thread_safe_d, ns_empty(), pool_alloc(), pool_set_obj(), sql_open(), sql_stop(), and stmt_start().

Referenced by process_start().

5.266.3.40 void sql_stop (void)

Shutdown and free the pool of mysql connections.

Returns:

This function returns no value.

Definition at line 189 of file mysql.c.

References magma_t::database, magma_t::iface, magma, my_once_free_d, mysql_close_d, mysql_server_end_d, pool_free(), pool_get_-obj(), and stmt_stop().

Referenced by process_stop(), and sql_start().

5.266.3.41 bool_t sql_thread_start (void)

Initialize mysql thread specific variables for the calling thread.

Note:

mysql_thread_init()

Returns:

0 on success or non-zero on error.

Definition at line 388 of file mysql.c.

References log_error, and mysql_thread_init_d.

Referenced by thread_start().

5.266.3.42 void sql_thread_stop (void)

Prepare the thread for exiting to destroy mysql thread specific variables.

Note:

mysql_thread_end()

Returns:

This function returns no value.

Definition at line 378 of file mysql.c.

References mysql_thread_end_d.

Referenced by thread_stop().

5.266.3.43 bool_t stmt_bind_param (MYSQL_STMT * *group*, MYSQL_BIND * *bind*)

stmts.c

Definition at line 251 of file stmts.c.

References log_critical, log_pedantic, mysql_stmt_bind_param_d, and stmt_error().

Referenced by stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), and stmt_insert_conn().

5.266.3.44 void stmt_close (MYSQL_STMT ∗ *local*)

Definition at line 68 of file stmts.c.

References log_critical, mysql_stmt_close_d, sql_errno(), and sql_error().

Referenced by stmt_rebuild(), and stmt_stop().

5.266.3.45 uint_t stmt_errno (MYSQL_STMT ∗ *local*)

Get the error number associated with a mysql statement.

Parameters:

local a pointer to the input mysql statement object.

Returns:

the errno associated with the specified mysql statement.

Definition at line 17 of file stmts.c.

References mysql_errno_d, and mysql_stmt_errno_d.

5.266.3.46 const chr_t∗ stmt_error (MYSQL_STMT ∗ *local*)

Return the error string for a mysql statement.

Parameters:

local A single MYSQL_STMT∗ parameter.

Returns:

This function returns the mysql error string, or NULL if unable to retrieve it.

Definition at line 34 of file stmts.c.

References mysql_errno_d, mysql_error_d, mysql_stmt_errno_d, and mysql_stmt_error_d.

Referenced by stmt_bind_param(), stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), stmt_insert_conn(), and stmt_prepare().

5.266.3.47 bool_t stmt_exec (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*)

Execute a prepared mysql statement.

See also:

stmt_exec_conn()

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the statement.

Returns:

false on failure, or true on success.

Definition at line 307 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_exec_conn().

Referenced by mail_db_hide_message(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), smtp_update_receive_stats(), smtp_update_transmission_stats(), and teacher_data_delete().

5.266.3.48 int64_t stmt_exec_affected (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*)

Execute a statement on a specified mysql connection and return the number of affected rows.

Note:

Technically the number of affected rows is a my_ulonglong value, but since we retrun -1 when an error occurs, we are using the signed equivalent, int64_t. This means if more than INT64_MAX (or 9,223,372,036,854,775,807) rows are ever altered, the function will return INT64_MAX (or 9,223,372,036,854,775,807) instead.

See also:

mysql_stmt_affected_rows()

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be bound to the prepared statement.

Returns:

-1 on failure, 0 if executed successfully, but no rows are affected, and a positive number with the number of altered rows upon success.

Definition at line 492 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_exec_affected_conn().

Referenced by api_endpoint_delete_user(), auth_data_update_legacy(), contact_delete(), contact_detail_delete(), contact_detail_upsert(), contact_update(), contact_update_stamp(), magma_folder_delete(), magma_folder_rename(), meta_data_delete_folder(), meta_data_delete_tag(), meta_data_insert_tag(), meta_data_truncate_tags(), meta_data_update_folder_name(), meta_data_update_lock(), meta_data_update_log(), user_config_delete(), and user_config_upsert().

5.266.3.49 int64_t stmt_exec_affected_conn (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*, uint32_t *connection*)

Execute a statement on a specified mysql connection and return the number of affected rows.

Note:

Technically the number of affected rows is a my_ulonglong value, but since we retrun -1 when an error occurs, we are using the signed equivalent, int64_t. This means if more than INT64_MAX (or 9,223,372,036,854,775,807) rows are ever altered, the function will return INT64_MAX (or 9,223,372,036,854,775,807) instead.

See also:

mysql_stmt_affected_rows()

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be bound to the prepared statement.

connection the mysql connection id over which the specified statement will be executed.

Returns:

-1 on failure, 0 if executed successfully, but no rows are affected, and a positive number with the number of altered rows upon success.

Definition at line 440 of file stmts.c.

References log_info, mysql_stmt_affected_rows_d, mysql_stmt_execute_d, stmt_bind_param(), stmt_error(), stmt_reset(), and uint64_clamp().

Referenced by mail_db_delete_message(), mail_db_update_message_folder(), meta_data_acknowledge_alert(), meta_data_insert_keys(), meta_data_insert_shard(), stmt_exec_affected(), and tank_delete_object().

5.266.3.50 bool_t stmt_exec_conn (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*, uint32_t *connection*)

Execute a prepared mysql statement over a specified connection.

Note:

This function will also reset the prepared statement and bind its parameters.

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the statement.

connection the mysql connection id.

Returns:

false on failure, or true on success.

Definition at line 278 of file stmts.c.

References log_info, mysql_stmt_execute_d, stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by mail_db_insert_duplicate_message(), mail_db_insert_message(), register_data_insert_user(), and stmt_exec().

5.266.3.51 table_t∗ stmt_get_result (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*)

Execute a prepared mysql statement and return the result.

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be passed with the query.

Returns:

the result of the query, or NULL on failure.

Definition at line 357 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_get_result_conn().

Referenced by auth_data_fetch(), config_fetch_host_number(), config_fetch_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_fetch_user(), register_data_check_username(), register_data_fetch_blocklist(), smtp_check_authorized_from(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_fetch_rollmessages(), statistics_refresh(), teacher_data_fetch(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.266.3.52 table_t* stmt_get_result_conn (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*, uint32_t *connection*)

Execute a prepared mysql statement on a specified connection and return the result.

Parameters:

group the prepared mysql statement to be executed.
parameters the parameters to be passed with the query.
connection the mysql connection identifier.

Returns:

the result of the query, or NULL on failure.

Definition at line 329 of file stmts.c.

References log_info, mysql_stmt_execute_d, res_stmt_store(), stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by meta_data_acknowledge_alert(), meta_data_fetch_keys(), meta_data_fetch_shard(), and stmt_get_result().

5.266.3.53 uint64_t stmt_insert (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*)

Execute a mysql prepared INSERT or UPDATE statement.

See also:

mysql_stmt_insert_id()

Parameters:

group the mysql prepared statement to be executed.
parameters the parameters to be bound to the prepared statement.

Returns:

0 on failure, or the last LAST_INSERT_ID() value returned for the mysql auto-increment column.

Definition at line 409 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_insert_conn().

Referenced by contact_insert(), magma_folder_insert(), meta_data_insert_folder(), and smtp_insert_spamsig().

5.266.3.54 uint64_t stmt_insert_conn (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*, uint32_t *connection*)

Execute a mysql prepared INSERT or UPDATE statement on a specified connection.

See also:

mysql_stmt_insert_id()

Parameters:

group the mysql prepared statement to be executed.
parameters the parameters to be bound to the prepared statement.
connection the underlying connection on which the statement will be executed.

Returns:

0 on failure, or the last LAST_INSERT_ID() value returned for the mysql auto-increment column.

Definition at line 380 of file stmts.c.

References log_info, mysql_stmt_execute_d, mysql_stmt_insert_id_d, stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by mail_db_insert_duplicate_message(), mail_db_insert_message(), register_data_insert_user(), stmt_insert(), and tank_insert_-object().

5.266.3.55 MYSQL_STMT∗ stmt_open (MYSQL ∗ *mysql*)

Initialize a mysql prepared statement.

See also:

mysql_stmt_init()

Parameters:

mysql the underlying mysql connection.

Returns:

This function is a thin wrapper around the mysql library function mysql_stmt_init_d().

Definition at line 52 of file stmts.c.

References log_critical, mysql_stmt_init_d, and sql_error().

Referenced by stmt_rebuild(), and stmt_start().

5.266.3.56 bool_t stmt_prepare (MYSQL_STMT ∗ *group*, const char ∗ *query*, unsigned long *length*)

Definition at line 116 of file stmts.c.

References log_critical, mysql_stmt_attr_set_d, mysql_stmt_prepare_d, and stmt_error().

Referenced by stmt_rebuild(), and stmt_start().

5.266.3.57 bool_t stmt_rebuild (uint32_t *connection*)

Definition at line 190 of file stmts.c.

References log_critical, ns_length_get(), pool_get_obj(), queries, sql_pool, stmt_close(), stmt_open(), and stmt_prepare().

Referenced by dspam_check(), dspam_train(), and stmt_reset().

5.266.3.58 MYSQL_STMT∗ stmt_reset (MYSQL_STMT ∗∗ *group*, uint32_t *connection*)

Definition at line 222 of file stmts.c.

References log_critical, log_pedantic, mysql_stmt_reset_d, sql_ping(), and stmt_rebuild().

Referenced by stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), and stmt_insert_conn().

5.266.3.59 bool_t stmt_start (void)

Initialize the global array of mysql prepared statements.

Note:

This function readies a copy of each prepared statement for every member of the global mysql connection pool.

Returns:

true on success or false on failure.

Definition at line 143 of file stmts.c.

References magma_t::database, magma_t::iface, log_critical, magma, mm_alloc(), mm_wipe(), ns_length_get(), pool_get_obj(), queries, sql_pool, stmt_open(), stmt_prepare(), and stmt_stop().

5.266.3.60 void stmt_stop (void)

Definition at line 90 of file stmts.c.

References magma_t::database, magma_t::iface, magma, mm_free(), queries, and stmt_close().

Referenced by sql_stop(), and stmt_start().

5.266.3.61 int64_t tran_commit (int64_t *transaction*)

transaction.c transaction.c

Parameters:

transaction the mysql connection identifier.

Returns:

0 on success, or a non-zero number on error.

Definition at line 72 of file transaction.c.

References command, length, log_info, PLACER, pool_get_obj(), pool_release(), sql_error(), sql_pool, sql_query_conn(), and tran_commands.

Referenced by api_endpoint_register(), mail_copy_message(), mail_move_message(), mail_remove_message(), mail_store_message(), meta_update_keys(), meta_update_realms(), portal_endpoint_alert_acknowledge(), register_business_step2(), tank_delete(), and tank_store().

5.266.3.62 int64_t tran_rollback (int64_t *transaction*)

Rollback a pending transaction in the mysql database.

Parameters:

transaction the mysql connection identifier.

Returns:

0 on success, or a non-zero number on error.

Definition at line 52 of file transaction.c.

References command, length, log_info, PLACER, pool_get_obj(), pool_release(), sql_error(), sql_pool, sql_query_conn(), and tran_commands.

```
#include "magma.h"
```

Functions

- uint_t sql_errno (MYSQL *mysql)

  Get the last error number for a mysql connection.

- const chr_t * sql_error (MYSQL *mysql)

  Get a human-readable error message for a mysql connection.

- void sql_stop (void)

  Shutdown and free the pool of mysql connections.

- MYSQL * sql_open (bool_t silent)

  Open up a new mysql connection to the configured database server.

- int_t sql_ping (uint32_t connection)

  Ping the MySQL server via the provided connection. If the underlying TCP/IP socket has timed out, the ping function will will cause the MySQL client library to reestablish the connection. Because a new connection is created the collection of prepared statements will need to be reinitialized.

- bool_t sql_start (void)

  Load up the mysql subsystem.

- void sql_thread_stop (void)

  Prepare the thread for exiting to destroy mysql thread specific variables.

- bool_t sql_thread_start (void)

  Initialize mysql thread specific variables for the calling thread.

- const char * serv_type_mysql (void)

  Determine whether the mysql library in use is embedded or not.

- const char * serv_charset_mysql (void)
- const char * serv_schema_mysql (void)
- const char * serv_version_mysql (void)

  Return the server version string of the mysql database.

- const char * lib_version_mysql (void)

  Return the version string of libmysql.

- bool_t lib_load_mysql (void)

  Initialize the libmysql and bind dynamically to the exported functions that are required.

Variables

- pool_t * sql_pool = NULL

- struct {
  char lib_version [16]

  const chr_t * dash
  } sql

5.267.1 Function Documentation

5.267.1.1 bool_t lib_load_mysql (void)

Initialize the libmysql and bind dynamically to the exported functions that are required. mysql.c

Returns:

true on success or false on failure.

Definition at line 494 of file mysql.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.267.1.2 const char* lib_version_mysql (void)

Return the version string of libmysql.

Returns:

a pointer to a character string containing the libmysql version information.

Definition at line 471 of file mysql.c.

References mysql_get_client_version_d, and sql.

Referenced by lib_load().

5.267.1.3 const char* serv_charset_mysql (void)

Definition at line 415 of file mysql.c.

References mm_wipe(), mysql_character_set_name_d, mysql_close_d, sql, and sql_open().

Referenced by lib_load().

5.267.1.4 const char* serv_schema_mysql (void)

Definition at line 431 of file mysql.c.

References mm_wipe(), mysql_close_d, sql, and sql_open().

Referenced by lib_load().

5.267.1.5 const char* serv_type_mysql (void)

Determine whether the mysql library in use is embedded or not.

Returns:

sql.type_embed ("Embedded") or sql.type_serv ("MySQL");

Definition at line 401 of file mysql.c.

References mysql_embedded_d, and sql.

Referenced by lib_load().

5.267.1.6 const char* serv_version_mysql (void)

Return the server version string of the mysql database.

Returns:

a pointer to a character string containing the mysql server version information.

Definition at line 451 of file mysql.c.

References mm_wipe(), mysql_close_d, mysql_get_server_info_d, sql, and sql_open().

Referenced by lib_load().

5.267.1.7 uint_t sql_errno (MYSQL * *mysql*)

Get the last error number for a mysql connection.

Parameters:

mysql a pointer to the MYSQL object of the connection to be queried.

Returns:

0 on failure, or the last mysql error message for the connection on success.

Definition at line 163 of file mysql.c.

References mysql_errno_d.

Referenced by stmt_close().

5.267.1.8 const chr_t* sql_error (MYSQL * *mysql*)

Get a human-readable error message for a mysql connection.

Parameters:

mysql a pointer to the MYSQL object of the connection to be queried.

Returns:

NULL on failure, or a pointer to a null-terminated string with the error message on success.

Definition at line 177 of file mysql.c.

References mysql_errno_d, and mysql_error_d.

Referenced by sql_open(), sql_ping(), sql_query_conn(), stmt_close(), stmt_open(), tran_commit(), tran_rollback(), and tran_start().

5.267.1.9 MYSQL* sql_open (bool_t *silent*)

Open up a new mysql connection to the configured database server.

Note:

The reconnect option will automatically be set on all new mysql connections.

Parameters:

silent if true, suppress logging of failure messages for this function.

Returns:

NULL on failure, or a pointer to a MSQL objection for the newly established connection on success.

Definition at line 216 of file mysql.c.

References magma_t::database, magma_t::iface, log_critical, magma, mysql_close_d, mysql_init_d, mysql_options_d, mysql_real_connect_d, and sql_error().

Referenced by serv_charset_mysql(), serv_schema_mysql(), serv_version_mysql(), and sql_start().

5.267.1.10 int_t sql_ping (uint32_t *connection*)

Ping the MySQL server via the provided connection. If the underlying TCP/IP socket has timed out, the ping function will will cause the MySQL client library to reestablish the connection. Because a new connection is created the collection of prepared statements will need to be reinitialized.

Warning:

If the connection timed out, the ping will trigger a reconnect, which invalidates the prepared statement references.

```
{.c}
if (sql_ping(connection) < 0 || !stmt_rebuild(connection)) { log_error("Invalid
     database connection."; return; }
```

Parameters:

connection The specific connection inside the pool that should be used for the ping.

Returns:

Returns 1 if the library performed an automatic reconnect, 0 if the connection is active, and -1 if the reconnect failed.

Definition at line 296 of file mysql.c.

References log_error, mysql_ping_d, mysql_thread_id_d, pool_get_obj(), and sql_error().

Referenced by dspam_check(), dspam_train(), and stmt_reset().

5.267.1.11 bool_t sql_start (void)

Load up the mysql subsystem.

Note:

This function will check that all necessary database parameters have been supplied, and that the supplied mysql library version is thread safe and initialized. It will also initialize the pool of database connections, and

Returns:

true on success or false on failure.

Definition at line 324 of file mysql.c.

References magma_t::database, magma_t::iface, log_critical, magma, mysql_server_init_d, mysql_thread_safe_d, ns_empty(), pool_alloc(), pool_set_obj(), sql_open(), sql_stop(), and stmt_start().

Referenced by process_start().

5.267.1.12 void sql_stop (void)

Shutdown and free the pool of mysql connections.

Returns:

This function returns no value.

Definition at line 189 of file mysql.c.

References magma_t::database, magma_t::iface, magma, my_once_free_d, mysql_close_d, mysql_server_end_d, pool_free(), pool_get_obj(), and stmt_stop().

Referenced by process_stop(), and sql_start().

5.267.1.13 bool_t sql_thread_start (void)

Initialize mysql thread specific variables for the calling thread.

Note:

mysql_thread_init()

Returns:

0 on success or non-zero on error.

Definition at line 388 of file mysql.c.

References log_error, and mysql_thread_init_d.

Referenced by thread_start().

5.267.1.14 void sql_thread_stop (void)

Prepare the thread for exiting to destroy mysql thread specific variables.

Note:

mysql_thread_end()

Returns:

This function returns no value.

Definition at line 378 of file mysql.c.

References mysql_thread_end_d.

Referenced by thread_stop().

5.267.2 Variable Documentation

5.267.2.1 const chr_t * dash

Definition at line 151 of file mysql.c.

5.267.2.2 char lib_version[16]

#include "magma.h"
```

Functions

- int64_t sql_query_conn (stringer_t *query, uint32_t connection)
  Execute a mysql statement.
- int64_t sql_query (stringer_t *query)
  Pull a connection from the sql pool and execute a mysql statement.

5.268.1 Function Documentation

5.268.1.1 int64_t sql_query (stringer_t * *query*)

Pull a connection from the sql pool and execute a mysql statement. query.c

See also:

sql_query_conn()

Parameters:

query the mysql statement to be executed.

Returns:

0 on success, or non-zero on failure.

Definition at line 35 of file query.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and sql_query_conn().

5.268.1.2 int64_t sql_query_conn (stringer_t * *query*, uint32_t *connection*)

Execute a mysql statement.

See also:

mysql_real_query()

Parameters:

query the mysql statement to be executed.

connection a connection id for the underlying mysql session.

Returns:

0 on success, or a non-zero number on error.

Definition at line 17 of file query.c.

References log_pedantic, mysql_real_query_d, pool_get_obj(), sql_error(), sql_pool, st_char_get(), st_data_get(), st_length_get(), and st_length_int().

Referenced by sql_query(), tran_commit(), tran_rollback(), and tran_start().

```

Functions

- row_t * res_field_generic (row_t *row, uint64_t field, size_t typesize)
- void * res_field_block (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as generic pointer.

- stringer_t * res_field_string (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as managed string.

- double_t res_field_double (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a double.

- float_t res_field_float (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a float.

- uint64_t res_field_uint64 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 64-bit integer.

- uint32_t res_field_uint32 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 32-bit integer.

- uint16_t res_field_uint16 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 16-bit integer.

- uint8_t res_field_uint8 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as an unsigned 8-bit integer.

- int64_t res_field_int64 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 64-bit integer.

- int32_t res_field_int32 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 32-bit integer.

- int16_t res_field_int16 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 16-bit integer.

- int8_t res_field_int8 (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a signed 8-bit integer.

- bool_t res_field_bool (row_t *row, uint64_t field)

  Get the value of a specified field in a database result row as a boolean.

- size_t res_field_length (row_t *row, uint64_t field)

  Get the length of a specified field in a database result row.

- void res_table_free (table_t *table)

  Free a MySQL results table.

- void res_bind_free (MYSQL_STMT *stmt, MYSQL_BIND *binding, uint64_t number)

  Free a prepared MySQL statement result set binding.

- table_t * res_table_alloc (uint64_t rows, uint64_t fields)
- uint64_t res_bind_create (MYSQL_STMT *stmt, MYSQL_BIND **result)
- uint64_t res_field_count (table_t *table)

  Return the number of fields stored in the database results table.

- uint64_t res_row_count (table_t *table)

  Return the number of rows in the MySQL results table.

- void res_row_set (row_t *row, chr_t *buffer)

  Set the buffer location for a database result row.

- row_t * res_row_get (table_t *table, uint64_t row)

  Retrieve a row from a database results table by index.

- row_t * res_row_next (table_t *table)

  Return the next row in the database results table and advance the cursor.

- bool_t res_row_store (uint64_t num, table_t *table, MYSQL_BIND *binding)
- table_t * res_stmt_store (MYSQL_STMT *stmt)

5.269.1 Function Documentation

5.269.1.1 uint64_t res_bind_create (MYSQL_STMT * *stmt*, MYSQL_BIND ** *result*)

Definition at line 348 of file results.c.

References length, log_info, mm_alloc(), mysql_fetch_field_d, mysql_free_result_d, mysql_num_fields_d, mysql_stmt_error_d, mysql_stmt_result_metadata_d, and res_bind_free().

Referenced by res_stmt_store().

5.269.1.2 void res_bind_free (MYSQL_STMT * *stmt*, MYSQL_BIND * *binding*, uint64_t *number*)

Free a prepared MySQL statement result set binding.

Parameters:

stmt the input prepared MySQL statement.

binding the binding for the result set.

number the number of fields in the result set.

Returns:

This function does not return a value.

Definition at line 290 of file results.c.

References length, mm_cleanup, mm_free(), and mysql_stmt_bind_result_d.

Referenced by res_bind_create(), and res_stmt_store().

5.269.1.3 void* res_field_block (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as generic pointer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a generic pointer, or NULL on failure.

Definition at line 43 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), config_load_database_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), smtp_check_receive_quota(), smtp_fetch_inbound(), user_config_fetch(), and warehouse_fetch_domains().

5.269.1.4 bool_t res_field_bool (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a boolean. results.c

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a boolean, or false on failure.

Definition at line 216 of file results.c.

References res_field_generic().

5.269.1.5 uint64_t res_field_count (table_t * *table*)

Return the number of fields stored in the database results table.

Parameters:

table the input database results table.

Returns:

0 on failure, or the number of table fields on success.

Definition at line 415 of file results.c.

References log_info.

Referenced by res_row_store().

5.269.1.6 double_t res_field_double (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a double.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a double, or 0 on failure.

Definition at line 86 of file results.c.

References res_field_generic().

5.269.1.7 float_t res_field_float (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a float.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a float, or 0 on failure.

Definition at line 99 of file results.c.

References res_field_generic().

5.269.1.8 row_t* res_field_generic (row_t * *row*, uint64_t *field*, size_t *typesize*)

Definition at line 10 of file results.c.

References log_info.

Referenced by res_field_block(), res_field_bool(), res_field_double(), res_field_float(), res_field_int16(), res_field_int32(), res_field_int64(), res_field_int8(), res_field_uint16(), res_field_uint32(), res_field_uint64(), and res_field_uint8().

5.269.1.9 int16_t res_field_int16 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 16-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 16-bit integer, or 0 on failure.

Definition at line 190 of file results.c.

References res_field_generic().

5.269.1.10 int32_t res_field_int32 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 32-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 32-bit integer, or 0 on failure.

Definition at line 177 of file results.c.

References res_field_generic().

5.269.1.11 int64_t res_field_int64 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 64-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 64-bit integer, or 0 on failure.

Definition at line 164 of file results.c.

References res_field_generic().

5.269.1.12 int8_t res_field_int8 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as a signed 8-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a signed 8-bit integer, or 0 on failure.

Definition at line 203 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), meta_data_fetch_user(), smtp_fetch_authorization(), smtp_fetch_inbound(), teacher_data_fetch(), and warehouse_fetch_domains().

5.269.1.13 size_t res_field_length (row_t * *row*, uint64_t *field*)

Get the length of a specified field in a database result row.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the length of the specified result row, or 0 on failure.

Definition at line 229 of file results.c.

References log_info.

Referenced by auth_data_fetch(), config_load_database_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), smtp_check_receive_quota(), smtp_fetch_inbound(), user_config_fetch(), and warehouse_fetch_domains().

5.269.1.14 stringer_t* res_field_string (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as managed string.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as a managed string, or NULL on failure.

Definition at line 56 of file results.c.

References length, log_info, and st_import().

Referenced by auth_data_fetch(), meta_data_fetch_all_tags(), meta_data_fetch_message_tags(), meta_data_fetch_user(), register_data_fetch_blocklist(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_rollout(), teacher_data_fetch(), and warehouse_fetch_patterns().

5.269.1.15 uint16_t res_field_uint16 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 16-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 16-bit integer, or 0 on failure.

Definition at line 138 of file results.c.

References res_field_generic().

5.269.1.16 uint32_t res_field_uint32 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 32-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 32-bit integer, or 0 on failure.

Definition at line 125 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), magma_folder_fetch(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_messages(), smtp_fetch_authorization(), smtp_fetch_inbound(), and smtp_rollout().

5.269.1.17 uint64_t res_field_uint64 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 64-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 64-bit integer, or 0 on failure.

Definition at line 112 of file results.c.

References res_field_generic().

Referenced by auth_data_fetch(), config_fetch_host_number(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_acknowledge_alert(), meta_data_fetch_alerts(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_messages(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_inbound(), smtp_rollout(), statistics_refresh(), teacher_data_fetch(), and user_config_fetch().

5.269.1.18 uint8_t res_field_uint8 (row_t * *row*, uint64_t *field*)

Get the value of a specified field in a database result row as an unsigned 8-bit integer.

Parameters:

row a pointer to the database result row to be examined.

field the zero-based index of the field in the row to be queried.

Returns:

the value of the specified result row as an unsigned 8-bit integer, or 0 on failure.

Definition at line 151 of file results.c.

References res_field_generic().

Referenced by meta_data_fetch_mailbox_aliases(), and meta_data_fetch_shard().

5.269.1.19 uint64_t res_row_count (table_t * *table*)

Return the number of rows in the MySQL results table.

Note:

The row count is provided for a one-indexed table.

Parameters:

table the input MySQL results table.

Returns:

0 on error, or the row count on success.

Definition at line 432 of file results.c.

References log_info.

Referenced by auth_data_fetch(), config_load_database_settings(), meta_data_fetch_message_tags(), res_row_store(), smtp_check_-authorized_from(), and smtp_fetch_inbound().

5.269.1.20 row_t* res_row_get (table_t * *table*, uint64_t *row*)

Retrieve a row from a database results table by index.

Note:

This function operates on a 0-indexed table.

Parameters:

table the input database results table. row the row # to be fetched.

Returns:

NULL on failure, or a pointer to a result row on success.

Definition at line 469 of file results.c.

References log_info.

Referenced by config_load_database_settings(), res_row_next(), and res_row_store().

5.269.1.21 row_t* res_row_next (table_t * *table*)

Return the next row in the database results table and advance the cursor.

Parameters:

table the input mysql results table.

Returns:

a pointer to the next result row in the table.

Definition at line 490 of file results.c.

References count, and res_row_get().

Referenced by auth_data_fetch(), config_fetch_host_number(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_-acknowledge_alert(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(),

meta_data_fetch_keys(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_fetch_shard(), meta_data_fetch_user(), register_data_check_username(), register_data_fetch_blocklist(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_rollout(), statistics_refresh(), teacher_data_fetch(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.269.1.22 void res_row_set (row_t * *row*, chr_t * *buffer*)

Set the buffer location for a database result row.

Parameters:

row the input database result row.

buffer the buffer to be assigned to the target row.

Returns:

This function returns no value.

Definition at line 449 of file results.c.

References log_info.

Referenced by res_row_store().

5.269.1.23 bool_t res_row_store (uint64_t *num*, table_t * *table*, MYSQL_BIND * *binding*)

Definition at line 510 of file results.c.

References length, log_info, mm_alloc(), mm_copy(), res_field_count(), res_row_count(), res_row_get(), and res_row_set().

Referenced by res_stmt_store().

5.269.1.24 table_t* res_stmt_store (MYSQL_STMT * *stmt*)

Definition at line 579 of file results.c.

References log_info, mysql_stmt_bind_result_d, mysql_stmt_error_d, mysql_stmt_fetch_d, mysql_stmt_free_result_d, mysql_stmt_num_rows_d, mysql_stmt_store_result_d, res_bind_create(), res_bind_free(), res_row_store(), res_table_alloc(), and res_table_free().

Referenced by stmt_get_result_conn().

5.269.1.25 table_t* res_table_alloc (uint64_t *rows*, uint64_t *fields*)

Definition at line 316 of file results.c.

References log_info, and mm_alloc().

Referenced by res_stmt_store().

5.269.1.26 void res_table_free (table_t * *table*)

Free a MySQL results table.

Parameters:

table the MySQL results table to be freed.

Returns:

This function does not return a value.

Definition at line 250 of file results.c.

References log_info, and mm_free().

Functions

- uint_t stmt_errno (MYSQL_STMT *local)

  Get the error number associated with a mysql statement.

- const chr_t * stmt_error (MYSQL_STMT *local)
- MYSQL_STMT * stmt_open (MYSQL *mysql)

  Initialize a mysql prepared statement.

- void stmt_close (MYSQL_STMT *local)
- void stmt_stop (void)
- bool_t stmt_prepare (MYSQL_STMT *group, const char *query, unsigned long length)
- bool_t stmt_start (void)

  Initialize the global array of mysql prepared statements.

- bool_t stmt_rebuild (uint32_t connection)
- MYSQL_STMT * stmt_reset (MYSQL_STMT **group, uint32_t connection)
- bool_t stmt_bind_param (MYSQL_STMT *group, MYSQL_BIND *bind)

  stmts.c

- bool_t stmt_exec_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a prepared mysql statement over a specified connection.

- bool_t stmt_exec (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a prepared mysql statement.

- table_t * stmt_get_result_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a prepared mysql statement on a specified connection and return the result.

- table_t * stmt_get_result (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a prepared mysql statement and return the result.

- uint64_t stmt_insert_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a mysql prepared INSERT or UPDATE statement on a specified connection.

- uint64_t stmt_insert (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a mysql prepared INSERT or UPDATE statement.

- int64_t stmt_exec_affected_conn (MYSQL_STMT **group, MYSQL_BIND *parameters, uint32_t connection)

  Execute a statement on a specified mysql connection and return the number of affected rows.

- int64_t stmt_exec_affected (MYSQL_STMT **group, MYSQL_BIND *parameters)

  Execute a statement on a specified mysql connection and return the number of affected rows.

Variables

- chr_t * queries [ ] = { QUERIES_INIT }

5.270.1 Function Documentation

5.270.1.1 bool_t stmt_bind_param (MYSQL_STMT * *group*, MYSQL_BIND * *bind*)

stmts.c

Definition at line 251 of file stmts.c.

References log_critical, log_pedantic, mysql_stmt_bind_param_d, and stmt_error().

Referenced by stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), and stmt_insert_conn().

5.270.1.2 void stmt_close (MYSQL_STMT * *local*)

Definition at line 68 of file stmts.c.

References log_critical, mysql_stmt_close_d, sql_errno(), and sql_error().

Referenced by stmt_rebuild(), and stmt_stop().

5.270.1.3 uint_t stmt_errno (MYSQL_STMT * *local*)

Get the error number associated with a mysql statement.

Parameters:

local a pointer to the input mysql statement object.

Returns:

the errno associated with the specified mysql statement.

Definition at line 17 of file stmts.c.

References mysql_errno_d, and mysql_stmt_errno_d.

5.270.1.4 const chr_t* stmt_error (MYSQL_STMT * *local*)

Return the error string for a mysql statement.

Parameters:

local A single MYSQL_STMT* parameter.

Returns:

This function returns the mysql error string, or NULL if unable to retrieve it.

Definition at line 34 of file stmts.c.

References mysql_errno_d, mysql_error_d, mysql_stmt_errno_d, and mysql_stmt_error_d.

Referenced by stmt_bind_param(), stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), stmt_insert_conn(), and stmt_prepare().

5.270.1.5 bool_t stmt_exec (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*)

Execute a prepared mysql statement.

See also:

stmt_exec_conn()

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the statement.

Returns:

false on failure, or true on success.

Definition at line 307 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_exec_conn().

Referenced by mail_db_hide_message(), meta_data_flags_add(), meta_data_flags_remove(), meta_data_flags_replace(), smtp_update_receive_stats(), smtp_update_transmission_stats(), and teacher_data_delete().

5.270.1.6 int64_t stmt_exec_affected (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*)

Execute a statement on a specified mysql connection and return the number of affected rows.

Note:

Technically the number of affected rows is a my_ulonglong value, but since we retrun -1 when an error occurs, we are using the signed equivalent, int64_t. This means if more than INT64_MAX (or 9,223,372,036,854,775,807) rows are ever altered, the function will return INT64_MAX (or 9,223,372,036,854,775,807) instead.

See also:

mysql_stmt_affected_rows()

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be bound to the prepared statement.

Returns:

-1 on failure, 0 if executed successfully, but no rows are affected, and a positive number with the number of altered rows upon success.

Definition at line 492 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_exec_affected_conn().

Referenced by api_endpoint_delete_user(), auth_data_update_legacy(), contact_delete(), contact_detail_delete(), contact_detail_upsert(), contact_update(), contact_update_stamp(), magma_folder_delete(), magma_folder_rename(), meta_data_delete_folder(), meta_data_delete_tag(), meta_data_insert_tag(), meta_data_truncate_tags(), meta_data_update_folder_name(), meta_data_update_lock(), meta_data_update_log(), user_config_delete(), and user_config_upsert().

5.270.1.7 int64_t stmt_exec_affected_conn (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*, uint32_t *connection*)

Execute a statement on a specified mysql connection and return the number of affected rows.

Note:

Technically the number of affected rows is a my_ulonglong value, but since we retrun -1 when an error occurs, we are using the signed equivalent, int64_t. This means if more than INT64_MAX (or 9,223,372,036,854,775,807) rows are ever altered, the function will return INT64_MAX (or 9,223,372,036,854,775,807) instead.

See also:

mysql_stmt_affected_rows()

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be bound to the prepared statement.

connection the mysql connection id over which the specified statement will be executed.

Returns:

-1 on failure, 0 if executed successfully, but no rows are affected, and a positive number with the number of altered rows upon success.

Definition at line 440 of file stmts.c.

References log_info, mysql_stmt_affected_rows_d, mysql_stmt_execute_d, stmt_bind_param(), stmt_error(), stmt_reset(), and uint64_-clamp().

Referenced by mail_db_delete_message(), mail_db_update_message_folder(), meta_data_acknowledge_alert(), meta_data_insert_keys(), meta_data_insert_shard(), stmt_exec_affected(), and tank_delete_object().

5.270.1.8 bool_t stmt_exec_conn (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*, uint32_t *connection*)

Execute a prepared mysql statement over a specified connection.

Note:

This function will also reset the prepared statement and bind its parameters.

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the statement.

connection the mysql connection id.

Returns:

false on failure, or true on success.

Definition at line 278 of file stmts.c.

References log_info, mysql_stmt_execute_d, stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by mail_db_insert_duplicate_message(), mail_db_insert_message(), register_data_insert_user(), and stmt_exec().

5.270.1.9 table_t∗ stmt_get_result (MYSQL_STMT ∗∗ *group*, MYSQL_BIND ∗ *parameters*)

Execute a prepared mysql statement and return the result.

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be passed with the query.

Returns:

the result of the query, or NULL on failure.

Definition at line 357 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_get_result_conn().

Referenced by auth_data_fetch(), config_fetch_host_number(), config_fetch_settings(), contact_details_fetch(), contacts_fetch(), magma_folder_fetch(), meta_data_fetch_alerts(), meta_data_fetch_all_tags(), meta_data_fetch_folder_messages(), meta_data_fetch_folders(), meta_data_fetch_mailbox_aliases(), meta_data_fetch_message_tags(), meta_data_fetch_messages(), meta_data_fetch_user(), register_data_check_username(), register_data_fetch_blocklist(), smtp_check_authorized_from(), smtp_check_receive_quota(), smtp_check_transmit_quota(), smtp_fetch_authorization(), smtp_fetch_autoreply(), smtp_fetch_inbound(), smtp_fetch_rollmessages(), statistics_refresh(), teacher_data_fetch(), user_config_fetch(), warehouse_fetch_domains(), and warehouse_fetch_patterns().

5.270.1.10 table_t* stmt_get_result_conn (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*, uint32_t *connection*)

Execute a prepared mysql statement on a specified connection and return the result.

Parameters:

group the prepared mysql statement to be executed.

parameters the parameters to be passed with the query.

connection the mysql connection identifier.

Returns:

the result of the query, or NULL on failure.

Definition at line 329 of file stmts.c.

References log_info, mysql_stmt_execute_d, res_stmt_store(), stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by meta_data_acknowledge_alert(), meta_data_fetch_keys(), meta_data_fetch_shard(), and stmt_get_result().

5.270.1.11 uint64_t stmt_insert (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*)

Execute a mysql prepared INSERT or UPDATE statement.

See also:

mysql_stmt_insert_id()

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the prepared statement.

Returns:

0 on failure, or the last LAST_INSERT_ID() value returned for the mysql auto-increment column.

Definition at line 409 of file stmts.c.

References log_info, PL_RESERVED, pool_pull(), pool_release(), sql_pool, and stmt_insert_conn().

Referenced by contact_insert(), magma_folder_insert(), meta_data_insert_folder(), and smtp_insert_spamsig().

5.270.1.12 uint64_t stmt_insert_conn (MYSQL_STMT ** *group*, MYSQL_BIND * *parameters*, uint32_t *connection*)

Execute a mysql prepared INSERT or UPDATE statement on a specified connection.

See also:

mysql_stmt_insert_id()

Parameters:

group the mysql prepared statement to be executed.

parameters the parameters to be bound to the prepared statement.

connection the underlying connection on which the statement will be executed.

Returns:

0 on failure, or the last LAST_INSERT_ID() value returned for the mysql auto-increment column.

Definition at line 380 of file stmts.c.

References log_info, mysql_stmt_execute_d, mysql_stmt_insert_id_d, stmt_bind_param(), stmt_error(), and stmt_reset().

Referenced by mail_db_insert_duplicate_message(), mail_db_insert_message(), register_data_insert_user(), stmt_insert(), and tank_insert_object().

5.270.1.13 MYSQL_STMT∗ stmt_open (MYSQL ∗ *mysql*)

Initialize a mysql prepared statement.

See also:

mysql_stmt_init()

Parameters:

mysql the underlying mysql connection.

Returns:

This function is a thin wrapper around the mysql library function mysql_stmt_init_d().

Definition at line 52 of file stmts.c.

References log_critical, mysql_stmt_init_d, and sql_error().

Referenced by stmt_rebuild(), and stmt_start().

5.270.1.14 bool_t stmt_prepare (MYSQL_STMT ∗ *group*, const char ∗ *query*, unsigned long *length*)

Definition at line 116 of file stmts.c.

References log_critical, mysql_stmt_attr_set_d, mysql_stmt_prepare_d, and stmt_error().

Referenced by stmt_rebuild(), and stmt_start().

5.270.1.15 bool_t stmt_rebuild (uint32_t *connection*)

Definition at line 190 of file stmts.c.

References log_critical, ns_length_get(), pool_get_obj(), queries, sql_pool, stmt_close(), stmt_open(), and stmt_prepare().

Referenced by dspam_check(), dspam_train(), and stmt_reset().

5.270.1.16 MYSQL_STMT∗ stmt_reset (MYSQL_STMT ∗∗ *group*, uint32_t *connection*)

Definition at line 222 of file stmts.c.

References log_critical, log_pedantic, mysql_stmt_reset_d, sql_ping(), and stmt_rebuild().

Referenced by stmt_exec_affected_conn(), stmt_exec_conn(), stmt_get_result_conn(), and stmt_insert_conn().

5.270.1.17 bool_t stmt_start (void)

Initialize the global array of mysql prepared statements.

Note:

This function readies a copy of each prepared statement for every member of the global mysql connection pool.

Returns:

true on success or false on failure.

Definition at line 143 of file stmts.c.

References magma_t::database, magma_t::iface, log_critical, magma, mm_alloc(), mm_wipe(), ns_length_get(), pool_get_obj(), queries, sql_pool, stmt_open(), stmt_prepare(), and stmt_stop().

Referenced by sql_start().

5.270.1.18 void stmt_stop (void)

Definition at line 90 of file stmts.c.

References magma_t::database, magma_t::iface, magma, mm_free(), queries, and stmt_close().

Referenced by sql_stop(), and stmt_start().

5.270.2 Variable Documentation

5.270.2.1 chr_t* queries[ ] = { QUERIES_INIT }

Definition at line 10 of file stmts.c.

Referenced by sanity_check(), stmt_rebuild(), stmt_start(), and stmt_stop().

5.271 src/providers/database/transaction.c File Reference

```
#include "magma.h"
```

Functions

- int64_t tran_start (void)

  Pull a connection from the SQL pool and start a transaction.

- int64_t tran_rollback (int64_t transaction)

  Rollback a pending transaction in the mysql database.

- int64_t tran_commit (int64_t transaction)

  Commit a transaction to the mysql database.

Variables

- struct {
  chr_t * command
  size_t length
  } tran_commands [3]

5.271.1 Function Documentation

5.271.1.1 int64_t tran_commit (int64_t *transaction*)

Commit a transaction to the mysql database. transaction.c

Parameters:

transaction the mysql connection identifier.

Returns:

0 on success, or a non-zero number on error.

Definition at line 72 of file transaction.c.

References command, length, log_info, PLACER, pool_get_obj(), pool_release(), sql_error(), sql_pool, sql_query_conn(), and tran_commands.

Referenced by api_endpoint_register(), mail_copy_message(), mail_move_message(), mail_remove_message(), mail_store_message(), meta_update_keys(), meta_update_realms(), portal_endpoint_alert_acknowledge(), register_business_step2(), tank_delete(), and tank_store().

5.271.1.2 int64_t tran_rollback (int64_t *transaction*)

Rollback a pending transaction in the mysql database.

Parameters:

transaction the mysql connection identifier.

Returns:

0 on success, or a non-zero number on error.

Definition at line 52 of file transaction.c.

References command, length, log_info, PLACER, pool_get_obj(), pool_release(), sql_error(), sql_pool, sql_query_conn(), and tran_commands.

Referenced by api_endpoint_register(), mail_copy_message(), mail_move_message(), mail_remove_message(), mail_store_message(), meta_update_keys(), meta_update_realms(), portal_endpoint_alert_acknowledge(), register_business_step2(), tank_delete(), and tank_store().

5.271.1.3 int64_t tran_start (void)

Pull a connection from the SQL pool and start a transaction.

Returns:

-1 on failure, or a MySQL connection id from the SQL pool on success.

Definition at line 26 of file transaction.c.

References command, length, log_info, PL_RESERVED, PLACER, pool_get_obj(), pool_pull(), pool_release(), sql_error(), sql_pool, sql_query_conn(), and tran_commands.

Referenced by api_endpoint_register(), mail_copy_message(), mail_move_message(), mail_remove_message(), mail_store_message(), meta_update_keys(), meta_update_realms(), portal_endpoint_alert_acknowledge(), register_business_step2(), tank_delete(), and tank_store().

5.271.2 Variable Documentation

5.271.2.1 chr_t* command

Definition at line 14 of file transaction.c.

Referenced by __attribute__(), dmtp_process(), imap_process(), molten_parse(), pop_process(), portal_endpoint(), smtp_process(), tran_commit(), tran_rollback(), and tran_start().

5.271.2.2 size_t length

Definition at line 15 of file transaction.c.

5.271.2.3 struct { ... } tran_commands[3]

LOW: Standardize how SQL connection and transaction handles are passed around. Some functions use int64_t, others use uint32_t. Perhaps we need to use a type def? Or perhaps create a similar type mapping for pool object handles?

Referenced by tran_commit(), tran_rollback(), and tran_start().

5.272 src/providers/deprecated/deprecated.h File Reference

Functions

- uint64_t cryptex_body_length (cryptex_t *cryptex)
  cryptex.c
- uint64_t cryptex_envelope_length (cryptex_t *cryptex)
  Get the length of a cryptex envelope.
- uint64_t cryptex_hmac_length (cryptex_t *cryptex)
  Get the length of a cryptex HMAC.
- uint64_t cryptex_original_length (cryptex_t *cryptex)
  Get the original length of a cryptex object's data buffer.
- uint64_t cryptex_total_length (cryptex_t *cryptex)
  Determine the total length of the data underlying a cryptex object.
- void * cryptex_alloc (uint64_t envelope, uint64_t hmac, uint64_t original, uint64_t body)
  Allocate a new cryptex object.
- void * cryptex_body_data (cryptex_t *cryptex)
  Get a pointer to the encrypted data body of a cryptex object.
- void * cryptex_envelope_data (cryptex_t *cryptex)
  Get a pointer to the envelope data of a cryptex object.
- void * cryptex_hmac_data (cryptex_t *cryptex)
  Get a pointer to the HMAC data of a cryptex object.
- void cryptex_free (cryptex_t *cryptex)
  Free a cryptex object.
- uchr_t * ecies_decrypt (stringer_t *key, ECIES_KEY_TYPE key_type, cryptex_t *cryptex, size_t *length)
  ecies.c
- cryptex_t * ecies_encrypt (stringer_t *key, ECIES_KEY_TYPE key_type, unsigned char *data, size_t length)
  Encrypt a block of data using an ECIES public key.
- void * ecies_envelope_derivation (const void *input, size_t ilen, void *output, size_t *olen)
- EC_GROUP * ecies_group (uint64_t curve, bool_t precompute)
- EC_KEY * ecies_key_alloc (void)
  Allocate a new ECIES key pair from the curve defined by ECIES_CURVE.
- EC_KEY * ecies_key_create (void)
  Generate a random ECIES key pair.
- void ecies_key_free (EC_KEY *key)
  Free an ECIES key pair.
- EC_KEY * ecies_key_private (uint64_t format, placer_t data)
- uchr_t * ecies_key_private_bin (EC_KEY *key, size_t *olen)

Return an ECIES private key as binary data.

- stringer_t * ecies_key_private_hex (EC_KEY *key)

  Return an ECIES private key as a hex string.

- EC_KEY * ecies_key_public (uint64_t format, placer_t data)
- uchr_t * ecies_key_public_bin (EC_KEY *key, size_t *olen)

  Return an ECIES public key as binary data.

- stringer_t * ecies_key_public_hex (EC_KEY *key)

  Return an ECIES public key as a null-terminated hex string.

- bool_t ecies_start (void)
- void ecies_stop (void)

  Destroy all initialized ECIES curve group information.

- stringer_t * hmac_digest (digest_t *digest, stringer_t *s, stringer_t *key, stringer_t *output)

  hmac.c

- stringer_t * hmac_md4 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_md5 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_ripemd160 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha1 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha224 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha256 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha384 (stringer_t *s, stringer_t *key, stringer_t *output)
- stringer_t * hmac_sha512 (stringer_t *s, stringer_t *key, stringer_t *output)
- scramble_t * scramble_alloc (size_t length)

  scramble.c

- void * scramble_body_data (scramble_t *buffer)

  Get a pointer to the start of the encrypted data from a scrambled data header.

- uint64_t scramble_body_hash (scramble_t *buffer)

  Get a hash of a scrambled object's (encrypted) body data.

- uint64_t scramble_body_length (scramble_t *buffer)

  Get the length of a scrambled object's (encrypted) body data.

- stringer_t * scramble_decrypt (stringer_t *key, scramble_t *input)

  Un-scramble a block of data using an decryption key.

- scramble_t * scramble_encrypt (stringer_t *key, stringer_t *input)

  Scramble a block of data using an encryption key.

- void scramble_free (scramble_t *buffer)

  Free a scrambled data block.

- void scramble_cleanup (scramble_t *buffer)

  Performed a checked free of a scramble buffer.

- scramble_t * scramble_import (stringer_t *s)

Return a managed string as a scrambled buffer, after validation.

- uint64_t scramble_orig_length (scramble_t *buffer)

  Get the length of the original (unencrypted) data underlying a scrambled object.

- uint64_t scramble_total_length (scramble_t *buffer)

  Get the total length of a scrambled object.

- void * scramble_vector_data (scramble_t *buffer)

  Get a pointer to the start of the IV from a scrambled data header.

- uint64_t scramble_vector_length (scramble_t *buffer)

  Get the length of a scrambled object's IV.

- stringer_t * symmetric_decrypt (cipher_t *cipher, stringer_t *vector, stringer_t *key, stringer_t *input)

  symmetric.c

- stringer_t * symmetric_encrypt (cipher_t *cipher, stringer_t *vector, stringer_t *key, stringer_t *input)

  HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.

- stringer_t * symmetric_key (cipher_t *cipher, stringer_t *key, stringer_t *output)

  Derive a symmetric key from a user's password.

- stringer_t * symmetric_vector (cipher_t *cipher, stringer_t *output)

  Generate an IV data suitable for the specified cipher.

5.272.1 Function Documentation

5.272.1.1 void* cryptex_alloc (uint64_t *envelope*, uint64_t *hmac*, uint64_t *original*, uint64_t *body*)

Allocate a new cryptex object.

Definition at line 109 of file cryptex.c.

References cryptex_head_t, log_pedantic, and mm_alloc().

Referenced by ecies_encrypt().

5.272.1.2 void* cryptex_body_data (cryptex_t * *cryptex*)

Get a pointer to the encrypted data body of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's encrypted data body.

Definition at line 98 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.3 uint64_t cryptex_body_length (cryptex_t * *cryptex*)

cryptex.c cryptex.c

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex encrypted data body.

Definition at line 40 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.4 void* cryptex_envelope_data (cryptex_t * *cryptex*)

Get a pointer to the envelope data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's envelope data.

Definition at line 76 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.5 uint64_t cryptex_envelope_length (cryptex_t * *cryptex*)

Get the length of a cryptex envelope.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex envelope.

Definition at line 16 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt().

5.272.1.6 void cryptex_free (cryptex_t * *cryptex*)

Free a cryptex object.

Parameters:

cryptex the cryptex object to be freed.

Returns:

This function returns no value.

Definition at line 133 of file cryptex.c.

Referenced by ecies_encrypt().

5.272.1.7 void∗ cryptex_hmac_data (cryptex_t ∗ *cryptex*)

Get a pointer to the HMAC data of a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

a pointer to the cryptex object's hmac data.

Definition at line 86 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.8 uint64_t cryptex_hmac_length (cryptex_t ∗ *cryptex*)

Get the length of a cryptex HMAC.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex HMAC.

Definition at line 28 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.9 uint64_t cryptex_original_length (cryptex_t ∗ *cryptex*)

Get the original length of a cryptex object's data buffer.

Parameters:

cryptex a pointer to the head of the cryptex object to be examined.

Returns:

the length, in bytes, of the cryptex object's original data.

Definition at line 52 of file cryptex.c.

References cryptex_head_t.

Referenced by ecies_decrypt().

5.272.1.10 uint64_t cryptex_total_length (cryptex_t * *cryptex*)

Determine the total length of the data underlying a cryptex object.

Parameters:

cryptex the input cryptex object.

Returns:

the total length of the associated cryptex data in bytes.

Definition at line 64 of file cryptex.c.

References cryptex_head_t.

5.272.1.11 uchr_t* ecies_decrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, cryptex_t * *cryptex*, size_t * *length*)

ecies.c ecies.c

Parameters:

key the ECIES private key in the specified format.

key_type the encoding type of the ECIES private key (ECIES_PRIVATE_BINARY or ECIES_PRIVATE_HEX).

cryptex a pointer to the head of the cryptex object with the encrypted data.

length a pointer to a size_t variable which will receive the final length of the unencrypted data.

Returns:

NULL on failure, or a pointer to a memory address containing the decrypted data on success..

Definition at line 579 of file ecies.c.

References cryptex_body_data(), cryptex_body_length(), cryptex_envelope_data(), cryptex_envelope_length(), cryptex_hmac_data(), cryptex_hmac_length(), cryptex_original_length(), EC_KEY_free_d, EC_KEY_get0_public_key_d, ECDH_compute_key_d, ECIES_-CIPHER, ecies_envelope_derivation(), ECIES_HMAC, ecies_key_private(), ecies_key_public(), ECIES_PRIVATE_BINARY, ECIES_-PRIVATE_HEX, ECIES_PUBLIC_BINARY, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_init_d, EVP_CIPHER_CTX_-set_padding_d, EVP_CIPHER_key_length_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, EVP_get_-cipherbyname_d, EVP_get_digestbyname_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_-Update_d, log_info, MEMORYBUF, mm_alloc(), OBJ_nid2sn_d, pl_init(), ssl_error_string(), and st_empty_out().

5.272.1.12 cryptex_t* ecies_encrypt (stringer_t * *key*, ECIES_KEY_TYPE *key_type*, unsigned char * *data*, size_t *length*)

Encrypt a block of data using an ECIES public key.

Parameters:

key the ECIES public key in the specified format.

key_type the encoding type of the ECIES public key (ECIES_PUBLIC_BINARY or ECIES_PUBLIC_HEX).

data a pointer to the block of data to be encrypted.

length the length, in bytes, of the data to be encrypted.

Returns:

NULL on failure, or a pointer to the header of the cryptex object containing the encrypted data on success..

Definition at line 408 of file ecies.c.

References cryptex_alloc(), cryptex_body_data(), cryptex_body_length(), cryptex_envelope_data(), cryptex_free(), cryptex_hmac_data(), cryptex_hmac_length(), EC_KEY_free_d, EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2oct_d, ECDH_compute_key_d, ECIES_CIPHER, ecies_envelope_derivation(), ECIES_HMAC, ecies_key_create(), ecies_key_public(), ECIES_PUBLIC_BINARY, ECIES_PUBLIC_HEX, EVP_CIPHER_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_init_d, EVP_CIPHER_CTX_set_padding_d, EVP_CIPHER_key_length_d, EVP_EncryptFinal_ex_d, EVP_EncryptInit_ex_d, EVP_EncryptUpdate_d, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, EVP_MD_size_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_info, MEMORYBUF, OBJ_nid2sn_d, pl_init(), ssl_error_string(), and st_empty_out().

5.272.1.13 void∗ ecies_envelope_derivation (const void ∗ *input*, size_t *ilen*, void ∗ *output*, size_t ∗ *olen*)

Definition at line 391 of file ecies.c.

References ecies_envelope_evp, and EVP_Digest_d.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.14 EC_GROUP∗ ecies_group (uint64_t *curve*, bool_t *precompute*)

Definition at line 90 of file ecies.c.

References EC_GROUP_free_d, EC_GROUP_new_by_curve_name_d, EC_GROUP_precompute_mult_d, EC_GROUP_set_point_conversion_form_d, log_error, MEMORYBUF, and ssl_error_string().

Referenced by ecies_start().

5.272.1.15 EC_KEY∗ ecies_key_alloc (void)

Allocate a new ECIES key pair from the curve defined by ECIES_CURVE.

See also:

NID_sect571k1

Returns:

NULL on failure, or a pointer to the newly allocated key pair.

Definition at line 59 of file ecies.c.

References EC_KEY_free_d, EC_KEY_new_by_curve_name_d, EC_KEY_new_d, EC_KEY_set_conv_form_d, EC_KEY_set_group_d, ECIES_CURVE, ecies_curve_group, log_info, MEMORYBUF, and ssl_error_string().

Referenced by ecies_key_create(), ecies_key_private(), and ecies_key_public().

5.272.1.16 EC_KEY∗ ecies_key_create (void)

Generate a random ECIES key pair.

Returns:

NULL on failure, or a new random ECIES key pair on success.

Definition at line 113 of file ecies.c.

References EC_KEY_free_d, EC_KEY_generate_key_d, ecies_key_alloc(), log_info, MEMORYBUF, and ssl_error_string().

Referenced by ecies_encrypt().

5.272.1.17 void ecies_key_free (EC_KEY ∗ *key*)

Free an ECIES key pair.

Returns:

This function returns no value.

Definition at line 48 of file ecies.c.

References EC_KEY_free_d.

5.272.1.18 EC_KEY∗ ecies_key_private (uint64_t *format*, placer_t *data*)

Definition at line 200 of file ecies.c.

Referenced by ecies_decrypt().

5.272.1.19 uchr_t∗ ecies_key_private_bin (EC_KEY ∗ *key*, size_t ∗ *olen*)

Return an ECIES private key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw private key.

Definition at line 360 of file ecies.c.

References BN_bn2bin_d, BN_num_bytes_d, EC_KEY_get0_private_key_d, log_info, MEMORYBUF, mm_sec_alloc(), mm_sec_free(), and ssl_error_string().

5.272.1.20 stringer_t∗ ecies_key_private_hex (EC_KEY ∗ *key*)

Return an ECIES private key as a hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted private key as a managed string.

Definition at line 326 of file ecies.c.

References BN_bn2hex_d, CONTIGUOUS, EC_KEY_get0_private_key_d, log_pedantic, MANAGED_T, MEMORYBUF, ns_length_get(), ns_wipe(), OPENSSL_free_d, SECURE, ssl_error_string(), and st_import_opts().

5.272.1.21 EC_KEY* ecies_key_public (uint64_t *format*, placer_t *data*)

Definition at line 132 of file ecies.c.

Referenced by ecies_decrypt(), and ecies_encrypt().

5.272.1.22 uchr_t* ecies_key_public_bin (EC_KEY * *key*, size_t * *olen*)

Return an ECIES public key as binary data.

Parameters:

key the input ECIES key pair.

olen a pointer to store the length of the returned key.

Returns:

NULL on failure, or a pointer to the raw public key.

Definition at line 289 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2oct_d, log_info, MEMORYBUF, mm_alloc(), mm_free(), and ssl_error_string().

5.272.1.23 stringer_t* ecies_key_public_hex (EC_KEY * *key*)

Return an ECIES public key as a null-terminated hex string.

Parameters:

key the input ECIES key pair.

Returns:

NULL on failure, or the hex-formatted public key as a null-terminated string.

Definition at line 256 of file ecies.c.

References EC_KEY_get0_group_d, EC_KEY_get0_public_key_d, EC_POINT_point2hex_d, log_info, MEMORYBUF, ns_length_get(), OPENSSL_free_d, ssl_error_string(), and st_import().

5.272.1.24 bool_t ecies_start (void)

Definition at line 16 of file ecies.c.

References ECIES_CIPHER, ecies_cipher_evp, ECIES_CURVE, ecies_curve_group, ECIES_ENVELOPE, ecies_envelope_evp, ecies_group(), ECIES_HMAC, ecies_hmac_evp, EVP_get_cipherbyname_d, EVP_get_digestbyname_d, log_error, and OBJ_nid2sn_d.

5.272.1.25 void ecies_stop (void)

Destroy all initialized ECIES curve group information.

Returns:

This function returns no value.

Definition at line 31 of file ecies.c.

References EC_GROUP_free_d, and ecies_curve_group.

5.272.1.26 stringer_t* hmac_digest (digest_t * *digest*, stringer_t * *s*, stringer_t * *key*, stringer_t * *output*)

hmac.c hmac.c

Parameters:

digest Digest to be used with the HMAC.

s Input data.

key Key used in HMAC.

output Stringer containing buffer for output.

Returns:

The managed string containing the resulting HMAC or NULL if an error occurs.

Definition at line 21 of file hmac.c.

References EVP_MD_size_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_-pedantic, st_alloc(), st_avail_get(), st_data_get(), st_empty, st_free(), st_length_get(), st_length_set(), st_valid_avail(), st_valid_destination(), and st_valid_tracked().

References EVP_sha384_d, and hmac_digest().

5.272.1.35 stringer_t* hmac_sha512 (stringer_t * *s*, stringer_t * *key*, stringer_t * *output*)

Definition at line 119 of file hmac.c.

References EVP_sha512_d, and hmac_digest().

5.272.1.36 scramble_t* scramble_alloc (size_t *length*)

scramble.c scramble.c

Parameters:

length the length, in bytes, of the scrambled data buffer (should include the IV and encrypted body length).

Returns:

a pointer to a newly allocated scrambled data header.

Definition at line 143 of file scramble.c.

References mm_alloc(), and scramble_head_t.

Referenced by scramble_encrypt().

5.272.1.37 void* scramble_body_data (scramble_t * *buffer*)

Get a pointer to the start of the encrypted data from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated encrypted data body.

Definition at line 82 of file scramble.c.

References scramble_head_t, and scramble_vector_length().

Referenced by scramble_decrypt(), scramble_encrypt(), and scramble_import().

5.272.1.38 uint64_t scramble_body_hash (scramble_t * *buffer*)

Get a hash of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the 64-bit bash of the specified scrambled object's body data.

Definition at line 34 of file scramble.c.

References scramble_head_t.

5.272.1.39 uint64_t scramble_body_length (scramble_t * *buffer*)

Get the length of a scrambled object's (encrypted) body data.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's body data.

Definition at line 58 of file scramble.c.

References scramble_head_t.

Referenced by scramble_decrypt(), and scramble_total_length().

5.272.1.40 void scramble_cleanup (scramble_t * *buffer*)

Performed a checked free of a scramble buffer.

See also:

scramble_free

Parameters:

block the scramble buffer to be freed.

Returns:

This function returns no value.

Definition at line 166 of file scramble.c.

References mm_free().

5.272.1.41 stringer_t* scramble_decrypt (stringer_t * *key*, scramble_t * *input*)

Un-scramble a block of data using an decryption key.

Parameters:

key a managed string containing the symmetric decryption key.

input a pointer to the scrambled data header to be decrypted.

Returns:

NULL on failure, or a managed string containing the verified decrypted data.

Definition at line 239 of file scramble.c.

References cipher_id(), hash_adler32(), log_info, log_pedantic, MANAGEDBUF, PLACER, scramble_body_data(), scramble_body_length(), scramble_head_t, scramble_vector_data(), scramble_vector_length(), st_free(), st_length_get(), symmetric_decrypt(), and symmetric_key().

5.272.1.42 scramble_t∗ scramble_encrypt (stringer_t ∗ *key*, stringer_t ∗ *input*)

Scramble a block of data using an encryption key.

Note:

This function is configured to use AES 256 in CBC mode.

Parameters:

key a managed string containing the symmetric encryption key.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a scrambled data header containing the encrypted data and its metadata.

Definition at line 182 of file scramble.c.

References cipher_id(), cipher_numeric_id(), hash_adler32(), log_pedantic, MANAGEDBUF, mm_copy(), scramble_alloc(), scramble_body_data(), scramble_head_t, scramble_vector_data(), st_data_get(), st_free(), st_length_get(), symmetric_encrypt(), symmetric_key(), and symmetric_vector().

5.272.1.43 void scramble_free (scramble_t ∗ *buffer*)

Free a scrambled data block.

Parameters:

buffer a pointer to the scrambled data header to be freed.

Returns:

This function returns no value.

Definition at line 153 of file scramble.c.

References mm_free().

5.272.1.44 scramble_t∗ scramble_import (stringer_t ∗ *s*)

Return a managed string as a scrambled buffer, after validation.

Note:

The returned pointer is inside the existing stringer, so it doesn't need be freed.

Parameters:

s a managed string containing the serialized scrambled data.

Returns:

NULL on failure, or a pointer to the scrambled data header on success.

Definition at line 103 of file scramble.c.

References hash_adler32(), log_pedantic, scramble_body_data(), scramble_head_t, st_data_get(), st_empty, and st_length_get().

5.272.1.45 uint64_t scramble_orig_length (scramble_t ∗ *buffer*)

Get the length of the original (unencrypted) data underlying a scrambled object.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's original data.

Definition at line 46 of file scramble.c.

References scramble_head_t.

5.272.1.46 uint64_t scramble_total_length (scramble_t ∗ *buffer*)

Get the total length of a scrambled object. TODO: Create a scramble_export() function, and/or alter the import interfaces to make using managed strings easier. ie. the import/export functions could provide wrappers around dsecrypt/encrypt which return strings instead of scramble objects. HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the total length, in bytes, of the scrambled object.

Definition at line 20 of file scramble.c.

References scramble_body_length(), scramble_head_t, and scramble_vector_length().

5.272.1.47 void∗ scramble_vector_data (scramble_t ∗ *buffer*)

Get a pointer to the start of the IV from a scrambled data header.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

a pointer to the start of the scrambled data header's associated IV block.

Definition at line 92 of file scramble.c.

References scramble_head_t.

Referenced by scramble_decrypt(), and scramble_encrypt().

5.272.1.48 uint64_t scramble_vector_length (scramble_t * *buffer*)

Get the length of a scrambled object's IV.

Parameters:

buffer a pointer to the header of the scrambled data.

Returns:

the length, in bytes, of the scrambled object's IV.

Definition at line 70 of file scramble.c.

References scramble_head_t.

Referenced by scramble_body_data(), scramble_decrypt(), and scramble_total_length().

5.272.1.49 stringer_t* symmetric_decrypt (cipher_t * *cipher*, stringer_t * *vector*, stringer_t * *key*, stringer_t * *input*)

symmetric.c

Definition at line 129 of file symmetric.c.

References EVP_CIPHER_CTX_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_-init_d, EVP_CIPHER_CTX_iv_length_d, EVP_CIPHER_CTX_key_length_d, EVP_CIPHER_flags_d, EVP_DecryptFinal_ex_d, EVP_-DecryptInit_ex_d, EVP_DecryptUpdate_d, log_pedantic, MEMORYBUF, ssl_error_string(), st_alloc(), st_data_get(), st_empty_out(), st_-free(), and st_length_set().

Referenced by scramble_decrypt().

5.272.1.50 stringer_t* symmetric_encrypt (cipher_t * *cipher*, stringer_t * *vector*, stringer_t * *key*, stringer_t * *input*)

HIGH: Alter the interfaces here to allow passing in the output buffer, or options which allow us to store the decrypted data in secure memory. Encrypt a block of data using a symmetric cipher.

Parameters:

cipher the cipher type being used to encrypt the data.

vector the IV used for the encryption operation.

key the symmetric encryption key used to encrypt the data.

input a managed string containing the data to be encrypted.

Returns:

NULL on failure, or a pointer to a managed string containing the encrypted data.

Definition at line 21 of file symmetric.c.

References EVP_CIPHER_CTX_block_size_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_-init_d, EVP_CIPHER_CTX_iv_length_d, EVP_CIPHER_CTX_key_length_d, EVP_CIPHER_flags_d, EVP_EncryptFinal_ex_d, EVP_-EncryptInit_ex_d, EVP_EncryptUpdate_d, log_pedantic, st_alloc(), st_data_get(), st_empty_out(), st_free(), and st_length_set().

Referenced by scramble_encrypt().

5.272.1.51 stringer_t* symmetric_key (cipher_t * *cipher*, stringer_t * *key*, stringer_t * *output*)

Derive a symmetric key from a user's password.

Note:

Depending on the length of the password, either SHA1, SHA224, or SHA256 may be used as the hashing algorithm.
If output is passed as NULL, a new managed string will be allocated to hold the output of the operation.

Parameters:

cipher the specified cipher type.

key the user's password, as a managed string.

output the output managed string to receive the digested password. Can be NULL.

Returns:

NULL on failure, or a pointer to the managed string containing the key.

Definition at line 289 of file symmetric.c.

References cipher_key_length(), hash_sha1(), hash_sha224(), hash_sha256(), st_length_get(), st_length_set(), st_output(), and st_valid_-tracked().

Referenced by scramble_decrypt(), and scramble_encrypt().

5.272.1.52 stringer_t* symmetric_vector (cipher_t * *cipher*, stringer_t * *output*)

Generate an IV data suitable for the specified cipher.

Note:

If output is NULL, a new managed string will be allocated and returned by the function.

Parameters:

cipher the cipher type to be used.

output the managed string that will store the IV data.

Returns:

NULL on failure, or a pointer to the managed string that contains the IV data.

Definition at line 252 of file symmetric.c.

References cipher_vector_length(), log_pedantic, PLACER, rand_write(), st_data_get(), st_free(), st_length_set(), st_output(), and st_valid_-tracked().

Referenced by scramble_encrypt().

Functions

- struct __attribute__ ((packed))
- void dump_last_error (void)
- void dump_error_stack (void)

  Dump the entire contents of the error stack to the console.

- void _dump_error (const errinfo_t *error)

  Dump an error stack entry to the console.

- const char * get_error_string (unsigned int errcode)

  Get the error string corresponding to a particular error code.

- unsigned int get_last_error_code (void)

  Get the value of the last error code on the error stack.

- const errinfo_t * get_last_error (void)

  Get the last error object on the error stack.

- errinfo_t * pop_last_error (void)
- const errinfo_t * get_first_error (void)
- void _clear_error_stack (void)

  Clear the calling thread's error stack.

- errinfo_t * _push_error_stack (const char *filename, const char *funcname, int lineno, unsigned int errcode, int xerrno, const char *auxmsg)

  Push an error onto the error stack.

- errinfo_t * _push_error_stack_fmt (const char *filename, const char *funcname, int lineno, unsigned int errcode, int xerrno, const char *fmt,...)

  Push an error onto the error stack with a format-string supplied aux message.

- errinfo_t * _push_error_stack_syscall (const char *filename, const char *funcname, int lineno, int xerrno, const char *errfunc)

  Push an error onto the error stack generated by a syscall (or anything that modifies errno).

- errinfo_t * _push_error_stack_openssl (const char *filename, const char *funcname, int lineno, unsigned int errcode, int xerrno)

  Push an openssl-generated error onto the error stack.

- errinfo_t * _push_error_stack_resolver (const char *filename, const char *funcname, int lineno, int xerrno, int herrno, const char *errfunc)

  Push an error onto the error stack generated by a resolver library function.

- errinfo_t * _create_new_error (errinfo_t *errptr, const char *filename, const char *funcname, int lineno, unsigned int errcode, int xerrno, const char *auxmsg)

  Populate a new entry on the error stack.

Variables

- __thread struct thread_err_stack _t_err_stack

5.275.1 Function Documentation

5.275.1.1 struct __attribute__ ((packed)) [read]

Definition at line 16 of file error.c.

References ERR_STACK_SIZE.

5.275.1.2 void _clear_error_stack (void)

Clear the calling thread's error stack.

Definition at line 178 of file error.c.

References _t_err_stack, and ERR_STACK_SIZE.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _dump_dime_record_cb(), _dump_dnskey_record_-cb(), _evict_if_stale(), _get_dime_record(), _get_dime_record_from_file(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), _get_signet(), _get_txt_record(), _load_cache_contents(), _lookup_dnskey(), _lookup_ds(), _save_cache_contents(), _unlink_object(), and _verify_-certificate_callback().

5.275.1.3 errinfo_t* _create_new_error (errinfo_t * *errptr*, const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *auxmsg*)

Populate a new entry on the error stack.

Definition at line 316 of file error.c.

Referenced by _push_error_stack().

5.275.1.4 void _dump_error (const errinfo_t * *error*)

Dump an error stack entry to the console.

Parameters:

error a pointer to the error stack object to be displayed.

Definition at line 83 of file error.c.

References get_error_string().

Referenced by dump_error_stack(), and dump_last_error().

5.275.1.5 errinfo_t* _push_error_stack (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *auxmsg*)

Push an error onto the error stack.

Definition at line 192 of file error.c.

References _create_new_error(), _t_err_stack, and ERR_STACK_SIZE.

Referenced by _push_error_stack_fmt(), _push_error_stack_openssl(), _push_error_stack_resolver(), and _push_error_stack_syscall().

5.275.1.6 errinfo_t* _push_error_stack_fmt (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *fmt*, ...)

Push an error onto the error stack with a format-string supplied aux message.

Definition at line 217 of file error.c.

References _push_error_stack().

5.275.1.7 errinfo_t* _push_error_stack_openssl (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*)

Push an openssl-generated error onto the error stack.

Definition at line 260 of file error.c.

References _push_error_stack(), BUF_strlcat_d, ERR_error_string_n_d, ERR_get_error_d, ERR_load_crypto_strings_d, ERR_peek_error_line_data_d, and SSL_load_error_strings_d.

5.275.1.8 errinfo_t* _push_error_stack_resolver (const char * *filename*, const char * *funcname*, int *lineno*, int *xerrno*, int *herrno*, const char * *errfunc*)

Push an error onto the error stack generated by a resolver library function.

Definition at line 302 of file error.c.

References _push_error_stack(), and ERR_RESOLVER.

5.275.1.9 errinfo_t* _push_error_stack_syscall (const char * *filename*, const char * *funcname*, int *lineno*, int *xerrno*, const char * *errfunc*)

Push an error onto the error stack generated by a syscall (or anything that modifies errno).

Parameters:

- ***filename*** the name of the source file in which the error occured.
- ***funcname*** the name of the function in which the error occured.
- ***lineno*** the line in the source file in which the error occured.
- ***xerrno*** the immediate value of errno which was set by the error-returning function.
- ***errfunc*** the name of the library call or syscall function responsible for setting errno.

Definition at line 240 of file error.c.

References _push_error_stack(), and ERR_SYSCALL.

5.275.1.10 void dump_error_stack (void)

Dump the entire contents of the error stack to the console.

Definition at line 55 of file error.c.

References _dump_error(), and _t_err_stack.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _dump_dime_record_cb(), _evict_if_stale(), _get_dime_record(), _get_dime_record_from_file(), _get_signet(), _get_txt_record(), _load_cache_contents(), _lookup_dnskey(), _lookup_ds(), _save_cache_contents(), and _unlink_object().

5.275.1.11 void dump_last_error (void)

Definition at line 36 of file error.c.

References _dump_error(), and _t_err_stack.

5.275.1.12 const char* get_error_string (unsigned int *errcode*)

Get the error string corresponding to a particular error code.

Parameters:

errcode the value of the error code to be looked up.

Returns:

a null-terminated string containing a description of the specified error code, or NULL on failure.

Definition at line 107 of file error.c.

References err_desc_t::errmsg.

Referenced by _dump_error().

5.275.1.13 const errinfo_t* get_first_error (void)

Definition at line 165 of file error.c.

References _t_err_stack.

5.275.1.14 const errinfo_t* get_last_error (void)

Get the last error object on the error stack.

Returns:

a pointer to the last error object on the error stack, or NULL if the error stack is empty.

Definition at line 139 of file error.c.

References _t_err_stack.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _evict_if_stale(), _get_dime_record(), _get_signet(), and _unlink_object().

5.275.1.15 unsigned int get_last_error_code (void)

Get the value of the last error code on the error stack.

Returns:

the numerical error code of the last error in the error stack, or 0 if the stack was empty.

Definition at line 125 of file error.c.

References _t_err_stack.

5.275.1.16 errinfo_t* pop_last_error (void)

Definition at line 145 of file error.c.

References _t_err_stack.

5.275.2 Variable Documentation

5.275.2.1 __thread struct thread_err_stack _t_err_stack

Definition at line 22 of file error.c.

Referenced by _clear_error_stack(), _push_error_stack(), dump_error_stack(), dump_last_error(), get_first_error(), get_last_error(), get_last_error_code(), and pop_last_error().

Typedefs

- typedef struct errinfo errinfo_t

Functions

- struct __attribute__ ((packed)) errinfo
- const char ∗ get_error_string (unsigned int errcode)

  Get the error string corresponding to a particular error code.

- const errinfo_t ∗ get_last_error (void)

  Get the last error object on the error stack.

- unsigned int get_last_error_code (void)

  Get the value of the last error code on the error stack.

- errinfo_t ∗ pop_last_error (void)
- const errinfo_t ∗ get_first_error (void)
- void dump_last_error (void)
- void dump_error_stack (void)

  Dump the entire contents of the error stack to the console.

- void _clear_error_stack (void)

  Clear the calling thread's error stack.

- errinfo_t ∗ _push_error_stack (const char ∗filename, const char ∗funcname, int lineno, unsigned int errcode, int xerrno, const char ∗auxmsg)

  Push an error onto the error stack.

- errinfo_t ∗ _push_error_stack_fmt (const char ∗filename, const char ∗funcname, int lineno, unsigned int errcode, int xerrno, const char ∗fmt,...) __attribute__((format(printf
- errinfo_t errinfo_t ∗ _push_error_stack_syscall (const char ∗filename, const char ∗funcname, int lineno, int xerrno, const char ∗errfunc)

  Push an error onto the error stack generated by a syscall (or anything that modifies errno).

- errinfo_t ∗ _push_error_stack_openssl (const char ∗filename, const char ∗funcname, int lineno, unsigned int errcode, int xerrno)

  Push an openssl-generated error onto the error stack.

- errinfo_t ∗ _push_error_stack_resolver (const char ∗filename, const char ∗funcname, int lineno, int xerrno, int herrno, const char ∗errfunc)

  Push an error onto the error stack generated by a resolver library function.

- errinfo_t ∗ _create_new_error (errinfo_t ∗errptr, const char ∗filename, const char ∗funcname, int lineno, unsigned int errcode, int xerrno, const char ∗auxmsg)

Populate a new entry on the error stack.

- void _dump_error (const errinfo_t *error)

  Dump an error stack entry to the console.

5.276.2 Typedef Documentation

5.276.2.1 typedef struct errinfo errinfo_t

Definition at line 74 of file error.h.

5.276.3 Function Documentation

5.276.3.1 struct __attribute__ ((packed)) [read]

Definition at line 65 of file error.h.

5.276.3.2 void _clear_error_stack (void)

Clear the calling thread's error stack.

Definition at line 178 of file error.c.

References _t_err_stack, and ERR_STACK_SIZE.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _dump_dime_record_cb(), _dump_dnskey_record_-cb(), _evict_if_stale(), _get_dime_record(), _get_dime_record_from_file(), _get_dnskey_by_tag(), _get_ds_by_dnskey(), _get_signet(), _get_txt_record(), _load_cache_contents(), _lookup_dnskey(), _lookup_ds(), _save_cache_contents(), _unlink_object(), and _verify_-certificate_callback().

5.276.3.3 errinfo_t* _create_new_error (errinfo_t * *errptr*, const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *auxmsg*)

Populate a new entry on the error stack.

Definition at line 316 of file error.c.

Referenced by _push_error_stack().

5.276.3.4 void _dump_error (const errinfo_t * *error*)

Dump an error stack entry to the console.

Parameters:

error a pointer to the error stack object to be displayed.

Definition at line 83 of file error.c.

References get_error_string().

Referenced by dump_error_stack(), and dump_last_error().

5.276.3.5 errinfo_t* _push_error_stack (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *auxmsg*)

Push an error onto the error stack.

Definition at line 192 of file error.c.

References _create_new_error(), _t_err_stack, and ERR_STACK_SIZE.

Referenced by _push_error_stack_fmt(), _push_error_stack_openssl(), _push_error_stack_resolver(), and _push_error_stack_syscall().

5.276.3.6 errinfo_t* _push_error_stack_fmt (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*, const char * *fmt*, ...)

5.276.3.7 errinfo_t* _push_error_stack_openssl (const char * *filename*, const char * *funcname*, int *lineno*, unsigned int *errcode*, int *xerrno*)

Push an openssl-generated error onto the error stack.

Definition at line 260 of file error.c.

References _push_error_stack(), BUF_strlcat_d, ERR_error_string_n_d, ERR_get_error_d, ERR_load_crypto_strings_d, ERR_peek_error_line_data_d, and SSL_load_error_strings_d.

5.276.3.8 errinfo_t* _push_error_stack_resolver (const char * *filename*, const char * *funcname*, int *lineno*, int *xerrno*, int *herrno*, const char * *errfunc*)

Push an error onto the error stack generated by a resolver library function.

Definition at line 302 of file error.c.

References _push_error_stack(), and ERR_RESOLVER.

5.276.3.9 errinfo_t errinfo_t* _push_error_stack_syscall (const char * *filename*, const char * *funcname*, int *lineno*, int *xerrno*, const char * *errfunc*)

Push an error onto the error stack generated by a syscall (or anything that modifies errno).

Parameters:

- ***filename*** the name of the source file in which the error occured.
- ***funcname*** the name of the function in which the error occured.
- ***lineno*** the line in the source file in which the error occured.
- ***xerrno*** the immediate value of errno which was set by the error-returning function.
- ***errfunc*** the name of the library call or syscall function responsible for setting errno.

Definition at line 240 of file error.c.

References _push_error_stack(), and ERR_SYSCALL.

5.276.3.10 void dump_error_stack (void)

Dump the entire contents of the error stack to the console.

Definition at line 55 of file error.c.

References _dump_error(), and _t_err_stack.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _dump_dime_record_cb(), _evict_if_stale(), _get_dime_record(), _get_dime_record_from_file(), _get_signet(), _get_txt_record(), _load_cache_contents(), _lookup_dnskey(), _lookup_ds(), _save_cache_contents(), and _unlink_object().

5.276.3.11 void dump_last_error (void)

Definition at line 36 of file error.c.

References _dump_error(), and _t_err_stack.

5.276.3.12 const char* get_error_string (unsigned int *errcode*)

Get the error string corresponding to a particular error code.

Parameters:

errcode the value of the error code to be looked up.

Returns:

a null-terminated string containing a description of the specified error code, or NULL on failure.

Definition at line 107 of file error.c.

References err_desc_t::errmsg.

Referenced by _dump_error().

5.276.3.13 const errinfo_t* get_first_error (void)

Definition at line 165 of file error.c.

References _t_err_stack.

5.276.3.14 const errinfo_t* get_last_error (void)

Get the last error object on the error stack.

Returns:

a pointer to the last error object on the error stack, or NULL if the error stack is empty.

Definition at line 139 of file error.c.

References _t_err_stack.

Referenced by _destroy_cache_entry(), _do_ocsp_validation(), _dump_cache_data(), _evict_if_stale(), _get_dime_record(), _get_signet(), and _unlink_object().

5.276.3.15 unsigned int get_last_error_code (void)

Get the value of the last error code on the error stack.

Returns:

the numerical error code of the last error in the error stack, or 0 if the stack was empty.

Definition at line 125 of file error.c.

References _t_err_stack.

5.276.3.16 errinfo_t* pop_last_error (void)

Definition at line 145 of file error.c.

References _t_err_stack.

Functions

- char * _b64encode_nopad (unsigned char const *buf, size_t len)

  Return the base64-encoded string of a data buffer without padding.

- unsigned char * _b64decode_nopad (char const *buf, size_t len, size_t *outlen)

  Decode a base64-encoded string without any padding characters and return the result.

- void _int_no_put_4b (void *buf, uint32_t val)

  Store a 4-byte value in a buffer in network byte order.

- void _int_no_put_3b (void *buf, uint32_t val)

  Store a 3-byte value in a buffer in network byte order.

- void _int_no_put_2b (void *buf, uint16_t val)

  Store a 2-byte value in a buffer in network byte order.

- uint32_t _int_no_get_4b (const void *buf)

  Fetch a 4 byte value from a buffer and return it in host byte order.

- uint32_t _int_no_get_3b (const void *buf)

  Fetch a 3 byte value from a buffer and return it in host byte order.

- uint16_t _int_no_get_2b (const void *buf)

  Fetch a 2 byte value from a buffer and return it in host byte order.

- char * _hex_encode (unsigned char const *buf, size_t len)

  Return a simple hex string representing a data buffer.

- void _set_dbg_level (unsigned int level)

  Set the debugging level of the current process.

- unsigned int _get_dbg_level (void)

Get the debugging level of the current process.

- int _str_printf (char **sbuf, const char *fmt,...)

  Append variable-argument formatted data to a dynamically allocated null-terminated string.

- int __str_printf (char **sbuf, const char *fmt, va_list ap)

  Append variable-argument formatted data to a dynamically allocated null-terminated string.

- size_t _mem_append (unsigned char **buf, size_t *blen, unsigned char const *data, size_t dlen)

  Append data to a dynamically allocated buffer.

- void _ptr_chain_free (void *buf)

  Free a pointer chain and all its member elements.

- void * _ptr_chain_add (void *buf, const void *addr)

  Append an address to the end of a pointer chain.

- int _count_ptr_chain (void *buf)

  Count the number of elements in a pointer chain.

- void * _ptr_chain_clone (void *buf)

  Clone a pointer chain.

- char * _get_chr_date (time_t time, int local)

  Get the human-readable, US-specific representation of a specified UNIX time.

- unsigned char * _b64decode (char const *buf, size_t len, size_t *outlen)

  Perform base64-decoding on a string and return the result.

- char * _b64encode (unsigned char const *buf, size_t len)

  Return the base64-encoded string of a data buffer.

- char * _b64encode_w_lineseperators (unsigned char const *buf, size_t len)
- void _dump_buf (unsigned char const *buf, size_t len, int all_hex)

  Dump a data buffer to the console for debugging purposes.

- void _dump_buf_outer (unsigned char const *buf, size_t len, size_t nouter, int all_hex)

  Dump a data buffer to the console in abbreviated format for debugging purposes.

- void _dbgprint (unsigned int dbglevel, const char *fmt,...)

  Print a debug string to the console.

- void __dbgprint (unsigned int dbglevel, char const *fmt, va_list ap)

  Print a debug string to the console.

- int _compute_sha_hash (size_t nbits, unsigned char const *buf, size_t blen, unsigned char *outbuf)

  Compute an SHA1, SHA256, or SHA512 hash of a block of data.

- int _compute_sha_hash_multibuf (size_t nbits, sha_databuf_t *bufs, unsigned char *outbuf)

  Compute an SHA1, SHA256, or SHA512 hash of a block of data.

- RSA * _decode_rsa_pubkey (unsigned char *data, size_t dlen)

  Decode an RSA public key from a buffer.

- unsigned char * _encode_rsa_pubkey (RSA *pubkey, size_t *enclen)

  Encode and store an RSA public key into a buffer.

- int _get_x509_cert_sha_hash (X509 *cert, size_t nbits, unsigned char *out)

  Get the SHA signature of an x509 certificate in DER format.

- int _is_buf_zeroed (void *buf, size_t len)

  Check to see if a buffer is filled with null bytes.

- int _compute_crc24_checksum (void *buffer, size_t length)

  Generate a 24-bit CRC value for the Privacy Enhanced Message format.

- int _write_pem_data (char const *b64_data, char const *checksum, char const *tag, char const *filename)

  Create a pem file with specified tags and filename.

- unsigned char * _read_file_data (char const *filename, size_t *fsize)

  Read the raw contents of a file into a buffer.

- char * _read_pem_data (char const *pemfile, char const *tag, int nospace)

  Read the contents of a specified tag inside a PEM file into a buffer.

- void _secure_wipe (void *buf, size_t len)

  Securely wipe a memory buffer, in preparation for deallocation.

Variables

- int _verbose = 0

5.277.1 Function Documentation

5.277.1.1 void __dbgprint (unsigned int *dbglevel*, char const * *fmt*, va_list *ap*)

Print a debug string to the console.

Definition at line 957 of file misc.c.

References _verbose.

Referenced by _dbgprint().

5.277.1.2 int __str_printf (char ** *sbuf*, const char * *fmt*, va_list *ap*)

Append variable-argument formatted data to a dynamically allocated null-terminated string.

Definition at line 323 of file misc.c.

References ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

Referenced by _str_printf().

5.277.1.3 unsigned char* _b64decode (char const * *buf*, size_t *len*, size_t * *outlen*)

Perform base64-decoding on a string and return the result.

Parameters:

buf a pointer to a buffer containing the data to be decoded.

len the length, in bytes, of the buffer to be decoded.

outlen a pointer to a variable to receive the length of the decoded data.

Returns:

a pointer to a newly allocated buffer containing the base64-decoded, or NULL on failure. {free}

Definition at line 619 of file misc.c.

References B64_DECODED_LEN, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_-ERROR_PTR.

Referenced by _b64decode_nopad(), _load_dnskey_file(), _load_ec_privkey(), _load_ec_pubkey(), _load_ed25519_privkey(), and _read_-pem_data().

5.277.1.4 unsigned char* _b64decode_nopad (char const * *buf*, size_t *len*, size_t * *outlen*)

Decode a base64-encoded string without any padding characters and return the result.

Parameters:

buf a pointer to a buffer containing the data to be decoded.

len the length, in bytes, of the buffer to be decoded.

outlen a pointer to a variable to receive the length of the decoded data.

Returns:

a pointer to a newly allocated buffer containing the base64-decoded, or NULL on failure. {free}

Definition at line 78 of file misc.c.

References _b64decode(), ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _parse_dime_record().

5.277.1.5 char* _b64encode (unsigned char const * *buf*, size_t *len*)

Return the base64-encoded string of a data buffer.

Parameters:

buf a pointer to the data buffer to be base-64 encoded.

len the length, in bytes, of the buffer to be encoded.

Returns:

a pointer to a newly allocated null-terminated string containing the base64-encoded data, or NULL on failure. {free}

Definition at line 705 of file misc.c.

References B64_ENCODED_LEN, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_-ERROR_PTR.

Referenced by _b64encode_nopad().

5.277.1.6 char* _b64encode_nopad (unsigned char const * *buf*, size_t *len*)

Return the base64-encoded string of a data buffer without padding.

Note:

This function ensures the smallest possible output length with no trailing '=' characters.

Parameters:

buf a pointer to the data buffer to be base-64 encoded.

len the length, in bytes, of the buffer to be encoded.

Returns:

a pointer to a newly allocated null-terminated string containing the base64-encoded data, or NULL on failure. {free}

Definition at line 42 of file misc.c.

References _b64encode(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_PTR.

Referenced by _dump_dime_record_cb().

5.277.1.7 char* _b64encode_w_lineseperators (unsigned char const * *buf*, size_t *len*)

Definition at line 769 of file misc.c.

References B64_ENCODED_LEN, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_-ERROR_PTR.

5.277.1.8 int _compute_crc24_checksum (void * *buffer*, size_t *length*)

Generate a 24-bit CRC value for the Privacy Enhanced Message format.

Note:

This function uses the predefined initial value and polynomial defined in RFC 4880.

Parameters:

buffer a pointer to the data to be checked.

length the length, in bytes, of the input buffer.

Returns:

the updated 24-bit CRC value in a 32-bit unsigned integer.

Definition at line 1350 of file misc.c.

Referenced by _read_pem_data().

5.277.1.9 int _compute_sha_hash (size_t *nbits*, unsigned char const * *buf*, size_t *blen*, unsigned char * *outbuf*)

Compute an SHA1, SHA256, or SHA512 hash of a block of data.

Parameters:

nbits specifies the number of bits for the hash operation (160, 256, and 512 are accepted values).

buf a pointer to a data buffer containing the data to be hashed.

blen the size, in bytes, of the buffer to be hashed.

outbuf a buffer that will contain the output of the hash operation (the caller is responsible for allocating the correct amount of space).

Returns:

0 on success or < 0 if an error was encountered.

Definition at line 991 of file misc.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, SHA1_Final_d, SHA1_Init_d, SHA1_-Update_d, SHA256_Final_d, SHA256_Init_d, SHA256_Update_d, SHA512_Final_d, SHA512_Init_d, and SHA512_Update_d.

Referenced by _add_cached_object(), _add_cached_object_cmp(), _compute_dnskey_sha_hash(), _ec_sign_sha_data(), _find_cached_-object(), _get_cache_ocsp_id(), _get_x509_cert_sha_hash(), _remove_cached_object(), and _verify_ec_sha_signature().

5.277.1.10 int _compute_sha_hash_multibuf (size_t *nbits*, sha_databuf_t * *bufs*, unsigned char * *outbuf*)

Compute an SHA1, SHA256, or SHA512 hash of a block of data.

Parameters:

nbits specifies the number of bits for the hash operation (160, 256, and 512 are accepted values).

bufs a pointer to a data buffer containing the data to be hashed.

outbuf a buffer that will contain the output of the hash operation (the caller is responsible for allocating the correct amount of space).

Returns:

0 on success or < 0 if an error was encountered.

Definition at line 1048 of file misc.c.

References bufptr, data, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, SHA1_Final_d, SHA1_-Init_d, SHA1_Update_d, SHA256_Final_d, SHA256_Init_d, SHA256_Update_d, SHA512_Final_d, SHA512_Init_d, and SHA512_-Update_d.

5.277.1.11 int _count_ptr_chain (void * *buf*)

Count the number of elements in a pointer chain.

Parameters:

buf the address of the pointer chain to be counted.

Returns:

the number of elements in the pointer chain, or -1 on general error.

Definition at line 505 of file misc.c.

References ERR_BAD_PARAM, and RET_ERROR_INT.

Referenced by _dump_dnskey_record_cb(), and _ptr_chain_clone().

5.277.1.12 void _dbgprint (unsigned int *dbglevel*, const char * *fmt*, ...)

Print a debug string to the console.

Parameters:

dbglevel the minimum necessary debugging level to be active in order for the data to be displayed.

fmt the format string specifier to be used to display the user data.

... the variable argument list specified by the format string.

Definition at line 945 of file misc.c.

References __dbgprint().

Referenced by _add_cached_object_cmp_forced(), _add_cached_object_forced(), _add_dnskey_entry(), _connect_host(), _destroy_dime_record(), _do_ocsp_validation(), _do_x509_validation(), _dump_dns_header(), _dx_connect_dual(), _get_cache_location(), _get_dime_record(), _get_dnskey_by_tag(), _get_mx_records(), _get_rsa_dnskey(), _get_signet(), _get_txt_record(), _initialize_resolver(), _load_cache_contents(), _lookup_dnskey(), _lookup_ds(), _mem_append(), _parse_dime_record(), _rsa_verify_record(), _save_cache_contents(), _set_cache_location(), _sgnt_resolv_dmtp_connect(), _sgnt_resolv_dmtp_expect_banner(), _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_dmtp_write_data(), _sgnt_resolv_read_dmtp_line(), _ssl_connect_host(), _ssl_disconnect(), _ssl_get_client_context(), _ssl_initialize(), _ssl_shutdown(), _ssl_starttls(), _unlink_object(), _validate_rrsig_rr(), _validate_self_signed(), _verify_certificate_callback(), and _verify_dx_certificate().

5.277.1.13 RSA* _decode_rsa_pubkey (unsigned char * *data*, size_t *dlen*)

Decode an RSA public key from a buffer.

Note:

This format is identical to the wire format of RSA public keys used for DNSSEC validation.

Parameters:

data a pointer to the data buffer that stores the encoded RSA public key in binary form.

dlen the length, in bytes, of the data buffer.

Returns:

a pointer to an RSA public key structure on success, or NULL on failure. {RSA_free}

Definition at line 1144 of file misc.c.

References BN_bin2bn_d, BN_free_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, and RSA_new_d.

Referenced by _deserialize_dnskey_record_cb().

5.277.1.14 void _dump_buf (unsigned char const * *buf*, size_t *len*, int *all_hex*)

Dump a data buffer to the console for debugging purposes.

Parameters:

buf a pointer to the data buffer to have its contents dumped.

len the size, in bytes, of the data buffer to be dumped.

all_hex if set, print all characters as hex codes - even printable ones.

Definition at line 849 of file misc.c.

Referenced by _dump_buf_outer(), _dump_dnskey_record_cb(), _dump_ds_record_cb(), _get_txt_record(), and _mem_append().

5.277.1.15 void _dump_buf_outer (unsigned char const * *buf*, size_t *len*, size_t *nouter*, int *all_hex*)

Dump a data buffer to the console in abbreviated format for debugging purposes.

Note:

At most, only the first nouter leading and trailing bytes will be dumped.

Parameters:

buf a pointer to the data buffer to have its contents dumped.

len the size, in bytes, of the data buffer to be dumped.

nouter the number of outer (leading and trailing) bytes to be dumped.

all_hex if set, print all characters as hex codes - even printable ones.

Definition at line 893 of file misc.c.

References _dump_buf().

Referenced by _validate_rrsig_rr().

5.277.1.16 unsigned char* _encode_rsa_pubkey (RSA * *pubkey*, size_t * *enclen*)

Encode and store an RSA public key into a buffer.

Parameters:

pubkey a pointer to the RSA public key to be encoded.

enclen a pointer to a size_t that will receive the total size of the encoded public key on completion.

Returns:

a pointer to a buffer containing the encoded RSA public key as binary data on success, or NULL on failure. {free}

Definition at line 1223 of file misc.c.

References BN_bn2bin_d, BN_num_bits_d, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_-ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _serialize_dnskey_record_cb().

5.277.1.17 char* _get_chr_date (time_t *time*, int *local*)

Get the human-readable, US-specific representation of a specified UNIX time.

Parameters:

time the time to be converted to a human-readable string.

local if set, return the time string as a local time; if not, as UTC.

Returns:

a string containing the formatted date-time; or NULL on errors. {free}

Definition at line 576 of file misc.c.

References ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _dump_cache(), _load_cache_contents(), and _validate_rrsig_rr().

5.277.1.18 unsigned int _get_dbg_level (void)

Get the debugging level of the current process.

Returns:

the current value of the debugging level.

Definition at line 298 of file misc.c.

References _verbose.

5.277.1.19 int _get_x509_cert_sha_hash (X509 ∗ *cert*, size_t *nbits*, unsigned char ∗ *out*)

Get the SHA signature of an x509 certificate in DER format.

Parameters:

cert a pointer to the x509 certificate to be hashed.

nbits the number of bits in the SHA operation (160, 256, and 512 are valid values).

out a pointer to a data buffer to receive the output (which the caller is responsible for allocating properly depending on the hash size).

Returns:

0 if the hash operation was completed successfully, or < 0 on error.

Definition at line 1290 of file misc.c.

References _compute_sha_hash(), CRYPTO_free_d, ERR_BAD_PARAM, ERR_UNSPEC, i2d_X509_d, PUSH_ERROR_OPENSSL, and RET_ERROR_INT.

Referenced by _verify_dx_certificate().

5.277.1.20 char∗ _hex_encode (unsigned char const ∗ *buf*, size_t *len*)

Return a simple hex string representing a data buffer.

Parameters:

buf a pointer to the data buffer to be encoded as a hex string.

len the size, in bytes, of the buffer to be processed.

Returns:

NULL on failure, or a newly allocated null-terminated string containing the hex encoded input on success. {free}

Definition at line 253 of file misc.c.

References ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _dump_dime_record_cb().

5.277.1.21 uint16_t _int_no_get_2b (const void ∗ *buf*)

Fetch a 2 byte value from a buffer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 2 bytes in the buffer in host byte order.

Definition at line 226 of file misc.c.

5.277.1.22 uint32_t _int_no_get_3b (const void * *buf*)

Fetch a 3 byte value from a buffer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 3 bytes in the buffer in host byte order.

Definition at line 203 of file misc.c.

5.277.1.23 uint32_t _int_no_get_4b (const void * *buf*)

Fetch a 4 byte value from a buffer and return it in host byte order.

Parameters:

buf a pointer to the data buffer from which the bytes will be read.

Returns:

the value of the first 4 bytes in the buffer in host byte order.

Definition at line 179 of file misc.c.

5.277.1.24 void _int_no_put_2b (void * *buf*, uint16_t *val*)

Store a 2-byte value in a buffer in network byte order.

Parameters:

buf a pointer to the data buffer where the value will be inserted.

val the 2 byte value to be placed in the specified buffer, in network byte order.

Definition at line 160 of file misc.c.

5.277.1.25 void _int_no_put_3b (void * *buf*, uint32_t *val*)

Store a 3-byte value in a buffer in network byte order.

Parameters:

buf a pointer to the data buffer where the value will be inserted.

val the 3 byte value to be placed in the specified buffer, in network byte order.

Definition at line 139 of file misc.c.

5.277.1.26 void _int_no_put_4b (void * *buf*, uint32_t *val*)

Store a 4-byte value in a buffer in network byte order.

Parameters:

buf a pointer to the data buffer where the value will be inserted.

val the 4 byte value to be placed in the specified buffer, in network byte order.

Definition at line 117 of file misc.c.

5.277.1.27 int _is_buf_zeroed (void * *buf*, size_t *len*)

Check to see if a buffer is filled with null bytes.

Parameters:

buf a pointer to the data buffer to be scanned.

len the size, in bytes, of the data buffer to be scanned.

Returns:

1 if the buffer was filled exclusively with null bytes, 0 if it was not, or -1 on general error.

Definition at line 1325 of file misc.c.

References ERR_BAD_PARAM, and RET_ERROR_INT.

5.277.1.28 size_t _mem_append (unsigned char ** *buf*, size_t * *blen*, unsigned char const * *data*, size_t *dlen*)

Append data to a dynamically allocated buffer.

Note:

This function should be called for the first time with *buf set to NULL.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that holds the buffer's current size and will receive the size of the newly resized output buffer.

data a pointer to a buffer holding the data that will be appended to the end of the output buffer.

dlen the size, in bytes, of the data buffer to be appended to the output buffer.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 385 of file misc.c.

References _dbgprint(), _dump_buf(), _verbose, ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _compute_dnskey_sha_hash(), _get_mx_records(), _load_dnskey_file(), _mem_append_canon(), _mem_append_serialized(), _mem_append_serialized_array(), _mem_append_serialized_array_cb(), _mem_append_serialized_str_array(), _mem_append_serialized_string(), _rsa_verify_record(), _serialize_dime_record_cb(), _serialize_dnskey_record_cb(), and _serialize_ds_record_cb().

5.277.1.29 void* _ptr_chain_add (void * *buf*, const void * *addr*)

Append an address to the end of a pointer chain.

Parameters:

buf the address of the target pointer chain. If NULL, allocate a new one for the caller.

addr the address to be appended to the pointer chain.

Definition at line 456 of file misc.c.

References ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _deserialize_array(), _deserialize_array_cb(), _deserialize_str_array(), _lookup_dnskey(), _lookup_ds(), and _parse_dime_-record().

5.277.1.30 void* _ptr_chain_clone (void * *buf*)

Clone a pointer chain.

Parameters:

buf a pointer to the pointer chain to be cloned.

Returns:

a pointer to the cloned pointer chain on success, or NULL on failure. {ptr_chain_free}

Definition at line 531 of file misc.c.

References _count_ptr_chain(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_-PTR.

Referenced by _clone_dnskey_record_cb().

5.277.1.31 void _ptr_chain_free (void * *buf*)

Free a pointer chain and all its member elements.

Note:

All pointers in the chain will be free()'ed. To avoid this behavior, call free() on the pointer chain instead.

Parameters:

buf the address of the pointer chain to be freed.

Definition at line 431 of file misc.c.

Referenced by _deserialize_array(), _deserialize_array_cb(), _deserialize_str_array(), and _destroy_dime_record().

5.277.1.32 unsigned char* _read_file_data (char const * *filename*, size_t * *fsize*)

Read the raw contents of a file into a buffer.

Parameters:

filename a null-terminated string with the name of the file to have its contents read into memory.

fsize a pointer to a variable that will receive the length, in bytes, of the read data.

Returns:

a pointer to a buffer containing the raw contents of the specified file, or NULL on failure. {free}

Definition at line 1471 of file misc.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

5.277.1.33 char* _read_pem_data (char const * *pemfile*, char const * *tag*, int *nospace*)

Read the contents of a specified tag inside a PEM file into a buffer.

Note:

This function will remove all newline characters inside the tag being read.

Parameters:

pemfile the name of the PEM file to be parsed.

tag the name of a tag in the file to have its contents read into memory.

nospace if set, strip all whitespace from the PEM file content.

Returns:

a pointer to a buffer containing the contents of the specified PEM file tag, or NULL on failure. {free}

Definition at line 1532 of file misc.c.

References _b64decode(), _compute_crc24_checksum(), _str_printf(), dbgprint(), ERR_BAD_PARAM, ERR_CORRUPTION, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _load_ec_privkey(), _load_ec_pubkey(), and _load_ed25519_privkey().

5.277.1.34 void _secure_wipe (void * *buf*, size_t *len*)

Securely wipe a memory buffer, in preparation for deallocation.

Parameters:

buf a pointer to the data buffer to be wiped.

len the size, in bytes, of the data buffer to be wiped.

Definition at line 1719 of file misc.c.

Referenced by _compute_aes256_kek(), _free_ed25519_key(), _generate_ed25519_keypair(), _load_ec_privkey(), _load_ec_pubkey(), _load_ed25519_privkey(), and _write_pem_data().

5.277.1.35 void _set_dbg_level (unsigned int *level*)

Set the debugging level of the current process.

Note:

The debugging level determines which debug strings are displayed to the console. If a debug string is printed with a level equal to or higher than the debugging level, it will be displayed to the user; otherwise it will be suppressed.

Parameters:

level the value of the new debugging level to be set.

Definition at line 288 of file misc.c.

References _verbose.

5.277.1.36 int _str_printf (char ** *sbuf*, const char * *fmt*, ...)

Append variable-argument formatted data to a dynamically allocated null-terminated string.

Definition at line 307 of file misc.c.

References __str_printf().

Referenced by _get_signing_key_names(), _read_pem_data(), _sgnt_resolv_dmtp_ehlo(), _sgnt_resolv_dmtp_mail_from(), _sgnt_resolv_-dmtp_rcpt_to(), and _sgnt_resolv_dmtp_stats().

5.277.1.37 int _write_pem_data (char const * *b64_data*, char const * *checksum*, char const * *tag*, char const * *filename*)

Create a pem file with specified tags and filename.

Parameters:

b64_data Null terminated base64 encoded data.

tag Null terminated ASCII string containing the desired PEM tag.

filename Null terminated string containing the desired filename.

Returns:

0 on success, -1 on failure.

Definition at line 1379 of file misc.c.

References _secure_wipe(), ERR_BAD_PARAM, ERR_SYSCALL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and RET_ERROR_-INT_FMT.

```

Defines

- #define CONNECT_TIMEOUT 5

Functions

- int _connect_host (char const ∗hostname, unsigned short port, int force_family)

  Connect to a host/tcp port in an address-independent manner, and return a file descriptor.

- int _connect_timeout (int fd, struct sockaddr const ∗addr, socklen_t addrlen)

  Attempt a TCP connection with a time-out mechanism.

5.280.1 Define Documentation

5.280.1.1 #define CONNECT_TIMEOUT 5

Definition at line 10 of file network.c.

Referenced by _connect_timeout().

5.280.2 Function Documentation

5.280.2.1 int _connect_host (char const ∗ *hostname*, unsigned short *port*, int *force_family*)

Connect to a host/tcp port in an address-independent manner, and return a file descriptor.

Parameters:

hostname the hostname of the server to connect to.

port the TCP port number to which the connection should be made.

force_family an optional address family to force the connection to (AF_INET or AF_INET6), or 0 to ignore).

Returns:

-1 on general failure or the file descriptor of the socket connection on success.

Definition at line 28 of file network.c.

References _connect_timeout(), _dbgprint(), ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_INT, and RET_ERROR_INT_FMT.

Referenced by _do_ocsp_validation(), _dx_connect_dual(), and _ssl_connect_host().

5.280.2.2 int _connect_timeout (int *fd*, struct sockaddr const * *addr*, socklen_t *addrlen*)

Attempt a TCP connection with a time-out mechanism.

Parameters:

fd the open socket descriptor across which the connection will be attempted.

addr a pointer to the prepared sockaddr structure that is the target of the connection.

addrlen the size of the supplied sockaddr structure.

Returns:

-1 on general error, 0 if the connection failed or timed out, and 1 on success.

Definition at line 113 of file network.c.

References CONNECT_TIMEOUT, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

Referenced by _connect_host().

SIGNET_USER_UNDEFINED ASCII undefined field

SIGNET_USER_PHOTO User photo

SIGNET_USER_FULL_SIG Final Organizational Signature

SIGNET_USER_ID User Signet ID

SIGNET_USER_ID_SIG Org Signature following the ID field

Definition at line 82 of file common.h.

5.285.2.8 enum signkey_format_t

Enumerator:

SIGNKEY_DEFAULT_FORMAT Currently the only legal format specifier for ED25519 signing keys

Definition at line 137 of file common.h.

5.285.2.9 enum sok_permissions_t

Enumerator:

SIGNET_SOK_NONE SOK = Secondary Organizational Key Can not be used for signing anything

SIGNET_SOK_SIGNET Can be used for signing signets

SIGNET_SOK_MSG Can be used for signing messages

SIGNET_SOK_TLS Can be used for signing TLS certificates

SIGNET_SOK_SOFTWARE Can be used for signing software

Definition at line 37 of file common.h.

5.285.3 Function Documentation

5.285.3.1 const char* dime_number_to_str (dime_number_t *number*)

Returns a string from a dime_number_t enum type.

Parameters:

number Dime number input.

Returns:

Null terminated string corresponding to the dime number.

Definition at line 1070 of file general.c.

References DIME_ENCRYPTED_MSG, DIME_ENCRYPTED_ORG_KEYS, DIME_ENCRYPTED_USER_KEYS, DIME_MSG_-TRACING, DIME_ORG_KEYS, DIME_ORG_SIGNET, DIME_SSR, DIME_USER_KEYS, and DIME_USER_SIGNET.

Data Structures

- struct object_chunk
- struct dmime_object_t
- struct dmime_message_t

Defines

- #define TRACING_LENGTH_SIZE 2

Typedefs

- typedef struct object_chunk dmime_object_chunk_t

Enumerations

- enum dmime_actor_t { id_author = 0, id_origin = 1, id_destination = 2, id_recipient = 3 }
- enum dmime_object_state_t {

  DMIME_OBJECT_STATE_NONE = 0, DMIME_OBJECT_STATE_CREATION, DMIME_OBJECT_STATE_LOADED_-ENVELOPE, DMIME_OBJECT_STATE_LOADED_SIGNETS,

  DMIME_OBJECT_STATE_INCOMPLETE_ENVELOPE, DMIME_OBJECT_STATE_INCOMPLETE_METADATA, DMIME_-OBJECT_STATE_COMPLETE }
- enum dmime_message_state_t {

  MESSAGE_STATE_NONE = 0, MESSAGE_STATE_INCOMPLETE, MESSAGE_STATE_EMPTY, MESSAGE_STATE_-ENCODED,

  MESSAGE_STATE_CHUNKS_SIGNED, MESSAGE_STATE_ENCRYPTED, MESSAGE_STATE_AUTHOR_SIGNED, MESSAGE_STATE_COMPLETE }
- enum dmime_message_chunk_state_t {

  MESSAGE_CHUNK_STATE_NONE = 0, MESSAGE_CHUNK_STATE_UNKNOWN, MESSAGE_CHUNK_STATE_CREATION, MESSAGE_CHUNK_STATE_ENCODED,

  MESSAGE_CHUNK_STATE_SIGNED, MESSAGE_CHUNK_STATE_ENCRYPTED }

Functions

- struct __attribute__ ((packed))
- char const * dime_dmsg_actor_to_string (dmime_actor_t actor)

  returns a string from dmime_actor_t.

- int dime_dmsg_chunks_sig_origin_sign (dmime_message_t *msg, unsigned char bounce_flags, dmime_kek_t *kek, ED25519_KEY *signkey)

  signs the encrypted, author signed dmime message with the origin signatures. the origin signature chunks must already exist in order for the signing to occur.

- int dime_dmsg_kek_in_derive (dmime_message_t const *msg, EC_KEY *enckey, dmime_kek_t *kek)

  calculates the key encryption key for a given private encryption key and dmime message, using the ephemeral key chunk in the message

- dmime_message_t * dime_dmsg_message_binary_deserialize (unsigned char const *in, size_t insize)

  converts a binary message into a dmime message. the message is assumed to be encrypted.

- unsigned char * dime_dmsg_message_binary_serialize (dmime_message_t const *msg, unsigned char sections, unsigned char tracing, size_t *outsize)

  converts the specified sections of a dmime message to a complete binary form. the message must be at least signed by author.

- int dime_dmsg_message_decrypt_as_auth (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the author from the message.

- int dime_dmsg_message_decrypt_as_dest (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the destination from the message.

- int dime_dmsg_message_decrypt_as_orig (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the origin from the message.

- int dime_dmsg_message_decrypt_as_recp (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the recipient from the message.

- void dime_dmsg_message_destroy (dmime_message_t *msg)

  destroys dmime_message_t structure.

- dmime_message_t * dime_dmsg_message_encrypt (dmime_object_t *object, ED25519_KEY *signkey)

  converts a dmime object to a dmime message, fully encrypting and signing the message !!as an author!!

- dmime_object_t * dime_dmsg_message_envelope_decrypt (dmime_message_t const *msg, dmime_actor_t actor, dmime_kek_t *kek)

  retrieves author name for the following actors: author, origin, recipient.

- dmime_message_state_t dime_dmsg_message_state_get (dmime_message_t const *message)

  retrieves dmime message state.

- dmime_object_chunk_t * dime_dmsg_object_chunk_create (dmime_chunk_type_t type, unsigned char *data, size_t data_size, unsigned char flags)

  creates a dmime object chunk with the specified type, data and flags.

- void dime_dmsg_object_chunklist_destroy (dmime_object_chunk_t *list)

  destroy dmime object chunk list.

- void dime_dmsg_object_destroy (dmime_object_t *object)

  destroy a dmime_object_t structure.

- int dime_dmsg_object_dump (dmime_object_t *object)

  dumps the contents of the dmime object.

- dmime_object_state_t dime_dmsg_object_state_init (dmime_object_t *object)

  takes a dmime object and determines the state it is in.

- const char * dime_dmsg_object_state_to_string (dmime_object_state_t state)

  returns a string from dmime_object_state_t.

Variables

5.286.4 Function Documentation

5.286.4.1 struct __attribute__ ((packed)) `[read]`

Definition at line 108 of file crypto.h.

References CHUNK_LENGTH_SIZE, data, and type().

5.286.4.2 char const* dime_dmsg_actor_to_string (dmime_actor_t *actor*)

returns a string from dmime_actor_t.

Parameters:

actor actor value.

Returns:

string containing human readable actor.

Definition at line 6091 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.3 int dime_dmsg_chunks_sig_origin_sign (dmime_message_t * *msg*, unsigned char *bounce_flags*, dmime_kek_t * *kek*, ED25519_KEY * *signkey*)

signs the encrypted, author signed dmime message with the origin signatures. the origin signature chunks must already exist in order for the signing to occur.

Parameters:

msg dmime message that will be signed by the origin.

bounce_flags flags indicating bounce signatures that the origin will sign.

kek origin's key encryption key.

signkey origin's private signing key that will be used to sign the message. the public part of this key must be included in the origin signet either as the pok or one of the soks with the message signing flag.

Returns:

0 on success, anything else indicates failure.

Definition at line 6115 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.4 int dime_dmsg_kek_in_derive (dmime_message_t const ∗ *msg*, EC_KEY ∗ *enckey*, dmime_kek_t ∗ *kek*)

calculates the key encryption key for a given private encryption key and dmime message, using the ephemeral key chunk in the message

Parameters:

msg pointer to the dmime message, which has the ephemeral key chunk to be used.

enckey private ec encryption key.

kek pointer to a dmime_kek_t - a key encryption key object that can be used to decrypt the keyslots.

Returns:

returns 0 on success, all other values indicate failure.

Definition at line 6144 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.5 dmime_message_t∗ dime_dmsg_message_binary_deserialize (unsigned char const ∗ *in*, size_t *insize*)

converts a binary message into a dmime message. the message is assumed to be encrypted.

Parameters:

in pointer to the binary message.

insize pointer to the binary size.

Returns:

pointer to a dmime message structure. {dime_dmsg_destroy_message}

Definition at line 6165 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.6 unsigned char∗ dime_dmsg_message_binary_serialize (dmime_message_t const ∗ *msg*, unsigned char *sections*, unsigned char *tracing*, size_t ∗ *outsize*)

converts the specified sections of a dmime message to a complete binary form. the message must be at least signed by author.

Parameters:

msg dmime message to be converted.

sections sections to be included.

tracing if set, include tracing, if clear don't include tracing.

outsize stores the output size of the binary. {free}

Definition at line 6187 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.7 int dime_dmsg_message_decrypt_as_auth (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the author from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the author.

msg dmime message to be decrypted.

kek author's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6216 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.8 int dime_dmsg_message_decrypt_as_dest (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the destination from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the destination.

msg dmime message to be decrypted.

kek destination's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6243 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.9 int dime_dmsg_message_decrypt_as_orig (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the origin from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the origin.

msg dmime message to be decrypted.

kek origin's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6266 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.10 int dime_dmsg_message_decrypt_as_recp (dmime_object_t ∗ *obj*, dmime_message_t const ∗ *msg*, dmime_kek_t ∗ *kek*)

decrypts, verifies and extracts all the information available to the recipient from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the recipient.

msg dmime message to be decrypted.

kek recipient's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6289 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.11 void dime_dmsg_message_destroy (dmime_message_t ∗ *msg*)

destroys dmime_message_t structure.

Parameters:

msg pointer to the dmime message to be destroyed.

Definition at line 6304 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.286.4.12 dmime_message_t∗ dime_dmsg_message_encrypt (dmime_object_t ∗ *object*, ED25519_KEY ∗ *signkey*)

converts a dmime object to a dmime message, fully encrypting and signing the message !!as an author!!

Parameters:

object dmime object which contains all the envelope, metadata, display and attachment information. as well as pointers to signets of author, origin, destination and recipient.

signkey the author's private ed25519 signing key which will be used.

Returns:

a pointer to a fully signed and encrypted dmime message. {dime_dmsg_destroy_message}

Definition at line 6324 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.13 dmime_object_t∗ dime_dmsg_message_envelope_decrypt (dmime_message_t const ∗ *msg*, dmime_actor_t *actor*, dmime_kek_t ∗ *kek*)

retrieves author name for the following actors: author, origin, recipient.

Parameters:

msg dmime message the author of which is retrieved.

actor who is trying to get the message author.

kek key encryption key for the specified actor.

Returns:

a newly allocated dmime object containing the envelope ids available to the actor. {dime_dmsg_destroy_object}

Definition at line 6346 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.14 dmime_message_state_t dime_dmsg_message_state_get (dmime_message_t const ∗ *message*)

retrieves dmime message state.

Parameters:

message pointer to a dmime message.

Returns:

dmime_message_state_t corresponding to the current state.

Definition at line 6363 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.15 dmime_object_chunk_t∗ dime_dmsg_object_chunk_create (dmime_chunk_type_t *type*, unsigned char ∗ *data*, size_t *data_size*, unsigned char *flags*)

creates a dmime object chunk with the specified type, data and flags.

Parameters:

type chunk type.

data pointer to an array that gets copied into newly allocated memory.

data_size length of data array.

flags specified flags for the object chunk. {dime_dmsg_object_chunklist_destroy}

Definition at line 6383 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.16 void dime_dmsg_object_chunklist_destroy (dmime_object_chunk_t ∗ *list*)

destroy dmime object chunk list.

Parameters:

list pointer to a dmime object chunk list to be destroyed.

Definition at line 6404 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.17 void dime_dmsg_object_destroy (dmime_object_t * *object*)

destroy a dmime_object_t structure.

Parameters:

object pointer to dmime object to be destroyed.

Definition at line 6416 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.286.4.18 int dime_dmsg_object_dump (dmime_object_t * *object*)

dumps the contents of the dmime object.

Parameters:

object dmime object to be dumped.

Returns:

0 on success, all other values indicate failure.

Definition at line 6430 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.19 dmime_object_state_t dime_dmsg_object_state_init (dmime_object_t * *object*)

takes a dmime object and determines the state it is in.

Parameters:

object dmime object, state of which will be retrieved.

Returns:

the state of dmime object.

Definition at line 6444 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.286.4.20 const char* dime_dmsg_object_state_to_string (dmime_object_state_t *state*)

returns a string from dmime_object_state_t.

Parameters:

state object state value.

Returns:

string containing human readable dmime object state.

Definition at line 6458 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Defines

- #define CKEY_EMPTY { 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, NULL, NULL }

Typedefs

- typedef dmime_kek_t dmime_kekset_t [4]
- typedef unsigned char dmime_ephemeral_payload_t [EC_PUBKEY_SIZE]
- typedef unsigned char dmime_signature_payload_t [ED25519_SIG_SIZE]
- typedef unsigned char * dmime_encrypted_payload_t

Functions

- struct __attribute__ ((packed))
- char const * dime_dmsg_actor_to_string (dmime_actor_t actor)

  returns a string from dmime_actor_t.

- int dime_dmsg_chunks_sig_origin_sign (dmime_message_t *msg, unsigned char bounce_flags, dmime_kek_t *kek, ED25519_KEY *signkey)

  signs the encrypted, author signed dmime message with the origin signatures. the origin signature chunks must already exist in order for the signing to occur.

- int dime_dmsg_kek_in_derive (dmime_message_t const *msg, EC_KEY *enckey, dmime_kek_t *kek)

  calculates the key encryption key for a given private encryption key and dmime message, using the ephemeral key chunk in the message

- dmime_message_t * dime_dmsg_message_binary_deserialize (unsigned char const *in, size_t insize)

  converts a binary message into a dmime message. the message is assumed to be encrypted.

- unsigned char * dime_dmsg_message_binary_serialize (dmime_message_t const *msg, unsigned char sections, unsigned char tracing, size_t *outsize)

  converts the specified sections of a dmime message to a complete binary form. the message must be at least signed by author.

- int dime_dmsg_message_decrypt_as_auth (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the author from the message.

- int dime_dmsg_message_decrypt_as_dest (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the destination from the message.

- int dime_dmsg_message_decrypt_as_orig (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the origin from the message.

- int dime_dmsg_message_decrypt_as_recp (dmime_object_t *obj, dmime_message_t const *msg, dmime_kek_t *kek)

  decrypts, verifies and extracts all the information available to the recipient from the message.

- void dime_dmsg_message_destroy (dmime_message_t *msg)

  destroys dmime_message_t structure.

- dmime_message_t * dime_dmsg_message_encrypt (dmime_object_t *object, ED25519_KEY *signkey)

  converts a dmime object to a dmime message, fully encrypting and signing the message !!as an author!!

- dmime_object_t * dime_dmsg_message_envelope_decrypt (dmime_message_t const *msg, dmime_actor_t actor, dmime_kek_t *kek)

  retrieves author name for the following actors: author, origin, recipient.

- dmime_message_state_t dime_dmsg_message_state_get (dmime_message_t const *message)

  retrieves dmime message state.

- dmime_object_chunk_t * dime_dmsg_object_chunk_create (dmime_chunk_type_t type, unsigned char *data, size_t data_size, unsigned char flags)

  creates a dmime object chunk with the specified type, data and flags.

- void dime_dmsg_object_chunklist_destroy (dmime_object_chunk_t *list)

  destroy dmime object chunk list.

- void dime_dmsg_object_destroy (dmime_object_t *object)

  destroy a dmime_object_t structure.

- int dime_dmsg_object_dump (dmime_object_t *object)

  dumps the contents of the dmime object.

- dmime_object_state_t dime_dmsg_object_state_init (dmime_object_t *object)

  takes a dmime object and determines the state it is in.

- const char * dime_dmsg_object_state_to_string (dmime_object_state_t state)

  returns a string from dmime_object_state_t.

Definition at line 21 of file dmsg.c.

5.287.3 Function Documentation

5.287.3.1 struct __attribute__ ((packed)) `[read]`

Definition at line 27 of file dmsg.c.

References AES_256_KEY_SIZE.

5.287.3.2 char const* dime_dmsg_actor_to_string (dmime_actor_t *actor*)

returns a string from dmime_actor_t.

Parameters:

actor actor value.

Returns:

string containing human readable actor.

Definition at line 6091 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.3 int dime_dmsg_chunks_sig_origin_sign (dmime_message_t * *msg*, unsigned char *bounce_flags*, dmime_kek_t * *kek*, ED25519_KEY * *signkey*)

signs the encrypted, author signed dmime message with the origin signatures. the origin signature chunks must already exist in order for the signing to occur.

Parameters:

msg dmime message that will be signed by the origin.

bounce_flags flags indicating bounce signatures that the origin will sign.

kek origin's key encryption key.

signkey origin's private signing key that will be used to sign the message. the public part of this key must be included in the origin signet either as the pok or one of the soks with the message signing flag.

Returns:

0 on success, anything else indicates failure.

Definition at line 6115 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.4 int dime_dmsg_kek_in_derive (dmime_message_t const * *msg*, EC_KEY * *enckey*, dmime_kek_t * *kek*)

calculates the key encryption key for a given private encryption key and dmime message, using the ephemeral key chunk in the message

Parameters:

msg pointer to the dmime message, which has the ephemeral key chunk to be used.

enckey private ec encryption key.

kek pointer to a dmime_kek_t - a key encryption key object that can be used to decrypt the keyslots.

Returns:

returns 0 on success, all other values indicate failure.

Definition at line 6144 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.5 dmime_message_t* dime_dmsg_message_binary_deserialize (unsigned char const * *in*, size_t *insize*)

converts a binary message into a dmime message. the message is assumed to be encrypted.

Parameters:

in pointer to the binary message.

insize pointer to the binary size.

Returns:

pointer to a dmime message structure. {dime_dmsg_destroy_message}

Definition at line 6165 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.6 unsigned char* dime_dmsg_message_binary_serialize (dmime_message_t const * *msg*, unsigned char *sections*, unsigned char *tracing*, size_t * *outsize*)

converts the specified sections of a dmime message to a complete binary form. the message must be at least signed by author.

Parameters:

msg dmime message to be converted.

sections sections to be included.

tracing if set, include tracing, if clear don't include tracing.

outsize stores the output size of the binary. {free}

Definition at line 6187 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.7 int dime_dmsg_message_decrypt_as_auth (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the author from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the author.

msg dmime message to be decrypted.

kek author's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6216 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.8 int dime_dmsg_message_decrypt_as_dest (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the destination from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the destination.

msg dmime message to be decrypted.

kek destination's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6243 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.9 int dime_dmsg_message_decrypt_as_orig (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the origin from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the origin.

msg dmime message to be decrypted.

kek origin's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6266 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.10 int dime_dmsg_message_decrypt_as_recp (dmime_object_t * *obj*, dmime_message_t const * *msg*, dmime_kek_t * *kek*)

decrypts, verifies and extracts all the information available to the recipient from the message.

Parameters:

obj dmime object into which the information is extracted, it must already contain the ids and signets of all the actors available to the recipient.

msg dmime message to be decrypted.

kek recipient's key encryption key.

Returns:

0 on success, all other output values indicate failure.

Definition at line 6289 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.11 void dime_dmsg_message_destroy (dmime_message_t ∗ *msg*)

destroys dmime_message_t structure.

Parameters:

msg pointer to the dmime message to be destroyed.

Definition at line 6304 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.287.3.12 dmime_message_t∗ dime_dmsg_message_encrypt (dmime_object_t ∗ *object*, ED25519_KEY ∗ *signkey*)

converts a dmime object to a dmime message, fully encrypting and signing the message !!as an author!!

Parameters:

object dmime object which contains all the envelope, metadata, display and attachment information. as well as pointers to signets of author, origin, destination and recipient.

signkey the author's private ed25519 signing key which will be used.

Returns:

a pointer to a fully signed and encrypted dmime message. {dime_dmsg_destroy_message}

Definition at line 6324 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.13 dmime_object_t∗ dime_dmsg_message_envelope_decrypt (dmime_message_t const ∗ *msg*, dmime_actor_t *actor*, dmime_kek_t ∗ *kek*)

retrieves author name for the following actors: author, origin, recipient.

Parameters:

msg dmime message the author of which is retrieved.

actor who is trying to get the message author.

kek key encryption key for the specified actor.

Returns:

a newly allocated dmime object containing the envelope ids available to the actor. {dime_dmsg_destroy_object}

Definition at line 6346 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.14 dmime_message_state_t dime_dmsg_message_state_get (dmime_message_t const * *message*)

retrieves dmime message state.

Parameters:

message pointer to a dmime message.

Returns:

dmime_message_state_t corresponding to the current state.

Definition at line 6363 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.15 dmime_object_chunk_t* dime_dmsg_object_chunk_create (dmime_chunk_type_t *type*, unsigned char * *data*, size_t *data_size*, unsigned char *flags*)

creates a dmime object chunk with the specified type, data and flags.

Parameters:

type chunk type.

data pointer to an array that gets copied into newly allocated memory.

data_size length of data array.

flags specified flags for the object chunk. {dime_dmsg_object_chunklist_destroy}

Definition at line 6383 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.16 void dime_dmsg_object_chunklist_destroy (dmime_object_chunk_t * *list*)

destroy dmime object chunk list.

Parameters:

list pointer to a dmime object chunk list to be destroyed.

Definition at line 6404 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.17 void dime_dmsg_object_destroy (dmime_object_t * *object*)

destroy a dmime_object_t structure.

Parameters:

object pointer to dmime object to be destroyed.

Definition at line 6416 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.287.3.18 int dime_dmsg_object_dump (dmime_object_t * *object*)

dumps the contents of the dmime object.

Parameters:

object dmime object to be dumped.

Returns:

0 on success, all other values indicate failure.

Definition at line 6430 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.19 dmime_object_state_t dime_dmsg_object_state_init (dmime_object_t * *object*)

takes a dmime object and determines the state it is in.

Parameters:

object dmime object, state of which will be retrieved.

Returns:

the state of dmime object.

Definition at line 6444 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.287.3.20 const char* dime_dmsg_object_state_to_string (dmime_object_state_t *state*)

returns a string from dmime_object_state_t.

Parameters:

state object state value.

Returns:

string containing human readable dmime object state.

Definition at line 6458 of file dmsg.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Definition at line 21 of file parse.h.

5.288.2 Function Documentation

5.288.2.1 void dime_prsr_envelope_destroy (dmime_envelope_object_t ∗ *obj*)

Destroys a dmime_envelop_object_t structure.

Parameters:

obj Pointer to the object to be destroyed.

Definition at line 751 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.288.2.2 sds dime_prsr_envelope_format (sds *user_id*, sds *org_id*, char const ∗ *user_fp*, char const ∗ *org_fp*, dmime_chunk_type_t *type*)

Formats the passed in envelope data into a string to be passed to an envelope chunk.

Parameters:

user_id Stringer containing the user email address.
org_id Stringer containing the organizational TLD.
user_fp Cstring containing cryptographic user signet.
org_fp Cstring containing organizational signet fingerprint.
type The type of envelope chunk.

Returns:

Buffer with formated envelope data. {st_free}

Definition at line 776 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.288.2.3 dmime_envelope_object_t∗ dime_prsr_envelope_parse (char const ∗ *in*, size_t *insize*, dmime_chunk_type_t *type*)

Parses a binary buffer from a dmime message into a dmime origin object.

Parameters:

in Binary origin array.
insize Size of input array.
type Type of the chunk.

Returns:

Pointer to a parsed dmime object or NULL on error. {dime_prsr_envelope_destroy}

Definition at line 800 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.288.2.4 dmime_common_headers_t* dime_prsr_headers_create (void)

Allocates memory for an empty dmime_common_headers_t type.

Returns:

dmime_common_headers_t structure. {dime_prsr_headers_destroy}

Definition at line 816 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.288.2.5 void dime_prsr_headers_destroy (dmime_common_headers_t * *obj*)

Destroys a dmime_common_headers_t structure.

Parameters:

obj Headers to be destroyed.

Definition at line 828 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.288.2.6 unsigned char* dime_prsr_headers_format (dmime_common_headers_t * *obj*, size_t * *outsize*)

Formats the dmime_common_headers_t into a single array for the common headers chunk.

Parameters:

obj The headers to be formatted.
outsize Stores the size of the output array.

Returns:

Returns the array of ASCII characters (not terminated by ") as pointer to unsigned char. {free}

Definition at line 846 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.288.2.7 dmime_common_headers_t* dime_prsr_headers_parse (unsigned char * *in*, size_t *insize*)

Parses the passed array of bytes into dmime_common_headers_t.

Parameters:

in Input buffer.
insize Input buffer size.

Returns:

A dmime_common_headers_t array of sds strings containing parsed header info. {dime_prsr_headers_destroy}

Definition at line 865 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

  Destroys a dmime_common_headers_t structure.

- unsigned char * dime_prsr_headers_format (dmime_common_headers_t *obj, size_t *outsize)

  Formats the dmime_common_headers_t into a single array for the common headers chunk.

- dmime_common_headers_t * dime_prsr_headers_parse (unsigned char *in, size_t insize)

  Parses the passed array of bytes into dmime_common_headers_t.

Variables

- dmime_header_key_t dmime_header_keys [DMIME_NUM_COMMON_HEADERS]

5.289.1 Function Documentation

5.289.1.1 void dime_prsr_envelope_destroy (dmime_envelope_object_t * *obj*)

Destroys a dmime_envelop_object_t structure.

Parameters:

obj Pointer to the object to be destroyed.

Definition at line 751 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.1.2 sds dime_prsr_envelope_format (sds *user_id*, sds *org_id*, char const * *user_fp*, char const * *org_fp*, dmime_chunk_type_t *type*)

Formats the passed in envelope data into a string to be passed to an envelope chunk.

Parameters:

user_id Stringer containing the user email address.

org_id Stringer containing the organizational TLD.

user_fp Cstring containing cryptographic user signet.

org_fp Cstring containing organizational signet fingerprint.

type The type of envelope chunk.

Returns:

Buffer with formated envelope data. {st_free}

Definition at line 776 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.1.3 dmime_envelope_object_t∗ dime_prsr_envelope_parse (char const ∗ *in*, size_t *insize*, dmime_chunk_type_t *type*)

Parses a binary buffer from a dmime message into a dmime origin object.

Parameters:

in Binary origin array.

insize Size of input array.

type Type of the chunk.

Returns:

Pointer to a parsed dmime object or NULL on error. {dime_prsr_envelope_destroy}

Definition at line 800 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.1.4 dmime_common_headers_t∗ dime_prsr_headers_create (void)

Allocates memory for an empty dmime_common_headers_t type.

Returns:

dmime_common_headers_t structure. {dime_prsr_headers_destroy}

Definition at line 816 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.1.5 void dime_prsr_headers_destroy (dmime_common_headers_t ∗ *obj*)

Destroys a dmime_common_headers_t structure.

Parameters:

obj Headers to be destroyed.

Definition at line 828 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

5.289.1.6 unsigned char* dime_prsr_headers_format (dmime_common_headers_t * *obj*, size_t * *outsize*)

Formats the dmime_common_headers_t into a single array for the common headers chunk.

Parameters:

obj The headers to be formatted.

outsize Stores the size of the output array.

Returns:

Returns the array of ASCII characters (not terminated by ") as pointer to unsigned char. {free}

Definition at line 846 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.1.7 dmime_common_headers_t* dime_prsr_headers_parse (unsigned char * *in*, size_t *insize*)

Parses the passed array of bytes into dmime_common_headers_t.

Parameters:

in Input buffer.

insize Input buffer size.

Returns:

A dmime_common_headers_t array of sds strings containing parsed header info. {dime_prsr_headers_destroy}

Definition at line 865 of file parser.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.289.2 Variable Documentation

5.289.2.1 dmime_header_key_t dmime_header_keys[DMIME_NUM_COMMON_HEADERS]

Initial value:

```
 {
    {1, "Date: ", 6},
    {1, "To: ", 4},
    {0, "CC: ", 4},
    {1, "From: ", 6},
    {0, "Organization: ", 14},
    {1, "Subject: ", 9},
    {0, NULL, 0}
}
```

Definition at line 732 of file parser.c.

5.290 src/providers/dime/dmtp/commands.c File Reference

```
#include <stdlib.h>
#include <string.h>
#include <ctype.h>
#include "dime/sds/sds.h"
#include "dime/dmtp/commands.h"
#include "dime/common/error.h"
```

Defines

- #define DMTP_IGNORE_ARG { NULL, 0, DMTP_ARG_PLAIN, 0 }
- #define DMTP_EMPTY_ARG { NULL, 0, DMTP_ARG_NONE, 0 }

Functions

- dmtp_command_t ∗ dime_dmtp_command_create (dmtp_command_type_t type)

  Create a dmtp command structure.

- void dime_dmtp_command_destroy (dmtp_command_t ∗command)

  Destroy a dmtp command structure.

- sds dime_dmtp_command_format (dmtp_command_t ∗command)

  Formats the specified dmtp command into a sds string.

- dmtp_parse_state_t dime_dmtp_command_parse (sds comm_line, dmtp_command_t ∗∗comm_struct)

  Parse the provided sds string into a dmtp command structure.

- sds dime_dmtp_command_starttls (sds host, dmtp_mode_t mode)

  Create a string containing dmtp STARTTLS command with specified arguments.

- sds dime_dmtp_command_helo (sds host)

  Create a string containing dmtp HELO command with specified arguments.

- sds dime_dmtp_command_ehlo (sds host)

  Create a string containing dmtp EHLO command with specified arguments.

- sds dime_dmtp_command_mode ()

  Create a string containing dmtp MODE command with specified arguments.

- sds dime_dmtp_command_rset ()

  Create a string containing dmtp RSET command with specified arguments.

- sds dime_dmtp_command_noop (sds optarg1, sds optarg2, sds optarg3)

  Create a string containing dmtp NOOP command with specified arguments.

- sds dime_dmtp_command_help ()

  Create a string containing dmtp HELP command with specified arguments.

- sds dime_dmtp_command_quit ()

Create a string containing dmtp QUIT command with specified arguments.

- sds dime_dmtp_command_mail (sds from, sds fingerprint)
  Create a string containing dmtp MAIL command with specified arguments.
- sds dime_dmtp_command_rcpt (sds to, sds fingerprint)
  Create a string containing dmtp RCPT command with specified arguments.
- sds dime_dmtp_command_data ()
  Create a string containing dmtp DATA command with specified arguments.
- sds dime_dmtp_command_sgnt_user (sds address, sds fingerprint)
  Create a string containing dmtp SGNT command with specified arguments.
- sds dime_dmtp_command_sgnt_domain (sds domain, sds fingerprint)
  Create a string containing dmtp SGNT command with specified arguments.
- sds dime_dmtp_command_hist (sds address, sds start, sds stop)
  Create a string containing dmtp HIST command with specified arguments.
- sds dime_dmtp_command_vrfy_user (sds address, sds fingerprint)
  Create a string containing dmtp VRFY command with specified arguments.
- sds dime_dmtp_command_vrfy_domain (sds domain, sds fingerprint)
  Create a string containing dmtp VRFY command with specified arguments.

Variables

- dmtp_command_key_t dmtp_command_list [DMTP_COMMANDS_NUM]

5.290.1 Define Documentation

5.290.1.1 #define DMTP_EMPTY_ARG { NULL, 0, DMTP_ARG_NONE, 0 }

Definition at line 9 of file commands.c.

5.290.1.2 #define DMTP_IGNORE_ARG { NULL, 0, DMTP_ARG_PLAIN, 0 }

Definition at line 8 of file commands.c.

5.290.2 Function Documentation

5.290.2.1 dmtp_command_t∗ dime_dmtp_command_create (dmtp_command_type_t *type*)

Create a dmtp command structure.

Parameters:

type dmtp command enum.

Returns:

A newly created dmtp command structure with specified type and NULL args. dime_dmtp_command_destroy

Definition at line 1086 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.290.2.2 sds dime_dmtp_command_data (void)

Create a string containing dmtp DATA command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1671 of file commands.c.

References DMTP_DATA, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.290.2.3 void dime_dmtp_command_destroy (dmtp_command_t ∗ *command*)

Destroy a dmtp command structure.

Parameters:

command dmtp command structure to be destroyed.

Definition at line 1099 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.290.2.4 sds dime_dmtp_command_ehlo (sds *host*)

Create a string containing dmtp EHLO command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1283 of file commands.c.

References dmtp_command_t::args, DMTP_EHLO, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.5 sds dime_dmtp_command_format (dmtp_command_t ∗ *command*)

Formats the specified dmtp command into a sds string.

Parameters:

command Command to be formatted.

Returns:

sds string containing formatted command. sdsfree

Definition at line 1116 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.290.2.6 sds dime_dmtp_command_helo (sds *host*)

Create a string containing dmtp HELO command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1232 of file commands.c.

References dmtp_command_t::args, DMTP_HELO, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.7 sds dime_dmtp_command_help (void)

Create a string containing dmtp HELP command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1468 of file commands.c.

References DMTP_HELP, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.290.2.8 sds dime_dmtp_command_hist (sds *address*, sds *start*, sds *stop*)

Create a string containing dmtp HIST command with specified arguments.

Parameters:

address sds string containing user mail address.

start sds string containing optional starting user signet fingerprint. NULL if unwanted.

stop sds string containing optional ending user signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1832 of file commands.c.

References dmtp_command_t::args, DMTP_HIST, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.9 sds dime_dmtp_command_mail (sds *from*, sds *fingerprint*)

Create a string containing dmtp MAIL command with specified arguments.

Parameters:

from sds string containg origin domain.

fingerprint sds string containing origin signet full fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1547 of file commands.c.

References dmtp_command_t::args, DMTP_MAIL, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.10 sds dime_dmtp_command_mode (void)

Create a string containing dmtp MODE command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1332 of file commands.c.

References DMTP_MODE, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.290.2.11 sds dime_dmtp_command_noop (sds *optarg1*, sds *optarg2*, sds *optarg3*)

Create a string containing dmtp NOOP command with specified arguments.

Parameters:

optarg1 Optional allowed argument 1. NULL if unwanted.

optarg2 Optional allowed argument 2. NULL if unwanted.

optarg3 Optional allowed argument 3. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1412 of file commands.c.

References dmtp_command_t::args, DMTP_NOOP, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.12 dmtp_parse_state_t dime_dmtp_command_parse (sds *comm_line*, dmtp_command_t ** *comm_struct*)

Parse the provided sds string into a dmtp command structure.

Parameters:

command sds dmtp command string.

Returns:

A valid dmtp command structure on success, NULL on failure. dime_dmtp_command_destroy

Definition at line 1133 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.290.2.13 sds dime_dmtp_command_quit (void)

Create a string containing dmtp QUIT command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1505 of file commands.c.

References DMTP_QUIT, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.290.2.14 sds dime_dmtp_command_rcpt (sds *to*, sds *fingerprint*)

Create a string containing dmtp RCPT command with specified arguments.

Parameters:

to sds string containg destination domain.

fingerprint sds string containing destination signet full fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1611 of file commands.c.

References dmtp_command_t::args, DMTP_RCPT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.15 sds dime_dmtp_command_rset (void)

Create a string containing dmtp RSET command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1369 of file commands.c.

References DMTP_RSET, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.290.2.16 sds dime_dmtp_command_sgnt_domain (sds *domain*, sds *fingerprint*)

Create a string containing dmtp SGNT command with specified arguments.

Parameters:

domain sds string containing domain name.

fingerprint sds string containing optional organizational signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1771 of file commands.c.

References dmtp_command_t::args, DMTP_SGNT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.17 sds dime_dmtp_command_sgnt_user (sds *address*, sds *fingerprint*)

Create a string containing dmtp SGNT command with specified arguments.

Parameters:

address sds string containing mail address of the user.

fingerprint sds string containing optional user signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1712 of file commands.c.

References dmtp_command_t::args, DMTP_SGNT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.18 sds dime_dmtp_command_starttls (sds *host*, dmtp_mode_t *mode*)

Create a string containing dmtp STARTTLS command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

mode optional mode parameter (DMTP or SMTP). DMTP_MODE_NONE to not specify mode.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1154 of file commands.c.

References dmtp_command_t::args, DMTP_MODE_DMTP, DMTP_MODE_NONE, DMTP_MODE_SMTP, DMTP_STARTTLS, ERR_-BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, sdsdup(), and sdsnewlen().

5.290.2.19 sds dime_dmtp_command_vrfy_domain (sds *domain*, sds *fingerprint*)

Create a string containing dmtp VRFY command with specified arguments.

Parameters:

domain sds string containing domain name.

start sds string containing organizational signet fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1961 of file commands.c.

References dmtp_command_t::args, DMTP_VRFY, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.2.20 sds dime_dmtp_command_vrfy_user (sds *address*, sds *fingerprint*)

Create a string containing dmtp VRFY command with specified arguments.

Parameters:

address sds string containing user mail address.

start sds string containing user signet fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1897 of file commands.c.

References dmtp_command_t::args, DMTP_VRFY, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.290.3 Variable Documentation

5.290.3.1 dmtp_command_key_t dmtp_command_list[DMTP_COMMANDS_NUM]

Definition at line 2013 of file commands.c.

#include "commands.h"
```

Functions

- int_t dmtp_compare (const void *compare, const void *command)
- void dmtp_sort (void)

  Sort the DMTP command table to be ready for binary searches.

- void dmtp_requeue (connection_t *con)

  commands.c

- void dmtp_process (connection_t *con)

  The main entry point in the DMTP server for processing commands issued by clients.

5.291.1 Function Documentation

5.291.1.1 int_t dmtp_compare (const void * *compare*, const void * *command*)

Definition at line 11 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by dmtp_process(), and dmtp_sort().

5.291.1.2 void dmtp_process (connection_t * *con*)

The main entry point in the DMTP server for processing commands issued by clients.

Parameters:

con a pointer to the connection object of the client issuing the DMTP command.

Returns:

This function returns no value.

Definition at line 48 of file commands.c.

References connection_t::command, command, con_read_line(), server_t::cutoff, dmtp_commands, dmtp_compare(), dmtp_data(), dmtp_invalid(), dmtp_process(), dmtp_quit(), dmtp_requeue(), enqueue(), command_t::function, command_t::length, connection_t::line, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, command_t::string, server_t::violations, and connection_t::violations.

Referenced by dmtp_process(), and dmtp_requeue().

5.291.1.3 void dmtp_requeue (connection_t * *con*)

commands.c

Definition at line 31 of file commands.c.

References con_status(), server_t::cutoff, dmtp_process(), dmtp_quit(), enqueue(), connection_t::protocol, connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by dmtp_data(), dmtp_init(), and dmtp_process().

5.291.1.4 void dmtp_sort (void)

Sort the DMTP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 26 of file commands.c.

References dmtp_commands, and dmtp_compare().

Referenced by protocol_init().

5.292 src/servers/imap/commands.c File Reference

```
#include "magma.h"
#include "commands.h"
```

Functions

- int_t imap_compare (const void *compare, const void *command)
  Compare the names of two commands.
- void imap_sort (void)
  Sort the IMAP command table to be ready for binary searches.
- void imap_requeue (connection_t *con)
  Requeue an imap connection for processing, or log it out if there was an error or excess of protocol violations.
- void imap_process (connection_t *con)
  Perform client command processing on an established imap session.

5.292.1 Function Documentation

5.292.1.1 int_t imap_compare (const void * *compare*, const void * *command*)

Compare the names of two commands. commands.c

Note:

This is an internal function used to sort imap commands and search for them.

Parameters:

compare a pointer to the first command to be compared.

command a pointer to the second command to be compared.

Returns:

-1 if compare < command, 1 if command < compare, or 0 if the two commands are equal.

Definition at line 18 of file commands.c.

References command_t::length, PLACER, st_cmp_ci_eq(), st_cmp_ci_starts(), and command_t::string.

Referenced by imap_process(), and imap_sort().

5.292.1.2 void imap_process (connection_t * *con*)

Perform client command processing on an established imap session.

Note:

This function will read the next line of user input, parse the command, and then attempt to execute it with the appropriate handler.

Parameters:

con a pointer to the connection object underlying the imap session.

Returns:

This function returns no value.

Definition at line 61 of file commands.c.

References connection_t::command, command, con_print(), con_read_line(), con_write_bl(), server_t::cutoff, enqueue(), command_t::function, connection_t::imap, imap_command_parser(), imap_commands, imap_compare(), imap_invalid(), imap_logout(), imap_process(), imap_requeue(), command_t::length, connection_t::line, connection_t::network, pl_empty(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, st_char_get(), st_length_get(), st_length_int(), command_t::string, server_t::violations, and connection_t::violations.

Referenced by imap_process(), and imap_requeue().

5.292.1.3 void imap_requeue (connection_t * *con*)

Requeue an imap connection for processing, or log it out if there was an error or excess of protocol violations.

Parameters:

con a pointer to the connection object of the imap session.

Returns:

This function returns no value.

Definition at line 43 of file commands.c.

References con_status(), server_t::cutoff, enqueue(), imap_logout(), imap_process(), connection_t::protocol, connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by imap_init(), and imap_process().

5.292.1.4 void imap_sort (void)

Sort the IMAP command table to be ready for binary searches.

Returns:

This function returns no value.

Definition at line 33 of file commands.c.

References imap_commands, and imap_compare().

Referenced by protocol_init().

Functions

- dmtp_command_t ∗ dime_dmtp_command_create (dmtp_command_type_t type)

  Create a dmtp command structure.

- void dime_dmtp_command_destroy (dmtp_command_t ∗command)

  Destroy a dmtp command structure.

- sds dime_dmtp_command_format (dmtp_command_t ∗command)

  Formats the specified dmtp command into a sds string.

- dmtp_parse_state_t dime_dmtp_command_parse (sds comm_line, dmtp_command_t ∗∗comm_struct)

  Parse the provided sds string into a dmtp command structure.

- sds dime_dmtp_command_starttls (sds host, dmtp_mode_t mode)

  Create a string containing dmtp STARTTLS command with specified arguments.

- sds dime_dmtp_command_helo (sds host)

  Create a string containing dmtp HELO command with specified arguments.

- sds dime_dmtp_command_ehlo (sds host)

  Create a string containing dmtp EHLO command with specified arguments.

- sds dime_dmtp_command_mode (void)

  Create a string containing dmtp MODE command with specified arguments.

- sds dime_dmtp_command_rset (void)

  Create a string containing dmtp RSET command with specified arguments.

- sds dime_dmtp_command_noop (sds optarg1, sds optarg2, sds optarg3)

  Create a string containing dmtp NOOP command with specified arguments.

- sds dime_dmtp_command_help (void)

  Create a string containing dmtp HELP command with specified arguments.

- sds dime_dmtp_command_quit (void)

  Create a string containing dmtp QUIT command with specified arguments.

- sds dime_dmtp_command_mail (sds from, sds fingerprint)

  Create a string containing dmtp MAIL command with specified arguments.

- sds dime_dmtp_command_rcpt (sds to, sds fingerprint)

  Create a string containing dmtp RCPT command with specified arguments.

- sds dime_dmtp_command_data (void)

  Create a string containing dmtp DATA command with specified arguments.

- sds dime_dmtp_command_sgnt_user (sds address, sds fingerprint)

  Create a string containing dmtp SGNT command with specified arguments.

- sds dime_dmtp_command_sgnt_domain (sds domain, sds fingerprint)

  Create a string containing dmtp SGNT command with specified arguments.

- sds dime_dmtp_command_hist (sds address, sds start, sds stop)

  Create a string containing dmtp HIST command with specified arguments.

- sds dime_dmtp_command_vrfy_user (sds address, sds fingerprint)

  Create a string containing dmtp VRFY command with specified arguments.

- sds dime_dmtp_command_vrfy_domain (sds domain, sds fingerprint)

  Create a string containing dmtp VRFY command with specified arguments.

DMTP_VRFY

DMTP_COMMAND_INVALID

Definition at line 10 of file commands.h.

5.296.2.3 enum dmtp_mode_t

Enumerator:

DMTP_MODE_DMTP
DMTP_MODE_SMTP
DMTP_MODE_NONE
dmtp_mode_unknown
dmtp_mode_dual
dmtp_mode_dmtp
dmtp_mode_smtp
dmtp_mode_esmtp

Definition at line 35 of file commands.h.

5.296.2.4 enum dmtp_parse_state_t

Enumerator:

DMTP_PARSE_SUCCESS
DMTP_PARSE_INVALID_CALL
DMTP_PARSE_INTERNAL_ERROR
DMTP_PARSE_COMMAND_ERROR
DMTP_PARSE_ARGUMENT_ERROR

Definition at line 41 of file commands.h.

5.296.3 Function Documentation

5.296.3.1 dmtp_command_t∗ dime_dmtp_command_create (dmtp_command_type_t *type*)

Create a dmtp command structure.

Parameters:

type dmtp command enum.

Returns:

A newly created dmtp command structure with specified type and NULL args. dime_dmtp_command_destroy

Definition at line 1086 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.296.3.2 sds dime_dmtp_command_data (void)

Create a string containing dmtp DATA command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1671 of file commands.c.

References DMTP_DATA, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.296.3.3 void dime_dmtp_command_destroy (dmtp_command_t * *command*)

Destroy a dmtp command structure.

Parameters:

command dmtp command structure to be destroyed.

Definition at line 1099 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.296.3.4 sds dime_dmtp_command_ehlo (sds *host*)

Create a string containing dmtp EHLO command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1283 of file commands.c.

References dmtp_command_t::args, DMTP_EHLO, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.5 sds dime_dmtp_command_format (dmtp_command_t * *command*)

Formats the specified dmtp command into a sds string.

Parameters:

command Command to be formatted.

Returns:

sds string containing formatted command. sdsfree

Definition at line 1116 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.296.3.6 sds dime_dmtp_command_helo (sds *host*)

Create a string containing dmtp HELO command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1232 of file commands.c.

References dmtp_command_t::args, DMTP_HELO, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.7 sds dime_dmtp_command_help (void)

Create a string containing dmtp HELP command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1468 of file commands.c.

References DMTP_HELP, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.296.3.8 sds dime_dmtp_command_hist (sds *address*, sds *start*, sds *stop*)

Create a string containing dmtp HIST command with specified arguments.

Parameters:

address sds string containing user mail address.

start sds string containing optional starting user signet fingerprint. NULL if unwanted.

stop sds string containing optional ending user signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1832 of file commands.c.

References dmtp_command_t::args, DMTP_HIST, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.9 sds dime_dmtp_command_mail (sds *from*, sds *fingerprint*)

Create a string containing dmtp MAIL command with specified arguments.

Parameters:

from sds string containg origin domain.

fingerprint sds string containing origin signet full fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1547 of file commands.c.

References dmtp_command_t::args, DMTP_MAIL, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.10 sds dime_dmtp_command_mode (void)

Create a string containing dmtp MODE command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1332 of file commands.c.

References DMTP_MODE, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.296.3.11 sds dime_dmtp_command_noop (sds *optarg1*, sds *optarg2*, sds *optarg3*)

Create a string containing dmtp NOOP command with specified arguments.

Parameters:

optarg1 Optional allowed argument 1. NULL if unwanted.
optarg2 Optional allowed argument 2. NULL if unwanted.
optarg3 Optional allowed argument 3. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1412 of file commands.c.

References dmtp_command_t::args, DMTP_NOOP, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.12 dmtp_parse_state_t dime_dmtp_command_parse (sds *comm_line*, dmtp_command_t ** *comm_struct*)

Parse the provided sds string into a dmtp command structure.

Parameters:

command sds dmtp command string.

Returns:

A valid dmtp command structure on success, NULL on failure. dime_dmtp_command_destroy

Definition at line 1133 of file commands.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.296.3.13 sds dime_dmtp_command_quit (void)

Create a string containing dmtp QUIT command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1505 of file commands.c.

References DMTP_QUIT, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.296.3.14 sds dime_dmtp_command_rcpt (sds *to*, sds *fingerprint*)

Create a string containing dmtp RCPT command with specified arguments.

Parameters:

to sds string containg destination domain.
fingerprint sds string containing destination signet full fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1611 of file commands.c.

References dmtp_command_t::args, DMTP_RCPT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.15 sds dime_dmtp_command_rset (void)

Create a string containing dmtp RSET command with specified arguments.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1369 of file commands.c.

References DMTP_RSET, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, and PUSH_ERROR.

5.296.3.16 sds dime_dmtp_command_sgnt_domain (sds *domain*, sds *fingerprint*)

Create a string containing dmtp SGNT command with specified arguments.

Parameters:

domain sds string containing domain name.

fingerprint sds string containing optional organizational signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1771 of file commands.c.

References dmtp_command_t::args, DMTP_SGNT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.17 sds dime_dmtp_command_sgnt_user (sds *address*, sds *fingerprint*)

Create a string containing dmtp SGNT command with specified arguments.

Parameters:

address sds string containing mail address of the user.

fingerprint sds string containing optional user signet fingerprint. NULL if unwanted.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1712 of file commands.c.

References dmtp_command_t::args, DMTP_SGNT, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.18 sds dime_dmtp_command_starttls (sds *host*, dmtp_mode_t *mode*)

Create a string containing dmtp STARTTLS command with specified arguments.

Parameters:

host Name of the domain that is being connected to.

mode optional mode parameter (DMTP or SMTP). DMTP_MODE_NONE to not specify mode.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1154 of file commands.c.

References dmtp_command_t::args, DMTP_MODE_DMTP, DMTP_MODE_NONE, DMTP_MODE_SMTP, DMTP_STARTTLS, ERR_-BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, sdsdup(), and sdsnewlen().

5.296.3.19 sds dime_dmtp_command_vrfy_domain (sds *domain*, sds *fingerprint*)

Create a string containing dmtp VRFY command with specified arguments.

Parameters:

domain sds string containing domain name.

start sds string containing organizational signet fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1961 of file commands.c.

References dmtp_command_t::args, DMTP_VRFY, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.296.3.20 sds dime_dmtp_command_vrfy_user (sds *address*, sds *fingerprint*)

Create a string containing dmtp VRFY command with specified arguments.

Parameters:

address sds string containing user mail address.

start sds string containing user signet fingerprint.

Returns:

sds string containing the desired command. sdsfree

Definition at line 1897 of file commands.c.

References dmtp_command_t::args, DMTP_VRFY, ERR_BAD_PARAM, ERR_UNSPEC, PUBLIC_FUNC_PROLOGUE, PUSH_ERROR, and sdsdup().

5.326.1.10 int_t ed25519_verify (ed25519_key_t * *key*, stringer_t * *data*, stringer_t * *signature*)

Verify an Ed25519 signature using the EdDSA algorithm.

Parameters:

key The public signing key.

data The data being verified.

signature The signature.

Returns:

0 for sucessful signature verification, -1 for a signature verification failures, -2 for processing or parameter issue.

Definition at line 196 of file ed25519.c.

```

Functions

- signet_t * _get_signet (const char *name, const char *fingerprint, int use_cache)
- dmtp_session_t * _sgnt_resolv_dmtp_connect (const char *domain, int force_family)

  Establish a DMTP connection to the DX server of a provided dark domain.

- void _sgnt_resolv_destroy_dmtp_session (dmtp_session_t *session)

  Destroy a DMTP session and its underlying data.

- dmtp_session_t * _dx_connect_standard (const char *host, const char *domain, int force_family, dime_record_t *dimerec)

  Establish (force) a DMTP connection to a specified DX server on tcp port 26/ssl.

- dmtp_session_t * _dx_connect_dual (const char *host, const char *domain, int force_family, dime_record_t *dimerec, int failover)

  Establish a DMTP connection to a specified DX server that is running DMTP in dual mode (port 25).

- int _verify_dx_certificate (dmtp_session_t *session)

  Compare the TLS certificate presented by a remote host against the TLS certificate signature field of a DIME management record.

- char * _sgnt_resolv_dmtp_get_signet (dmtp_session_t *session, const char *signame, const char *fingerprint)

  Look up a named user or organizational signet.

- int _sgnt_resolv_dmtp_ehlo (dmtp_session_t *session, const char *domain)

  Issue an EHLO command to the remote DMTP server.

- int _sgnt_resolv_dmtp_mail_from (dmtp_session_t *session, const char *origin, size_t msgsize, dmtp_mail_rettype_t rettype, dmtp_mail_datatype_t dtype)

  Issue a MAIL FROM command to the remote DMTP server.

- int _sgnt_resolv_dmtp_rcpt_to (dmtp_session_t *session, const char *domain)

  Issue an RCPT TO command to the remote DMTP server.

- char * _sgnt_resolv_dmtp_data (dmtp_session_t *session, void *msg, size_t msglen)

  Issue an DATA command to the remote DMTP server.

- int _sgnt_resolv_dmtp_verify_signet (dmtp_session_t *session, const char *signame, const char *fingerprint, char **newprint)

  Verify whether a named user or org signet is current or not, given both its name and fingerprint.

- char * _sgnt_resolv_dmtp_history (dmtp_session_t *session, const char *signame, const char *startfp, const char *endfp)

Retrieve the history (key chain) of a named user or organizational signet.

- char * _sgnt_resolv_dmtp_stats (dmtp_session_t *session, const unsigned char *secret __attribute__((__unused__)))
- dmtp_mode_t _sgnt_resolv_dmtp_str_to_mode (const char *modestr)

  Return the DMTP mode corresponding to a DMTP mode string.

- dmtp_mode_t _sgnt_resolv_dmtp_get_mode (dmtp_session_t *session)

  Get the current DMTP server mode.

- int _sgnt_resolv_dmtp_noop (dmtp_session_t *session)

  Issue a no-operation command to the remote DMTP server.

- int _sgnt_resolv_dmtp_reset (dmtp_session_t *session)

  Issue a reset command to the remote DMTP server.

- char * _sgnt_resolv_dmtp_help (dmtp_session_t *session)

  Get a list of supported DMTP server commands by issuing the HELP command.

- int _sgnt_resolv_dmtp_quit (dmtp_session_t *session, int do_close)

  Terminate an active DMTP session by issuing the QUIT command.

- char * _sgnt_resolv_read_dmtp_line (dmtp_session_t *session, int *overflow, unsigned short *rcode, int *multiline)

  Read a CR/LF-terminated line of input from an active DMTP session.

- char * _sgnt_resolv_read_dmtp_multiline (dmtp_session_t *session, int *overflow, unsigned short *rcode)

  Read a multiple-line response from the DMTP server.

- char * _sgnt_resolv_parse_line_code (const char *line, unsigned short *rcode, int *multiline)

  Parse a DMTP line into a numerical code and the trailing text.

- dmtp_mode_t _sgnt_resolv_dmtp_initiate_starttls (dmtp_session_t *session, const char *dxname)

  Initiate a DMTP session over a plain TCP connection with the DMTP STARTTLS command.

- int _sgnt_resolv_dmtp_expect_banner (dmtp_session_t *session)

  Attempt to receive a valid DMTP banner immediately after a connection is established.

- int _sgnt_resolv_dmtp_issue_command (dmtp_session_t *session, const char *cmd)

  Issue a command to the remote server in a DMTP session.

- char * _sgnt_resolv_dmtp_send_and_read (dmtp_session_t *session, const char *cmd, unsigned short *rcode)

  Issue a command to a DMTP server and get the response.

- int _sgnt_resolv_dmtp_write_data (dmtp_session_t *session, const void *buf, size_t buflen)

  Write raw data to the remote end of a DMTP session.

5.349.1 Function Documentation

5.349.1.1 dmtp_session_t* _dx_connect_dual (const char * *host*, const char * *domain*, int *force_family*, dime_record_t * *dimerec*, int *failover*)

Establish a DMTP connection to a specified DX server that is running DMTP in dual mode (port 25).

Note:

This function should only be called externally with care.

Parameters:

host the hostname of the DX server to which the DMTP connection will be established.

domain the dark domain which the DX server is servicing.

force_family an optional address family (AF_INET or AF_INET6) to force the TCP connection to take.

dimerec an optional pointer to a DIME management record to be attached to the session.

failover if set, attempt to retry failed connections on the backup port (587).

Returns:

NULL on failure, or a pointer to a newly established DMTP session on success.

Definition at line 338 of file dmtp.c.

References _connect_host(), _dbgprint(), dmtp_session_t::_fd, _sgnt_resolv_destroy_dmtp_session(), _sgnt_resolv_dmtp_expect_banner(), _sgnt_resolv_dmtp_initiate_starttls(), dmtp_session_t::active, dmtp_mode_dmtp, dmtp_mode_dual, DMTP_PORT_DUAL, dmtp_session_t::domain, dmtp_session_t::drec, dmtp_session_t::dx, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dmtp_session_t::mode, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

5.349.1.2 dmtp_session_t* _dx_connect_standard (const char * *host*, const char * *domain*, int *force_family*, dime_record_t * *dimerec*)

Establish (force) a DMTP connection to a specified DX server on tcp port 26/ssl.

Note:

This function should only be called externally with care.

Parameters:

host the hostname of the DX server to which the DMTP connection will be established.

domain the dark domain which the DX server is servicing.

force_family an optional address family (AF_INET or AF_INET6) to force the TCP connection to take.

dimerec an optional pointer to a DIME management record to be attached to the session.

Returns:

NULL on failure, or a pointer to a newly established DMTP session on success.

5.349.1.3 signet_t* _get_signet (const char * *name*, const char * *fingerprint*, int *use_cache*)

Definition at line 15 of file dmtp.c.

References _add_cached_object(), _clear_error_stack(), _dbgprint(), _find_cached_object(), _get_cache_obj_data(), _save_cache_contents(), _sgnt_resolv_destroy_dmtp_session(), _sgnt_resolv_dmtp_connect(), _sgnt_resolv_dmtp_get_signet(), _verify_dx_certificate(), cached_data_signet, cached_stores, dime_sgnt_signet_b64_deserialize(), dime_sgnt_signet_destroy(), dime_sgnt_validate_all(), dmtp_session_t::drec, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, get_last_error(), org_signet, dime_record_t::pubkey, RET_ERROR_PTR, and SS_FULL.

5.349.1.4 void _sgnt_resolv_destroy_dmtp_session (dmtp_session_t * *session*)

Destroy a DMTP session and its underlying data.

Parameters:

session a pointer to the DMTP session to be destroyed/disconnected.

Definition at line 246 of file dmtp.c.

References _destroy_dime_record(), dmtp_session_t::_fd, dmtp_session_t::_inbuf, _ssl_disconnect(), dmtp_session_t::con, dmtp_session_t::domain, dmtp_session_t::drec, and dmtp_session_t::dx.

Referenced by _dx_connect_dual(), _dx_connect_standard(), and _get_signet().

5.349.1.5 dmtp_session_t* _sgnt_resolv_dmtp_connect (const char * *domain*, int *force_family*)

Establish a DMTP connection to the DX server of a provided dark domain.

Note:

This function automatically queries the DIME management record of the domain to determine the appropriate way to establish a connection to the domain's DX server. This is the function that should be used by all general callers.

Parameters:

domain a null-terminated string containing the specified dark domain.

force_family an optional address family (AF_INET or AF_INET6) to force the TCP connection to take.

Returns:

NULL if unable to establish a DMTP connection successfully, or a pointer to the DMTP session on success.

Definition at line 158 of file dmtp.c.

References _dbgprint(), _destroy_dime_record(), _dx_connect_dual(), _dx_connect_standard(), _get_dime_record(), _get_mx_records(), DMTP_MAX_MX_RETRIES, DMTP_PORT, DMTP_PORT_DUAL, dime_record_t::dx, ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_PTR, and dime_record_t::validated.

Referenced by _get_signet().

5.349.1.6 char* _sgnt_resolv_dmtp_data (dmtp_session_t * *session*, void * *msg*, size_t *msglen*)

Issue an DATA command to the remote DMTP server.

Definition at line 772 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), _sgnt_resolv_dmtp_write_data(), _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_FMT, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.349.1.7 int _sgnt_resolv_dmtp_ehlo (dmtp_session_t * *session*, const char * *domain*)

Issue an EHLO command to the remote DMTP server.

Parameters:

session a pointer to the DMTP session across which the EHLO command will be issued.

domain a null-terminated string containing the domain name that is the parameter to the EHLO command.

Returns:

0 if the EHLO command was issued and received successfully, or -1 on failure.

Definition at line 629 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_multiline(), _str_printf(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_INT.

5.349.1.8 int _sgnt_resolv_dmtp_expect_banner (dmtp_session_t * *session*)

Attempt to receive a valid DMTP banner immediately after a connection is established.

Parameters:

session a pointer to the DMTP session to have the server banner read.

Returns:

-1 on failure or 0 if a banner was succesfully received advertising DMTPv1 compatibility.

Definition at line 1667 of file dmtp.c.

References _dbgprint(), _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_INT.

Referenced by _dx_connect_dual(), and _dx_connect_standard().

5.349.1.9 dmtp_mode_t _sgnt_resolv_dmtp_get_mode (dmtp_session_t * *session*)

Get the current DMTP server mode.

Parameters:

session a pointer to the DMTP session across which the MODE command will be issued.

Returns:

the value of the current DMTP mode on success, or dmtp_mode_unknown on failure.

Definition at line 1105 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), _sgnt_resolv_dmtp_str_to_mode(), dmtp_mode_unknown, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_CUST.

5.349.1.10 char* _sgnt_resolv_dmtp_get_signet (dmtp_session_t * *session*, const char * *signame*, const char * *fingerprint*)

Look up a named user or organizational signet.

Note:

If the fingerprint parameter is omitted, the signet record returned by the server will be only for the current certificate.

Parameters:

session

signame the name of the requested organizational or user signet.

fingerprint if not NULL, an optional fingerprint that the returned signet MUST match.

Definition at line 551 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), chr_isspace, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_FMT, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _get_signet().

5.349.1.11 char* _sgnt_resolv_dmtp_help (dmtp_session_t * *session*)

Get a list of supported DMTP server commands by issuing the HELP command.

Parameters:

session a pointer to the DMTP session across which the HELP command will be issued.

Returns:

NULL on failure or a pointer to a string containing the full server help table on success.

Definition at line 1207 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_multiline(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_-ERROR_FMT, and RET_ERROR_PTR.

5.349.1.12 char* _sgnt_resolv_dmtp_history (dmtp_session_t * *session*, const char * *signame*, const char * *startfp*, const char * *endfp*)

Retrieve the history (key chain) of a named user or organizational signet.

Parameters:

session a pointer to the DMTP session across which the HIST command will be issued.

signame the name of the user or organizational signet to have its history retrieved.

startfp the starting fingerprint of the signet in the queried chain of custody.

endfp the ending fingerprint of the signet in the queried chain of custody.

Returns:

NULL on failure, or a pointer to a string containing the signet's history on success.

Definition at line 941 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_multiline(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_-ERROR_FMT, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.349.1.13 dmtp_mode_t _sgnt_resolv_dmtp_initiate_starttls (dmtp_session_t * *session*, const char * *dxname*)

Initiate a DMTP session over a plain TCP connection with the DMTP STARTTLS command.

Note:

The dxname argument will be used as a parameter to the STARTTLS command for requesting a TLS certificate explcitly by hostname.

Parameters:

session a pointer to the DMTP session to have its transport security upgraded with TLS.

dxname the name of the DX server providing the TLS service of this DMTP session.

Returns:

dmtp_mode_unknown on failure or the active mode of the DMTP session as reported by the server on success.

Definition at line 1585 of file dmtp.c.

References dmtp_session_t::_fd, _sgnt_resolv_dmtp_str_to_mode(), _sgnt_resolv_read_dmtp_line(), _sgnt_resolv_read_dmtp_multiline(), _ssl_starttls(), chr_isspace, dmtp_session_t::con, dmtp_mode_dmtp, dmtp_mode_unknown, ERR_BAD_PARAM, ERR_UNSPEC, dmtp_-session_t::mode, PUSH_ERROR_FMT, and RET_ERROR_CUST.

Referenced by _dx_connect_dual().

5.349.1.14 int _sgnt_resolv_dmtp_issue_command (dmtp_session_t * *session*, const char * *cmd*)

Issue a command to the remote server in a DMTP session.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

Returns:

-1 on failure or 0 if the command was successfully sent.

Definition at line 1715 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::con, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and SSL_write_d.

Referenced by _sgnt_resolv_dmtp_ehlo(), _sgnt_resolv_dmtp_help(), _sgnt_resolv_dmtp_history(), _sgnt_resolv_dmtp_send_and_read(), and _sgnt_resolv_dmtp_stats().

5.349.1.15 int _sgnt_resolv_dmtp_mail_from (dmtp_session_t * *session*, const char * *origin*, size_t *msgsize*, dmtp_mail_rettype_t *rettype*, dmtp_mail_datatype_t *dtype*)

Issue a MAIL FROM command to the remote DMTP server.

Definition at line 667 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), _str_printf(), data_type_7bit, data_type_8bit, data_type_default, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_FMT, RET_ERROR_INT, return_type_default, return_type_display, return_type_full, and return_type_header.

5.349.1.16 int _sgnt_resolv_dmtp_noop (dmtp_session_t * *session*)

Issue a no-operation command to the remote DMTP server.

Parameters:

session a pointer to the DMTP session across which the NOOP command will be issued.

Returns:

-1 on failure or 0 if the command was successfully executed.

Definition at line 1151 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_INT.

5.349.1.17 int _sgnt_resolv_dmtp_quit (dmtp_session_t * *session*, int *do_close*)

Terminate an active DMTP session by issuing the QUIT command.

Parameters:

session a pointer to the DMTP session across which the QUIT command will be issued.

do_close currently unused

Returns:

-1 on failure or 0 if the command was successfully executed.

Definition at line 1238 of file dmtp.c.

References dmtp_session_t::_fd, _sgnt_resolv_dmtp_send_and_read(), _ssl_disconnect(), dmtp_session_t::active, dmtp_session_t::con, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR, PUSH_ERROR_FMT, and RET_ERROR_INT.

5.349.1.18 int _sgnt_resolv_dmtp_rcpt_to (dmtp_session_t * *session*, const char * *domain*)

Issue an RCPT TO command to the remote DMTP server.

Parameters:

session a pointer to the DMTP session across which the RCPT TO command will be issued.

domain a null-terminated string containing the domain name that is the parameter to the RCPT TO command.

Returns:

0 if the RCPT TO command was issued and received successfully, or -1 on failure.

Definition at line 739 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), _str_printf(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_INT.

5.349.1.19 int _sgnt_resolv_dmtp_reset (dmtp_session_t * *session*)

Issue a reset command to the remote DMTP server.

Parameters:

session a pointer to the DMTP session across which the RSET command will be issued.

Returns:

-1 on failure or 0 if the command was successfully executed.

Definition at line 1179 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_INT.

5.349.1.20 char* _sgnt_resolv_dmtp_send_and_read (dmtp_session_t * *session*, const char * *cmd*, unsigned short * *rcode*)

Issue a command to a DMTP server and get the response.

Parameters:

session a pointer to the DMTP session across which the command will be issued.

cmd a null-terminated string containing the value of the specified DMTP command.

rcode

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server on success.

Definition at line 1756 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_UNSPEC, and RET_ERROR_PTR.

Referenced by _sgnt_resolv_dmtp_data(), _sgnt_resolv_dmtp_get_mode(), _sgnt_resolv_dmtp_get_signet(), _sgnt_resolv_dmtp_mail_from(), _sgnt_resolv_dmtp_noop(), _sgnt_resolv_dmtp_quit(), _sgnt_resolv_dmtp_rcpt_to(), _sgnt_resolv_dmtp_reset(), and _sgnt_resolv_dmtp_verify_signet().

5.349.1.21 char* _sgnt_resolv_dmtp_stats (dmtp_session_t * *session*, const unsigned char *secret __*attribute*__(__unused__))

Definition at line 991 of file dmtp.c.

References _sgnt_resolv_dmtp_issue_command(), _sgnt_resolv_read_dmtp_multiline(), _str_printf(), chr_isspace, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_FMT, and RET_ERROR_PTR.

5.349.1.22 dmtp_mode_t _sgnt_resolv_dmtp_str_to_mode (const char * *modestr*)

Return the DMTP mode corresponding to a DMTP mode string.

Parameters:

modestr a null-terminated string containing the human-readable name of the mode.

Returns:

the DMTP mode type corresponding to the supplied mode string, or dmtp_mode_unknown otherwise.

Definition at line 1083 of file dmtp.c.

References dmtp_mode_dmtp, dmtp_mode_esmtp, dmtp_mode_smtp, and dmtp_mode_unknown.

Referenced by _sgnt_resolv_dmtp_get_mode(), and _sgnt_resolv_dmtp_initiate_starttls().

5.349.1.23 int _sgnt_resolv_dmtp_verify_signet (dmtp_session_t * *session*, const char * *signame*, const char * *fingerprint*, char ** *newprint*)

Verify whether a named user or org signet is current or not, given both its name and fingerprint.

Parameters:

session a pointer to the DMTP session across which the VRFY command will be issued.

signame the name of the user or organizational signet to be verified.

fingerprint the fingerprint of the signet to be checked for updates.

newprint an optional pointer to a string which will be updated to point to the latest fingerprint of the specified signet, if it is out of date.

Returns:

-1 on general failure, 0 if the signet fingerprint was out of date, or 1 if it is the most current one.

Definition at line 870 of file dmtp.c.

References _sgnt_resolv_dmtp_send_and_read(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_FMT, PUSH_ERROR_-SYSCALL, RET_ERROR_INT, and status.

5.349.1.24 int _sgnt_resolv_dmtp_write_data (dmtp_session_t * *session*, const void * *buf*, size_t *buflen*)

Write raw data to the remote end of a DMTP session.

Parameters:

session a pointer to the DMTP session to which the data will be written.

buf a pointer to the buffer containing the raw data to be written.

buflen the size, in bytes, of the data buffer to be written to the DMTP session.

Returns:

0 if all requested bytes were written successfully to the connection, or -1 on failure.

Definition at line 1783 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::con, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, and SSL_write_d.

Referenced by _sgnt_resolv_dmtp_data().

5.349.1.25 char* _sgnt_resolv_parse_line_code (const char * *line*, unsigned short * *rcode*, int * *multiline*)

Parse a DMTP line into a numerical code and the trailing text.

Parameters:

line a pointer to a null-terminated string to be parsed as a DMTP response line or lines.

rcode an opointer to a variable that will receive the numeric response code of the DMTP reply.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1524 of file dmtp.c.

References chr_isspace, ERR_BAD_PARAM, ERR_UNSPEC, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _sgnt_resolv_read_dmtp_line().

5.349.1.26 char* _sgnt_resolv_read_dmtp_line (dmtp_session_t * *session*, int * *overflow*, unsigned short * *rcode*, int * *multiline*)

Read a CR/LF-terminated line of input from an active DMTP session.

Parameters:

session a pointer to the DMTP session from which the response line will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

multiline an optional parameter that if set will permit multiline DMTP responses. If this was the final line of a multiline response, the value will be set to 1 when the function returns, or 0 if there is more content to follow.

Returns:

NULL on failure or a pointer to a string containing the next line(s) of output from the DMTP server.

Definition at line 1292 of file dmtp.c.

References _dbgprint(), dmtp_session_t::_fd, dmtp_session_t::_inbuf, dmtp_session_t::_inpos, _sgnt_resolv_parse_line_code(), _ssl_disconnect(), dmtp_session_t::active, dmtp_session_t::con, dmtp_mode_dmtp, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dmtp_session_t::mode, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and SSL_read_d.

Referenced by _sgnt_resolv_dmtp_data(), _sgnt_resolv_dmtp_expect_banner(), _sgnt_resolv_dmtp_initiate_starttls(), _sgnt_resolv_dmtp_send_and_read(), and _sgnt_resolv_read_dmtp_multiline().

5.349.1.27 char* _sgnt_resolv_read_dmtp_multiline (dmtp_session_t * *session*, int * *overflow*, unsigned short * *rcode*)

Read a multiple-line response from the DMTP server.

Note:

A multiline response is designated by the presence of a hyphen between the response code and the respones text. A regular response, or the final line of a multiline response will instead have a space.

Parameters:

session a pointer to the DMTP session from which the response line(s) will be read.

overflow an optional pointer to a variable that will be set if the read operation exceeds the size of the internal line buffer.

rcode an optional pointer to a variable that will receive the numeric response code of the DMTP reply that was just received.

Returns:

NULL on failure or a pointer to a string containing the next response from the DMTP server on success.

Definition at line 1443 of file dmtp.c.

References _sgnt_resolv_read_dmtp_line(), ERR_BAD_PARAM, ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _sgnt_resolv_dmtp_ehlo(), _sgnt_resolv_dmtp_help(), _sgnt_resolv_dmtp_history(), _sgnt_resolv_dmtp_initiate_starttls(), and _sgnt_resolv_dmtp_stats().

5.349.1.28 int _verify_dx_certificate (dmtp_session_t ∗ *session*)

Compare the TLS certificate presented by a remote host against the TLS certificate signature field of a DIME management record.

Note:

This function accomplishes a number of steps in the following order: 1. If the DIME record has a TLS certificate signature field, perform a comparison of it against the remote peer's certificate. 2. If necessary, perform x509 chain validation against the certificate. 3. If necessary, verify that the certificate has not been revoked by issuing an OCSP request.

Parameters:

session a pointer to the DMTP session to have its TLS certificate verified.

Returns:

-1 on general error, 0 if the connection's TLS certificate failed verification, and 1 if the certificate passed verification.

Definition at line 404 of file dmtp.c.

References _dbgprint(), _do_ocsp_validation(), _do_x509_hostname_check(), _do_x509_validation(), _ed25519_verify_sig(), _get_x509_-cert_sha_hash(), dmtp_session_t::con, dmtp_session_t::drec, dmtp_session_t::dx, ERR_BAD_PARAM, ERR_UNSPEC, dime_record_-t::pubkey, ED25519_KEY::public_key, PUSH_ERROR_OPENSSL, RET_ERROR_INT, SHA_512_SIZE, SSL_get_peer_cert_chain_d, SSL_get_peer_certificate_d, dime_record_t::tlssig, dime_record_t::validated, and X509_check_issued_d.

Referenced by _get_signet().

  The start of the protocol handler for the DMTP server.

5.350.1 Function Documentation

5.350.1.1 void dmtp_data (connection_t * *con*)

Process an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 123 of file dmtp.c.

References con_write_bl(), and dmtp_requeue().

Referenced by dmtp_process().

5.350.1.2 void dmtp_ehlo (connection_t * *con*)

Process an DMTP EHLO command. dmtp.c

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 15 of file dmtp.c.

References con_print(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

5.350.1.3 void dmtp_helo (connection_t * *con*)

Process an DMTP HELO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 28 of file dmtp.c.

References con_print(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

5.350.1.4 void dmtp_help (connection_t * *con*)

Definition at line 158 of file dmtp.c.

References con_write_bl().

5.350.1.5 void dmtp_hist (connection_t * *con*)

Definition at line 144 of file dmtp.c.

References con_write_bl().

5.350.1.6 void dmtp_init (connection_t * *con*)

The start of the protocol handler for the DMTP server.

Parameters:

con the new inbound DMTP client connection.

Returns:

This function returns no value.

Definition at line 175 of file dmtp.c.

References con_print(), con_reverse_enqueue(), dmtp_requeue(), server_t::domain, connection_t::server, st_char_get(), and st_length_int().

Referenced by protocol_enqueue().

5.350.1.7 void dmtp_invalid (connection_t ∗ *con*)

A function that is executed when an invalid DMTP command is executed.

Returns:

This function returns no value.

Definition at line 52 of file dmtp.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by dmtp_process().

5.350.1.8 void dmtp_mail (connection_t ∗ *con*)

Specify the origin domain for a message in response to an DMTP MAIL command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 111 of file dmtp.c.

References con_write_bl().

5.350.1.9 void dmtp_mode (connection_t ∗ *con*)

Definition at line 130 of file dmtp.c.

References con_write_bl().

5.350.1.10 void dmtp_noop (connection_t ∗ *con*)

Perform an DMTP NOOP (no-operation) command.

Note:

This command does essentially nothing and is mostly a way to keep connections alive without timing out due to inactivity.

Returns:

This function returns no value.

Definition at line 42 of file dmtp.c.

References con_write_bl().

5.350.1.11 void dmtp_quit (connection_t * *con*)

Gracefully terminate an DMTP session, especially in response to an DMTP QUIT command.

Parameters:

the DMTP client connection to be terminated.

Returns:

This functi::include "smtp/smtp.h"on returns no value.

Definition at line 65 of file dmtp.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by dmtp_process(), and dmtp_requeue().

5.350.1.12 void dmtp_rcpt (connection_t * *con*)

Specify the destination domain for a message in response to an DMTP RCPT command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 100 of file dmtp.c.

References con_write_bl().

5.350.1.13 void dmtp_rset (connection_t * *con*)

Reset the DMTP session, in response to an DMTP RSET command.

Note:

This command clears any sender, recipient, and mail data, along with all buffers and state tables. The connection structure is reset to the same it was in immediately after the HELO/EHLO command.

Parameters:

con the DMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 88 of file dmtp.c.

References con_write_bl(), and dmtp_session_reset().

5.350.1.14 void dmtp_sgnt (connection_t * *con*)

Definition at line 137 of file dmtp.c.

References con_write_bl().

5.350.1.15 void dmtp_verb (connection_t * *con*)

Definition at line 164 of file dmtp.c.

```
#include "dime/signet-resolver/dns.h"
#include "dime/signet-resolver/cache.h"
#include "dime/common/misc.h"
#include "dime/common/error.h"
#include "providers/symbols.h"
```

Defines

- #define INITIALIZE_DNS() { if (!_dns_initialized && (_initialize_resolver() < 0)) { RET_ERROR_PTR(ERR_UNSPEC, "failed to initialize DNS resolver"); } }

Functions

- size_t _mem_append_canon (unsigned char **buf, size_t *blen, const char *name)

  Append a DNS label in uncompressed, canonical format to a dynamic buffer.

- unsigned int _get_keytag (const unsigned char *rdata, size_t rdlen)

  Calculate the keytag value for a DNSKEY resource record.

- RSA * _get_rsa_dnskey (const unsigned char *rdptr, size_t rdlen)

  Extract an RSA public key from a DNSKEY resource record.

- int _rsa_verify_record (const char *label, unsigned char algorithm, RSA *pubkey, const unsigned char *rrsig, const unsigned char *sigbuf, size_t siglen, ns_msg *dhandle)

  Verify that an RRSIG record has been signed properly using a given RSA public key.

- int _load_dnskey_file (const char *filename)

  Load a collection of DNS key(s) from a config file (into the object cache).

- int _is_validated_key (dnskey_t *dk)

  Trace a DNSKEY backwards through its DS entry to the root, to see if it is validated.

- int _compute_dnskey_sha_hash (const dnskey_t *key, size_t nbits, unsigned char *outbuf)

  Perform a SHA-family hash against a DNSKEY public key.

- dnskey_t * _add_dnskey_entry_rsa (const char *label, uint16_t flags, unsigned char algorithm, RSA *pubkey, unsigned int keytag, const unsigned char *rdata, size_t rdlen, unsigned long ttl, unsigned int do_cache, int forced)

  Create and add a new RSA DNSKEY entry to the object cache.

- ds_t * _add_ds_entry (const char *label, unsigned int keytag, unsigned char algorithm, unsigned char digest_type, const unsigned char *digest, size_t dlen, unsigned long ttl)

  Create and add a new DS entry to the object cache.

- dnskey_t * _get_dnskey_by_tag (unsigned int tag, const char *signer, int force_lookup)

  Find a DNSKEY entry by its keytag value.

- ds_t * _get_ds_by_dnskey (const dnskey_t *key)

  Look up a DS record by its matching DNSKEY record.

- int _dnskey_tag_comparator (const void *object, const void *key)

  An object cache callback for comparing two DNSKEY records based on tag value.

- int _dnskey_domain_comparator (const void *object, const void *key)

  An object cache callback for comparing two DNSKEY records based on domain label.

- int _ds_comparator (const void *object, const void *key)

  An object cache callback for comparing two DS records for general equivalence.

- void _destroy_dnskey (dnskey_t *key)

  Free a DNSKEY object and its underlying data.

- void _destroy_ds (ds_t *ds)

  Free a DS object and its underlying data.

- dnskey_t * _add_dnskey_entry (const char *label, const unsigned char *buf, size_t len, unsigned long ttl)

  Create and add a new DNSKEY entry to the object cache.

- int _validate_rrsig_rr (const char *label, ns_msg *dhandle, unsigned short covered, const unsigned char *rdata, size_t rdlen, dnskey_t **outkey)

  Verify the signature provided by an RRSIG record.

- void _dump_dns_header (ns_msg *handle)

  Dump the contents of a DNS reply header.

- void * _lookup_dnskey (const char *label)
- void * _lookup_ds (const char *label)

  Lookup the DS record for a specified domain.

- char * _get_txt_record (const char *qstring, unsigned long *ttl, int *validated)

  Get the answer to a DNS TXT record query.

- void _free_mx_records (mx_record_t **mxs)

  Free a collection of MX records returned by _get_mx_records().

- mx_record_t ** _get_mx_records (const char *qstring)

  Retrieve the collection of MX records for a given domain.

- int _initialize_resolver (void)

  Initialize the DNS resolver subsystem.

- void _destroy_dnskey_record_cb (void *record)

  A callback handler to destroy a DNSKEY record.

- void _dump_dnskey_record_cb (FILE *fp, void *record, int brief)

  A callback handler to dump a DNSKEY record to the console.

- void _destroy_ds_record_cb (void *record)

  A callback handler to destroy a DS record.

- void _dump_ds_record_cb (FILE *fp, void *record, int brief)

  A callback handler to dump a DS record to a file.

- void * _deserialize_ds_record_cb (void *data, size_t len)

  A callback handler to deserialize a DS record from the object cache.

- void * _serialize_ds_record_cb (void *record, size_t *outlen)

  A callback record to serialize a DS record for storage in the object cache.

- void * _deserialize_dnskey_record_cb (void *data, size_t len)

  A callback handler to deserialize a DNSKEY record.

- void * _serialize_dnskey_record_cb (void *record, size_t *outlen)

  A callback handler to serialize a DNSKEY record.

- void * _clone_dnskey_record_cb (void *record)
- void _fixup_ds_links (void)

  Link any DNSKEY entries in the cache with dangling DS pointers to the right place.

- void _fixup_dnskey_validation (void)

  Mark as validated any DNSKEY entries in the object cache that should be but aren't.

- int _sort_rrs_canonical (ns_msg *dhandle, int *ordbuf, size_t nanswers)

  Sort the RRs in an RRSET into canonical order for DNSSEC signature verification.

- int _compare_rdata (const unsigned char *rdata1, size_t rdlen1, const unsigned char *rdata2, size_t rdlen2)

  Compare two RR's, for the purpose of allowing for canonical ordering within an RRSET.

- char * _get_signing_key_names (dnskey_t **keys)

  Get the names of a collection of signing DNSKEYs for human display.

5.352.1 Define Documentation

5.352.1.1 #define INITIALIZE_DNS() { if (!_dns_initialized && (_initialize_resolver() < 0)) { RET_ERROR_PTR(ERR_UNSPEC, "failed to initialize DNS resolver"); } }

Definition at line 9 of file dns.c.

Referenced by _get_mx_records(), and _get_txt_record().

5.352.2 Function Documentation

5.352.2.1 dnskey_t* _add_dnskey_entry (const char * *label*, const unsigned char * *buf*, size_t *len*, unsigned long *ttl*)

Create and add a new DNSKEY entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified key.

buf a pointer to the beginning of the DNSKEY's RR rdata.

len the length, in bytes, of the DNSKEY RR's rdata.

ttl the TTL value indicated by the DNSKEY resource record.

Definition at line 1140 of file dns.c.

References _add_dnskey_entry_rsa(), _dbgprint(), _fixup_dnskey_validation(), _get_keytag(), _get_rsa_dnskey(), dnskey_rr_flags_t, DNSKEY_RR_PROTO, ERR_BAD_PARAM, ERR_UNSPEC, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _lookup_dnskey().

5.352.2.2 dnskey_t* _add_dnskey_entry_rsa (const char * *label*, uint16_t *flags*, unsigned char *algorithm*, RSA * *pubkey*, unsigned int *keytag*, const unsigned char * *rdata*, size_t *rdlen*, unsigned long *ttl*, unsigned int *do_cache*, int *forced*)

Create and add a new RSA DNSKEY entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified key.

flags a bitmask of flags corresponding to the DNSKEY's RR flags field.

algorithm the value of the DNSKEY's RR algorithm field.

pubkey a pointer to an RSA public key used to validate signatures made by this key.

keytag a numerical value linking this to other RRSIG or DS records.

rdata a pointer to the beginning of this DNSKEY's RR rdata.

rdlen the length, in bytes, of the DNSKEY's RR rdata.

ttl the TTL value indicated by the DNSKEY resource record.

do_cache if set, the new object cache entry for this DNSKEY can be persisted to the cache file.

forced if set, this entry will forcibly replace (overshadow) any clashing or matching existing DNSKEY entry inside the object cache.

Returns:

NULL on failure, or a pointer to the new DNSKEY object cache entry on success.

Definition at line 698 of file dns.c.

References _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _destroy_dnskey(), _dnskey_tag_comparator(), _get_cache_obj_data(), dnskey::algorithm, cached_data_dnskey, cached_stores, DNSKEY_RR_FLAG_SEP, DNSKEY_RR_FLAG_ZK, dnskey::do_cache, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, and RET_ERROR_PTR.

Referenced by _add_dnskey_entry(), and _load_dnskey_file().

5.352.2.3 ds_t* _add_ds_entry (const char * *label*, unsigned int *keytag*, unsigned char *algorithm*, unsigned char *digest_type*, const unsigned char * *digest*, size_t *dlen*, unsigned long *ttl*)

Create and add a new DS entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified DS record.

keytag a numerical value identifying the DNSKEY entry linked to this record.

algorithm the value of the DS's RR algorithm field.

digest_type the value of the DS's RR digest type field.

digest a pointer to a buffer containing the DS record's digest data.

dlen the size, in bytes, of the DS record's digest.

ttl the TTL value indicated by the DS resource record.

Returns:

NULL on failure, or a pointer to the new DS object cache entry on success.

Definition at line 796 of file dns.c.

References _add_cached_object_cmp(), _destroy_ds(), _ds_comparator(), _fixup_ds_links(), _get_cache_obj_data(), ds::algorithm, cached_-data_ds, cached_stores, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, ds::keytag, ds::label, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _lookup_ds().

5.352.2.4 void* _clone_dnskey_record_cb (void * *record*)

Definition at line 2383 of file dns.c.

References _destroy_dnskey(), _ptr_chain_clone(), dnskey::algorithm, dnskey::dse, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, RSAPublicKey_dup_d, dnskey::signkeys, and dnskey::validated.

5.352.2.5 int _compare_rdata (const unsigned char * *rdata1*, size_t *rdlen1*, const unsigned char * *rdata2*, size_t *rdlen2*)

Compare two RR's, for the purpose of allowing for canonical ordering within an RRSET.

Note:

This function is used to sort resource records for the reliable validation of RRSIG records.
According to Section 6.3 of RFC 4034 ("Canonical RR Ordering within an RRSET"): This is treated as a left-justified octet sequence where the absence of an octet sorts before a zero octet.

Parameters:

rdata1 a pointer to the beginning of the first resource record's rdata.

rdlen1 the length, in bytes, of the first resource record's rdata.

rdata2 a pointer to the beginning of the second resource record's rdata.

rdlen2 the length, in bytes, of the second resource record's rdata.

Returns:

-1 if rdata1 < rdata2, 1 if rdata2 > rdata1, or 0 if the two resource records were equal.

Definition at line 2574 of file dns.c.

Referenced by _sort_rrs_canonical().

5.352.2.6 int _compute_dnskey_sha_hash (const dnskey_t * *key*, size_t *nbits*, unsigned char * *outbuf*)

Perform a SHA-family hash against a DNSKEY public key.

See also:

compuute_sha_hash()

Note:

This hash value is the data that is used to link a DNSKEY to its corresponding DS record.
According to section 5.1.4 of RFC 4034, the digest is taken over the concatenation of: the owner name of the DNSKEY record in canonical form, with the DSNKEY rdata appended.

Parameters:

key a pointer to the DNSKEY record to be hashed.

nbits the number of bits to be used for the SHA hash (160, 256, or 512).

outbuf a pointer to the output buffer of size nbits bits to receive the DNSKEY hash value.

Returns:

-1 on general error or 0 on success.

Definition at line 654 of file dns.c.

References _compute_sha_hash(), _mem_append(), _mem_append_canon(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::label, dnskey::rdata, dnskey::rdlen, and RET_ERROR_INT.

Referenced by _dump_dnskey_record_cb(), _get_ds_by_dnskey(), and _lookup_ds().

5.352.2.7 void* _deserialize_dnskey_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a buffer containing the data to be deserialized.

len the length, in bytes, of the data buffer to be deserialized.

Returns:

a pointer to a newly allocated dnskey_t structure on success, or NULL on failure.

Definition at line 2263 of file dns.c.

References _decode_rsa_pubkey(), _deserialize_data(), _deserialize_string(), _deserialize_vardata(), _destroy_dnskey(), dnskey::algorithm, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, and dnskey::validated.

5.352.2.8 void* _deserialize_ds_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DS record from the object cache.

Definition at line 2197 of file dns.c.

References _deserialize_data(), _deserialize_string(), _deserialize_vardata(), _destroy_ds(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, ds::keytag, ds::label, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and ds::validated.

5.352.2.9 void _destroy_dnskey (dnskey_t * *key*)

Free a DNSKEY object and its underlying data.

Parameters:

key a pointer to the DNSKEY object to be destroyed.

Definition at line 1071 of file dns.c.

References dnskey::dse, dnskey::label, dnskey::pubkey, dnskey::rdata, RSA_free_d, and dnskey::signkeys.

Referenced by _add_dnskey_entry_rsa(), _clone_dnskey_record_cb(), _deserialize_dnskey_record_cb(), and _destroy_dnskey_record_cb().

5.352.2.10 void _destroy_dnskey_record_cb (void * *record*)

A callback handler to destroy a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DNSKEY structure to be destroyed.

Definition at line 2032 of file dns.c.

References _destroy_dnskey().

5.352.2.11 void _destroy_ds (ds_t * *ds*)

Free a DS object and its underlying data.

Parameters:

ds a pointer to the DS object to be destroyed.

Definition at line 1108 of file dns.c.

References ds::digest, ds::label, and ds::signkeys.

Referenced by _add_ds_entry(), _deserialize_ds_record_cb(), and _destroy_ds_record_cb().

5.352.2.12 void _destroy_ds_record_cb (void * *record*)

A callback handler to destroy a DS record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DS structure to be destroyed.

Definition at line 2147 of file dns.c.

References _destroy_ds().

5.352.2.13 int _dnskey_domain_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DNSKEY records based on domain label.

Returns:

-1 if a < b, 1 if b > a, or 0 if the records were equivalent.

Definition at line 996 of file dns.c.

References dnskey::label.

Referenced by _load_dnskey_file().

5.352.2.14 int _dnskey_tag_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DNSKEY records based on tag value.

Note:

This function also checks to make sure that the domain labels match as well.

Parameters:

object a pointer to the DNSKEY cache entry to be compared against the key.

key a pointer to a key value to be compared against the object.

Returns:

-1 if a < b, 1 if b > a, or 0 if the records were equivalent.

Definition at line 962 of file dns.c.

References dnskey::keytag, and dnskey::label.

Referenced by _add_dnskey_entry_rsa(), and _get_dnskey_by_tag().

5.352.2.15 int _ds_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DS records for general equivalence.

Note:

This function is used to map a DNSKEY record to a DS record.

Definition at line 1021 of file dns.c.

References ds::digest, ds::diglen, ds::keytag, and ds::label.

Referenced by _add_ds_entry(), and _get_ds_by_dnskey().

5.352.2.16 void _dump_dns_header (ns_msg * *handle*)

Dump the contents of a DNS reply header.

Parameters:

handle a pointer to the DNS reply to have its header dumped to the console.

Definition at line 1297 of file dns.c.

References _dbgprint().

Referenced by _get_mx_records(), _get_txt_record(), _lookup_dnskey(), and _lookup_ds().

5.352.2.17 void _dump_dnskey_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DNSKEY record to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the DNSKEY structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 2045 of file dns.c.

References _clear_error_stack(), _compute_dnskey_sha_hash(), _count_ptr_chain(), _dump_buf(), _get_signing_key_names(), _is_validated_key(), dnskey::algorithm, DNSSEC_DIGEST_SHA1, DNSSEC_DIGEST_SHA256, dnskey::dse, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, dnskey::rdlen, SHA_160_SIZE, SHA_256_SIZE, SHA_512_SIZE, and dnskey::signkeys.

5.352.2.18 void _dump_ds_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DS record to a file.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp the file to which the DS record is dumped.

record a pointer to the DS structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 2160 of file dns.c.

References _dump_buf(), _get_signing_key_names(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ds::keytag, ds::label, ds::signkeys, and ds::validated.

5.352.2.19 void _fixup_dnskey_validation (void)

Mark as validated any DNSKEY entries in the object cache that should be but aren't.

Note:

The retrieval of a new, validated DNSKEY can mean that another DNSKEY in the cache that was signed by it will now be validated by virtue of transitivity.

Definition at line 2469 of file dns.c.

References _is_validated_key(), _lock_cache_store(), _unlock_cache_store(), cached_data_dnskey, cached_stores, cached_object::data, dnskey::do_cache, cached_store_t::head, cached_object::next, cached_object::persists, store, and dnskey::validated.

Referenced by _add_dnskey_entry(), and _get_txt_record().

5.352.2.20 void _fixup_ds_links (void)

Link any DNSKEY entries in the cache with dangling DS pointers to the right place.

Note:

This function should be used after the retrieval of new records, or after a cache load.

Definition at line 2441 of file dns.c.

Referenced by _add_ds_entry().

5.352.2.21 void _free_mx_records (mx_record_t ** *mxs*)

Free a collection of MX records returned by _get_mx_records().

Parameters:

mxs the array of MX records to be freed.

Definition at line 1837 of file dns.c.

5.352.2.22 dnskey_t* _get_dnskey_by_tag (unsigned int *tag*, const char * *signer*, int *force_lookup*)

Find a DNSKEY entry by its keytag value.

Parameters:

tag the semi-unique keytag value identifying the target DNSKEY entry.

signer a null-terminated string containing the name of the signing domain that owns the DNSKEY entry.

force_lookup if set, perform a live-lookup of any DNSKEY entry that could not be located by keytag; otherwise, lookups will be restricted only to the object cache.

Returns:

a pointer to the specified DNSKEY record if it was found, or NULL on error or if it wasn't.

Definition at line 868 of file dns.c.

References _clear_error_stack(), _dbgprint(), _dnskey_tag_comparator(), _find_cached_object_cmp(), _get_cache_obj_data(), _lookup_dnskey(), _lookup_ds(), cached_data_dnskey, cached_stores, ERR_BAD_PARAM, IS_ROOT_LABEL, dnskey::keytag, dnskey::label, and RET_ERROR_PTR.

Referenced by _lookup_ds(), and _validate_rrsig_rr().

5.352.2.23 ds_t* _get_ds_by_dnskey (const dnskey_t * *key*)

Look up a DS record by its matching DNSKEY record.

Parameters:

key a pointer to the DNSKEY record that will be used to find the matching DS record.

Returns:

a pointer to the matching DS record on success or NULL on failure.

Definition at line 912 of file dns.c.

References _clear_error_stack(), _compute_dnskey_sha_hash(), _ds_comparator(), _find_cached_object_cmp(), _get_cache_obj_data(), dnskey::algorithm, ds::algorithm, cached_data_ds, cached_stores, ds::digest, ds::digest_type, ds::diglen, DNSSEC_DIGEST_SHA1, DNSSEC_DIGEST_SHA256, ERR_BAD_PARAM, ERR_UNSPEC, dnskey::keytag, ds::keytag, dnskey::label, ds::label, NS_ALG_RSASHA1, NS_ALG_RSASHA256, RET_ERROR_PTR, RET_ERROR_PTR_FMT, SHA_160_SIZE, and SHA_256_SIZE.

5.352.2.24 unsigned int _get_keytag (const unsigned char * *rdata*, size_t *rdlen*)

Calculate the keytag value for a DNSKEY resource record.

Note:

This value is not necessarily unique, but should distinguish between keys of different owners/algorithms. As per RFC 4034, this applies to all algorithms except of type 1.

Parameters:

rdata a pointer to the start of the rdata buffer of the DNSKEY RR.

rdlen the rdlength (total size, in bytes) of the DNSKEY RR.

Returns:

a keytag value for the specified DNSKEY RR to be referenced in RRSIG (or DS) records.

Definition at line 105 of file dns.c.

References ERR_BAD_PARAM, and RET_ERROR_UINT.

Referenced by _add_dnskey_entry(), and _load_dnskey_file().

5.352.2.25 mx_record_t** _get_mx_records (const char * *qstring*)

Retrieve the collection of MX records for a given domain.

Parameters:

qstring a null-terminated string containing the domain name to be queried via DNS.

Returns:

NULL on failure, or a pointer to a null-entry terminated array of mx_record pointers describing the domain on success.

Definition at line 1857 of file dns.c.

References _dbgprint(), _dump_dns_header(), _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, INITIALIZE_DNS, PUSH_ERROR_RESOLVER, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _sgnt_resolv_dmtp_connect().

5.352.2.26 RSA* _get_rsa_dnskey (const unsigned char * *rdptr*, size_t *rdlen*)

Extract an RSA public key from a DNSKEY resource record.

Note:

The parameters to this function are not the same as the RR's rdata/rdlen, but rather, the RSA key data that usually begins 4 bytes into this buffer.

Parameters:

rdptr a pointer to the start of the raw RSA key data inside the DNSKEY RR's rdata.

rdlen the length, in bytes, of the encoded RSA public key.

Returns:

NULL on failure, or a pointer to a newly allocated RSA public key on success.

Definition at line 132 of file dns.c.

References _dbgprint(), BN_bin2bn_d, BN_free_d, BN_num_bits_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, RET_ERROR_PTR_FMT, and RSA_new_d.

Referenced by _add_dnskey_entry(), and _load_dnskey_file().

5.352.2.27 char* _get_signing_key_names (dnskey_t ** *keys*)

Get the names of a collection of signing DNSKEYs for human display.

Parameters:

keys a pointer to an array of DNSKEY entries to be printed to a human-readable string.

Returns:

NULL on failure, or a pointer to a newly allocated null-terminated string containing the DNSKEY collection info on success.

Definition at line 2612 of file dns.c.

References _str_printf(), ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _dump_dnskey_record_cb(), and _dump_ds_record_cb().

5.352.2.28 char* _get_txt_record (const char * *qstring*, unsigned long * *ttl*, int * *validated*)

Get the answer to a DNS TXT record query.

Parameters:

qstring a pointer to a null-terminated string containing the DNS query string.

ttl if not NULL, an optional pointer to a value that will store the TTL of the retrieved record on success.

validated

Definition at line 1598 of file dns.c.

References _clear_error_stack(), _dbgprint(), _dump_buf(), _dump_dns_header(), _fixup_dnskey_validation(), _is_validated_key(), _validate_rrsig_rr(), _verbose, dump_error_stack(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, INITIALIZE_DNS, IS_ROOT_LABEL, PUSH_ERROR_RESOLVER, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, RET_ERROR_PTR_FMT, and T_RRSIG.

Referenced by _get_dime_record().

5.352.2.29 int _initialize_resolver (void)

Initialize the DNS resolver subsystem.

Returns:

-1 on failure or 0 on success.

Definition at line 1994 of file dns.c.

References _dbgprint(), _get_dime_dir_location(), _load_dnskey_file(), ERR_UNSPEC, PUSH_ERROR_FMT, RET_ERROR_INT, and ROOT_KEY_FILE.

5.352.2.30 int _is_validated_key (dnskey_t * *dk*)

Trace a DNSKEY backwards through its DS entry to the root, to see if it is validated.

Note:

Chain validation works recursively on a starting DNSKEY in the following way: 1. For each of the DNSKEYs that were used to sign this DNSKEY record, 2. For each of the signing DNSKEY's DS records, 3. Validate the signing DNSKEY of the DS record. In the end, a DNSKEY can only be considered if its validated flag has been set, or a key by which it has been signed has also been validated. Only the keys supplied from the function _load_dnskey_file() carry the validation flag by default.

Parameters:

dk a pointer to the DNSKEY to be validated.

Returns:

-1 on general error, 0 if the specified key could not be validated, or 1 if it is.

Definition at line 593 of file dns.c.

References ERR_BAD_PARAM, IS_ROOT_LABEL, dnskey::label, RET_ERROR_INT, dnskey::signkeys, and dnskey::validated.

Referenced by _dump_dnskey_record_cb(), _fixup_dnskey_validation(), and _get_txt_record().

5.352.2.31 int _load_dnskey_file (const char ∗ *filename*)

Load a collection of DNS key(s) from a config file (into the object cache).

Note:

Any DNSKEY entry loaded from this file will be treated as verified and having final authority. This function will fail if there are no root [.] DNSKEY entries supplied in the file.

Parameters:

filename a null-terminated string containing the name of the file containing the DNS key entries.

Returns:

0 if key(s) were successfully loaded from the file or -1 on failure.

Definition at line 424 of file dns.c.

References _add_dnskey_entry_rsa(), _b64decode(), _dnskey_domain_comparator(), _find_cached_object_cmp(), _get_keytag(), _get_rsa_dnskey(), _mem_append(), cached_data_dnskey, cached_stores, chr_isspace, DNSKEY_RR_FLAG_SEP, DNSKEY_RR_FLAG_ZK, DNSKEY_RR_PROTO, ERR_BAD_PARAM, ERR_UNSPEC, dnskey::label, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, PUSH_ERROR_SYSCALL, RET_ERROR_INT, RET_ERROR_INT_FMT, and dnskey::validated.

Referenced by _initialize_resolver().

5.352.2.32 void∗ _lookup_dnskey (const char ∗ *label*)

Definition at line 1309 of file dns.c.

References _add_dnskey_entry(), _clear_error_stack(), _dbgprint(), _dump_dns_header(), _ptr_chain_add(), _validate_rrsig_rr(), dump_error_stack(), ERR_UNSPEC, PUSH_ERROR_RESOLVER, RET_ERROR_PTR, T_DNSKEY, and T_RRSIG.

Referenced by _get_dnskey_by_tag().

5.352.2.33 void∗ _lookup_ds (const char ∗ *label*)

Lookup the DS record for a specified domain.

Parameters:

label a null-terminated string containing the name of the domain to have its DS record queried.

Definition at line 1422 of file dns.c.

References _add_ds_entry(), _clear_error_stack(), _compute_dnskey_sha_hash(), _dbgprint(), _dump_dns_header(), _get_dnskey_by_tag(), _ptr_chain_add(), _validate_rrsig_rr(), DNSSEC_DIGEST_SHA1, DNSSEC_DIGEST_SHA256, ds_rr_t, dnskey::dse, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, PUSH_ERROR_RESOLVER, RET_ERROR_PTR, T_DS, and T_RRSIG.

Referenced by _get_dnskey_by_tag().

5.352.2.34 size_t _mem_append_canon (unsigned char ** *buf*, size_t * *blen*, const char * *name*)

Append a DNS label in uncompressed, canonical format to a dynamic buffer.

Note:

This function should be called for the first time with *buf and *blen set to NULL.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that will both hold the initial size of and receive the newly resized output buffer following the completion of the append operation.

name a null-terminated string containing the domain label to be stored in the buffer in canonical form.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 23 of file dns.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _compute_dnskey_sha_hash(), and _rsa_verify_record().

5.352.2.35 int _rsa_verify_record (const char * *label*, unsigned char *algorithm*, RSA * *pubkey*, const unsigned char * *rrsig*, const unsigned char * *sigbuf*, size_t *siglen*, ns_msg * *dhandle*)

Verify that an RRSIG record has been signed properly using a given RSA public key.

Note:

According to RFC 4034, the signature calculation is computed over the following data: RRSIG_RDATA | RR(1) | RR(2) | RR(s) where RRSIG_RDATA is the wire format of the RRSIG RDATA with the signer's name in canonical form and NO signature field RR(s) is the RRset of all matching RR's. RR(x): owner | type | class | ttl (original ttl) | rdlen | rdata

These fields of each RR and the RRSIG RR must match: owner, class, type=covered, ttl=original ttl The RRSET must be in canonical order, and the DNS names in the RDATA must be in canonical form.

Each domain name in an RR must be fully expanded and qualified, and in lowercase. Finally, the RR's need to be sorted in canonical order.

Parameters:

label a pointer to the label of the RRSIG record being verified.

algorithm the value of the algorithm used to produce the signature (ex. NS_ALG_RSASHA1).

pubkey a pointer to the RSA public key that will be used to verify the specified signature.

rrsig a pointer to the beginning of the RRSIG record's rdata content.

sigbuf a pointer to the start of the input buffer containing the RR signature data.

siglen the length, in bytes, of the RR signature data.

dhandle a pointer to the handle of the DNS answer message containing the RRSIG record being verified.

Returns:

-1 on general error, 0 if the RSA signature value did not match the data, or 1 if the signature was valid.

Definition at line 233 of file dns.c.

References _dbgprint(), _mem_append(), _mem_append_canon(), _sort_rrs_canonical(), ERR_BAD_PARAM, ERR_NOMEM, ERR_-UNSPEC, EVP_DigestInit_d, EVP_DigestUpdate_d, EVP_MD_CTX_init_d, EVP_PKEY_new_d, EVP_PKEY_set1_RSA_d, EVP_sha1_-d, EVP_sha256_d, EVP_sha512_d, EVP_VerifyFinal_d, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, PUSH_-ERROR_OPENSSL, PUSH_ERROR_RESOLVER, PUSH_ERROR_SYSCALL, RET_ERROR_INT, RET_ERROR_INT_FMT, and rrsig_-rr_t.

Referenced by _validate_rrsig_rr().

5.352.2.36 void∗ _serialize_dnskey_record_cb (void ∗ *record*, size_t ∗ *outlen*)

A callback handler to serialize a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DNSKEY structure to be serialized.

outlen a pointer to a variable that will receive the length of the serialized DNSKEY.

Returns:

a pointer to a newly allocated buffer holding the serialized DNSKEY on success, or NULL on failure.

Definition at line 2340 of file dns.c.

References _encode_rsa_pubkey(), _mem_append(), _mem_append_serialized(), _mem_append_serialized_string(), dnskey::algorithm, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, and dnskey::validated.

5.352.2.37 void∗ _serialize_ds_record_cb (void ∗ *record*, size_t ∗ *outlen*)

A callback record to serialize a DS record for storage in the object cache.

Definition at line 2232 of file dns.c.

References _mem_append(), _mem_append_serialized(), _mem_append_serialized_string(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ds::keytag, ds::label, RET_ERROR_PTR, and ds::validated.

5.352.2.38 int _sort_rrs_canonical (ns_msg ∗ *dhandle*, int ∗ *ordbuf*, size_t *nanswers*)

Sort the RRs in an RRSET into canonical order for DNSSEC signature verification.

Note:

This function does not actually sort the targeted RR's, but rather produces an output buffer containing an array of the sorted RR indices.

Parameters:

dhandle the handle of the DNS reply containing the answer RRs to be sorted.

ordbuf a pointer to an array of integers of size nanswers that will be updated to contain the new zero-indexed RR indices in proper canonically sorted order.

nanswers the number of answers in the DNS reply to be sorted (must match dhandle).

Returns:

-1 on error or 0 on success.

Definition at line 2517 of file dns.c.

References _compare_rdata(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_RESOLVER, and RET_ERROR_INT.

Referenced by _rsa_verify_record().

5.352.2.39 int _validate_rrsig_rr (const char * *label*, ns_msg * *dhandle*, unsigned short *covered*, const unsigned char * *rdata*, size_t *rdlen*, dnskey_t ** *outkey*)

Verify the signature provided by an RRSIG record.

See also:

rsa_verify_record()

Returns:

1 if the RRSIG signature was correct for the RR data, 0 if it was not, or -1 on general error.

Definition at line 1204 of file dns.c.

References _dbgprint(), _dump_buf_outer(), _get_chr_date(), _get_dnskey_by_tag(), _rsa_verify_record(), _verbose, ERR_BAD_PARAM, ERR_UNSPEC, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, dnskey::pubkey, PUSH_ERROR_RESOLVER, PUSH_ERROR_SYSCALL, RET_ERROR_INT, RET_ERROR_INT_FMT, and rrsig_rr_t.

Referenced by _get_txt_record(), _lookup_dnskey(), and _lookup_ds().

- int _initialize_resolver (void)

  Initialize the DNS resolver subsystem.

- dnskey_t * _add_dnskey_entry (const char *label, const unsigned char *buf, size_t len, unsigned long ttl)

  Create and add a new DNSKEY entry to the object cache.

- dnskey_t * _add_dnskey_entry_rsa (const char *label, uint16_t flags, unsigned char algorithm, RSA *pubkey, unsigned int keytag, const unsigned char *rdata, size_t rdlen, unsigned long ttl, unsigned int do_cache, int forced)

  Create and add a new RSA DNSKEY entry to the object cache.

- ds_t * _add_ds_entry (const char *label, unsigned int keytag, unsigned char algorithm, unsigned char digest_type, const unsigned char *digest, size_t dlen, unsigned long ttl)

  Create and add a new DS entry to the object cache.

- RSA * _get_rsa_dnskey (const unsigned char *rdptr, size_t rdlen)

  Extract an RSA public key from a DNSKEY resource record.

- void _destroy_dnskey_record_cb (void *record)

  A callback handler to destroy a DNSKEY record.

- void _destroy_ds_record_cb (void *record)

  A callback handler to destroy a DS record.

- void * _serialize_dnskey_record_cb (void *record, size_t *outlen)

  A callback handler to serialize a DNSKEY record.

- void * _serialize_ds_record_cb (void *record, size_t *outlen)

  A callback record to serialize a DS record for storage in the object cache.

- void * _deserialize_dnskey_record_cb (void *data, size_t len)

  A callback handler to deserialize a DNSKEY record.

- void * _deserialize_ds_record_cb (void *data, size_t len)

A callback handler to deserialize a DS record from the object cache.

- void * _clone_dnskey_record_cb (void *record)
- void _dump_dns_header (ns_msg *handle)

  Dump the contents of a DNS reply header.

- void _dump_dnskey_record_cb (FILE *fp, void *record, int brief)

  A callback handler to dump a DNSKEY record to the console.

- void _dump_ds_record_cb (FILE *fp, void *record, int brief)

  A callback handler to dump a DS record to a file.

- void _fixup_ds_links (void)

  Link any DNSKEY entries in the cache with dangling DS pointers to the right place.

- void _fixup_dnskey_validation (void)

  Mark as validated any DNSKEY entries in the object cache that should be but aren't.

- int _sort_rrs_canonical (ns_msg *dhandle, int *ordbuf, size_t nanswers)

  Sort the RRs in an RRSET into canonical order for DNSSEC signature verification.

- int _compare_rdata (const unsigned char *rdata1, size_t rdlen1, const unsigned char *rdata2, size_t rdlen2)

  Compare two RR's, for the purpose of allowing for canonical ordering within an RRSET.

- char * _get_signing_key_names (dnskey_t **keys)

  Get the names of a collection of signing DNSKEYs for human display.

- int _ds_comparator (const void *object, const void *key)

  An object cache callback for comparing two DS records for general equivalence.

- int _dnskey_tag_comparator (const void *object, const void *key)

  An object cache callback for comparing two DNSKEY records based on tag value.

- int _dnskey_domain_comparator (const void *object, const void *key)

  An object cache callback for comparing two DNSKEY records based on domain label.

- size_t _mem_append_canon (unsigned char **buf, size_t *blen, const char *name)

  Append a DNS label in uncompressed, canonical format to a dynamic buffer.

< The type of the rr set covered by this record.

< The numerical id of the cryptographic algorithm used to generate the signature.

< The number of labels in the original RRSIG RR owner name.

< The original TTL of the covered rrset as it appears in the authoritative zone.

< The expiration date after which the RRSIG record must not be used for authentication.

< The inception date before which the RRSIG record must not be used for authentication.

< A tag (selector) identifying the corresponding DNSKEY RR (which isn't necessarily unique) that validates this record.

< A label identifying the owner name of the DNSKEY RR validating this signature (must not use name compression).

< The keytag of the DNSKEY RR to which this record refers.

< The algorithm used by this RR's referenced DNSKEY.

< The type of the digest algorithm used by the digest field.

< A digest of this RR's referenced DNSKEY.

Definition at line 82 of file dns.h.

5.353.3.2 dnskey_t* _add_dnskey_entry (const char * *label*, const unsigned char * *buf*, size_t *len*, unsigned long *ttl*)

Create and add a new DNSKEY entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified key.

buf a pointer to the beginning of the DNSKEY's RR rdata.

len the length, in bytes, of the DNSKEY RR's rdata.

ttl the TTL value indicated by the DNSKEY resource record.

Definition at line 1140 of file dns.c.

References _add_dnskey_entry_rsa(), _dbgprint(), _fixup_dnskey_validation(), _get_keytag(), _get_rsa_dnskey(), dnskey_rr_flags_t, DNSKEY_RR_PROTO, ERR_BAD_PARAM, ERR_UNSPEC, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, RET_ERROR_PTR, and RET_ERROR_PTR_FMT.

Referenced by _lookup_dnskey().

5.353.3.3 dnskey_t* _add_dnskey_entry_rsa (const char * *label*, uint16_t *flags*, unsigned char *algorithm*, RSA * *pubkey*, unsigned int *keytag*, const unsigned char * *rdata*, size_t *rdlen*, unsigned long *ttl*, unsigned int *do_cache*, int *forced*)

Create and add a new RSA DNSKEY entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified key.

flags a bitmask of flags corresponding to the DNSKEY's RR flags field.

algorithm the value of the DNSKEY's RR algorithm field.

pubkey a pointer to an RSA public key used to validate signatures made by this key.

keytag a numerical value linking this to other RRSIG or DS records.

rdata a pointer to the beginning of this DNSKEY's RR rdata.

rdlen the length, in bytes, of the DNSKEY's RR rdata.

ttl the TTL value indicated by the DNSKEY resource record.

do_cache if set, the new object cache entry for this DNSKEY can be persisted to the cache file.

forced if set, this entry will forcibly replace (overshadow) any clashing or matching existing DNSKEY entry inside the object cache.

Returns:

NULL on failure, or a pointer to the new DNSKEY object cache entry on success.

Definition at line 698 of file dns.c.

References _add_cached_object_cmp(), _add_cached_object_cmp_forced(), _destroy_dnskey(), _dnskey_tag_comparator(), _get_cache_obj_data(), dnskey::algorithm, cached_data_dnskey, cached_stores, DNSKEY_RR_FLAG_SEP, DNSKEY_RR_FLAG_ZK, dnskey::do_cache, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, and RET_ERROR_PTR.

Referenced by _add_dnskey_entry(), and _load_dnskey_file().

5.353.3.4 ds_t* _add_ds_entry (const char * *label*, unsigned int *keytag*, unsigned char *algorithm*, unsigned char *digest_type*, const unsigned char * *digest*, size_t *dlen*, unsigned long *ttl*)

Create and add a new DS entry to the object cache.

Parameters:

label a pointer to a null-terminated string containing the name of the domain supplying the specified DS record.

keytag a numerical value identifying the DNSKEY entry linked to this record.

algorithm the value of the DS's RR algorithm field.

digest_type the value of the DS's RR digest type field.

digest a pointer to a buffer containing the DS record's digest data.

dlen the size, in bytes, of the DS record's digest.

ttl the TTL value indicated by the DS resource record.

Returns:

NULL on failure, or a pointer to the new DS object cache entry on success.

Definition at line 796 of file dns.c.

References _add_cached_object_cmp(), _destroy_ds(), _ds_comparator(), _fixup_ds_links(), _get_cache_obj_data(), ds::algorithm, cached_-data_ds, cached_stores, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, ds::keytag, ds::label, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _lookup_ds().

5.353.3.5 void* _clone_dnskey_record_cb (void * *record*)

Definition at line 2383 of file dns.c.

References _destroy_dnskey(), _ptr_chain_clone(), dnskey::algorithm, dnskey::dse, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, RSAPublicKey_dup_d, dnskey::signkeys, and dnskey::validated.

5.353.3.6 int _compare_rdata (const unsigned char * *rdata1*, size_t *rdlen1*, const unsigned char * *rdata2*, size_t *rdlen2*)

Compare two RR's, for the purpose of allowing for canonical ordering within an RRSET.

Note:

This function is used to sort resource records for the reliable validation of RRSIG records.
According to Section 6.3 of RFC 4034 ("Canonical RR Ordering within an RRSET"): This is treated as a left-justified octet sequence where the absence of an octet sorts before a zero octet.

Parameters:

rdata1 a pointer to the beginning of the first resource record's rdata.

rdlen1 the length, in bytes, of the first resource record's rdata.

rdata2 a pointer to the beginning of the second resource record's rdata.

rdlen2 the length, in bytes, of the second resource record's rdata.

Returns:

-1 if rdata1 < rdata2, 1 if rdata2 > rdata1, or 0 if the two resource records were equal.

Definition at line 2574 of file dns.c.

Referenced by _sort_rrs_canonical().

5.353.3.7 void* _deserialize_dnskey_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a buffer containing the data to be deserialized.

len the length, in bytes, of the data buffer to be deserialized.

Returns:

a pointer to a newly allocated dnskey_t structure on success, or NULL on failure.

Definition at line 2263 of file dns.c.

References _decode_rsa_pubkey(), _deserialize_data(), _deserialize_string(), _deserialize_vardata(), _destroy_dnskey(), dnskey::algorithm, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, PUSH_ERROR_SYSCALL, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, and dnskey::validated.

5.353.3.8 void* _deserialize_ds_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DS record from the object cache.

Definition at line 2197 of file dns.c.

References _deserialize_data(), _deserialize_string(), _deserialize_vardata(), _destroy_ds(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, ds::keytag, ds::label, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and ds::validated.

5.353.3.9 void _destroy_dnskey_record_cb (void * *record*)

A callback handler to destroy a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DNSKEY structure to be destroyed.

Definition at line 2032 of file dns.c.

References _destroy_dnskey().

5.353.3.10 void _destroy_ds_record_cb (void * *record*)

A callback handler to destroy a DS record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DS structure to be destroyed.

Definition at line 2147 of file dns.c.

References _destroy_ds().

5.353.3.11 int _dnskey_domain_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DNSKEY records based on domain label.

Returns:

-1 if a < b, 1 if b > a, or 0 if the records were equivalent.

Definition at line 996 of file dns.c.

References dnskey::label.

Referenced by _load_dnskey_file().

5.353.3.12 int _dnskey_tag_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DNSKEY records based on tag value.

Note:

This function also checks to make sure that the domain labels match as well.

Parameters:

object a pointer to the DNSKEY cache entry to be compared against the key.

key a pointer to a key value to be compared against the object.

Returns:

-1 if a < b, 1 if b > a, or 0 if the records were equivalent.

Definition at line 962 of file dns.c.

References dnskey::keytag, and dnskey::label.

Referenced by _add_dnskey_entry_rsa(), and _get_dnskey_by_tag().

5.353.3.13 int _ds_comparator (const void * *object*, const void * *key*)

An object cache callback for comparing two DS records for general equivalence.

Note:

This function is used to map a DNSKEY record to a DS record.

Definition at line 1021 of file dns.c.

References ds::digest, ds::diglen, ds::keytag, and ds::label.

Referenced by _add_ds_entry(), and _get_ds_by_dnskey().

5.353.3.14 void _dump_dns_header (ns_msg * *handle*)

Dump the contents of a DNS reply header.

Parameters:

handle a pointer to the DNS reply to have its header dumped to the console.

Definition at line 1297 of file dns.c.

References _dbgprint().

Referenced by _get_mx_records(), _get_txt_record(), _lookup_dnskey(), and _lookup_ds().

5.353.3.15 void _dump_dnskey_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DNSKEY record to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the DNSKEY structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 2045 of file dns.c.

References _clear_error_stack(), _compute_dnskey_sha_hash(), _count_ptr_chain(), _dump_buf(), _get_signing_key_names(), _is_-validated_key(), dnskey::algorithm, DNSSEC_DIGEST_SHA1, DNSSEC_DIGEST_SHA256, dnskey::dse, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, NS_ALG_RSASHA1, NS_ALG_RSASHA256, NS_ALG_RSASHA512, dnskey::rdlen, SHA_160_SIZE, SHA_256_SIZE, SHA_512_SIZE, and dnskey::signkeys.

5.353.3.16 void _dump_ds_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DS record to a file.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp the file to which the DS record is dumped.

record a pointer to the DS structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 2160 of file dns.c.

References _dump_buf(), _get_signing_key_names(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ds::keytag, ds::label, ds::signkeys, and ds::validated.

5.353.3.17 void _fixup_dnskey_validation (void)

Mark as validated any DNSKEY entries in the object cache that should be but aren't.

Note:

The retrieval of a new, validated DNSKEY can mean that another DNSKEY in the cache that was signed by it will now be validated by virtue of transitivity.

Definition at line 2469 of file dns.c.

References _is_validated_key(), _lock_cache_store(), _unlock_cache_store(), cached_data_dnskey, cached_stores, cached_object::data, dnskey::do_cache, cached_store_t::head, cached_object::next, cached_object::persists, store, and dnskey::validated.

Referenced by _add_dnskey_entry(), and _get_txt_record().

5.353.3.18 void _fixup_ds_links (void)

Link any DNSKEY entries in the cache with dangling DS pointers to the right place.

Note:

This function should be used after the retrieval of new records, or after a cache load.

Definition at line 2441 of file dns.c.

Referenced by _add_ds_entry().

5.353.3.19 RSA* _get_rsa_dnskey (const unsigned char * *rdptr*, size_t *rdlen*)

Extract an RSA public key from a DNSKEY resource record.

Note:

The parameters to this function are not the same as the RR's rdata/rdlen, but rather, the RSA key data that usually begins 4 bytes into this buffer.

Parameters:

rdptr a pointer to the start of the raw RSA key data inside the DNSKEY RR's rdata.

rdlen the length, in bytes, of the encoded RSA public key.

Returns:

NULL on failure, or a pointer to a newly allocated RSA public key on success.

Definition at line 132 of file dns.c.

References _dbgprint(), BN_bin2bn_d, BN_free_d, BN_num_bits_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, RET_ERROR_PTR_FMT, and RSA_new_d.

Referenced by _add_dnskey_entry(), and _load_dnskey_file().

5.353.3.20 char* _get_signing_key_names (dnskey_t ** *keys*)

Get the names of a collection of signing DNSKEYs for human display.

Parameters:

keys a pointer to an array of DNSKEY entries to be printed to a human-readable string.

Returns:

NULL on failure, or a pointer to a newly allocated null-terminated string containing the DNSKEY collection info on success.

Definition at line 2612 of file dns.c.

References _str_printf(), ERR_NOMEM, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

Referenced by _dump_dnskey_record_cb(), and _dump_ds_record_cb().

5.353.3.21 int _initialize_resolver (void)

Initialize the DNS resolver subsystem.

Returns:

-1 on failure or 0 on success.

Definition at line 1994 of file dns.c.

References _dbgprint(), _get_dime_dir_location(), _load_dnskey_file(), ERR_UNSPEC, PUSH_ERROR_FMT, RET_ERROR_INT, and ROOT_KEY_FILE.

5.353.3.22 size_t _mem_append_canon (unsigned char ∗∗ *buf*, size_t ∗ *blen*, const char ∗ *name*)

Append a DNS label in uncompressed, canonical format to a dynamic buffer.

Note:

This function should be called for the first time with ∗buf and ∗blen set to NULL.

Parameters:

buf a pointer to the address of the output buffer that will be resized to hold the result, or NULL to allocate one.

blen a pointer to a variable that will both hold the initial size of and receive the newly resized output buffer following the completion of the append operation.

name a null-terminated string containing the domain label to be stored in the buffer in canonical form.

Returns:

the new size of the (re)allocated output buffer, or 0 on failure.

Definition at line 23 of file dns.c.

References _mem_append(), ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_UINT.

Referenced by _compute_dnskey_sha_hash(), and _rsa_verify_record().

5.353.3.23 void∗ _serialize_dnskey_record_cb (void ∗ *record*, size_t ∗ *outlen*)

A callback handler to serialize a DNSKEY record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DNSKEY structure to be serialized.

outlen a pointer to a variable that will receive the length of the serialized DNSKEY.

Returns:

a pointer to a newly allocated buffer holding the serialized DNSKEY on success, or NULL on failure.

Definition at line 2340 of file dns.c.

References _encode_rsa_pubkey(), _mem_append(), _mem_append_serialized(), _mem_append_serialized_string(), dnskey::algorithm, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dnskey::is_sep, dnskey::is_zone, dnskey::keytag, dnskey::label, dnskey::pubkey, dnskey::rdata, dnskey::rdlen, RET_ERROR_PTR, and dnskey::validated.

5.353.3.24 void* _serialize_ds_record_cb (void * *record*, size_t * *outlen*)

A callback record to serialize a DS record for storage in the object cache.

Definition at line 2232 of file dns.c.

References _mem_append(), _mem_append_serialized(), _mem_append_serialized_string(), ds::algorithm, ds::digest, ds::digest_type, ds::diglen, ERR_BAD_PARAM, ERR_NOMEM, ds::keytag, ds::label, RET_ERROR_PTR, and ds::validated.

5.353.3.25 int _sort_rrs_canonical (ns_msg * *dhandle*, int * *ordbuf*, size_t *nanswers*)

Sort the RRs in an RRSET into canonical order for DNSSEC signature verification.

Note:

This function does not actually sort the targeted RR's, but rather produces an output buffer containing an array of the sorted RR indices.

Parameters:

dhandle the handle of the DNS reply containing the answer RRs to be sorted.

ordbuf a pointer to an array of integers of size nanswers that will be updated to contain the new zero-indexed RR indices in proper canonically sorted order.

nanswers the number of answers in the DNS reply to be sorted (must match dhandle).

Returns:

-1 on error or 0 on success.

Definition at line 2517 of file dns.c.

References _compare_rdata(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_RESOLVER, and RET_ERROR_INT.

Referenced by _rsa_verify_record().

Functions

- void _destroy_dime_record (dime_record_t *record)
  Destroy a DIME management record and its underlying data.
- void _dump_dime_record_cb (FILE *fp, void *record, int brief)
  A callback handler to dump a DIME management record to the console.
- void _destroy_dime_record_cb (void *record)
  A callback handler to destroy a DIME management record.
- void * _deserialize_dime_record_cb (void *data, size_t len)
  A callback handler to deserialize a DIME record from the persistent cache for use in memory.
- void * _serialize_dime_record_cb (void *record, size_t *outlen)
  A callback handler to serialize a DIME record for persistence through the data cache.
- dime_record_t * _parse_dime_record (const char *txt, size_t len)
  Parse a data buffer into a DIME management record.
- dime_record_t * _get_dime_record (const char *domain, unsigned long *ttl, int use_cache)
  Retrieve a DIME management record for a given dark domain via DNS.
- int _validate_dime_record (const dime_record_t *record)
  Validate the syntax of a DIME record for correctness.
- dime_record_t * _get_dime_record_from_file (const char *filename, const char *domain)
  Retrieve and parse a DIME management record from an input file.

5.354.1 Function Documentation

5.354.1.1 void* _deserialize_dime_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DIME record from the persistent cache for use in memory.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a serialized DIME record in binary form that will be deserialized.

len the length, in bytes, of the buffer to be deserialized.

Returns:

a pointer to a newly allocated DIME management record structure constructed from the serialized data, or NULL on failure.

Definition at line 196 of file mrec.c.

References _deserialize_array(), _deserialize_data(), _deserialize_str_array(), _deserialize_string(), _destroy_dime_record(), _validate_dime_record(), dime_record_t::dx, ED25519_KEY_SIZE, ED25519_SIG_SIZE, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dime_record_t::expiry, dime_record_t::policy, dime_record_t::pubkey, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, dime_record_t::subdomain, dime_record_t::syndicates, dime_record_t::tlssig, dime_record_t::validated, and dime_record_t::version.

5.354.1.2 void _destroy_dime_record (dime_record_t * *record*)

Destroy a DIME management record and its underlying data.

Parameters:

record a pointer to the DIME management record object to be destroyed.

Definition at line 13 of file mrec.c.

References _dbgprint(), _ptr_chain_free(), dime_record_t::dx, dime_record_t::pubkey, dime_record_t::syndicates, and dime_record_t::tlssig.

Referenced by _deserialize_dime_record_cb(), _destroy_dime_record_cb(), _get_dime_record(), _parse_dime_record(), _sgnt_resolv_destroy_dmtp_session(), and _sgnt_resolv_dmtp_connect().

5.354.1.3 void _destroy_dime_record_cb (void * *record*)

A callback handler to destroy a DIME management record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DIME management record to be destroyed.

Definition at line 183 of file mrec.c.

References _destroy_dime_record().

5.354.1.4 void _dump_dime_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DIME management record to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the DIME management record structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 41 of file mrec.c.

References _b64encode_nopad(), _clear_error_stack(), _hex_encode(), dump_error_stack(), dime_record_t::dx, ED25519_KEY_SIZE, ED25519_SIG_SIZE, dime_record_t::expiry, msg_experimental, msg_mixed, msg_strict, dime_record_t::policy, dime_record_t::pubkey, sub_explicit, sub_relaxed, sub_strict, dime_record_t::subdomain, dime_record_t::syndicates, dime_record_t::tlssig, dime_record_t::validated, and dime_record_t::version.

5.354.1.5 dime_record_t* _get_dime_record (const char * *domain*, unsigned long * *ttl*, int *use_cache*)

Retrieve a DIME management record for a given dark domain via DNS.

Parameters:

domain a null-terminated string containing the name of the dark domain to be queried.

ttl an optional pointer to a variable that will receive the current TTL value of the DIME record's TXT RR.

use_cache if set, use the cache as the first-line resolver; if 0, only perform live network lookups.

Returns:

NULL on failure, or a pointer to a populated dime_record_t structure on success.

Definition at line 489 of file mrec.c.

References _add_cached_object(), _clear_error_stack(), _create_cached_object(), _dbgprint(), _destroy_cache_entry(), _destroy_dime_-record(), _find_cached_object(), _get_cache_obj_data(), _get_txt_record(), _is_object_expired(), _parse_dime_record(), _replace_object(), cached_data_drec, cached_stores, cached_object::data, DIME_RECORD_DNS_PREFIX, dump_error_stack(), ERR_BAD_PARAM, ERR_-NOMEM, ERR_UNSPEC, cached_object::expiration, dime_record_t::expiry, get_last_error(), PUSH_ERROR, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, and dime_record_t::validated.

Referenced by _sgnt_resolv_dmtp_connect().

5.354.1.6 dime_record_t* _get_dime_record_from_file (const char * *filename*, const char * *domain*)

Retrieve and parse a DIME management record from an input file.

Parameters:

filename a null-terminated string containing the filename containing the DIME management record to be parsed.

domain a null-terminated string containing the name of the dark domain with which the DIME record is to be associated.

Returns:

NULL on failure or a pointer to the retrieved DIME management record on success.

Definition at line 631 of file mrec.c.

References _add_cached_object_forced(), _clear_error_stack(), _get_cache_obj_data(), _parse_dime_record(), cached_data_drec, cached_-stores, chr_isprint, dump_error_stack(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_PTR.

5.354.1.7 dime_record_t* _parse_dime_record (const char * *txt*, size_t *len*)

Parse a data buffer into a DIME management record.

Note:

The data passed to this function is typically retrieved from DNS via the _dx TXT record.

Parameters:

txt a pointer to the data buffer to be parsed.

len the length, in bytes, of the data buffer to be parsed.

Returns:

a pointer to the DIME management record on success, or NULL on failure.

Definition at line 280 of file mrec.c.

References _b64decode_nopad(), _dbgprint(), _destroy_dime_record(), _ptr_chain_add(), _validate_dime_record(), chr_isspace, DIME_VERSION_NO, dime_record_t::dx, ED25519_KEY_B64_SIZE, ED25519_KEY_SIZE, ED25519_SIG_B64_SIZE, ED25519_SIG_SIZE, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, msg_experimental, msg_mixed, msg_strict, dime_record_t::policy, dime_record_t::pubkey, PUSH_ERROR_FMT, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, sub_explicit, sub_relaxed, sub_strict, dime_record_t::subdomain, dime_record_t::tlssig, and dime_record_t::version.

Referenced by _get_dime_record(), and _get_dime_record_from_file().

5.354.1.8 void* _serialize_dime_record_cb (void * *record*, size_t * *outlen*)

A callback handler to serialize a DIME record for persistence through the data cache.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to a DIME management record object to be serialized for persistence.

outlen a pointer to a variable to receive the length of the serialized data on completion.

Returns:

a pointer to a newly allocated buffer containing the serialized DIME record data, or NULL on failure.

Definition at line 241 of file mrec.c.

References _mem_append(), _mem_append_serialized_array(), _mem_append_serialized_str_array(), _mem_append_serialized_string(), dime_record_t::dx, ED25519_KEY_SIZE, ED25519_SIG_SIZE, ERR_BAD_PARAM, ERR_NOMEM, dime_record_t::expiry, dime_record_t::policy, dime_record_t::pubkey, RET_ERROR_PTR, dime_record_t::subdomain, dime_record_t::syndicates, dime_record_t::tlssig, dime_record_t::validated, and dime_record_t::version.

5.354.1.9 int _validate_dime_record (const dime_record_t * *record*)

Validate the syntax of a DIME record for correctness.

Parameters:

record a pointer to the DIME management record to be validated.

Returns:

0 if the record was validated successfully or -1 on error.

Definition at line 595 of file mrec.c.

References DIME_VERSION_NO, ERR_BAD_PARAM, ERR_UNSPEC, msg_experimental, msg_mixed, msg_strict, dime_record_t::policy, dime_record_t::pubkey, RET_ERROR_INT, RET_ERROR_INT_FMT, sub_explicit, sub_relaxed, sub_strict, dime_record_t::subdomain, and dime_record_t::version.

Definition at line 25 of file mrec.h.

5.355.3 Function Documentation

5.355.3.1 void* _deserialize_dime_record_cb (void * *data*, size_t *len*)

A callback handler to deserialize a DIME record from the persistent cache for use in memory.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a serialized DIME record in binary form that will be deserialized.

len the length, in bytes, of the buffer to be deserialized.

Returns:

a pointer to a newly allocated DIME management record structure constructed from the serialized data, or NULL on failure.

Definition at line 196 of file mrec.c.

References _deserialize_array(), _deserialize_data(), _deserialize_str_array(), _deserialize_string(), _destroy_dime_record(), _validate_dime_record(), dime_record_t::dx, ED25519_KEY_SIZE, ED25519_SIG_SIZE, ERR_BAD_PARAM, ERR_NOMEM, ERR_UNSPEC, dime_record_t::expiry, dime_record_t::policy, dime_record_t::pubkey, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, dime_record_t::subdomain, dime_record_t::syndicates, dime_record_t::tlssig, dime_record_t::validated, and dime_record_t::version.

5.355.3.2 void _destroy_dime_record_cb (void * *record*)

A callback handler to destroy a DIME management record.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the DIME management record to be destroyed.

Definition at line 183 of file mrec.c.

References _destroy_dime_record().

5.355.3.3 void _dump_dime_record_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump a DIME management record to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the DIME management record structure to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 41 of file mrec.c.

References _b64encode_nopad(), _clear_error_stack(), _hex_encode(), dump_error_stack(), dime_record_t::dx, ED25519_KEY_SIZE, ED25519_SIG_SIZE, dime_record_t::expiry, msg_experimental, msg_mixed, msg_strict, dime_record_t::policy, dime_record_t::pubkey, sub_explicit, sub_relaxed, sub_strict, dime_record_t::subdomain, dime_record_t::syndicates, dime_record_t::tlssig, dime_record_t::validated, and dime_record_t::version.

5.355.3.4 void* _serialize_dime_record_cb (void * *record*, size_t * *outlen*)

A callback handler to serialize a DIME record for persistence through the data cache.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to a DIME management record object to be serialized for persistence.

outlen a pointer to a variable to receive the length of the serialized data on completion.

Returns:

a pointer to a newly allocated buffer containing the serialized DIME record data, or NULL on failure.

Definition at line 241 of file mrec.c.

Referenced by _ssl_initialize().

5.357.2 Function Documentation

5.357.2.1 void* _deserialize_ocsp_response_cb (void * *data*, size_t *len*)

A callback handler to deserialize an OCSP response message.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a buffer containing the data to be deserialized.

len the length, in bytes, of the data buffer to be deserialized.

Returns:

a pointer to a newly allocated OCSP_RESPONSE structure on success, or NULL on failure.

Definition at line 1478 of file ssl.c.

References d2i_OCSP_RESPONSE_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, and RET_ERROR_PTR.

5.357.2.2 void _destroy_ocsp_response_cb (void * *record*)

A callback handler to destroy an OCSP_RESPONSE object.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the OCSP_RESPONSE object to be destroyed.

Definition at line 1274 of file ssl.c.

References OCSP_RESPONSE_free_d.

5.357.2.3 int _domain_wildcard_check (const char * *pattern*, const char * *domain*)

Perform a check against a wildcard pattern for a domain name.

Parameters:

pattern a pointer to the wildcard pattern string, subject as a certificate CN or SAN dnsname.

domain a pointer to the domain name, which will be compared against the supplied wildcard string.

Returns:

1 if the domain name matches the pattern or 0 if it does not; -1 if a general error was encountered.

Definition at line 1061 of file ssl.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

5.357.2.4 void _dump_ocsp_response_cb (FILE * *fp*, void * *record*, int *brief*)

A callback handler to dump an OCSP response to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the OCSP_RESPONSE object to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 1344 of file ssl.c.

References ASN1_GENERALIZEDTIME_print_d, ASN1_INTEGER_to_BN_d, BIO_free_d, BIO_new_fp_d, BN_bn2hex_d, BN_free_d, ERR_print_errors_fp_d, OCSP_BASICRESP_free_d, OCSP_check_validity_d, OCSP_response_get1_basic_d, OCSP_response_status_d, OCSP_response_status_str_d, sk_num_d, sk_pop_d, and STACK_OF().

5.357.2.5 char* _get_cache_ocsp_id (X509 * *cert*, OCSP_CERTID * *cid*, char * *buf*, size_t *blen*)

Get a unique identifier string for an OCSP response to be used in the object cache.

Parameters:

cert a pointer to the X509 certificate undergoing verification.

cid a pointer to the OCSP certificate ID derived from the certificate and its issuer.

buf a pointer to a buffer that will hold the generated OCSP response ID in the cache.

blen the size, in bytes, of the buffer holding the OCSP response id.

Returns:

a pointer to the output buffer with the OCSP response ID on success, or NULL on failure.

Definition at line 1290 of file ssl.c.

References _compute_sha_hash(), _get_cert_subject_cn(), CRYPTO_free_d, ERR_BAD_PARAM, ERR_UNSPEC, i2d_OCSP_CERTID_d, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, and SHA_160_SIZE.

Referenced by _do_ocsp_validation().

5.357.2.6 X509_STORE∗ _get_cert_store (void)

Get an x509 certificate store populated with the root certificate bundle.

Returns:

NULL on failure, or a pointer to the x509 certificate store on success.

Definition at line 1124 of file ssl.c.

References ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, store, X509_STORE_free_d, X509_STORE_load_locations_-d, and X509_STORE_new_d.

Referenced by _do_ocsp_validation().

5.357.2.7 int _ocsp_response_callback (SSL ∗ *s*, void ∗ *arg*)

An OCSP stapling rOCSP_REQUEST_freeesponse callback for the TLS subsystem.

Note:

This function currently does not do anything!

Parameters:

s a pointer to the SSL connection that generated the callback.

arg an optional callback parameter that was set by the caller.

Returns:

1 if the OCSP response was valid or 0 if it was not.

Definition at line 1238 of file ssl.c.

References _verbose, d2i_OCSP_RESPONSE_d, ERR_print_errors_fp_d, OCSP_RESPONSE_free_d, OCSP_RESPONSE_print_d, and SSL_ctrl_d.

Referenced by _ssl_connect_host().

5.357.2.8 void* _serialize_ocsp_response_cb (void * *record*, size_t * *outlen*)

A callback handler to serialize an OCSP response message.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the OCSP_RESPONSE object to be serialized.

outlen a pointer ot a variable that will receive the length of the serialized OCSP response.

Returns:

a pointer to a newly allocated buffer holding the serialized OCSP_RESPONSE on success, or NULL on failure.

Definition at line 1502 of file ssl.c.

References ERR_BAD_PARAM, ERR_UNSPEC, i2d_OCSP_RESPONSE_d, PUSH_ERROR_OPENSSL, and RET_ERROR_PTR.

5.357.2.9 void _ssl_fd_loop (SSL * *connection*)

Create an fd loop (connect stdin to an ssl connection write fd, and ssl connection output to stdout).

Parameters:

connection the SSL connection handle to be passed to the control of the active console.

Definition at line 1147 of file ssl.c.

References ERR_print_errors_fp_d, SSL_get_rfd_d, SSL_read_d, and SSL_write_d.

5.357.2.10 int _validate_self_signed (X509 * *cert*)

Validate a self-signed x509 certificate.

Note:

This is completed by adding the certificate to a temporary cert store/context and calling internal validation.

Parameters:

cert a pointer to the x509 certificate to be validated.

Returns:

-1 on general failure, 0 on validation error, or 1 on success.

Definition at line 1005 of file ssl.c.

References _dbgprint(), ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, store, X509_STORE_CTX_free_d, X509_STORE_CTX_get_error_d, X509_STORE_CTX_init_d, X509_STORE_CTX_new_d, X509_STORE_free_d, X509_STORE_new_d, X509_verify_cert_d, and X509_verify_cert_error_string_d.

5.357.2.11 int _verify_certificate_callback (int *preverify_ok*, X509_STORE_CTX * *ctx*)

An internal callback function for DMTP TLS certificate verification.

Note:

This callback is set from SSL_CTX_set_verify_d().

Parameters:

preverify_ok if set, indicates that the verification of the certificate passed, or 0 if it didn't.

ctx a pointer to the complete context used for the certificate chain verification.

Returns:

if 0, the verification process is stopped immediately, or if 1, the process is continued.

Definition at line 947 of file ssl.c.

References _clear_error_stack(), _dbgprint(), _get_cert_subject_cn(), ERR_print_errors_fp_d, X509_get_subject_name_d, X509_NAME_-oneline_d, X509_STORE_CTX_get_current_cert_d, X509_STORE_CTX_get_error_d, and X509_STORE_CTX_get_error_depth_d.

Referenced by _ssl_get_client_context().

#include "providers/symbols.h"
```

Functions

- int _ssl_initialize (void)

  Initialize all the dependent layers of the openssl library for use.

- void _ssl_shutdown (void)

  Shutdown the openssl subsystem.

- SSL_CTX * _ssl_get_client_context (void)

  Get an SSL context that will be used for all DMTP client connections.

- SSL * _ssl_starttls (int fd)

  Negotiate a TLS session over an existing network socket connection.

- SSL * _ssl_connect_host (const char *hostname, unsigned short port, int force_family)

  Connect to a specified host and port via a TLS-enabled service.

- void _ssl_disconnect (SSL *handle)

  Terminate an SSL connection.

- int _do_x509_validation (X509 *cert, STACK_OF(X509)*chain)

  Perform X509 validation on a certificate presented by a remote TLS service.

- int _do_x509_hostname_check (X509 *cert, const char *domain)

  Check to see that an issued X509 certificate matches the expected target domain name.

- int _do_ocsp_validation (SSL *connection, int *fallthrough)

  Perform OCSP validation on an x509 certificate.

- char * _get_cert_subject_cn (X509 *cert)

  Get the subject common name (CN) attribute of an X509 certificate.

- int _verify_certificate_callback (int preverify_ok, X509_STORE_CTX *ctx)

  An internal callback function for DMTP TLS certificate verification.

- int _validate_self_signed (X509 *cert)

  Validate a self-signed x509 certificate.

- int _domain_wildcard_check (const char *pattern, const char *domain)

  Perform a check against a wildcard pattern for a domain name.

- X509_STORE * _get_cert_store (void)

  Get an x509 certificate store populated with the root certificate bundle.

- void _ssl_fd_loop (SSL *connection)

  Create an fd loop (connect stdin to an ssl connection write fd, and ssl connection output to stdout).

- int _ocsp_response_callback (SSL *s, void *arg)

  An OCSP stapling rOCSP_REQUEST_freeesponse callback for the TLS subsystem.

- void _destroy_ocsp_response_cb (void *record)

  A callback handler to destroy an OCSP_RESPONSE object.

- char * _get_cache_ocsp_id (X509 *cert, OCSP_CERTID *cid, char *buf, size_t blen)

  Get a unique identifier string for an OCSP response to be used in the object cache.

- void _dump_ocsp_response_cb (FILE *fp, void *record, int brief)

  A callback handler to dump an OCSP response to the console.

- void * _deserialize_ocsp_response_cb (void *data, size_t len)

  A callback handler to deserialize an OCSP response message.

- void * _serialize_ocsp_response_cb (void *record, size_t *outlen)

  A callback handler to serialize an OCSP response message.

5.358.1 Function Documentation

5.358.1.1 void* _deserialize_ocsp_response_cb (void * *data*, size_t *len*)

A callback handler to deserialize an OCSP response message.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

data a pointer to a buffer containing the data to be deserialized.

len the length, in bytes, of the data buffer to be deserialized.

Returns:

a pointer to a newly allocated OCSP_RESPONSE structure on success, or NULL on failure.

Definition at line 1478 of file ssl.c.

References d2i_OCSP_RESPONSE_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, and RET_ERROR_PTR.

5.358.1.2 void _destroy_ocsp_response_cb (void * *record*)

A callback handler to destroy an OCSP_RESPONSE object.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the OCSP_RESPONSE object to be destroyed.

Definition at line 1274 of file ssl.c.

References OCSP_RESPONSE_free_d.

5.358.1.3 int _do_ocsp_validation (SSL * *connection*, int * *fallthrough*)

Perform OCSP validation on an x509 certificate.

Parameters:

connection a pointer to the SSL connection associated with the peer certificate to be OCSP validated.

fallthrough an optional pointer to a variable that will be set if OCSP validation did not fail for various reasons (ie. OCSP was not available), but validation was not completed.

Returns:

-1 on general error, 0 if the certificate did not pass OCSP validation, or 1 if it did so successfully.

Definition at line 425 of file ssl.c.

References _add_cached_object(), _clear_error_stack(), _connect_host(), _dbgprint(), _find_cached_object(), _get_cache_ocsp_id(), _get_cert_store(), _save_cache_contents(), _unlink_object(), _verbose, ASN1_GENERALIZEDTIME_print_d, BIO_free_all_d, BIO_free_d, BIO_new_fp_d, BIO_new_socket_d, cached_data_ocsp, cached_stores, cached_object::data, dump_error_stack(), ERR_BAD_PARAM, ERR_NOMEM, ERR_print_errors_fp_d, ERR_UNSPEC, get_last_error(), OCSP_basic_verify_d, OCSP_BASICRESP_free_d, OCSP_cert_to_id_d, OCSP_check_nonce_d, OCSP_check_validity_d, OCSP_parse_url_d, OCSP_REQ_CTX_add1_header_d, OCSP_REQ_CTX_set1_req_d, OCSP_request_add0_id_d, OCSP_request_add1_nonce_d, OCSP_REQUEST_free_d, OCSP_REQUEST_new_d, OCSP_REQUEST_print_d, OCSP_resp_find_status_d, OCSP_RESPONSE_free_d, OCSP_response_get1_basic_d, OCSP_RESPONSE_print_d, OCSP_response_status_d, OCSP_response_status_str_d, OCSP_sendreq_nbio_d, OCSP_sendreq_new_d, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_INT, RET_ERROR_INT_FMT, sk_num_d, sk_value_d, SSL_get_peer_cert_chain_d, SSL_get_peer_certificate_d, STACK_OF(), status, store, X509_check_issued_d, X509_email_free_d, X509_get1_ocsp_d, and X509_STORE_free_d.

Referenced by _verify_dx_certificate().

5.358.1.4 int _do_x509_hostname_check (X509 * *cert*, const char * *domain*)

Check to see that an issued X509 certificate matches the expected target domain name.

See also:

_domain_wildcard_check()

Note:

This function will check two parts of the specified certificate against the supplied domain name: 1. The CN attribute of the subject field. 2. The dnsName of the SAN extension

Parameters:

cert a pointer to the X509 certificate that will be matched against the specified domain name.

domain a null-terminated string containing the domain name to be matched against the target certificate.

Returns:

-1 on general error, 0 if a match did not occur, or 1 if the domain matched the certificate.

Definition at line 349 of file ssl.c.

References ERR_BAD_PARAM, RET_ERROR_INT, and X509_check_host_d.

Referenced by _verify_dx_certificate().

5.358.1.5 int _do_x509_validation (X509 ∗ *cert*, STACK_OF(X509)∗ *chain*)

Perform X509 validation on a certificate presented by a remote TLS service.

Parameters:

cert a pointer to the x509 certificate to be chain-validated.

chain an optional pointer to the x509 certificate chain presented by the remote service; it will be added to the root certificate store already used for validation.

Returns:

-1 on general error, 0 if the certificate failed validation, or 1 if it passed validation successfully.

Definition at line 244 of file ssl.c.

References _dbgprint(), _verbose, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, RET_ERROR_INT_FMT, store, X509_get_subject_name_d, X509_LOOKUP_file_d, X509_NAME_oneline_d, X509_STORE_add_lookup_d, X509_STORE_CTX_free_d, X509_STORE_CTX_init_d, X509_STORE_CTX_new_d, X509_STORE_CTX_set_chain_d, X509_STORE_free_d, X509_STORE_load_locations_d, X509_STORE_new_d, X509_STORE_set_flags_d, X509_verify_cert_d, and X509_verify_cert_error_string_d.

Referenced by _verify_dx_certificate().

5.358.1.6 int _domain_wildcard_check (const char ∗ *pattern*, const char ∗ *domain*)

Perform a check against a wildcard pattern for a domain name.

Parameters:

pattern a pointer to the wildcard pattern string, subject as a certificate CN or SAN dnsname.

domain a pointer to the domain name, which will be compared against the supplied wildcard string.

Returns:

1 if the domain name matches the pattern or 0 if it does not; -1 if a general error was encountered.

Definition at line 1061 of file ssl.c.

References ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_SYSCALL, and RET_ERROR_INT.

5.358.1.7 void _dump_ocsp_response_cb (FILE ∗ *fp*, void ∗ *record*, int *brief*)

A callback handler to dump an OCSP response to the console.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

fp a pointer to the file stream that will receive the dump output.

record a pointer to the OCSP_RESPONSE object to be dumped.

brief if set, only print a brief one-line description for the requested record.

Definition at line 1344 of file ssl.c.

References ASN1_GENERALIZEDTIME_print_d, ASN1_INTEGER_to_BN_d, BIO_free_d, BIO_new_fp_d, BN_bn2hex_d, BN_free_d, ERR_print_errors_fp_d, OCSP_BASICRESP_free_d, OCSP_check_validity_d, OCSP_response_get1_basic_d, OCSP_response_status_d, OCSP_response_status_str_d, sk_num_d, sk_pop_d, and STACK_OF().

5.358.1.8 char∗ _get_cache_ocsp_id (X509 ∗ *cert*, OCSP_CERTID ∗ *cid*, char ∗ *buf*, size_t *blen*)

Get a unique identifier string for an OCSP response to be used in the object cache.

Parameters:

cert a pointer to the X509 certificate undergoing verification.

cid a pointer to the OCSP certificate ID derived from the certificate and its issuer.

buf a pointer to a buffer that will hold the generated OCSP response ID in the cache.

blen the size, in bytes, of the buffer holding the OCSP response id.

Returns:

a pointer to the output buffer with the OCSP response ID on success, or NULL on failure.

Definition at line 1290 of file ssl.c.

References _compute_sha_hash(), _get_cert_subject_cn(), CRYPTO_free_d, ERR_BAD_PARAM, ERR_UNSPEC, i2d_OCSP_CERTID_d, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, and SHA_160_SIZE.

Referenced by _do_ocsp_validation().

5.358.1.9 X509_STORE∗ _get_cert_store (void)

Get an x509 certificate store populated with the root certificate bundle.

Returns:

NULL on failure, or a pointer to the x509 certificate store on success.

Definition at line 1124 of file ssl.c.

References ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, store, X509_STORE_free_d, X509_STORE_load_locations_d, and X509_STORE_new_d.

Referenced by _do_ocsp_validation().

5.358.1.10 char∗ _get_cert_subject_cn (X509 ∗ *cert*)

Get the subject common name (CN) attribute of an X509 certificate.

Parameters:

cert a pointer to the X509 certificate to have its subject field parsed.

Returns:

a pointer to the X509 certificate's CN as a null-terminated string on success, or NULL on failure.

Definition at line 896 of file ssl.c.

References ASN1_STRING_data_d, ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, PUSH_ERROR_SYSCALL, RET_ERROR_PTR, X509_get_subject_name_d, X509_NAME_ENTRY_get_data_d, X509_NAME_get_entry_d, and X509_NAME_get_-index_by_NID_d.

Referenced by _get_cache_ocsp_id(), and _verify_certificate_callback().

5.358.1.11 int _ocsp_response_callback (SSL ∗ *s*, void ∗ *arg*)

An OCSP stapling rOCSP_REQUEST_freeesponse callback for the TLS subsystem.

Note:

This function currently does not do anything!

Parameters:

s a pointer to the SSL connection that generated the callback.

arg an optional callback parameter that was set by the caller.

Returns:

1 if the OCSP response was valid or 0 if it was not.

Definition at line 1238 of file ssl.c.

References _verbose, d2i_OCSP_RESPONSE_d, ERR_print_errors_fp_d, OCSP_RESPONSE_free_d, OCSP_RESPONSE_print_d, and SSL_ctrl_d.

Referenced by _ssl_connect_host().

5.358.1.12 void∗ _serialize_ocsp_response_cb (void ∗ *record*, size_t ∗ *outlen*)

A callback handler to serialize an OCSP response message.

Note:

This is an internal function used by the cache management subsystem.

Parameters:

record a pointer to the OCSP_RESPONSE object to be serialized.

outlen a pointer ot a variable that will receive the length of the serialized OCSP response.

Returns:

a pointer to a newly allocated buffer holding the serialized OCSP_RESPONSE on success, or NULL on failure.

Definition at line 1502 of file ssl.c.

References ERR_BAD_PARAM, ERR_UNSPEC, i2d_OCSP_RESPONSE_d, PUSH_ERROR_OPENSSL, and RET_ERROR_PTR.

5.358.1.13 SSL* _ssl_connect_host (const char * *hostname*, unsigned short *port*, int *force_family*)

Connect to a specified host and port via a TLS-enabled service.

Parameters:

hostname the hostname of the server to which the TLS connection will be established.

port the numerical port number of the service to which the connection should be made.

force_family an optional address family (AF_INET or AF_INET6) to force the TCP connection to take.

Returns:

NULL on failure, or the SSL descriptor of the newly established TLS session on success.

Definition at line 159 of file ssl.c.

References _connect_host(), _dbgprint(), _ocsp_response_callback(), _ssl_get_client_context(), ERR_BAD_PARAM, ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, SSL_connect_d, SSL_ctrl_d, SSL_CTX_callback_ctrl_d, SSL_CTX_ctrl_d, SSL_new_d, and SSL_set_fd_d.

Referenced by _dx_connect_standard().

5.358.1.14 void _ssl_disconnect (SSL * *handle*)

Terminate an SSL connection.

Parameters:

handle the SSL connection handle to be closed.

Definition at line 213 of file ssl.c.

References _dbgprint(), ERR_print_errors_fp_d, SSL_free_d, SSL_get_fd_d, and SSL_shutdown_d.

Referenced by _dx_connect_standard(), _sgnt_resolv_destroy_dmtp_session(), _sgnt_resolv_dmtp_quit(), and _sgnt_resolv_read_dmtp_line().

5.358.1.15 void _ssl_fd_loop (SSL * *connection*)

Create an fd loop (connect stdin to an ssl connection write fd, and ssl connection output to stdout).

Parameters:

connection the SSL connection handle to be passed to the control of the active console.

Definition at line 1147 of file ssl.c.

References ERR_print_errors_fp_d, SSL_get_rfd_d, SSL_read_d, and SSL_write_d.

5.358.1.16 SSL_CTX* _ssl_get_client_context (void)

Get an SSL context that will be used for all DMTP client connections.

Returns:

a pointer to the DMTP SSL client context on success, or NULL on failure.

Definition at line 74 of file ssl.c.

References _dbgprint(), _ssl_initialize(), _verify_certificate_callback(), DMTP_V1_CIPHER_LIST, ERR_UNSPEC, PUSH_ERROR_-OPENSSL, RET_ERROR_PTR, SSL_CTX_ctrl_d, SSL_CTX_new_d, SSL_CTX_set_cipher_list_d, SSL_CTX_set_verify_d, and SSLv23_client_method_d.

Referenced by _ssl_connect_host(), and _ssl_starttls().

5.358.1.17 int _ssl_initialize (void)

Initialize all the dependent layers of the openssl library for use.

Returns:

0 on success or -1 on error.

Definition at line 27 of file ssl.c.

References _dbgprint(), _get_dime_dir_location(), CA_FILE, CRL_FILE, ERR_UNSPEC, RET_ERROR_INT, SSL_library_init_d, and SSL_load_error_strings_d.

Referenced by _ssl_get_client_context().

5.358.1.18 void _ssl_shutdown (void)

Shutdown the openssl subsystem.

Definition at line 56 of file ssl.c.

References _dbgprint(), ERR_free_strings_d, and SSL_CTX_free_d.

5.358.1.19 SSL∗ _ssl_starttls (int *fd*)

Negotiate a TLS session over an existing network socket connection.

Note:

This function is called immediately after server confirmation of a STARTTLS command receipt.

Parameters:

fd the file descriptor of the network socket over which the TLS session will be initiated.

Returns:

NULL on failure, or the SSL descriptor of the newly established TLS session on success.

Definition at line 122 of file ssl.c.

References _dbgprint(), _ssl_get_client_context(), ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_PTR, SSL_connect_d, SSL_-new_d, and SSL_set_fd_d.

Referenced by _sgnt_resolv_dmtp_initiate_starttls().

5.358.1.20 int _validate_self_signed (X509 ∗ *cert*)

Validate a self-signed x509 certificate.

Note:

This is completed by adding the certificate to a temporary cert store/context and calling internal validation.

Parameters:

cert a pointer to the x509 certificate to be validated.

Returns:

-1 on general failure, 0 on validation error, or 1 on success.

Definition at line 1005 of file ssl.c.

References _dbgprint(), ERR_UNSPEC, PUSH_ERROR_OPENSSL, RET_ERROR_INT, store, X509_STORE_CTX_free_d, X509_-STORE_CTX_get_error_d, X509_STORE_CTX_init_d, X509_STORE_CTX_new_d, X509_STORE_free_d, X509_STORE_new_d, X509_verify_cert_d, and X509_verify_cert_error_string_d.

5.358.1.21 int _verify_certificate_callback (int *preverify_ok*, X509_STORE_CTX ∗ *ctx*)

An internal callback function for DMTP TLS certificate verification.

Note:

This callback is set from SSL_CTX_set_verify_d().

Parameters:

preverify_ok if set, indicates that the verification of the certificate passed, or 0 if it didn't.

ctx a pointer to the complete context used for the certificate chain verification.

Returns:

if 0, the verification process is stopped immediately, or if 1, the process is continued.

Definition at line 947 of file ssl.c.

References _clear_error_stack(), _dbgprint(), _get_cert_subject_cn(), ERR_print_errors_fp_d, X509_get_subject_name_d, X509_NAME_-oneline_d, X509_STORE_CTX_get_current_cert_d, X509_STORE_CTX_get_error_d, and X509_STORE_CTX_get_error_depth_d.

Referenced by _ssl_get_client_context().

Data Structures

- struct signet_field_t

Functions

- EC_KEY * dime_sgnt_enckey_fetch (signet_t const *signet)

  Retrieves the public encryption key from the signet, if the signet is a user signet only retrieves the main encryption key (not alternate).

- int dime_sgnt_enckey_set (signet_t *signet, EC_KEY *key, unsigned char format)

  Sets the public encryption key (non-alterante encryption key) for the signet.

- int dime_sgnt_fid_count_get (signet_t const *signet, unsigned char fid)

  Retrieves the number of fields with the specified field id.

- int dime_sgnt_fid_exists (signet_t const *signet, unsigned char fid)

  Checks for presence of field with specified id in the signet.

- unsigned char * dime_sgnt_fid_num_fetch (signet_t const *signet, unsigned char fid, unsigned int num, size_t *data_size)

  Fetches the binary data value of the field specified by field id and the number at which it appears in the signet amongst fields with the same field id (1, 2, ...).

- int dime_sgnt_fid_num_remove (signet_t *signet, unsigned char fid, int num)

  Removes the field specified by a field id and the number in which it appears in the target signet amongst fields with the same field id from the target signet.

- int dime_sgnt_field_defined_create (signet_t *signet, unsigned char fid, size_t data_size, unsigned char const *data)

  Adds a field to the target field.

- int dime_sgnt_field_defined_set (signet_t *signet, unsigned char fid, size_t data_size, const unsigned char *data)

  Replaces all fields in the target signet with the specified field id with a new field specified by the parameters.

- int dime_sgnt_field_undefined_create (signet_t *signet, size_t name_size, unsigned char const *name, size_t data_size, unsigned char const *data)

  Adds an undefined field to signet with specified name and data.

- unsigned char * dime_sgnt_field_undefined_fetch (signet_t const *signet, size_t name_size, unsigned char const *name, size_t *data_size)

  Fetches the first undefined field with the specified field name.

- int dime_sgnt_field_undefined_remove (signet_t *signet, size_t name_size, unsigned char const *name)

  Removes an undefined field from the target signet by name.

- int dime_sgnt_file_create (signet_t *signet, char const *filename)

Stores a signet from the signet_t structure in a PEM formatted file specified by the filename.

- char * dime_sgnt_fingerprint_crypto (signet_t const *signet)
  Takes a SHA512 fingerprint of a signet with all fields after the cryptographic signature field stripped off.
- char * dime_sgnt_fingerprint_full (signet_t const *signet)
  Takes a SHA512 fingerprint of the user or org signet with the ID and FULL signature fields stripped off.
- char * dime_sgnt_fingerprint_id (signet_t const *signet)
  Takes a SHA512 fingerprint of the entire user or org signet.
- char * dime_sgnt_fingerprint_ssr (signet_t const *signet)
  Takes a SHA512 fingerprint of a user signet or an ssr with all fields after the SSR signature stripped off.
- char * dime_sgnt_id_fetch (signet_t *signet)
  Retrieves signet id.
- int dime_sgnt_id_set (signet_t *signet, size_t id_size, unsigned char const *id)
  Sets the ID of the signet to the specified NULL terminated string.
- int dime_sgnt_msg_sig_verify (signet_t const *signet, ed25519_signature sig, unsigned char const *buf, size_t buf_len)
  Uses a signet's signing keys to verify a signature.
- int dime_sgnt_sig_coc_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the chain of custody signature field and adds the SSR signature.
- int dime_sgnt_sig_crypto_sign (signet_t *signet, ED25519_KEY *key)
  Signs an SSR or an incomplete ORG signet with the cryptographic signature after checking for the presence of all previous required fields.
- int dime_sgnt_sig_full_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the full signature and signs all the fields that come before the CORE signature field.
- int dime_sgnt_sig_id_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the FULL signature and signs the entire target signet using the specified key.
- int dime_sgnt_sig_ssr_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the SSR signature field and adds the SSR signature.
- signet_t * dime_sgnt_signet_binary_deserialize (unsigned char const *in, size_t len)
  Returns a new signet_t structure that gets deserialized from a data buffer.
- unsigned char * dime_sgnt_signet_binary_serialize (signet_t *signet, uint32_t *serial_size)
  Serializes a signet structure into binary data.
- signet_t * dime_sgnt_signet_b64_deserialize (const char *b64_in)
  Deserializes a b64 signet into a signet structure.
- char * dime_sgnt_signet_b64_serialize (signet_t *signet)
  Serializes a signet structure into b64 data.
- signet_t * dime_sgnt_signet_create (signet_type_t type)
  Returns a new signet_t structure.

- signet_t * dime_sgnt_signet_create_w_keys (signet_type_t type, char const *keysfile)
  Creates a signet structure with public signing and encyption keys. Also creates a keys file in which the private keys are stored.
- signet_t * dime_sgnt_signet_crypto_split (signet_t const *signet)
  Creates a copy of the target user signet with all fields beyond the INITIAL signature stripped off.
- void dime_sgnt_signet_destroy (signet_t *signet)
  Destroys a signet_t structure.
- void dime_sgnt_signet_dump (FILE *fp, signet_t *signet)
  Dumps signet into the specified file descriptor.
- signet_t * dime_sgnt_signet_dupe (signet_t *signet)
  Create a copy of the provided signet.
- signet_t * dime_sgnt_signet_full_split (signet_t const *signet)
  Creates a copy of the target signet with the ID field and the FULL signature stripped off.
- signet_t * dime_sgnt_signet_load (char const *filename)
  Loads signet_t structure from a PEM formatted file specified by filename.
- ED25519_KEY * dime_sgnt_signkey_fetch (signet_t const *signet)
  Retrieves the public signing key from the signet, if the signet is an org signet only retrieves the POK.
- int dime_sgnt_signkey_set (signet_t *signet, ED25519_KEY *key, unsigned char format)
  Retrieves all the signing keys from an org signet that can be used to sign a message.
- ED25519_KEY ** dime_sgnt_signkeys_msg_fetch (signet_t const *signet)
  Retrieves all the signing keys from an org signet that can be used to sign a signet.
- ED25519_KEY ** dime_sgnt_signkeys_signet_fetch (signet_t const *signet)
  Retrieves all the signing keys from an org signet that can be used to sign software.
- ED25519_KEY ** dime_sgnt_signkeys_software_fetch (signet_t const *signet)
  Retrieves all the signing keys from an org signet that can be used to sign a TLS certificate.
- ED25519_KEY ** dime_sgnt_signkeys_tls_fetch (signet_t const *signet)
  sets the signing key (pok - primary signing key in case of an org signet).
- int dime_sgnt_sok_create (signet_t *signet, ED25519_KEY *key, unsigned char format, uint8_t perm)
  adds a sok (secondary organizational signing key) to an organizational signet.
- ED25519_KEY * dime_sgnt_sok_num_fetch (signet_t const *signet, unsigned int num)
  fetch the secondary organizational signing key from the signet by number (starting at 1)
- char const * dime_sgnt_state_to_str (signet_state_t state)
  returns a string from a signet_state_t enum type.
- signet_type_t dime_sgnt_type_get (const signet_t *signet)
  retrieves the signet type, org or user (signet_type_org or signet_type_user)
- int dime_sgnt_type_set (signet_t *signet, signet_type_t type)
  sets the target signet to a specified type.

- signet_state_t dime_sgnt_validate_all (signet_t const ∗signet, signet_t const ∗previous, signet_t const ∗orgsig, unsigned char const ∗∗dime_pok)

  verifies a user signet, org signet or ssr for syntax, context and cryptographic validity. does not perform chain of custody validation.

5.361.1 Function Documentation

5.361.1.1 EC_KEY∗ dime_sgnt_enckey_fetch (signet_t const ∗ *signet*)

Retrieves the public encryption key from the signet, if the signet is a user signet only retrieves the main encryption key (not alternate).

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to the target encryption public key. {free_ec_key}

Definition at line 3909 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.2 int dime_sgnt_enckey_set (signet_t ∗ *signet*, EC_KEY ∗ *key*, unsigned char *format*)

Sets the public encryption key (non-alterante encryption key) for the signet.

Parameters:

signet Target signet.

key Public encryption key.

format Format specifier. TODO currently unused! (spec requires 0x04 but openssl natively serializes it to 0x02).

Returns:

0 on success, -1 on failure.

Definition at line 3926 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.3 int dime_sgnt_fid_count_get (signet_t const ∗ *signet*, unsigned char *fid*)

Retrieves the number of fields with the specified field id.

Parameters:

signet Pointer to the target signet.

fid The target field id.

Returns:

The number of fields with specified field id. On various errors returns -1. NOTE: int overflow should not occur because of field size lower and signet size upper bounds.

Definition at line 3942 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.4 int dime_sgnt_fid_exists (signet_t const * *signet*, unsigned char *fid*)

Checks for presence of field with specified id in the signet.

Parameters:

signet The signet to be checked

fid Specified field id

Returns:

1 if such a field exists, 0 if it does not exist, -1 if error.

Definition at line 3956 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.5 unsigned char* dime_sgnt_fid_num_fetch (signet_t const * *signet*, unsigned char *fid*, unsigned int *num*, size_t * *data_size*)

Fetches the binary data value of the field specified by field id and the number at which it appears in the signet amongst fields with the same field id (1, 2, ...).

Parameters:

signet Pointer to the target signet.

fid Specified field id.

num Specified field number based on the order in which it appears in the signet.

data_size Pointer to the length of returned array.

Returns:

Array containing the binary data of the specified field, NULL if an error occurs. {free}

Definition at line 3978 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.6 int dime_sgnt_fid_num_remove (signet_t * *signet*, unsigned char *fid*, int *num*)

Removes the field specified by a field id and the number in which it appears in the target signet amongst fields with the same field id from the target signet.

Parameters:

signet Pointer to the target signet.

fid Field id of the field to be removed.

num The number in which the field to be removed appears amongst other fields with the same field id in the target signet, (1, 2, ...).

Returns:

0 on success, -1 on failure.

Definition at line 3996 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.7 int dime_sgnt_field_defined_create (signet_t * *signet*, unsigned char *fid*, size_t *data_size*, unsigned char const * *data*)

Adds a field to the target field.

Parameters:

signet Pointer to the target signet.

fid Field id of the field to be added.

data_size Size of the array containing the field data.

data Field data.

Returns:

0 on success, -1 on failure.

Definition at line 4012 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.8 int dime_sgnt_field_defined_set (signet_t * *signet*, unsigned char *fid*, size_t *data_size*, const unsigned char * *data*)

Replaces all fields in the target signet with the specified field id with a new field specified by the parameters.

Parameters:

signet Pointer to the target signet_t structure.

fid Field id which specifies the fields to be replaced with the new field.

data_size Size of field data array.

data Array contaning field data.

Returns:

0 on success, -1 on failure.

Definition at line 4030 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.9 int dime_sgnt_field_undefined_create (signet_t * *signet*, size_t *name_size*, unsigned char const * *name*, size_t *data_size*, unsigned char const * *data*)

Adds an undefined field to signet with specified name and data.

Parameters:

signet Pointer to the target signet to which the field is added.

name_size Size of field name.

name Pointer to field name.

data_size Size of field data.

data Pointer to field data.

Returns:

0 on success, -1 on failure.

Definition at line 4050 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.10 unsigned char* dime_sgnt_field_undefined_fetch (signet_t const * *signet*, size_t *name_size*, unsigned char const * *name*, size_t * *data_size*)

Fetches the first undefined field with the specified field name.

Parameters:

signet Pointer to the target signet.

name_size Length of the passed array containing the length of the target field name.

name Array containing the name of the desired undefined field.

data_size Pointer to the size of the array that gets returned by the function.

Returns:

The array containing the data from the specified field or NULL in case of failure such as if the field was not found. {free}

Definition at line 4069 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.11 int dime_sgnt_field_undefined_remove (signet_t * *signet*, size_t *name_size*, unsigned char const * *name*)

Removes an undefined field from the target signet by name.

Parameters:

signet Pointer to the target signet.

name_size Size of field name.

name Name of the field to be removed.

Returns:

0 on success, -1 on failure.

Definition at line 4085 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.12 int dime_sgnt_file_create (signet_t * *signet*, char const * *filename*)

Stores a signet from the signet_t structure in a PEM formatted file specified by the filename.

Parameters:

signet Pointer to the signet_t structure containing the signet.

filename NULL terminated string containing the desired filename for the signet.

Returns:

0 on success, -1 on failure.

Definition at line 4100 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.13 char* dime_sgnt_fingerprint_crypto (signet_t const * *signet*)

Takes a SHA512 fingerprint of a signet with all fields after the cryptographic signature field stripped off.

Note:

To take an SSR fingerprint, use the signet_ssr_fingerprint() function.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated string to a base64 encoded unpadded fingerprint. NULL on error. {free}

Definition at line 4118 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.14 char* dime_sgnt_fingerprint_full (signet_t const * *signet*)

Takes a SHA512 fingerprint of the user or org signet with the ID and FULL signature fields stripped off.

Note:

To take an SSR fingerprint, use the signet_ssr_fingerprint() function.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. NULL on failure. {free}

Definition at line 4136 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.15 char* dime_sgnt_fingerprint_id (signet_t const * *signet*)

Takes a SHA512 fingerprint of the entire user or org signet.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. NULL on failure; {free}

Definition at line 4151 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.16 char* dime_sgnt_fingerprint_ssr (signet_t const * *signet*)

Takes a SHA512 fingerprint of a user signet or an ssr with all fields after the SSR signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. {free}

Definition at line 4166 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.17 char* dime_sgnt_id_fetch (signet_t * *signet*)

Retrieves signet id.

Parameters:

signet Signet from which the id is retrieved.

Returns:

Cstring containing ID or NULL on error. {free}

Definition at line 4180 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.18 int dime_sgnt_id_set (signet_t * *signet*, size_t *id_size*, unsigned char const * *id*)

Sets the ID of the signet to the specified NULL terminated string.

Parameters:

signet Pointer to the target signet.

id_size Size of signet id.

id Signet id.

Returns:

0 on success, -1 on failure.

Definition at line 4196 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.19 int dime_sgnt_msg_sig_verify (signet_t const * *signet*, ed25519_signature *sig*, unsigned char const * *buf*, size_t *buf_len*)

Uses a signet's signing keys to verify a signature.

Parameters:

signet Pointer to the signet.

sig ed25519 signature buffer to be verified.

buf Data buffer over which the signature was taken.

buf_len Length of data buffer.

Returns:

1 on successful verification, 0 if the signature could not be verified, -1 if an error occurred.

Definition at line 4215 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.20 int dime_sgnt_sig_coc_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the chain of custody signature field and adds the SSR signature.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4230 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.21 int dime_sgnt_sig_crypto_sign (signet_t * *signet*, ED25519_KEY * *key*)

Signs an SSR or an incomplete ORG signet with the cryptographic signature after checking for the presence of all previous required fields.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4245 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.22 int dime_sgnt_sig_full_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the full signature and signs all the fields that come before the CORE signature field.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4261 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.23 int dime_sgnt_sig_id_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the FULL signature and signs the entire target signet using the specified key.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4275 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.24 int dime_sgnt_sig_ssr_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the SSR signature field and adds the SSR signature.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4290 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.25 signet_t* dime_sgnt_signet_b64_deserialize (const char * *b64_in*)

Deserializes a b64 signet into a signet structure.

Parameters:

b64_in NULL terminated array of b64 signet data.

Returns:

Pointer to newly allocated signet structure, NULL if failure. {dime_sgnt_destroy_signet}

Definition at line 4336 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _get_signet().

5.361.1.26 char* dime_sgnt_signet_b64_serialize (signet_t * *signet*)

Serializes a signet structure into b64 data.

Parameters:

signet Pointer to the target signet.

Returns:

Signet serialized into b64 data. NULL on error. {free}

Definition at line 4350 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.27 signet_t* dime_sgnt_signet_binary_deserialize (unsigned char const * *in*, size_t *len*)

Returns a new signet_t structure that gets deserialized from a data buffer.

Parameters:

in data buffer containing the binary form of a signet

in_len length of data buffer

Returns:

A pointer to a newly allocated signet_t structure type, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4306 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _deserialize_signet_cb().

5.361.1.28 unsigned char* dime_sgnt_signet_binary_serialize (signet_t * *signet*, uint32_t * *serial_size*)

Serializes a signet structure into binary data.

Parameters:

signet Pointer to the target signet.

serial_size Pointer to the value that stores the length of the array returned.

Returns:

Signet serialized into binary data. NULL on error. {free}

Definition at line 4322 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _serialize_signet_cb().

5.361.1.29 signet_t* dime_sgnt_signet_create (signet_type_t *type*)

Returns a new signet_t structure.

Parameters:

type signet type user org or sss (SIGNET_TYPE_USER, SIGNET_TYPE_ORG or SIGNET_TYPE_SSR)

Returns:

A pointer to a newly allocated signet_t structure type, NULL if failure. {dime_sgnt_destroy_signet}

Definition at line 4364 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.30 signet_t* dime_sgnt_signet_create_w_keys (signet_type_t *type*, char const * *keysfile*)

Creates a signet structure with public signing and encyption keys. Also creates a keys file in which the private keys are stored.

Parameters:

type Signet type, org, user or ssr (SIGNET_TYPE_ORG, SIGNET_TYPE_USER or SIGNET_TYPE_SSR).
keysfile NULL terminated string containing the name of the keyfile to be created.

Returns:

Pointer to the newly created and allocated signet_t structure or NULL on error. {dime_sgnt_destroy_signet}

Definition at line 4383 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.31 signet_t* dime_sgnt_signet_crypto_split (signet_t const * *signet*)

Creates a copy of the target user signet with all fields beyond the INITIAL signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to a stripped signet on success, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4398 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.32 void dime_sgnt_signet_destroy (signet_t * *signet*)

Destroys a signet_t structure.

Parameters:

signet Pointer to the signet to be destroyed.

Definition at line 4408 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

Referenced by _destroy_signet_cb(), and _get_signet().

5.361.1.33 void dime_sgnt_signet_dump (FILE * *fp*, signet_t * *signet*)

Dumps signet into the specified file descriptor.

Parameters:

fp File descriptor the signet is dumped to.
signet Pointer to the signet_t structure to be dumped.

Definition at line 4420 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

Referenced by _dump_signet_cb().

5.361.1.34 signet_t* dime_sgnt_signet_dupe (signet_t * *signet*)

Create a copy of the provided signet.

Parameters:

signet Signet to be copied.

Returns:

The copy. {dime_sgnt_destroy_signet}

Definition at line 4434 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.35 signet_t* dime_sgnt_signet_full_split (signet_t const * *signet*)

Creates a copy of the target signet with the ID field and the FULL signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to a stripped signet on success, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4449 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.36 signet_t* dime_sgnt_signet_load (char const * *filename*)

Loads signet_t structure from a PEM formatted file specified by filename.

Parameters:

filename NULL terminated string containing the filename of the file containing the signet.

Returns:

Pointer to a newly created signet_t structure loaded from the file, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4465 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.37 ED25519_KEY* dime_sgnt_signkey_fetch (signet_t const * *signet*)

Retrieves the public signing key from the signet, if the signet is an org signet only retrieves the POK.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to the target ed25519 public key. {free_ed25519_key}

Definition at line 4480 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.38 int dime_sgnt_signkey_set (signet_t * *signet*, ED25519_KEY * *key*, unsigned char *format*)

Retrieves all the signing keys from an org signet that can be used to sign a message.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4496 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.39 ED25519_KEY** dime_sgnt_signkeys_msg_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign a signet.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4513 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.40 ED25519_KEY** dime_sgnt_signkeys_signet_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign software.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4530 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.41 ED25519_KEY** dime_sgnt_signkeys_software_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign a TLS certificate.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4547 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.42 ED25519_KEY** dime_sgnt_signkeys_tls_fetch (signet_t const * *signet*)

sets the signing key (pok - primary signing key in case of an org signet).

Parameters:

signet pointer to the target signet.

key public signing key to be set as the signing key of the signet.

format format specifier byte, dictating the format.

Returns:

0 on success, -1 on failure.

Definition at line 4564 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.43 int dime_sgnt_sok_create (signet_t * *signet*, ED25519_KEY * *key*, unsigned char *format*, uint8_t *perm*)

adds a sok (secondary organizational signing key) to an organizational signet.

Parameters:

signet pointer to the target org signet.

key ed25519 key to be added as a sok to the signet.

format format specifier byte dictating the format.

perm permissions for the usage of the sok.

Returns:

0 on success, -1 on failure.

Definition at line 4583 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.44 ED25519_KEY∗ dime_sgnt_sok_num_fetch (signet_t const ∗ *signet*, unsigned int *num*)

fetch the secondary organizational signing key from the signet by number (starting at 1)

Parameters:

signet pointer to the target organizational signet.

num the sok number to be fetched.

Returns:

retrieved ed25519 key. {free_ed25519_key}

Definition at line 4600 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.45 char const∗ dime_sgnt_state_to_str (signet_state_t *state*)

returns a string from a signet_state_t enum type.

Parameters:

state signet state.

Returns:

null terminated string corresponding to the state.

Definition at line 4613 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.46 signet_type_t dime_sgnt_type_get (const signet_t ∗ *signet*)

retrieves the signet type, org or user (signet_type_org or signet_type_user)

Parameters:

signet pointer to the target signet.

Returns:

a signet_type_t enum type with the signet type, signet_type_error on failure.

Definition at line 4627 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.47 int dime_sgnt_type_set (signet_t ∗ *signet*, signet_type_t *type*)

sets the target signet to a specified type.

Parameters:

signet pointer to the target signet.

type specified signet type.

Returns:

0 on success, -1 on error.

Definition at line 4641 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.361.1.48 signet_state_t dime_sgnt_validate_all (signet_t const * *signet*, signet_t const * *previous*, signet_t const * *orgsig*, unsigned char const ** *dime_pok*)

verifies a user signet, org signet or ssr for syntax, context and cryptographic validity. does not perform chain of custody validation.

Parameters:

signet pointer to the target signet_t structure.

orgsig pointer to the org signet associated with the target signet if the target signet is a user signet. if target signet is not a user signet, orgsig should be passed as null.

previous pointer to the previous user signet, which will be used validate the chain of custody signature, if such is available.

dime_pok a null terminated array of pointers to ed25519 poks from the dime record associated with the target signet if the target signet is an org signet. if the target signet is not an org signet dime_pok should be passed as null;

Returns:

signet state as a signet_state_t enum type. ss_unknown on error.

Definition at line 4666 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _get_signet().

  Retrieves the public encryption key from the signet, if the signet is a user signet only retrieves the main encryption key (not alternate).

- int dime_sgnt_enckey_set (signet_t *signet, EC_KEY *key, unsigned char format)

  Sets the public encryption key (non-alterante encryption key) for the signet.

- int dime_sgnt_fid_count_get (const signet_t *signet, unsigned char fid)

  Retrieves the number of fields with the specified field id.

- int dime_sgnt_fid_exists (const signet_t *signet, unsigned char fid)

  Checks for presence of field with specified id in the signet.

- unsigned char * dime_sgnt_fid_num_fetch (const signet_t *signet, unsigned char fid, unsigned int num, size_t *data_size)

  Fetches the binary data value of the field specified by field id and the number at which it appears in the signet amongst fields with the same field id (1, 2, ...).

- int dime_sgnt_fid_num_remove (signet_t *signet, unsigned char fid, int num)

  Removes the field specified by a field id and the number in which it appears in the target signet amongst fields with the same field id from the target signet.

- int dime_sgnt_field_defined_create (signet_t *signet, unsigned char fid, size_t data_size, const unsigned char *data)

  Adds a field to the target field.

- int dime_sgnt_field_defined_set (signet_t *signet, unsigned char fid, size_t data_size, const unsigned char *data)

  Replaces all fields in the target signet with the specified field id with a new field specified by the parameters.

- int dime_sgnt_field_undefined_create (signet_t *signet, size_t name_size, const unsigned char *name, size_t data_size, const unsigned char *data)

  Adds an undefined field to signet with specified name and data.

- unsigned char * dime_sgnt_field_undefined_fetch (const signet_t *signet, size_t name_size, const unsigned char *name, size_t *data_size)

Fetches the first undefined field with the specified field name.

- int dime_sgnt_field_undefined_remove (signet_t *signet, size_t name_size, const unsigned char *name)
  Removes an undefined field from the target signet by name.

- int dime_sgnt_file_create (signet_t *signet, const char *filename)
  Stores a signet from the signet_t structure in a PEM formatted file specified by the filename.

- char * dime_sgnt_fingerprint_crypto (const signet_t *signet)
  Takes a SHA512 fingerprint of a signet with all fields after the cryptographic signature field stripped off.

- char * dime_sgnt_fingerprint_full (const signet_t *signet)
  Takes a SHA512 fingerprint of the user or org signet with the ID and FULL signature fields stripped off.

- char * dime_sgnt_fingerprint_id (const signet_t *signet)
  Takes a SHA512 fingerprint of the entire user or org signet.

- char * dime_sgnt_fingerprint_ssr (const signet_t *signet)
  Takes a SHA512 fingerprint of a user signet or an ssr with all fields after the SSR signature stripped off.

- char * dime_sgnt_id_fetch (signet_t *signet)
  Retrieves signet id.

- int dime_sgnt_id_set (signet_t *signet, size_t id_size, const unsigned char *id)
  Sets the ID of the signet to the specified NULL terminated string.

- int dime_sgnt_msg_sig_verify (const signet_t *signet, ed25519_signature sig, const unsigned char *buf, size_t buf_len)
  Uses a signet's signing keys to verify a signature.

- int dime_sgnt_sig_coc_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the chain of custody signature field and adds the SSR signature.

- int dime_sgnt_sig_crypto_sign (signet_t *signet, ED25519_KEY *key)
  Signs an SSR or an incomplete ORG signet with the cryptographic signature after checking for the presence of all previous required fields.

- int dime_sgnt_sig_full_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the full signature and signs all the fields that come before the CORE signature field.

- int dime_sgnt_sig_id_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the FULL signature and signs the entire target signet using the specified key.

- int dime_sgnt_sig_ssr_sign (signet_t *signet, ED25519_KEY *key)
  Checks for the presence of all required fields that come before the SSR signature field and adds the SSR signature.

- signet_t * dime_sgnt_signet_binary_deserialize (const unsigned char *in, size_t in_len)
  Returns a new signet_t structure that gets deserialized from a data buffer.

- unsigned char * dime_sgnt_signet_binary_serialize (signet_t *signet, uint32_t *serial_size)
  Serializes a signet structure into binary data.

- signet_t * dime_sgnt_signet_b64_deserialize (const char *b64_in)
  Deserializes a b64 signet into a signet structure.

- char * dime_sgnt_signet_b64_serialize (signet_t *signet)
  Serializes a signet structure into b64 data.

- signet_t * dime_sgnt_signet_create (signet_type_t type)
  Returns a new signet_t structure.

- signet_t * dime_sgnt_signet_create_w_keys (signet_type_t type, const char *keysfile)
  Creates a signet structure with public signing and encyption keys. Also creates a keys file in which the private keys are stored.

- signet_t * dime_sgnt_signet_crypto_split (const signet_t *signet)
  Creates a copy of the target user signet with all fields beyond the INITIAL signature stripped off.

- void dime_sgnt_signet_destroy (signet_t *signet)
  Destroys a signet_t structure.

- void dime_sgnt_signet_dump (FILE *fp, signet_t *signet)
  Dumps signet into the specified file descriptor.

- signet_t * dime_sgnt_signet_dupe (signet_t *signet)
  Create a copy of the provided signet.

- signet_t * dime_sgnt_signet_full_split (const signet_t *signet)
  Creates a copy of the target signet with the ID field and the FULL signature stripped off.

- signet_t * dime_sgnt_signet_load (const char *filename)
  Loads signet_t structure from a PEM formatted file specified by filename.

- ED25519_KEY * dime_sgnt_signkey_fetch (const signet_t *signet)
  Retrieves the public signing key from the signet, if the signet is an org signet only retrieves the POK.

- ED25519_KEY ** dime_sgnt_signkeys_msg_fetch (const signet_t *signet)
  Retrieves all the signing keys from an org signet that can be used to sign a signet.

- ED25519_KEY ** dime_sgnt_signkeys_signet_fetch (const signet_t *signet)
  Retrieves all the signing keys from an org signet that can be used to sign software.

- ED25519_KEY ** dime_sgnt_signkeys_software_fetch (const signet_t *signet)
  Retrieves all the signing keys from an org signet that can be used to sign a TLS certificate.

- ED25519_KEY ** dime_sgnt_signkeys_tls_fetch (const signet_t *signet)
  sets the signing key (pok - primary signing key in case of an org signet).

- int dime_sgnt_signkey_set (signet_t *signet, ED25519_KEY *key, unsigned char format)
  Retrieves all the signing keys from an org signet that can be used to sign a message.

- int dime_sgnt_sok_create (signet_t *signet, ED25519_KEY *key, unsigned char format, uint8_t perm)
  adds a sok (secondary organizational signing key) to an organizational signet.

- ED25519_KEY * dime_sgnt_sok_num_fetch (const signet_t *signet, unsigned int num)
  fetch the secondary organizational signing key from the signet by number (starting at 1)

- const char * dime_sgnt_state_to_str (signet_state_t state)
  returns a string from a signet_state_t enum type.

- signet_type_t dime_sgnt_type_get (const signet_t *signet)

  retrieves the signet type, org or user (signet_type_org or signet_type_user)

- int dime_sgnt_type_set (signet_t *signet, signet_type_t type)

  sets the target signet to a specified type.

- signet_state_t dime_sgnt_validate_all (const signet_t *signet, const signet_t *previous, const signet_t *orgsig, const unsigned char **dime_pok)

  verifies a user signet, org signet or ssr for syntax, context and cryptographic validity. does not perform chain of custody validation.

5.362.1 Enumeration Type Documentation

5.362.1.1 enum signet_state_t

Enumerator:

SS_UNKNOWN Invalid signet, state unknown/currently unclassified

SS_MALFORMED Invalid signet, it either doesn't fit the field format or has multiple unique fields

SS_OVERFLOW Invalid signet due to it being too large.

SS_INCOMPLETE Invalid signet, it is missing fields required to fit one of the valid categories, likely unsigned

SS_BROKEN_COC Invalid signet due to chain of custody signature being invalid

SS_INVALID Invalid signet, one or more signatures can not be verified

SS_SSR Valid unsigned SSR

SS_CRYPTO Valid cryptographic signet

SS_FULL Valid full signet

SS_ID Valid full signet with ID and organizational-identifiable-signature

Definition at line 7 of file signet.h.

5.362.1.2 enum signet_type_t

Enumerator:

SIGNET_TYPE_ERROR

SIGNET_TYPE_ORG

SIGNET_TYPE_USER

SIGNET_TYPE_SSR

Definition at line 20 of file signet.h.

5.362.2 Function Documentation

5.362.2.1 EC_KEY* dime_sgnt_enckey_fetch (signet_t const * *signet*)

Retrieves the public encryption key from the signet, if the signet is a user signet only retrieves the main encryption key (not alternate).

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to the target encryption public key. {free_ec_key}

Definition at line 3909 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.2 int dime_sgnt_enckey_set (signet_t * *signet*, EC_KEY * *key*, unsigned char *format*)

Sets the public encryption key (non-alterante encryption key) for the signet.

Parameters:

signet Target signet.

key Public encryption key.

format Format specifier. TODO currently unused! (spec requires 0x04 but openssl natively serializes it to 0x02).

Returns:

0 on success, -1 on failure.

Definition at line 3926 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.3 int dime_sgnt_fid_count_get (signet_t const * *signet*, unsigned char *fid*)

Retrieves the number of fields with the specified field id.

Parameters:

signet Pointer to the target signet.

fid The target field id.

Returns:

The number of fields with specified field id. On various errors returns -1. NOTE: int overflow should not occur because of field size lower and signet size upper bounds.

Definition at line 3942 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.4 int dime_sgnt_fid_exists (signet_t const * *signet*, unsigned char *fid*)

Checks for presence of field with specified id in the signet.

Parameters:

signet The signet to be checked

fid Specified field id

Returns:

1 if such a field exists, 0 if it does not exist, -1 if error.

Definition at line 3956 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.5 unsigned char* dime_sgnt_fid_num_fetch (signet_t const * *signet*, unsigned char *fid*, unsigned int *num*, size_t * *data_size*)

Fetches the binary data value of the field specified by field id and the number at which it appears in the signet amongst fields with the same field id (1, 2, ...).

Parameters:

signet Pointer to the target signet.

fid Specified field id.

num Specified field number based on the order in which it appears in the signet.

data_size Pointer to the length of returned array.

Returns:

Array containing the binary data of the specified field, NULL if an error occurs. {free}

Definition at line 3978 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.6 int dime_sgnt_fid_num_remove (signet_t * *signet*, unsigned char *fid*, int *num*)

Removes the field specified by a field id and the number in which it appears in the target signet amongst fields with the same field id from the target signet.

Parameters:

signet Pointer to the target signet.

fid Field id of the field to be removed.

num The number in which the field to be removed appears amongst other fields with the same field id in the target signet, (1, 2, ...).

Returns:

0 on success, -1 on failure.

Definition at line 3996 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.7 int dime_sgnt_field_defined_create (signet_t * *signet*, unsigned char *fid*, size_t *data_size*, unsigned char const * *data*)

Adds a field to the target field.

Parameters:

signet Pointer to the target signet.

fid Field id of the field to be added.

data_size Size of the array containing the field data.

data Field data.

Returns:

0 on success, -1 on failure.

Definition at line 4012 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.8 int dime_sgnt_field_defined_set (signet_t * *signet*, unsigned char *fid*, size_t *data_size*, const unsigned char * *data*)

Replaces all fields in the target signet with the specified field id with a new field specified by the parameters.

Parameters:

signet Pointer to the target signet_t structure.

fid Field id which specifies the fields to be replaced with the new field.

data_size Size of field data array.

data Array contaning field data.

Returns:

0 on success, -1 on failure.

Definition at line 4030 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.9 int dime_sgnt_field_undefined_create (signet_t * *signet*, size_t *name_size*, unsigned char const * *name*, size_t *data_size*, unsigned char const * *data*)

Adds an undefined field to signet with specified name and data.

Parameters:

signet Pointer to the target signet to which the field is added.

name_size Size of field name.

name Pointer to field name.

data_size Size of field data.

data Pointer to field data.

Returns:

0 on success, -1 on failure.

Definition at line 4050 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.10 unsigned char* dime_sgnt_field_undefined_fetch (signet_t const * *signet*, size_t *name_size*, unsigned char const * *name*, size_t * *data_size*)

Fetches the first undefined field with the specified field name.

Parameters:

signet Pointer to the target signet.

name_size Length of the passed array containing the length of the target field name.

name Array containing the name of the desired undefined field.

data_size Pointer to the size of the array that gets returned by the function.

Returns:

The array containing the data from the specified field or NULL in case of failure such as if the field was not found. {free}

Definition at line 4069 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.11 int dime_sgnt_field_undefined_remove (signet_t * *signet*, size_t *name_size*, unsigned char const * *name*)

Removes an undefined field from the target signet by name.

Parameters:

signet Pointer to the target signet.

name_size Size of field name.

name Name of the field to be removed.

Returns:

0 on success, -1 on failure.

Definition at line 4085 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.12 int dime_sgnt_file_create (signet_t * *signet*, char const * *filename*)

Stores a signet from the signet_t structure in a PEM formatted file specified by the filename.

Parameters:

signet Pointer to the signet_t structure containing the signet.

filename NULL terminated string containing the desired filename for the signet.

Returns:

0 on success, -1 on failure.

Definition at line 4100 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.13 char* dime_sgnt_fingerprint_crypto (signet_t const * *signet*)

Takes a SHA512 fingerprint of a signet with all fields after the cryptographic signature field stripped off.

Note:

To take an SSR fingerprint, use the signet_ssr_fingerprint() function.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated string to a base64 encoded unpadded fingerprint. NULL on error. {free}

Definition at line 4118 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.14 char* dime_sgnt_fingerprint_full (signet_t const * *signet*)

Takes a SHA512 fingerprint of the user or org signet with the ID and FULL signature fields stripped off.

Note:

To take an SSR fingerprint, use the signet_ssr_fingerprint() function.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. NULL on failure. {free}

Definition at line 4136 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.15 char* dime_sgnt_fingerprint_id (signet_t const * *signet*)

Takes a SHA512 fingerprint of the entire user or org signet.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. NULL on failure; {free}

Definition at line 4151 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.16 char* dime_sgnt_fingerprint_ssr (signet_t const * *signet*)

Takes a SHA512 fingerprint of a user signet or an ssr with all fields after the SSR signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Allocated NULL terminated buffer to a base64 encoded unpadded fingerprint. {free}

Definition at line 4166 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.17 char* dime_sgnt_id_fetch (signet_t * *signet*)

Retrieves signet id.

Parameters:

signet Signet from which the id is retrieved.

Returns:

Cstring containing ID or NULL on error. {free}

Definition at line 4180 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.18 int dime_sgnt_id_set (signet_t * *signet*, size_t *id_size*, unsigned char const * *id*)

Sets the ID of the signet to the specified NULL terminated string.

Parameters:

signet Pointer to the target signet.
id_size Size of signet id.
id Signet id.

Returns:

0 on success, -1 on failure.

Definition at line 4196 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.19 int dime_sgnt_msg_sig_verify (signet_t const * *signet*, ed25519_signature *sig*, unsigned char const * *buf*, size_t *buf_len*)

Uses a signet's signing keys to verify a signature.

Parameters:

signet Pointer to the signet.
sig ed25519 signature buffer to be verified.
buf Data buffer over which the signature was taken.
buf_len Length of data buffer.

Returns:

1 on successful verification, 0 if the signature could not be verified, -1 if an error occurred.

Definition at line 4215 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.20 int dime_sgnt_sig_coc_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the chain of custody signature field and adds the SSR signature.

Parameters:

signet Pointer to the target signet_t structure.
key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4230 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.21 int dime_sgnt_sig_crypto_sign (signet_t * *signet*, ED25519_KEY * *key*)

Signs an SSR or an incomplete ORG signet with the cryptographic signature after checking for the presence of all previous required fields.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4245 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.22 int dime_sgnt_sig_full_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the full signature and signs all the fields that come before the CORE signature field.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4261 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.23 int dime_sgnt_sig_id_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the FULL signature and signs the entire target signet using the specified key.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4275 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.24 int dime_sgnt_sig_ssr_sign (signet_t * *signet*, ED25519_KEY * *key*)

Checks for the presence of all required fields that come before the SSR signature field and adds the SSR signature.

Parameters:

signet Pointer to the target signet_t structure.

key Specified ed25519 key used for signing.

Returns:

0 on success, -1 on failure.

Definition at line 4290 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.25 signet_t* dime_sgnt_signet_b64_deserialize (const char * *b64_in*)

Deserializes a b64 signet into a signet structure.

Parameters:

b64_in NULL terminated array of b64 signet data.

Returns:

Pointer to newly allocated signet structure, NULL if failure. {dime_sgnt_destroy_signet}

Definition at line 4336 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _get_signet().

5.362.2.26 char* dime_sgnt_signet_b64_serialize (signet_t * *signet*)

Serializes a signet structure into b64 data.

Parameters:

signet Pointer to the target signet.

Returns:

Signet serialized into b64 data. NULL on error. {free}

Definition at line 4350 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.27 signet_t* dime_sgnt_signet_binary_deserialize (unsigned char const * *in*, size_t *len*)

Returns a new signet_t structure that gets deserialized from a data buffer.

Parameters:

in data buffer containing the binary form of a signet

in_len length of data buffer

Returns:

A pointer to a newly allocated signet_t structure type, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4306 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _deserialize_signet_cb().

5.362.2.28 unsigned char* dime_sgnt_signet_binary_serialize (signet_t * *signet*, uint32_t * *serial_size*)

Serializes a signet structure into binary data.

Parameters:

signet Pointer to the target signet.

serial_size Pointer to the value that stores the length of the array returned.

Returns:

Signet serialized into binary data. NULL on error. {free}

Definition at line 4322 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _serialize_signet_cb().

5.362.2.29 signet_t* dime_sgnt_signet_create (signet_type_t *type*)

Returns a new signet_t structure.

Parameters:

type signet type user org or sss (SIGNET_TYPE_USER, SIGNET_TYPE_ORG or SIGNET_TYPE_SSR)

Returns:

A pointer to a newly allocated signet_t structure type, NULL if failure. {dime_sgnt_destroy_signet}

Definition at line 4364 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.30 signet_t* dime_sgnt_signet_create_w_keys (signet_type_t *type*, char const * *keysfile*)

Creates a signet structure with public signing and encyption keys. Also creates a keys file in which the private keys are stored.

Parameters:

type Signet type, org, user or ssr (SIGNET_TYPE_ORG, SIGNET_TYPE_USER or SIGNET_TYPE_SSR).

keysfile NULL terminated string containing the name of the keyfile to be created.

Returns:

Pointer to the newly created and allocated signet_t structure or NULL on error. {dime_sgnt_destroy_signet}

Definition at line 4383 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.31 signet_t* dime_sgnt_signet_crypto_split (signet_t const * *signet*)

Creates a copy of the target user signet with all fields beyond the INITIAL signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to a stripped signet on success, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4398 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.32 void dime_sgnt_signet_destroy (signet_t * *signet*)

Destroys a signet_t structure.

Parameters:

signet Pointer to the signet to be destroyed.

Definition at line 4408 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

Referenced by _destroy_signet_cb(), and _get_signet().

5.362.2.33 void dime_sgnt_signet_dump (FILE * *fp*, signet_t * *signet*)

Dumps signet into the specified file descriptor.

Parameters:

fp File descriptor the signet is dumped to.

signet Pointer to the signet_t structure to be dumped.

Definition at line 4420 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT_VOID.

Referenced by _dump_signet_cb().

5.362.2.34 signet_t* dime_sgnt_signet_dupe (signet_t * *signet*)

Create a copy of the provided signet.

Parameters:

signet Signet to be copied.

Returns:

The copy. {dime_sgnt_destroy_signet}

Definition at line 4434 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.35 signet_t* dime_sgnt_signet_full_split (signet_t const * *signet*)

Creates a copy of the target signet with the ID field and the FULL signature stripped off.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to a stripped signet on success, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4449 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.36 signet_t* dime_sgnt_signet_load (char const * *filename*)

Loads signet_t structure from a PEM formatted file specified by filename.

Parameters:

filename NULL terminated string containing the filename of the file containing the signet.

Returns:

Pointer to a newly created signet_t structure loaded from the file, NULL on failure. {dime_sgnt_destroy_signet}

Definition at line 4465 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.37 ED25519_KEY* dime_sgnt_signkey_fetch (signet_t const * *signet*)

Retrieves the public signing key from the signet, if the signet is an org signet only retrieves the POK.

Parameters:

signet Pointer to the target signet.

Returns:

Pointer to the target ed25519 public key. {free_ed25519_key}

Definition at line 4480 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.38 int dime_sgnt_signkey_set (signet_t * *signet*, ED25519_KEY * *key*, unsigned char *format*)

Retrieves all the signing keys from an org signet that can be used to sign a message.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4496 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.39 ED25519_KEY** dime_sgnt_signkeys_msg_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign a signet.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4513 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.40 ED25519_KEY** dime_sgnt_signkeys_signet_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign software.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4530 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.41 ED25519_KEY** dime_sgnt_signkeys_software_fetch (signet_t const * *signet*)

Retrieves all the signing keys from an org signet that can be used to sign a TLS certificate.

Parameters:

signet Pointer to target organizational signet.

Returns:

A NULL pointer terminated array of ed25519 public signing key objects.

Note:

Always returns at least POK. {free_ed25519_key_chain}

Definition at line 4547 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.42 ED25519_KEY** dime_sgnt_signkeys_tls_fetch (signet_t const * *signet*)

sets the signing key (pok - primary signing key in case of an org signet).

Parameters:

signet pointer to the target signet.

key public signing key to be set as the signing key of the signet.

format format specifier byte, dictating the format.

Returns:

0 on success, -1 on failure.

Definition at line 4564 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.43 int dime_sgnt_sok_create (signet_t * *signet*, ED25519_KEY * *key*, unsigned char *format*, uint8_t *perm*)

adds a sok (secondary organizational signing key) to an organizational signet.

Parameters:

signet pointer to the target org signet.

key ed25519 key to be added as a sok to the signet.

format format specifier byte dictating the format.

perm permissions for the usage of the sok.

Returns:

0 on success, -1 on failure.

Definition at line 4583 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.44 ED25519_KEY* dime_sgnt_sok_num_fetch (signet_t const * *signet*, unsigned int *num*)

fetch the secondary organizational signing key from the signet by number (starting at 1)

Parameters:

signet pointer to the target organizational signet.

num the sok number to be fetched.

Returns:

retrieved ed25519 key. {free_ed25519_key}

Definition at line 4600 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.45 const char* dime_sgnt_state_to_str (signet_state_t *state*)

returns a string from a signet_state_t enum type.

Parameters:

state signet state.

Returns:

null terminated string corresponding to the state.

Definition at line 4613 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.46 signet_type_t dime_sgnt_type_get (const signet_t * *signet*)

retrieves the signet type, org or user (signet_type_org or signet_type_user)

Parameters:

signet pointer to the target signet.

Returns:

a signet_type_t enum type with the signet type, signet_type_error on failure.

Definition at line 4627 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.47 int dime_sgnt_type_set (signet_t * *signet*, signet_type_t *type*)

sets the target signet to a specified type.

Parameters:

signet pointer to the target signet.

type specified signet type.

Returns:

0 on success, -1 on error.

Definition at line 4641 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

5.362.2.48 signet_state_t dime_sgnt_validate_all (signet_t const * *signet*, signet_t const * *previous*, signet_t const * *orgsig*, unsigned char const ** *dime_pok*)

verifies a user signet, org signet or ssr for syntax, context and cryptographic validity. does not perform chain of custody validation.

Parameters:

signet pointer to the target signet_t structure.

orgsig pointer to the org signet associated with the target signet if the target signet is a user signet. if target signet is not a user signet, orgsig should be passed as null.

previous pointer to the previous user signet, which will be used validate the chain of custody signature, if such is available.

dime_pok a null terminated array of pointers to ed25519 poks from the dime record associated with the target signet if the target signet is an org signet. if the target signet is not an org signet dime_pok should be passed as null;

Returns:

signet state as a signet_state_t enum type. ss_unknown on error.

Definition at line 4666 of file signet.c.

References PUBLIC_FUNCTION_IMPLEMENT.

Referenced by _get_signet().

Functions

- derror_t const ∗ libdime_base64_decode (dime_ctx_t const ∗dime_ctx, unsigned char ∗∗result, size_t ∗result_length, char const ∗buf, size_t len)

  Perform base64-decoding on a string and return the result.

- derror_t const ∗ libdime_base64_encode (dime_ctx_t const ∗dime_ctx, sds ∗result, unsigned char const ∗buf, size_t len)

  Return the base64-encoded string of a data buffer.

5.363.1 Function Documentation

5.363.1.1 derror_t const∗ libdime_base64_decode (dime_ctx_t const ∗ *dime_ctx*, unsigned char ∗∗ *result*, size_t ∗ *result_length*, char const ∗ *buf*, size_t *len*)

Perform base64-decoding on a string and return the result.

Note:

SOLVED PROBLEM - why are we reinventing the wheel?

Parameters:

result double pointer to a newly allocated buffer containing the base64-decoded data, or NULL on failure.

buf a pointer to a buffer containing the data to be decoded.

len the length, in bytes, of the buffer to be decoded.

outlen a pointer to a variable to receive the length of the decoded data. {free}

Definition at line 36 of file encoding.c.

References DIME_LOG_ERROR, ERR_BAD_PARAM, ERR_ENCODING, and ERR_NOMEM.

5.363.1.2 derror_t const∗ libdime_base64_encode (dime_ctx_t const ∗ *dime_ctx*, sds ∗ *result*, unsigned char const ∗ *buf*, size_t *len*)

Return the base64-encoded string of a data buffer.

Parameters:

result a pointer to a newly allocated sds string containing the base64-encoded data, or NULL on failure.

buf a pointer to the data buffer to be base-64 encoded.

len the length, in bytes, of the buffer to be encoded. {sdsfree}

Definition at line 155 of file encoding.c.

References DIME_LOG_ERROR, ERR_BAD_PARAM, ERR_NOMEM, sdsfree(), and sdsnewlen().

Data Structures

- struct encrypt_ctx

Defines

- #define LOG_OPENSSL_ERROR(ctx, buf, msg)

Functions

- derror_t const * encrypt_ctx_new (dime_ctx_t const *dime_ctx, encrypt_ctx_t **result)

  Initialize the cryptographic subsystem.

- void encrypt_ctx_free (encrypt_ctx_t *ctx)

  Shutdown the cryptographic subsystem.

- derror_t const * encrypt_keypair_generate (dime_ctx_t const *dime_ctx, encrypt_ctx_t const *encrypt_ctx, encrypt_keypair_t **result)

  Generate an EC key pair.

- derror_t const * encrypt_deserialize_pubkey (dime_ctx_t const *dime_ctx, encrypt_keypair_t **result, unsigned char const *buf, size_t blen)

  Deserialize an EC public key stored in binary format.

- derror_t const * encrypt_deserialize_privkey (dime_ctx_t const *dime_ctx, encrypt_keypair_t **result, unsigned char const *buf, size_t blen)

  Deserialize an EC private key stored in binary format.

5.365.1 Define Documentation

5.365.1.1 #define LOG_OPENSSL_ERROR(ctx, buf, msg)

Value:

```
do {\
    get_openssl_error(buf, sizeof(buf)); \
    DIME_LOG_ERROR(dime_ctx, buf); \
    DIME_LOG_ERROR(dime_ctx, msg); \
} while (0)
```

Definition at line 74 of file encrypt.c.

Referenced by encrypt_ctx_new(), encrypt_deserialize_privkey(), encrypt_deserialize_pubkey(), and encrypt_keypair_generate().

5.365.2 Function Documentation

5.365.2.1 void encrypt_ctx_free (encrypt_ctx_t * *ctx*)

Shutdown the cryptographic subsystem.

Definition at line 156 of file encrypt.c.

References EC_GROUP_clear_free_d, encrypt_ctx::encryption_group, ERR_free_strings_d, and EVP_cleanup_d.

5.365.2.2 derror_t const* encrypt_ctx_new (dime_ctx_t const * *dime_ctx*, encrypt_ctx_t ** *result*)

Initialize the cryptographic subsystem.

Note:

This is currently NOT reentrant. (Apparently OpenSSL likes global state :P)

Definition at line 88 of file encrypt.c.

References EC_GROUP_clear_free_d, EC_GROUP_new_by_curve_name_d, ERR_BAD_PARAM, ERR_CRYPTO, ERR_free_strings_d, ERR_NOMEM, EVP_cleanup_d, EVP_get_digestbyname_d, LOG_OPENSSL_ERROR, OBJ_nid2sn_d, OPENSSL_add_all_algorithms_-noconf_d, SSL_library_init_d, and SSL_load_error_strings_d.

5.365.2.3 derror_t const* encrypt_deserialize_privkey (dime_ctx_t const * *dime_ctx*, encrypt_keypair_t ** *result*, unsigned char const * *buf*, size_t *blen*)

Deserialize an EC private key stored in binary format.

Parameters:

result a pointer to the deserialized EC private key on success, or NULL on failure.

buf a pointer to the buffer holding the EC private key in binary format.

blen the length, in bytes, of the buffer holding the EC private key.

Definition at line 306 of file encrypt.c.

References d2i_ECPrivateKey_d, EC_GROUP_new_by_curve_name_d, EC_KEY_free_d, EC_KEY_new_d, EC_KEY_set_group_d, ERR_BAD_PARAM, ERR_CRYPTO, and LOG_OPENSSL_ERROR.

5.365.2.4 derror_t const* encrypt_deserialize_pubkey (dime_ctx_t const * *dime_ctx*, encrypt_keypair_t ** *result*, unsigned char const * *buf*, size_t *blen*)

Deserialize an EC public key stored in binary format.

Parameters:

result a pointer to the deserialized EC public key on success, or NULL on failure.

buf a pointer to the buffer holding the EC public key in binary format.

blen the length, in bytes, of the buffer holding the EC public key.

Definition at line 235 of file encrypt.c.

References EC_GROUP_new_by_curve_name_d, EC_KEY_free_d, EC_KEY_new_d, EC_KEY_set_group_d, ERR_BAD_PARAM, ERR_CRYPTO, LOG_OPENSSL_ERROR, and o2i_ECPublicKey_d.

5.365.2.5 derror_t const* encrypt_keypair_generate (dime_ctx_t const * *dime_ctx*, encrypt_ctx_t const * *encrypt_ctx*, encrypt_keypair_t ** *result*)

Generate an EC key pair.

Parameters:

result a newly allocated and generated EC key pair on success, or NULL on failure.

Definition at line 175 of file encrypt.c.

References EC_KEY_free_d, EC_KEY_generate_key_d, EC_KEY_new_d, EC_KEY_set_group_d, encrypt_ctx::encryption_group, ERR_-BAD_PARAM, ERR_CRYPTO, and LOG_OPENSSL_ERROR.

```

Functions

- chr_t * lib_version_jansson (void)
  Return the version string for libjansson.
- bool_t lib_load_jansson (void)
  Initialize the Jansson library and dynamically bind to the required symbols.

5.372.1 Function Documentation

5.372.1.1 bool_t lib_load_jansson (void)

Initialize the Jansson library and dynamically bind to the required symbols. json.c

Returns:

true on success or false on failure.

Definition at line 22 of file json.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.372.1.2 chr_t* lib_version_jansson (void)

Return the version string for libjansson.

Returns:

a pointer to a character string containing the libjansson version information.

Definition at line 14 of file json.c.

References jansson_version_d.

Referenced by lib_load().

5.373 src/providers/parsers/utf8.c File Reference

```
#include "magma.h"
```

Functions

- chr_t ∗ lib_version_utf8proc (void)

  Return the shared library version string for libutf8proc.

- bool_t lib_load_utf8proc (void)

  Initialize the UTF8 library and dynamically bind to the required symbols.

- const chr_t ∗ utf8_error_string (ssize_t error_code)

  Exchange an error code for a string explaining the nature of the UTF8 error.

- size_t utf8_length_st (stringer_t ∗s)

  Determine how many valid Unicode characters the string has.

- bool_t utf8_valid_st (stringer_t ∗s)

  Determine whether a managed string is a properly formatted UTF8 string.

5.373.1 Function Documentation

5.373.1.1 bool_t lib_load_utf8proc (void)

Initialize the UTF8 library and dynamically bind to the required symbols. utf.c

Returns:

true on success or false on failure.

Definition at line 23 of file utf8.c.

References lib_symbols(), and M_BIND.

Referenced by lib_load().

5.373.1.2 chr_t∗ lib_version_utf8proc (void)

Return the shared library version string for libutf8proc.

Returns:

a pointer to a character string containing the libutf8proc version information.

Definition at line 15 of file utf8.c.

References utf8proc_version_d.

Referenced by lib_load().

5.373.1.3 const chr_t* utf8_error_string (ssize_t *error_code*)

Exchange an error code for a string explaining the nature of the UTF8 error.

Parameters:

error_code the numeric error returned by the internal UTF8 mapping logic.

Returns:

A string constant with the error message. If the code goes unrecognized, then a generic message is returned.

Definition at line 42 of file utf8.c.

References utf8proc_errmsg_d.

Referenced by utf8_length_st().

5.373.1.4 size_t utf8_length_st (stringer_t * *s*)

Determine how many valid Unicode characters the string has.

Parameters:

s the managed string to be tested.

Returns:

The number of codepoints found if the string is valid, otherwise 0.

Definition at line 51 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), utf8_error_string(), utf8proc_get_property_d, and utf8proc_iterate_d.

Referenced by stacie_derive_rounds().

5.373.1.5 bool_t utf8_valid_st (stringer_t * *s*)

Determine whether a managed string is a properly formatted UTF8 string.

Parameters:

s the managed string to be tested.

Returns:

Valid strings return true, while invalid strings return false.

Definition at line 90 of file utf8.c.

References bytes, log_pedantic, st_empty_out(), and utf8proc_iterate_d.

5.374 src/providers/parsers/xml.c File Reference

```
#include "magma.h"
```

Functions

- const chr_t ∗ lib_version_xml (void)
  Return the version string of libxml.
- bool_t lib_load_xml (void)
  Initialize libxml and bind dynamically to the exported functions that are required.
- void xml_node_free (xmlNodePtr node)
  Free an xml node.
- xmlChar ∗ xml_encode (xmlDocPtr doc, stringer_t ∗string)
  Encode an xml string, performing proper replacement of defined entities and non-ASCII values.
- int_t xml_xpath_set_namespace (xmlXPathContextPtr ctxt, xmlChar ∗prefix, xmlChar ∗ns_uri)
  Set the namespace for an xpath context.
- xmlNodePtr xml_node_add_sibling (xmlNodePtr current, xmlNodePtr element)
  Add an xml node to the list of siblings of another xml node.
- xmlNodePtr xml_node_new (uchr_t ∗name)
  Create an xml node.
- stringer_t ∗ xml_node_get_content_st (xmlNodePtr node)
  Get the content of an xml node as a managed string.
- void xml_node_set_content (xmlNodePtr node, uchr_t ∗content)
  Set the content of an xml node.
- xmlAttrPtr xml_node_set_property (xmlNodePtr node, uchr_t ∗name, uchr_t ∗value)
  Set an attribute of an xml node.
- uint64_t xml_get_xpath_uint64 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.
- uint32_t xml_get_xpath_uint32 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.
- uint16_t xml_get_xpath_uint16 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.
- uint8_t xml_get_xpath_uint8 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.
- int64_t xml_get_xpath_int64 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.
- int32_t xml_get_xpath_int32 (xmlXPathContextPtr xpath_ctx, xmlChar ∗xpath_query)

Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.

- int16_t xml_get_xpath_int16 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.
- int8_t xml_get_xpath_int8 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.
- stringer_t * xml_get_xpath_st (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
  Get the value of a node element or attribute selected by an xpath expression as a managed string.
- bool_t xml_set_xpath_uint64 (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uint64_t val)
  Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.
- bool_t xml_set_xpath_ns (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uchr_t *val)
  Set the value of a node element selected by an xpath expression, as a null-terminated string.
- bool_t xml_set_xpath_property (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query, uchr_t *name, uchr_t *val)
  Set the value of a specified property of a node element selected by an xpath expression.
- chr_t * xml_get_xpath_ns (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
  Get the content of an evaluated xpath expression as a null-terminated string.
- size_t xml_get_xpath_node_count (xmlXPathContextPtr xpath_ctx, xmlChar *xpath_query)
  This function is not currently being called by any other part of the code.
- void xml_error (void *ctx, const chr_t *format,...)
  A function handler for displaying xml parser error messages to the user.
- void xml_free_xpath_ctx (xmlXPathContextPtr ctx)
  Free an xml xpath context.
- void xml_free_xpath_obj (xmlXPathObjectPtr obj)
  Free an xml xpath object.
- xmlXPathContextPtr xml_create_xpath_ctx (xmlDocPtr doc)
  Create an xpath context for an xml document.
- xmlXPathObjectPtr xml_xpath_eval (const uchr_t *xpath, xmlXPathContextPtr ctx)
  Evaluate an xml xpath expression.
- xmlParserCtxtPtr xml_create_parser_ctx (void)
  Create and initialize a new xml parser context.
- void xml_free_parser_ctx (xmlParserCtxtPtr ctx)
  Destroy an xml parser context.
- void xml_free_doc (xmlDocPtr doc)
  Free an xml document.
- stringer_t * xml_dump_doc (xmlDocPtr doc)
  Get an xml document object as a string.

- xmlDocPtr xml_create_doc (xmlParserCtxtPtr ctx, const chr_t *buffer, int_t size, const chr_t *url, const chr_t *encoding, int_t options)

  Create a new xml document object from specified user data.

- void xml_stop (void)

  Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.

- bool_t xml_start (void)

  Initialize the xml parser library.

Variables

- chr_t xml_version_string [9]
- pthread_mutex_t log_mutex

5.374.1 Function Documentation

5.374.1.1 bool_t lib_load_xml (void)

Initialize libxml and bind dynamically to the exported functions that are required. xml.c

Returns:

true on success or false on failure.

Definition at line 26 of file xml.c.

References lib_symbols(), M_BIND, uint64_conv_ns(), xml_version_string, and xmlParserVersion_d.

Referenced by lib_load().

5.374.1.2 const chr_t* lib_version_xml (void)

Return the version string of libxml.

Returns:

a pointer to a character string containing the libxml version information.

Definition at line 17 of file xml.c.

References xml_version_string.

Referenced by lib_load().

5.374.1.3 xmlDocPtr xml_create_doc (xmlParserCtxtPtr *ctx*, const chr_t * *buffer*, int_t *size*, const chr_t * *url*, const chr_t * *encoding*, int_t *options*)

Create a new xml document object from specified user data.

See also:

xmlCtxtReadMemory()

Parameters:

ctx a pointer to the xml context to be used for the parsing operation.

buffer a null-terminated string containing the xml data to be parsed.

size the length, in bytes, of the xml data buffer to be parsed.

url a null-terminated string containing the base url to be used for the document.

encoding a null-terminated string specifying the document encoding type, or NULL for default.

options a value containing a mask of xml parser options of type xmlParserOption.

Returns:

NULL on failure, or a pointer to the xml document tree of the parsed xml text on success.

Definition at line 1051 of file xml.c.

References log_pedantic, and xmlCtxtReadMemory_d.

Referenced by http_page_get().

5.374.1.4 xmlParserCtxtPtr xml_create_parser_ctx (void)

Create and initialize a new xml parser context.

Returns:

NULL on failure, or a newly initialized xml parser context on success.

Definition at line 961 of file xml.c.

References log_pedantic, xml_error(), and xmlNewParserCtxt_d.

Referenced by http_page_get().

5.374.1.5 xmlXPathContextPtr xml_create_xpath_ctx (xmlDocPtr *doc*)

Create an xpath context for an xml document.

Parameters:

doc a pointer to the input xml document object.

Returns:

NULL on failure, or a pointer to the new xpath context on success.

Definition at line 917 of file xml.c.

References log_pedantic, and xmlXPathNewContext_d.

Referenced by http_page_get().

5.374.1.6 stringer_t* xml_dump_doc (xmlDocPtr *doc*)

Get an xml document object as a string.

Parameters:

doc a pointer to the xml document object to be serialized.

Returns:

NULL on failure or a pointer to a managed string containing the specified xml document's serialized data on success.

Definition at line 1018 of file xml.c.

References mm_free(), st_import(), and xmlDocDumpFormatMemory_d.

Referenced by contact_print_form(), contact_print_message(), portal_print_login(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.374.1.7 xmlChar* xml_encode (xmlDocPtr *doc*, stringer_t * *string*)

Encode an xml string, performing proper replacement of defined entities and non-ASCII values.

Parameters:

doc a pointer to the xml document containing the DTD to be used for the encoding process.

string a managed string containing the xml data to be encoded.

NULL on failure, or a newly allocated null-terminated string containing the encoded xml data on success.

Definition at line 69 of file xml.c.

References st_data_get(), and xmlEncodeEntitiesReentrant_d.

Referenced by contact_print_form().

5.374.1.8 void xml_error (void * *ctx*, const chr_t * *format*, ...)

A function handler for displaying xml parser error messages to the user.

Parameters:

ctx a placeholder; ignored.

format a null-terminated string containing a format string for the error message to be displayed.

... a variable argument list containing the parameters to the format string.

Returns:

This function returns no value.

Definition at line 854 of file xml.c.

References log_internal(), M_LOG_FILE_DISABLE, M_LOG_FUNCTION_DISABLE, M_LOG_LINE_DISABLE, M_LOG_LINE_FEED_DISABLE, M_LOG_STACK_TRACE_DISABLE, and M_LOG_TIME_DISABLE.

Referenced by xml_create_parser_ctx().

5.374.1.9 void xml_free_doc (xmlDocPtr *doc*)

Free an xml document.

Parameters:

doc a pointer to the xml document to be freed.

Returns:

This function returns no value.

Definition at line 1001 of file xml.c.

References log_pedantic, and xmlFreeDoc_d.

Referenced by http_page_free().

5.374.1.10 void xml_free_parser_ctx (xmlParserCtxtPtr *ctx*)

Destroy an xml parser context.

Parameters:

ctx a pointer to the xml parser context to be freed.

Returns:

This function returns no value.

Definition at line 984 of file xml.c.

References log_pedantic, and xmlFreeParserCtxt_d.

Referenced by http_page_free().

5.374.1.11 void xml_free_xpath_ctx (xmlXPathContextPtr *ctx*)

Free an xml xpath context.

Parameters:

ctx a pointer to the xml xpath context to be freed.

Returns:

This function returns no value.

Definition at line 883 of file xml.c.

References log_pedantic, and xmlXPathFreeContext_d.

Referenced by http_page_free().

5.374.1.12 void xml_free_xpath_obj (xmlXPathObjectPtr *obj*)

Free an xml xpath object.

Parameters:

obj a pointer to the xml xpath object to be freed.

Returns:

This function returns no value.

Definition at line 900 of file xml.c.

References log_pedantic, and xmlXPathFreeObject_d.

Referenced by xml_set_xpath_ns(), xml_set_xpath_property(), and xml_set_xpath_uint64().

5.374.1.13 int16_t xml_get_xpath_int16 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 16-bit integer.

Definition at line 503 of file xml.c.

References int16_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.14 int32_t xml_get_xpath_int32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 32-bit integer.

Definition at line 448 of file xml.c.

References int32_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.15 int64_t xml_get_xpath_int64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 64-bit integer.

Definition at line 393 of file xml.c.

References int64_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.16 int8_t xml_get_xpath_int8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a signed 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a signed 8-bit integer.

Definition at line 558 of file xml.c.

References int8_conv_st(), log_pedantic, ns_length_get(), PLACER, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.17 size_t xml_get_xpath_node_count (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

This function is not currently being called by any other part of the code.

Definition at line 817 of file xml.c.

References log_pedantic, xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.18 chr_t* xml_get_xpath_ns (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the content of an evaluated xpath expression as a null-terminated string.

Parameters:

ctx a pointer to the xpath context to be used for the evaluation.

xpath_query a null-terminated string containing the xpath expression to be evaluated.

Returns:

NULL on failure, or a null-terminated string containing the value of the xpath expression's specified node on success.

Definition at line 766 of file xml.c.

References log_pedantic, ns_dupe(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.19 stringer_t* xml_get_xpath_st (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as a managed string.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as a managed string.

Definition at line 613 of file xml.c.

References log_pedantic, ns_length_get(), st_import(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.20 uint16_t xml_get_xpath_uint16 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 16-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 16-bit integer.

Definition at line 283 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint16_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.21 uint32_t xml_get_xpath_uint32 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 32-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 32-bit integer.

Definition at line 229 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint32_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.22 uint64_t xml_get_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 64-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 64-bit integer.

Definition at line 174 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint64_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.23 uint8_t xml_get_xpath_uint8 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*)

Get the value of a node element or attribute selected by an xpath expression as an unsigned 8-bit integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

Returns:

0 on failure, or the value of the selected node as an unsigned 8-bit integer.

Definition at line 338 of file xml.c.

References log_pedantic, ns_length_get(), PLACER, uint8_conv_st(), xmlXPathEvalExpression_d, and xmlXPathFreeObject_d.

5.374.1.24 xmlNodePtr xml_node_add_sibling (xmlNodePtr *current*, xmlNodePtr *element*)

Add an xml node to the list of siblings of another xml node.

Note:

If the sibling node was already inserted into a document it will first be unlinked.

Parameters:

current a pointer to the xml node to which the sibling node will be added.

element a pointer to the sibling node to be added to the target node.

Returns:

NULL on failure, or a pointer to the sibling node on success.

Definition at line 94 of file xml.c.

References xmlAddSibling_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.374.1.25 void xml_node_free (xmlNodePtr *node*)

Free an xml node.

Parameters:

node a pointer to the xml node to be freed.

Returns:

This function returns no value.

Definition at line 57 of file xml.c.

References xmlFreeNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.374.1.26 stringer_t∗ xml_node_get_content_st (xmlNodePtr *node*)

Get the content of an xml node as a managed string.

Parameters:

node a pointer to the xml node to be queried.

Returns:

NULL on failure, or a pointer to a managed string

Definition at line 114 of file xml.c.

References log_pedantic, st_import(), xmlBufferContent_d, xmlBufferCreate_d, xmlBufferFree_d, xmlBufferLength_d, and xmlNodeBufGetContent_d.

5.374.1.27 xmlNodePtr xml_node_new (uchr_t ∗ *name*)

Create an xml node.

Parameters:

name the name of the new xml node.

Returns:

NULL on failure, or a pointer to the newly allocated and initialized xml node on success.

Definition at line 104 of file xml.c.

References xmlNewNode_d.

Referenced by contact_business_add_error(), and teacher_add_error().

5.374.1.28 void xml_node_set_content (xmlNodePtr *node*, uchr_t * *content*)

Set the content of an xml node.

Parameters:

node a pointer to the xml node to be set.
content a null-terminated string containing the new content of the xml node.

Returns:

This function returns no value.

Definition at line 150 of file xml.c.

References xmlNodeSetContent_d.

Referenced by contact_business_add_error(), portal_print_login(), teacher_add_error(), xml_set_xpath_ns(), and xml_set_xpath_uint64().

5.374.1.29 xmlAttrPtr xml_node_set_property (xmlNodePtr *node*, uchr_t * *name*, uchr_t * *value*)

Set an attribute of an xml node.

Parameters:

node a pointer to the xml node to be set.
name a null-terminated string containing the name of the node attribute to be set.
value a null-terminated string containing the new value of the specified xml node's attribute.

Returns:

NULL on failure, or a pointer to node's attribute on success.

Definition at line 163 of file xml.c.

References xmlSetProp_d.

Referenced by contact_business_add_error(), teacher_add_error(), and xml_set_xpath_property().

5.374.1.30 bool_t xml_set_xpath_ns (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *val*)

Set the value of a node element selected by an xpath expression, as a null-terminated string.

Parameters:

xpath_ctx a pointer to the specified xpath context.
xpath_query a null-terminated string containing the xpath expression to select the desired node.
val the new value of the selected node, as a null-terminated string.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 702 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.374.1.31 bool_t xml_set_xpath_property (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uchr_t * *name*, uchr_t * *val*)

Set the value of a specified property of a node element selected by an xpath expression.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

name a null-terminated string containing the name of the node's property to be set.

val the new value of the selected node's property, as a null-terminated string.

Returns:

true if the selected node's value was set successfully, or false on failure.

Definition at line 735 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_property(), and xml_xpath_eval().

Referenced by contact_print_form(), contact_print_message(), and teacher_print_form().

5.374.1.32 bool_t xml_set_xpath_uint64 (xmlXPathContextPtr *xpath_ctx*, xmlChar * *xpath_query*, uint64_t *val*)

Set the value of a node element selected by an xpath expression, as a 64-bit unsigned integer.

Parameters:

xpath_ctx a pointer to the specified xpath context.

xpath_query a null-terminated string containing the xpath expression to select the desired node.

val the new value of the selected node, as a 64-bit unsigned integer.

Returns:

true if the value was set successfully, or false on failure.

Definition at line 668 of file xml.c.

References log_pedantic, xml_free_xpath_obj(), xml_node_set_content(), and xml_xpath_eval().

Referenced by statistics_process().

5.374.1.33 bool_t xml_start (void)

Initialize the xml parser library.

Returns:

This function returns no value.

Definition at line 1079 of file xml.c.

References xmlInitParser_d.

Referenced by process_start().

5.374.1.34 void xml_stop (void)

Cleanup the state and allocated memory of the xml parser in preparation to be shutdown.

Returns:

This function returns no value.

Definition at line 1066 of file xml.c.

References xmlCleanupGlobals_d, xmlCleanupParser_d, and xmlMemoryDump_d.

Referenced by process_stop().

5.374.1.35 xmlXPathObjectPtr xml_xpath_eval (const uchr_t * *xpath*, xmlXPathContextPtr *ctx*)

Evaluate an xml xpath expression.

Parameters:

a null-terminated string containing the xpath expression to be evaluated.

a pointer to the xpath context in which to perform the evaluation. NULL on failure, or a pointer to the xml path object of the evaluation on success.

Definition at line 941 of file xml.c.

References log_pedantic, and xmlXPathEvalExpression_d.

5.374.1.36 int_t xml_xpath_set_namespace (xmlXPathContextPtr *ctxt*, xmlChar * *prefix*, xmlChar * *ns_uri*)

Set the namespace for an xpath context.

See also:

xmlXPathRegisterNs()

Parameters:

ctxt a pointer to the specified xpath context.

prefix a pointer to the prefix of the namespace as a string.

ns_uri a pointer to the uri of the namespace as a string.

Returns:

-1 on failure or 0 on success.

Definition at line 82 of file xml.c.

References xmlXPathRegisterNs_d.

Referenced by encrypted_chunk_set().

5.375.2.6 placer_t aes_cipher_key (stringer_t * *key*)

Extract the symmetric cipher portion of the key. aes.c

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a place holder with the cipher key portion, or NULL if the supplied key was invalid.

Definition at line 58 of file aes.c.

References AES_KEY_LEN, AES_TAG_LEN, AES_VECTOR_LEN, log_error, pl_init(), pl_null(), placer_t, PRIME_OBJECT_KEY_LEN, st_data_get(), st_empty, and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), and aes_chunk_encrypt().

5.375.2.7 placer_t aes_tag_shard (stringer_t ∗ *key*)

Extract the portion of the key used for the tag shard.

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a placeholder with the tag shard, or NULL if the supplied key was invalid.

Definition at line 100 of file aes.c.

References AES_TAG_LEN, AES_VECTOR_LEN, log_error, pl_init(), pl_null(), placer_t, PRIME_OBJECT_KEY_LEN, st_data_get(), st_empty, and st_length_get().

Referenced by aes_artifact_decrypt(), aes_artifact_encrypt(), aes_chunk_decrypt(), and aes_chunk_encrypt().

5.375.2.8 placer_t aes_vector_shard (stringer_t ∗ *key*)

Extract the portion of the key used for the vector shard.

Parameters:

key The complete key, which holds the vector and tag shard values along with the cipher key.

Returns:

returns a place holder with the vector shard, or NULL if the supplied key was invalid.

Definition at line 79 of file aes.c.

References AES_VECTOR_LEN, log_error, pl_init(), pl_null(), placer_t, PRIME_OBJECT_KEY_LEN, st_data_get(), st_empty, and st_length_get().

Variables

- EC_GROUP * prime_curve_group

5.376.1 Function Documentation

5.376.1.1 secp256k1_key_t* secp256k1_alloc (void)

Allocate a new key pair using the secp256k1 curve. secp256k1.c

See also:

NID_secp256k1

Returns:

NULL on failure, or a pointer to the newly allocated key pair.

Definition at line 53 of file secp256k1.c.

References EC_KEY_free_d, EC_KEY_new_by_curve_name_d, EC_KEY_new_d, EC_KEY_set_conv_form_d, EC_KEY_set_group_d, log_info, MEMORYBUF, prime_curve_group, and ssl_error_string().

Referenced by secp256k1_generate(), secp256k1_private_set(), and secp256k1_public_set().

5.376.1.2 stringer_t* secp256k1_compute_kek (secp256k1_key_t * *priv*, secp256k1_key_t * *pub*, stringer_t * *output*)

Parameters:

private

public

output

Returns:

Definition at line 321 of file secp256k1.c.

References EC_KEY_get0_public_key_d, ECDH_compute_key_d, log_info, log_pedantic, MEMORYBUF, SECP256K1_SHARED_-SECRET_LEN, ssl_error_string(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_destination(), and st_valid_tracked().

Referenced by keks_get(), and keks_set().

5.376.1.3 void secp256k1_free (secp256k1_key_t * *key*)

Free a secp256k1 key structure.

See also:

EC_KEY_free()

Parameters:

key the managed string to be freed.

Returns:

This function returns no value.

Definition at line 33 of file secp256k1.c.

References EC_KEY_free_d, and log_pedantic.

Referenced by encrypted_message_free(), ephemeral_chunk_free(), org_key_free(), org_signet_free(), user_key_free(), and user_signet_-free().

5.376.1.4 secp256k1_key_t* secp256k1_generate (void)

Generate a random secp256k1 key pair.

Returns:

NULL on failure, or a new, randomly generated secp256k1 key pair on success.

Definition at line 86 of file secp256k1.c.

References EC_KEY_free_d, EC_KEY_generate_key_d, log_info, MEMORYBUF, secp256k1_alloc(), and ssl_error_string().

Referenced by _generate_ec_keypair(), naked_message_set(), org_key_generate(), and user_key_generate().

5.376.1.5 stringer_t* secp256k1_private_get (secp256k1_key_t * *key*, stringer_t * *output*)

Return a secp256k1 private key as a big endian integer inside a managed string.

Parameters:

key the input secp256k1 key pair.

Returns:

NULL on failure, or the private key as a big endian integer.

Definition at line 151 of file secp256k1.c.

References BN_bn2bin_d, BN_num_bits_d, BN_num_bytes_d, EC_KEY_get0_private_key_d, log_pedantic, MEMORYBUF, SECP256K1_KEY_PRIV_LEN, ssl_error_string(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_destination(), st_valid_tracked(), and st_wipe().

- void keks_free (prime_chunk_keks_t *keks)
- prime_chunk_keks_t * keks_get (prime_chunk_keys_t *keys, prime_chunk_keks_t *keks)

  Uses the private ephemeral encryption key to compute a KEK with all of the provided actor public keys.

- prime_chunk_keks_t * keks_set (prime_chunk_keys_t *keys, prime_chunk_keks_t *keks)

  Uses the public ephemeral encryption key to compute a KEK with all of the provided actor private keys.

- int_t slots_actors (prime_message_chunk_type_t type)

  slots.c

- prime_chunk_slots_t * slots_alloc (prime_message_chunk_type_t type)
- placer_t slots_buffer (prime_chunk_slots_t *slots)
- void slots_cleanup (prime_chunk_slots_t *slots)
- int_t slots_count (prime_message_chunk_type_t type)

  Returns the number of slots for a given chunk type.

- void slots_free (prime_chunk_slots_t *slots)
- stringer_t * slots_get (prime_message_chunk_type_t type, stringer_t *slots, prime_chunk_keks_t *keks, stringer_t *output)
- stringer_t * slots_key (prime_chunk_slots_t *slots, prime_chunk_keks_t *keks, stringer_t *output)

  Get the unstreteched key value using the first available kek with a matching keyslot value.

- prime_chunk_slots_t * slots_set (prime_message_chunk_type_t type, stringer_t *key, prime_chunk_keks_t *keks)
- stringer_t * signature_full_get (prime_message_chunk_type_t type, ed25519_key_t *signing, prime_chunk_keks_t *keks, stringer_t *data)

  signature.c

- int_t signature_full_verify (ed25519_key_t *signing, prime_chunk_keks_t *keks, stringer_t *data, stringer_t *chunk)

  Verify an Ed25519 signature using the EdDSA algorithm.

- int_t signature_tree_add (prime_signature_tree_t *chunk, stringer_t *data)
- prime_signature_tree_t * signature_tree_alloc (void)
- void signature_tree_cleanup (prime_signature_tree_t *chunk)
- void signature_tree_free (prime_signature_tree_t *chunk)
- stringer_t * signature_tree_get (ed25519_key_t *signing, prime_signature_tree_t *chunk, prime_chunk_keks_t *keks)

  Calculates the tree signature value by concatenating the hashes together, and generating an Ed25519 signature using the result.

- int_t signature_tree_verify (ed25519_key_t *signing, prime_signature_tree_t *chunk, prime_chunk_keks_t *keks, stringer_t *data)

Verify an Ed25519 signature using the EdDSA algorithm.

- prime_ephemeral_chunk_t ∗ ephemeral_chunk_alloc (void)

  ephemeral.c

- stringer_t ∗ ephemeral_chunk_buffer (prime_ephemeral_chunk_t ∗chunk)
- void ephemeral_chunk_cleanup (prime_ephemeral_chunk_t ∗chunk)
- void ephemeral_chunk_free (prime_ephemeral_chunk_t ∗chunk)
- prime_ephemeral_chunk_t ∗ ephemeral_chunk_get (ed25519_key_t ∗signing, secp256k1_key_t ∗encryption)

  Generate an ephemeral message chunk. A public encryption key is required, while the public signing key is optional, but will be included if a signing key is provided.

- prime_ephemeral_chunk_t ∗ ephemeral_chunk_set (stringer_t ∗chunk)

  Parse an ephemeral message chunk. A public encryption key is required, while the ephemeral signing key is optional.

- prime_encrypted_chunk_t ∗ encrypted_chunk_alloc (void)

  encrypted.c

- stringer_t ∗ encrypted_chunk_buffer (prime_encrypted_chunk_t ∗chunk)

  Returns the chunk buffer, which contains a serialized version of the encrypted chunk data.

- void encrypted_chunk_cleanup (prime_encrypted_chunk_t ∗chunk)
- void encrypted_chunk_free (prime_encrypted_chunk_t ∗chunk)
- stringer_t ∗ encrypted_chunk_get (ed25519_key_t ∗signing, prime_chunk_keks_t ∗keks, stringer_t ∗chunk, stringer_t ∗output, bool_t ∗spanning)

  Take an encrypted message chunk, in serialized form, and return the decrypted payload data.

- prime_encrypted_chunk_t ∗ encrypted_chunk_set (prime_message_chunk_type_t type, ed25519_key_t ∗signing, prime_chunk_keks_t ∗keks, prime_message_chunk_flags_t flags, stringer_t ∗payload)

  Generate an encrypted message chunk. The signing and encryption keys are required, along with the public encryption key for at least one actor.

5.390 src/providers/prime/prime.c File Reference

```
#include "magma.h"
```

Functions

- bool_t prime_start (void)
  Initialize the global PRIME structures.
- void prime_stop (void)
  Destroy the global PRIME structures.
- void prime_free (prime_t *object)
- void prime_cleanup (prime_t *object)
- prime_t * prime_alloc (prime_type_t type, prime_flags_t flags)
  prime.c
- stringer_t * prime_get (prime_t *object, prime_encoding_t encoding, stringer_t *output)
  Serializes a PRIME object and returns it in binary form, or with an ASCII armor encoding.
- prime_t * prime_set (stringer_t *object, prime_encoding_t encoding, prime_flags_t flags)
  Parses a serialized PRIME object into a working context.
- prime_t * prime_key_generate (prime_artifact_type_t type, prime_flags_t flags)
  Generates a new organizational or user key.
- prime_t * prime_signet_generate (prime_t *object)
  Takes an organizational key, and generates the corresponding signet.
- stringer_t * prime_signet_fingerprint (prime_t *object, stringer_t *output)
  Takes an organizational signet, or a user signet, and returns the corresponding cryptographic fingerprint.
- bool_t prime_signet_validate (prime_t *object, prime_t *validator)
  Takes a signet, and validates the self signature. If the object is a user signet, and the validator is a user signet, then the custody signature is verified. If the validator is an organizational signet, then the organizational signature is validated. If the object is a signing request, then the validator must be a user signet, and the chain of custody signature is verified.
- prime_t * prime_request_generate (prime_t *object, prime_t *previous)
  Takes a user key, and possibly the previous user key, and generate a signet signing request.
- prime_t * prime_request_sign (prime_t *request, prime_t *org)
  Takes a user signing request, and an organizational key, and returns a signed user signet.
- stringer_t * prime_message_encrypt (stringer_t *message, prime_t *author, prime_t *origin, prime_t *destination, prime_t *recipient)
  Encrypt a message.
- stringer_t * prime_message_decrypt (stringer_t *message, prime_t *org, prime_t *user)
  Decrypt a message.
- stringer_t * prime_key_encrypt (stringer_t *key, prime_t *object, prime_encoding_t encoding, stringer_t *output)
  Encrypt an organizational or user key using a STACIE realm key.
- prime_t * prime_key_decrypt (stringer_t *key, stringer_t *object, prime_encoding_t encoding, prime_flags_t flags)
  Decrypt an organizational or user key using a STACIE realm key.

Variables

- prime_t ∗ org_key = NULL
- prime_t ∗ org_signet = NULL
- EC_GROUP ∗ prime_curve_group = NULL

5.390.1 Function Documentation

5.390.1.1 prime_t∗ prime_alloc (prime_type_t *type*, prime_flags_t *flags*)

prime.c

Definition at line 155 of file prime.c.

References log_pedantic, mm_alloc(), mm_wipe(), prime_free(), PRIME_MESSAGE_ENCRYPTED, PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, PRIME_ORG_SIGNET, prime_t, PRIME_USER_KEY, PRIME_USER_SIGNET, and PRIME_USER_SIGNING_-REQUEST.

Referenced by prime_key_decrypt(), prime_key_generate(), prime_message_encrypt(), prime_request_generate(), prime_request_sign(), prime_set(), and prime_signet_generate().

5.390.1.2 void prime_cleanup (prime_t ∗ *object*)

Definition at line 148 of file prime.c.

References prime_free().

Referenced by mail_store_message(), meta_crypto_keys_create(), meta_free(), and smtp_free_inbound().

5.390.1.3 void prime_free (prime_t ∗ *object*)

Definition at line 99 of file prime.c.

References encrypted_message_free(), log_pedantic, mm_free(), org_key_free(), org_signet_free(), PRIME_MESSAGE_ENCRYPTED, PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, PRIME_ORG_SIGNET, PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_-USER_SIGNING_REQUEST, user_key_free(), and user_signet_free().

Referenced by meta_crypto_keys_create(), prime_alloc(), prime_cleanup(), prime_key_decrypt(), prime_message_decrypt(), prime_-message_encrypt(), prime_request_generate(), prime_request_sign(), prime_set(), prime_signet_generate(), and prime_stop().

5.390.1.4 stringer_t∗ prime_get (prime_t ∗ *object*, prime_encoding_t *encoding*, stringer_t ∗ *output*)

Serializes a PRIME object and returns it in binary form, or with an ASCII armor encoding.

Definition at line 205 of file prime.c.

References ARMORED, log_pedantic, org_key_get(), org_signet_get(), PRIME_ORG_KEY, PRIME_ORG_SIGNET, prime_pem_wrap(), PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_USER_SIGNING_REQUEST, st_dupe(), st_free(), user_key_get(), user_request_-get(), and user_signet_get().

Referenced by meta_crypto_keys_create().

5.390.1.5 prime_t∗ prime_key_decrypt (stringer_t ∗ *key*, stringer_t ∗ *object*, prime_encoding_t *encoding*, prime_flags_t *flags*)

Decrypt an organizational or user key using a STACIE realm key.

Definition at line 659 of file prime.c.

References ARMORED, log_pedantic, org_encrypted_key_set(), prime_alloc(), prime_free(), prime_header_read(), PRIME_ORG_-KEY, PRIME_ORG_KEY_ENCRYPTED, prime_pem_unwrap(), prime_t, PRIME_USER_KEY, PRIME_USER_KEY_ENCRYPTED, st_-cleanup, st_length_get(), STACIE_KEY_LENGTH, type(), and user_encrypted_key_set().

Referenced by meta_update_keys().

5.390.1.6 stringer_t* prime_key_encrypt (stringer_t * *key*, prime_t * *object*, prime_encoding_t *encoding*, stringer_t * *output*)

Encrypt an organizational or user key using a STACIE realm key.

Definition at line 606 of file prime.c.

References ARMORED, log_pedantic, org_encrypted_key_get(), PRIME_ORG_KEY, prime_pem_wrap(), PRIME_USER_KEY, st_dupe(), st_free(), and user_encrypted_key_get().

Referenced by meta_crypto_keys_create().

5.390.1.7 prime_t* prime_key_generate (prime_artifact_type_t *type*, prime_flags_t *flags*)

Generates a new organizational or user key.

Definition at line 358 of file prime.c.

References log_pedantic, mm_free(), org_key_generate(), prime_alloc(), PRIME_ORG_KEY, prime_t, PRIME_USER_KEY, and user_key_-generate().

Referenced by meta_crypto_keys_create().

5.390.1.8 stringer_t* prime_message_decrypt (stringer_t * *message*, prime_t * *org*, prime_t * *user*)

Decrypt a message.

Definition at line 586 of file prime.c.

References log_pedantic, naked_message_get(), prime_free(), PRIME_ORG_SIGNET, and PRIME_USER_KEY.

Referenced by mail_load_message().

5.390.1.9 stringer_t* prime_message_encrypt (stringer_t * *message*, prime_t * *author*, prime_t * *origin*, prime_t * *destination*, prime_t * *recipient*)

Encrypt a message.

Definition at line 558 of file prime.c.

References log_pedantic, naked_message_set(), NONE, prime_alloc(), prime_free(), PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, prime_t, and PRIME_USER_SIGNET.

Referenced by mail_store_message().

5.390.1.10 prime_t* prime_request_generate (prime_t * *object*, prime_t * *previous*)

Takes a user key, and possibly the previous user key, and generate a signet signing request.

Definition at line 505 of file prime.c.

References log_pedantic, NONE, prime_alloc(), prime_free(), prime_t, PRIME_USER_KEY, PRIME_USER_SIGNING_REQUEST, user_-request_generate(), and user_request_rotation().

Referenced by meta_crypto_keys_create().

5.390.1.11 prime_t* prime_request_sign (prime_t * *request*, prime_t * *org*)

Takes a user signing request, and an organizational key, and returns a signed user signet.

Definition at line 532 of file prime.c.

References log_pedantic, NONE, prime_alloc(), prime_free(), PRIME_ORG_KEY, prime_t, PRIME_USER_SIGNET, PRIME_USER_-SIGNING_REQUEST, and user_request_sign().

Referenced by meta_crypto_keys_create().

5.390.1.12 prime_t* prime_set (stringer_t * *object*, prime_encoding_t *encoding*, prime_flags_t *flags*)

Parses a serialized PRIME object into a working context.

Definition at line 267 of file prime.c.

References ARMORED, log_pedantic, org_key_set(), org_signet_set(), prime_alloc(), prime_free(), prime_header_read(), PRIME_ORG_-KEY, PRIME_ORG_SIGNET, prime_pem_unwrap(), prime_t, PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_USER_SIGNING_-REQUEST, st_cleanup, type(), user_key_set(), user_request_set(), and user_signet_set().

Referenced by meta_update_keys(), prime_start(), and smtp_fetch_inbound().

5.390.1.13 stringer_t* prime_signet_fingerprint (prime_t * *object*, stringer_t * *output*)

Takes an organizational signet, or a user signet, and returns the corresponding cryptographic fingerprint.

Definition at line 419 of file prime.c.

References log_pedantic, org_signet_fingerprint(), PRIME_ORG_SIGNET, PRIME_USER_SIGNET, and user_signet_fingerprint().

5.390.1.14 prime_t* prime_signet_generate (prime_t * *object*)

Takes an organizational key, and generates the corresponding signet.

Definition at line 395 of file prime.c.

References log_pedantic, NONE, org_signet_generate(), prime_alloc(), prime_free(), PRIME_ORG_KEY, PRIME_ORG_SIGNET, and prime_t.

5.390.1.15 bool_t prime_signet_validate (prime_t * *object*, prime_t * *validator*)

Takes a signet, and validates the self signature. If the object is a user signet, and the validator is a user signet, then the custody signature is verified. If the validator is an organizational signet, then the organizational signature is validated. If the object is a signing request, then the validator must be a user signet, and the chain of custody signature is verified.

Definition at line 450 of file prime.c.

References log_pedantic, org_signet_verify(), PRIME_ORG_SIGNET, PRIME_USER_SIGNET, PRIME_USER_SIGNING_REQUEST, user_request_verify_chain_of_custody(), user_request_verify_self(), user_signet_verify_chain_of_custody(), user_signet_verify_org(), and user_signet_verify_self().

5.390.1.16 bool_t prime_start (void)

Initialize the global PRIME structures.

Returns:

returns true if everything initializes properly, or false if an error occurrs.

TODO: Verify that the provided signet matches the provided key file.

Definition at line 19 of file prime.c.

References ARMORED, magma_t::dime, EC_GROUP_free_d, EC_GROUP_new_by_curve_name_d, EC_GROUP_precompute_mult_d, EC_GROUP_set_point_conversion_form_d, file_load(), file_world_accessible(), magma_t::key, log_critical, log_error, magma, MEMORYBUF, NONE, org_key, org_signet, prime_curve_group, prime_set(), SECURE, magma_t::signet, ssl_error_string(), st_char_get(), st_free(), and st_length_int().

Functions

- struct __attribute__ ((packed))
- prime_t ∗ prime_alloc (prime_type_t type, prime_flags_t flags)

  prime.c

- void prime_cleanup (prime_t ∗object)
- void prime_free (prime_t ∗object)
- stringer_t ∗ prime_get (prime_t ∗object, prime_encoding_t encoding, stringer_t ∗output)

  Serializes a PRIME object and returns it in binary form, or with an ASCII armor encoding.

- prime_t ∗ prime_key_decrypt (stringer_t ∗key, stringer_t ∗object, prime_encoding_t encoding, prime_flags_t flags)

  Decrypt an organizational or user key using a STACIE realm key.

- stringer_t ∗ prime_key_encrypt (stringer_t ∗key, prime_t ∗object, prime_encoding_t encoding, stringer_t ∗output)

  Encrypt an organizational or user key using a STACIE realm key.

- prime_t ∗ prime_key_generate (prime_artifact_type_t type, prime_flags_t flags)

  Generates a new organizational or user key.

- stringer_t ∗ prime_message_decrypt (stringer_t ∗message, prime_t ∗org, prime_t ∗user)

  Decrypt a message.

- stringer_t ∗ prime_message_encrypt (stringer_t ∗message, prime_t ∗author, prime_t ∗origin, prime_t ∗destination, prime_t ∗recipient)

  Encrypt a message.

- prime_t ∗ prime_request_generate (prime_t ∗object, prime_t ∗previous)

  Takes a user key, and possibly the previous user key, and generate a signet signing request.

- prime_t ∗ prime_request_sign (prime_t ∗request, prime_t ∗org)

  Takes a user signing request, and an organizational key, and returns a signed user signet.

- prime_t ∗ prime_set (stringer_t ∗object, prime_encoding_t encoding, prime_flags_t flags)

  Parses a serialized PRIME object into a working context.

- stringer_t ∗ prime_signet_fingerprint (prime_t ∗object, stringer_t ∗output)

  Takes an organizational signet, or a user signet, and returns the corresponding cryptographic fingerprint.

- prime_t * prime_signet_generate (prime_t *object)

  Takes an organizational key, and generates the corresponding signet.

- bool_t prime_signet_validate (prime_t *object, prime_t *validator)

  Takes a signet, and validates the self signature. If the object is a user signet, and the validator is a user signet, then the custody signature is verified. If the validator is an organizational signet, then the organizational signature is validated. If the object is a signing request, then the validator must be a user signet, and the chain of custody signature is verified.

- bool_t prime_start (void)

  Initialize the global PRIME structures.

- void prime_stop (void)

  Destroy the global PRIME structures.

5.391.2 Typedef Documentation

5.391.2.1 prime_type_t

Definition at line 167 of file prime.h.

5.391.2.2 typedef void secp256k1_key_t

Definition at line 173 of file prime.h.

5.391.3 Enumeration Type Documentation

5.391.3.1 enum ed25519_key_type_t

Enumerator:

ED25519_ERR
ED25519_PUB
ED25519_PRIV

Definition at line 27 of file prime.h.

5.391.3.2 enum prime_artifact_type_t

Enumerator:

PRIME_ORG_SIGNET Organizational signet.
PRIME_ORG_KEY Organizational key.
PRIME_ORG_KEY_ENCRYPTED Encrypted organizational key.
PRIME_USER_SIGNING_REQUEST User signing request.
PRIME_USER_SIGNET User signet.
PRIME_USER_KEY User key.
PRIME_USER_KEY_ENCRYPTED Encrypted user key.

Definition at line 79 of file prime.h.

5.391.3.3 enum prime_encoding_t

Enumerator:

BINARY Serialized object in binary form.
ARMORED An object that has been aromored using the Privacy Enhanced Message format.
DEBUG Printable version of the object, with labels, and binary data encoded using base64.

Definition at line 45 of file prime.h.

5.391.3.4 enum prime_flags_t

Enumerator:

NONE
SECURITY Store the object in secure memory.

Definition at line 54 of file prime.h.

5.391.3.5 enum prime_message_chunk_flags_t

Enumerator:

PRIME_CHUNK_FLAG_INVALID

PRIME_CHUNK_FLAG_NONE The empty set.

PRIME_CHUNK_FLAG_ALTERNATE_PADDING Alternate chunk padding algorithm.

PRIME_CHUNK_FLAG_ALTERNATE_ENCRYPT Payload is further encrypted by the alternate cipher suite.

PRIME_CHUNK_FLAG_COMPRESSED The data was compressed before being encrypted.

PRIME_CHUNK_FLAG_SPANNING The payload continues into the next available chunk.

Definition at line 121 of file prime.h.

5.391.3.6 enum prime_message_chunk_type_t

Enumerator:

PRIME_CHUNK_INVALID

PRIME_CHUNK_TRACING Tracing data.

PRIME_CHUNK_EPHEMERAL Ephemeral chunk.

PRIME_CHUNK_ORIGIN Origin chunk.

PRIME_CHUNK_DESTINATION Destination chunk.

PRIME_CHUNK_COMMON Common headers chunk.

PRIME_CHUNK_HEADERS Remaining headers chunk.

PRIME_CHUNK_BODY Naked unstructured message body.

PRIME_SIGNATURE_TREE

PRIME_SIGNATURE_USER

PRIME_SIGNATURE_ORGIN

PRIME_SIGNATURE_DESTINATION

Definition at line 92 of file prime.h.

5.391.3.7 enum prime_message_type_t

Enumerator:

PRIME_MESSAGE_ENCRYPTED An encrypted message.

PRIME_MESSAGE_SENT An encrypted, appended, sent message.

PRIME_MESSAGE_DRAFT An encrypted, appended, message draft.

PRIME_MESSAGE_NAKED An encrypted, imported, unstructured, naked message.

PRIME_MESSAGE_BOUNCE An encapsulated, encrypted message, that has bounced.

PRIME_MESSAGE_FORWARD An encapsulated, encrypted message, that has been forwarded.

PRIME_MESSAGE_ABUSE An encapsulated, encrypted message, sent as an abuse complaint.

PRIME_BINARY_OBJECT A binary object.

PRIME_PROTOCOL_TICKET An encrypted protocol ticket.

Definition at line 62 of file prime.h.

5.391.3.8 enum prime_org_artifact_fields_t

Enumerator:

ORG_PRIMARY_KEY
ORG_SECONDARY_KEY
ORG_ENCRYPTION_KEY
ORG_SELF_SIGNATURE
ORG_FULL_SIGNATURE
ORG_IDENTIFIER
ORG_IDENTIFIABLE_SIGNATURE

Definition at line 139 of file prime.h.

5.391.3.9 enum prime_user_artifact_fields_t

Enumerator:

USER_SIGNING_KEY
USER_ENCRYPTION_KEY
USER_ALTERNATE_ENCRYPTION_KEY
USER_CUSTODY_SIGNATURE
USER_SELF_SIGNATURE
USER_CRYPTO_SIGNATURE
USER_FULL_SIGNATURE
USER_IDENTIFIER
USER_IDENTIFIABLE_SIGNATURE

Definition at line 152 of file prime.h.

5.391.3.10 enum secp256k1_key_type_t

Enumerator:

SECP256K1_ERR
SECP256K1_PUB
SECP256K1_PRIV

Definition at line 36 of file prime.h.

5.391.4 Function Documentation

5.391.4.1 struct __attribute__ ((packed)) `[read]`

< User signing key, field 1.

< User encryption key, field 2.

< User chain of custody signature, field 4.

< User signature, field 5.

< Organizational signature, field 6.

< Organizational signing key, field 1.

< Organizational encryption key, field 3.

< Organizational signature, field 4.

< Chunk type, which curently, should always be 1.

< Payload length. Currently, this should only be 35 or 69.

< Chunk type, 1 through 255.

< Payload length, must be divisible by 16 and less than 2^24 - 1.

Definition at line 340 of file prime.h.

References prime_message_t, prime_org_key_t, prime_org_signet_t, prime_user_key_t, prime_user_signet_t, type(), and __attribute__-::user.

5.391.4.2 prime_t∗ prime_alloc (prime_type_t *type*, prime_flags_t *flags*)

prime.c

Definition at line 155 of file prime.c.

References log_pedantic, mm_alloc(), mm_wipe(), prime_free(), PRIME_MESSAGE_ENCRYPTED, PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, PRIME_ORG_SIGNET, prime_t, PRIME_USER_KEY, PRIME_USER_SIGNET, and PRIME_USER_SIGNING_-REQUEST.

Referenced by prime_key_decrypt(), prime_key_generate(), prime_message_encrypt(), prime_request_generate(), prime_request_sign(), prime_set(), and prime_signet_generate().

5.391.4.3 void prime_cleanup (prime_t ∗ *object*)

Definition at line 148 of file prime.c.

References prime_free().

Referenced by mail_store_message(), meta_crypto_keys_create(), meta_free(), and smtp_free_inbound().

5.391.4.4 void prime_free (prime_t ∗ *object*)

Definition at line 99 of file prime.c.

References encrypted_message_free(), log_pedantic, mm_free(), org_key_free(), org_signet_free(), PRIME_MESSAGE_ENCRYPTED, PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, PRIME_ORG_SIGNET, PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_-USER_SIGNING_REQUEST, user_key_free(), and user_signet_free().

5.391.4.5 stringer_t∗ prime_get (prime_t ∗ *object*, prime_encoding_t *encoding*, stringer_t ∗ *output*)

Serializes a PRIME object and returns it in binary form, or with an ASCII armor encoding.

Definition at line 205 of file prime.c.

References ARMORED, log_pedantic, org_key_get(), org_signet_get(), PRIME_ORG_KEY, PRIME_ORG_SIGNET, prime_pem_wrap(), PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_USER_SIGNING_REQUEST, st_dupe(), st_free(), user_key_get(), user_request_-get(), and user_signet_get().

Referenced by meta_crypto_keys_create().

5.391.4.6 prime_t* prime_key_decrypt (stringer_t * *key*, stringer_t * *object*, prime_encoding_t *encoding*, prime_flags_t *flags*)

Decrypt an organizational or user key using a STACIE realm key.

Definition at line 659 of file prime.c.

References ARMORED, log_pedantic, org_encrypted_key_set(), prime_alloc(), prime_free(), prime_header_read(), PRIME_ORG_KEY, PRIME_ORG_KEY_ENCRYPTED, prime_pem_unwrap(), prime_t, PRIME_USER_KEY, PRIME_USER_KEY_ENCRYPTED, st_cleanup, st_length_get(), STACIE_KEY_LENGTH, type(), and user_encrypted_key_set().

Referenced by meta_update_keys().

5.391.4.7 stringer_t* prime_key_encrypt (stringer_t * *key*, prime_t * *object*, prime_encoding_t *encoding*, stringer_t * *output*)

Encrypt an organizational or user key using a STACIE realm key.

Definition at line 606 of file prime.c.

References ARMORED, log_pedantic, org_encrypted_key_get(), PRIME_ORG_KEY, prime_pem_wrap(), PRIME_USER_KEY, st_dupe(), st_free(), and user_encrypted_key_get().

Referenced by meta_crypto_keys_create().

5.391.4.8 prime_t* prime_key_generate (prime_artifact_type_t *type*, prime_flags_t *flags*)

Generates a new organizational or user key.

Definition at line 358 of file prime.c.

References log_pedantic, mm_free(), org_key_generate(), prime_alloc(), PRIME_ORG_KEY, prime_t, PRIME_USER_KEY, and user_key_generate().

Referenced by meta_crypto_keys_create().

5.391.4.9 stringer_t* prime_message_decrypt (stringer_t * *message*, prime_t * *org*, prime_t * *user*)

Decrypt a message.

Definition at line 586 of file prime.c.

References log_pedantic, naked_message_get(), prime_free(), PRIME_ORG_SIGNET, and PRIME_USER_KEY.

Referenced by mail_load_message().

5.391.4.10 stringer_t* prime_message_encrypt (stringer_t * *message*, prime_t * *author*, prime_t * *origin*, prime_t * *destination*, prime_t * *recipient*)

Encrypt a message.

Definition at line 558 of file prime.c.

References log_pedantic, naked_message_set(), NONE, prime_alloc(), prime_free(), PRIME_MESSAGE_NAKED, PRIME_ORG_KEY, prime_t, and PRIME_USER_SIGNET.

Referenced by mail_store_message().

5.391.4.11 prime_t* prime_request_generate (prime_t * *object*, prime_t * *previous*)

Takes a user key, and possibly the previous user key, and generate a signet signing request.

Definition at line 505 of file prime.c.

References log_pedantic, NONE, prime_alloc(), prime_free(), prime_t, PRIME_USER_KEY, PRIME_USER_SIGNING_REQUEST, user_-request_generate(), and user_request_rotation().

Referenced by meta_crypto_keys_create().

5.391.4.12 prime_t* prime_request_sign (prime_t * *request*, prime_t * *org*)

Takes a user signing request, and an organizational key, and returns a signed user signet.

Definition at line 532 of file prime.c.

References log_pedantic, NONE, prime_alloc(), prime_free(), PRIME_ORG_KEY, prime_t, PRIME_USER_SIGNET, PRIME_USER_-SIGNING_REQUEST, and user_request_sign().

Referenced by meta_crypto_keys_create().

5.391.4.13 prime_t* prime_set (stringer_t * *object*, prime_encoding_t *encoding*, prime_flags_t *flags*)

Parses a serialized PRIME object into a working context.

Definition at line 267 of file prime.c.

References ARMORED, log_pedantic, org_key_set(), org_signet_set(), prime_alloc(), prime_free(), prime_header_read(), PRIME_ORG_-KEY, PRIME_ORG_SIGNET, prime_pem_unwrap(), prime_t, PRIME_USER_KEY, PRIME_USER_SIGNET, PRIME_USER_SIGNING_-REQUEST, st_cleanup, type(), user_key_set(), user_request_set(), and user_signet_set().

Referenced by meta_update_keys(), prime_start(), and smtp_fetch_inbound().

5.391.4.14 stringer_t* prime_signet_fingerprint (prime_t * *object*, stringer_t * *output*)

Takes an organizational signet, or a user signet, and returns the corresponding cryptographic fingerprint.

Definition at line 419 of file prime.c.

References log_pedantic, org_signet_fingerprint(), PRIME_ORG_SIGNET, PRIME_USER_SIGNET, and user_signet_fingerprint().

5.391.4.15 prime_t* prime_signet_generate (prime_t * *object*)

Takes an organizational key, and generates the corresponding signet.

Definition at line 395 of file prime.c.

References log_pedantic, NONE, org_signet_generate(), prime_alloc(), prime_free(), PRIME_ORG_KEY, PRIME_ORG_SIGNET, and prime_t.

5.391.4.16 bool_t prime_signet_validate (prime_t * *object*, prime_t * *validator*)

Takes a signet, and validates the self signature. If the object is a user signet, and the validator is a user signet, then the custody signature is verified. If the validator is an organizational signet, then the organizational signature is validated. If the object is a signing request, then the validator must be a user signet, and the chain of custody signature is verified.

Definition at line 450 of file prime.c.

References log_pedantic, org_signet_verify(), PRIME_ORG_SIGNET, PRIME_USER_SIGNET, PRIME_USER_SIGNING_REQUEST, user_request_verify_chain_of_custody(), user_request_verify_self(), user_signet_verify_chain_of_custody(), user_signet_verify_org(), and user_signet_verify_self().

5.391.4.17 bool_t prime_start (void)

Initialize the global PRIME structures.

Returns:

returns true if everything initializes properly, or false if an error occurrs.

TODO: Verify that the provided signet matches the provided key file.

Definition at line 19 of file prime.c.

References ARMORED, magma_t::dime, EC_GROUP_free_d, EC_GROUP_new_by_curve_name_d, EC_GROUP_precompute_mult_d, EC_GROUP_set_point_conversion_form_d, file_load(), file_world_accessible(), magma_t::key, log_critical, log_error, magma, MEMORYBUF, NONE, org_key, org_signet, prime_curve_group, prime_set(), SECURE, magma_t::signet, ssl_error_string(), st_char_get(), st_free(), and st_length_int().

Referenced by process_start().

5.391.4.18 void prime_stop (void)

Destroy the global PRIME structures.

Returns:

This function returns no value.

Definition at line 83 of file prime.c.

References EC_GROUP_free_d, org_key, org_signet, prime_curve_group, and prime_free().

Referenced by process_stop().

Functions

- size_t user_request_length (prime_user_signet_t *user)
- prime_user_signet_t * user_request_sign (prime_user_signet_t *request, prime_org_key_t *org)

  Accepts a user signet signing request and signs it using the provided org key, returning a valid signet.

- prime_user_signet_t * user_request_generate (prime_user_key_t *user)

  Derive a user signet signing request from the corresponding private key structures.

- prime_user_signet_t * user_request_rotation (prime_user_key_t *user, prime_user_key_t *previous)

  Generate a user signet signing rotation request using the previous, and new user private key structures.

- stringer_t * user_request_get (prime_user_signet_t *user, stringer_t *output)
- prime_user_signet_t * user_request_set (stringer_t *user)
- bool_t user_request_verify_self (prime_user_signet_t *user)
- bool_t user_request_verify_chain_of_custody (prime_user_signet_t *user, prime_user_signet_t *previous)

5.392.1 Function Documentation

5.392.1.1 prime_user_signet_t* user_request_generate (prime_user_key_t * *user*)

Derive a user signet signing request from the corresponding private key structures. requests.c

Definition at line 101 of file requests.c.

References ED25519_KEY_PUB_LEN, ED25519_PRIV, ed25519_public_get(), ed25519_public_set(), ed25519_sign(), log_pedantic, MANAGEDBUF, mm_alloc(), prime_field_write(), prime_user_signet_t, PRIME_USER_SIGNING_REQUEST, SECP256K1_KEY_PUB_LEN, secp256k1_public_get(), secp256k1_public_set(), st_length_get(), st_write, and user_signet_free().

Referenced by org_signet_get().

5.396.2.12 int_t prime_header_read (stringer_t * *object*, uint16_t * *type*, uint32_t * *size*)

Read the first few bytes of a serialized PRIME object and return the magic number and object size in native form.

Parameters:

data The serialized object buffer.

type A pointer where the type will be stored, if sucessful.

size A pointer to where the parsed size will be stored, if the read is sucessful.

Returns:

0 if sucessful, negative values if the object data is invalid, or postive numbers if a programmatic error occurs. 2 = The object buffer was empty. 1 = A null pointer was supplied. 0 = Success. -1 = The buffer is too short for a valid PRIME object header. -2 = The size in the header doesn't match the amount of data supplied. (size = header_len + object_len). -3 = The header indicates an unrecognized PRIME type.

Definition at line 53 of file headers.c.

5.398.1.2 int_t prime_reader_payload (prime_reader_t ∗ *reader*, int_t *bytes*, placer_t ∗ *payload*)

Read in the field payload and return the result wrapped up by a place holder.

Parameters:

reader

Returns:

-1 if an error occurs, or a 0 if the payload is packaged and returned sucessfully.

Definition at line 61 of file reader.c.

References pl_init(), and pl_null().

Referenced by prime_unpack_fields(), and prime_unpack_validate().

5.398.1.3 int_t prime_reader_size (prime_reader_t ∗ *reader*, int_t *bytes*)

Read 1, 2 or 3 bytes representing a the payload size for a field, and convert the bytes from big endian into the native format before returning the result.

Parameters:

reader

Returns:

-1 if an error occurs, or a field type between 1 and 255 if the reader contained data.

Definition at line 39 of file reader.c.

References mm_copy().

Referenced by prime_unpack_fields(), and prime_unpack_validate().

5.398.1.4 int_t prime_reader_type (prime_reader_t * *reader*)

Read a single byte using the reader and convert it to a type field.

Parameters:

reader

Returns:

-1 if an error occurs, 0 if the end of the buffer is reached, or a field type between 1 and 255 if the reader contained data.

Definition at line 16 of file reader.c.

Referenced by prime_unpack_fields(), and prime_unpack_validate().

5.402 src/providers/stacie/creation.c File Reference

Create cryptographically strong random STACIE salt, nonce, and shard values. `#include "magma.h"`

Functions

- stringer_t ∗ stacie_create_shard (stringer_t ∗output)

  Generates a random shard of precisely 64 bytes, suitable for use with a STACIE realm.

- stringer_t ∗ stacie_create_salt (stringer_t ∗output)

  Generates a random salt of precisely 128 bytes, suitable for use with STACIE authentication scheme.

- stringer_t ∗ stacie_create_nonce (stringer_t ∗output)

  Generates a random nonce of precisely 128 bytes, suitable for use with the STACIE authentication scheme.

5.402.1 Detailed Description

Create cryptographically strong random STACIE salt, nonce, and shard values.

Definition in file creation.c.

5.402.2 Function Documentation

5.402.2.1 stringer_t∗ stacie_create_nonce (stringer_t ∗ *output*)

Generates a random nonce of precisely 128 bytes, suitable for use with the STACIE authentication scheme. creation.c

Note:

While the salt and nonce creation functions are nearly identical, they remain seperated so they can use distinct preprocessor definitions for the result length.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated nonce in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 91 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_NONCE_LENGTH.

Referenced by auth_challenge(), and auth_response().

5.402.2.2 stringer_t∗ stacie_create_salt (stringer_t ∗ *output*)

Generates a random salt of precisely 128 bytes, suitable for use with STACIE authentication scheme.

Note:

While the salt and nonce creation functions are nearly identical, they remain seperated so they can use distinct preprocessor definitions for the result length.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated salt in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 55 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_SALT_LENGTH.

Referenced by auth_login(), and register_data_insert_user().

5.402.2.3 stringer_t∗ stacie_create_shard (stringer_t ∗ *output*)

Generates a random shard of precisely 64 bytes, suitable for use with a STACIE realm.

Note:

The master key is combined with the realm label and a random shard value to create the realm key.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated shard in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 19 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_SHARD_LENGTH.

Referenced by meta_update_realms(), and register_data_insert_user().

5.403 src/providers/stacie/passwords.c File Reference

Process passwords into STACIE key values. `#include "magma.h"`

Functions

- uint32_t stacie_derive_rounds (stringer_t *password, uint32_t bonus)

  Calculate the number of hash rounds needed for the seed and key derivation stages.

- stringer_t * stacie_derive_seed (uint32_t rounds, stringer_t *password, stringer_t *salt)

  Concentrates and then extracts the random entropy provided by the password into a seed value for the first hash stage.

- stringer_t * stacie_derive_key (stringer_t *base, uint32_t rounds, stringer_t *username, stringer_t *password, stringer_t *salt)

  Derive the master key and password key values using the user credentials. The base value provided is dependent upon which of the two keys is being derived. The result is obtained by applying the designated hash function over the input values the appropriate number of times.

5.403.1 Detailed Description

Process passwords into STACIE key values.

Definition in file passwords.c.

5.403.2 Function Documentation

5.403.2.1 stringer_t* stacie_derive_key (stringer_t * *base*, uint32_t *rounds*, stringer_t * *username*, stringer_t * *password*, stringer_t * *salt*)

Derive the master key and password key values using the user credentials. The base value provided is dependent upon which of the two keys is being derived. The result is obtained by applying the designated hash function over the input values the appropriate number of times.

Note:

The "master key" and the "password key" are referred to as "keys" because deriving them values requires knowing "secret" information, or more specifically, the plain text password and the number of hash rounds being applied. The number of hash rounds is considered a "secret" because it requires knowledge of the plain text password to derive. If an attacker were able to discover the number of rounds they could, at least in theory, use that information to derive the length of a password. If you don't understand why an attacker knowing the length of a password might be considered a bad thing, then I pity you.

Parameters:

base The initial entropy being applied to the key derivation process. For the master key derivation, this should be the entropy seed value. For the password key derivation, this should be the master key value. Because the base value is a created using the designated hash function, its length must match output size. For Magma, which is using SHA-512, that means the base value must always be 64 bytes.

username The pre-processed username, encoded in UTF8. The rules for normalization and equivalence are different for every domain/deployment. Depending on those rules, the username passed in may be just the local part, or it may consist of the full email address, which would includes the separator (usually the '@' symbol) and a domain name (preferably a fully qualified domain).

password The pre-processed password, encoded in UTF8 and normalized using the canonical composition form (aka NFC).

salt The user specific salt, which provides protection against precomputed lookup tables. For Magma, the salt value must always be 128 bytes in length;

See also:

stacie_derive_seed() for more on the salt length.

Returns:

provides a managed string with the derived key stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes, every single time.

Definition at line 183 of file passwords.c.

References CONTIGUOUS, count, EVP_DigestFinal_d, EVP_DigestInit_ex_d, EVP_DigestUpdate_d, EVP_MD_CTX_cleanup_d, EVP_-MD_CTX_init_d, EVP_sha512_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, SECURE, ssl_error_string(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty_out(), st_length_int(), st_length_set(), STACIE_KEY_ROUNDS_MAX, STACIE_SALT_-LENGTH, and status.

Referenced by auth_stacie().

5.403.2.2 uint32_t stacie_derive_rounds (stringer_t ∗ *password*, uint32_t *bonus*)

Calculate the number of hash rounds needed for the seed and key derivation stages.

Note:

This function has an effective maximum of 16,777,216 because STACIE requires the current round be appended to the string being hashed. This value is supplied as an unsigned 24 bit big endian integer. THe prescribed maximum is derived from the fact that the total number of possible values for an unsigned 24 bit integer is 16,777,216. This includes 0, since the values being appended by the derivation functions start at 0.

Remarks:

While on the subject of a maximum value, if 16,777,216 hash rounds doesn't provide sufficient protection then the the problem is likely the password, or the hash function, and not the number of rounds.

Parameters:

password A password which may contain any valid Unicode character (presumably encoded using UTF-8).

bonus The number of additional rounds which should be added beyond the number of dynamic rounds calculated using the password length.

Returns:

Valid passwords will return a value between 8 (the prescribed minimum) and 16,777,216 (the prescribed maximum). If an error occurs, then 0 will be returned.

Definition at line 28 of file passwords.c.

References log_pedantic, STACIE_KEY_ROUNDS_MAX, STACIE_KEY_ROUNDS_MIN, uint64_clamp(), and utf8_length_st().

Referenced by auth_stacie().

5.403.2.3 stringer_t∗ stacie_derive_seed (uint32_t *rounds*, stringer_t ∗ *password*, stringer_t ∗ *salt*)

Concentrates and then extracts the random entropy provided by the password into a seed value for the first hash stage. passwords.c

Note:

This implementation requires a seed value of 128 bytes because it was written specifically for Magma. However, the STACIE specification does technically allow the salt value to be empty, or of a different length, and provides additional logic in those circumstances. Those additional rules have not been implemented, so if this implementation does not receive a salt value that is exactly 128 bytes in length, it will return NULL to indicate the error.

Parameters:

rounds The derived number of rounds, based on the password length, bonus rounds, and applicable limits.

password The pre-processed password, encoded in UTF8 and normalized using the canonical composition form (aka NFC).

salt The user specific salt, which provides protection against precomputed lookup tables. The salt must be 128 bytes in length.

Returns:

provides a managed string with the entropy seed value stored in a secure memory buffer, or NULL if an error occurs. The length of the return value depends on the HMAC function being used. Magma currently uses an HMAC function based around SHA-512, which results in the output being exactly 64 bytes, at least it was 64 bytes every time I bothered to look.

Definition at line 81 of file passwords.c.

References CONTIGUOUS, count, EVP_sha512_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, SECURE, ssl_error_string(), st_alloc_opts(), st_cleanup, st_-data_get(), st_empty_out(), st_length_set(), STACIE_KEY_ROUNDS_MAX, and STACIE_SALT_LENGTH.

Referenced by auth_stacie().

5.404 src/providers/stacie/realms.c File Reference

Dervice STACIE realm key and vector shard values. `#include "magma.h"`

Functions

- stringer_t ∗ stacie_realm_key (stringer_t ∗master_key, stringer_t ∗realm, stringer_t ∗salt, stringer_t ∗shard)
  Derive the symmetric encryption keys applicable to a given realm.
- stringer_t ∗ stacie_realm_cipher (stringer_t ∗realm_key)
  Extract the symmetric encryption key from the realm key.
- stringer_t ∗ stacie_realm_vector (stringer_t ∗realm_key)
  Extract the vector key from the realm key.
- stringer_t ∗ stacie_realm_tag (stringer_t ∗realm_key)
  Extract the tag key from the realm key.

5.404.1 Detailed Description

Dervice STACIE realm key and vector shard values.

Definition in file realms.c.

5.404.2 Function Documentation

5.404.2.1 stringer_t∗ stacie_realm_cipher (stringer_t ∗ *realm_key*)

Extract the symmetric encryption key from the realm key. realms.c

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the symmetric encryption key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 126 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

5.404.2.2 stringer_t∗ stacie_realm_key (stringer_t ∗ *master_key*, stringer_t ∗ *realm*, stringer_t ∗ *salt*, stringer_t ∗ *shard*)

Derive the symmetric encryption keys applicable to a given realm.

Note:

It is important that implementations use unique shard's for every realm. This ensures that if a realm key is ever compromised, the data in alternate realms will remain secure. Also, depending on the implementation, the shard might only be stored on the server. This means if the client device is ever lost, a user can protect the information on the device by changing their password. This ensures that any data residing on the lost device will remain protected, even if the lost device holds the plain text of the former password or the stale master key. This operational methodology won't work for everyone, as it also prevents data from being accessible offline.

Parameters:

master_key The master key, which was derived using the user's password.

realm Realm human readable name for the category of data protected using the given symmetric key.

salt The user specific salt value. For legacy derivations, this will be a shard duplicate.

shard The shard is the realm specific portion of the key. The shard must be exactly 64 bytes in length.

Returns:

provides a managed string with the realm specific key stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes. The output will contain the cipher key, and the initialization vector, which will need to parsed out.

Definition at line 30 of file realms.c.

References CONTIGUOUS, EVP_DigestFinal_d, EVP_DigestInit_ex_d, EVP_DigestUpdate_d, EVP_MD_CTX_cleanup_d, EVP_MD_-CTX_init_d, EVP_sha512_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, PLACER, SECURE, ssl_error_string(), st_alloc_-opts(), st_cleanup, st_empty_out(), st_xor(), and STACIE_KEY_LENGTH.

Referenced by meta_update_realms(), and register_data_insert_user().

5.404.2.3 stringer_t∗ stacie_realm_tag (stringer_t ∗ *realm_key*)

Extract the tag key from the realm key.

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the tag key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 170 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

5.404.2.4 stringer_t∗ stacie_realm_vector (stringer_t ∗ *realm_key*)

Extract the vector key from the realm key.

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the vector key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 148 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

5.405 src/providers/stacie/stacie.h File Reference

These functions implement the Safely Turning Authentication Credentials Into Entropy (STACIE) standard. This standard defines how process passwords into encryption keys, and/or authentication tokens, derive realm specific encryption keys, and perform symmetric encryption using the realm keys. The inputs passed into these functions must be santized, and normalized to ensure a deterministic output.

5.405.1 Detailed Description

These functions implement the Safely Turning Authentication Credentials Into Entropy (STACIE) standard. This standard defines how process passwords into encryption keys, and/or authentication tokens, derive realm specific encryption keys, and perform symmetric encryption using the realm keys. The inputs passed into these functions must be santized, and normalized to ensure a deterministic output.

5.405.3 Function Documentation

5.405.3.1 stringer_t* stacie_create_nonce (stringer_t * *output*)

creation.c creation.c

Note:

While the salt and nonce creation functions are nearly identical, they remain seperated so they can use distinct preprocessor definitions for the result length.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated nonce in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 91 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_NONCE_LENGTH.

Referenced by auth_challenge(), and auth_response().

5.405.3.2 stringer_t∗ stacie_create_salt (stringer_t ∗ *output*)

Generates a random salt of precisely 128 bytes, suitable for use with STACIE authentication scheme.

Note:

While the salt and nonce creation functions are nearly identical, they remain seperated so they can use distinct preprocessor definitions for the result length.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated salt in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 55 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_SALT_LENGTH.

Referenced by auth_login(), and register_data_insert_user().

5.405.3.3 stringer_t∗ stacie_create_shard (stringer_t ∗ *output*)

Generates a random shard of precisely 64 bytes, suitable for use with a STACIE realm.

Note:

The master key is combined with the realm label and a random shard value to create the realm key.

Parameters:

output a managed string to receive the output; if passed as NULL, an output buffer will be allocated.

Returns:

A managed string holding the freshly generated shard in binary form. If NULL was passed in then the result must be freed by the caller.

Definition at line 19 of file creation.c.

References log_pedantic, PLACER, rand_write(), st_alloc(), st_avail_get(), st_cleanup, st_data_get(), st_length_set(), st_opt_get(), st_valid_-destination(), st_valid_tracked(), and STACIE_SHARD_LENGTH.

Referenced by meta_update_realms(), and register_data_insert_user().

5.405.3.4 stringer_t∗ stacie_decrypt (stringer_t ∗ *vector_key*, stringer_t ∗ *tag_key*, stringer_t ∗ *cipher_key*, stringer_t ∗ *buffer*)

crypto.c

Parameters:

vector_key

tag_key

cipher_key

buffer

Returns:

Definition at line 185 of file crypto.c.

References EVP_aes_256_gcm_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_init_d, EVP_-CIPHER_CTX_key_length_d, EVP_DecryptFinal_ex_d, EVP_DecryptInit_ex_d, EVP_DecryptUpdate_d, log_error, log_pedantic, MANAGEDBUF, MEMORYBUF, mm_move(), PLACER, ssl_error_string(), st_alloc(), st_data_get(), st_empty_out(), st_free(), st_length_get(), st_length_set(), st_xor(), and STACIE_ENVELOPE_LENGTH.

5.405.3.5 stringer_t∗ stacie_derive_key (stringer_t ∗ *base*, uint32_t *rounds*, stringer_t ∗ *username*, stringer_t ∗ *password*, stringer_t ∗ *salt*)

Derive the master key and password key values using the user credentials. The base value provided is dependent upon which of the two keys is being derived. The result is obtained by applying the designated hash function over the input values the appropriate number of times.

Note:

The "master key" and the "password key" are referred to as "keys" because deriving them values requires knowing "secret" information, or more specifically, the plain text password and the number of hash rounds being applied. The number of hash rounds is considered a "secret" because it requires knowledge of the plain text password to derive. If an attacker were able to discover the number of rounds they could, at least in theory, use that information to derive the length of a password. If you don't understand why an attacker knowing the length of a password might be considered a bad thing, then I pity you.

Parameters:

base The initial entropy being applied to the key derivation process. For the master key derivation, this should be the entropy seed value. For the password key derivation, this should be the master key value. Because the base value is a created using the designated hash function, its length must match output size. For Magma, which is using SHA-512, that means the base value must always be 64 bytes.

username The pre-processed username, encoded in UTF8. The rules for normalization and equivalence are different for every domain/deployment. Depending on those rules, the username passed in may be just the local part, or it may consist of the full email address, which would includes the separator (usually the '@' symbol) and a domain name (preferably a fully qualified domain).

password The pre-processed password, encoded in UTF8 and normalized using the canonical composition form (aka NFC).

salt The user specific salt, which provides protection against precomputed lookup tables. For Magma, the salt value must always be 128 bytes in length;

See also:

stacie_derive_seed() for more on the salt length.

Returns:

provides a managed string with the derived key stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes, every single time.

Definition at line 183 of file passwords.c.

References CONTIGUOUS, count, EVP_DigestFinal_d, EVP_DigestInit_ex_d, EVP_DigestUpdate_d, EVP_MD_CTX_cleanup_d, EVP_-MD_CTX_init_d, EVP_sha512_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, SECURE, ssl_error_string(), st_alloc_opts(),

st_char_get(), st_cleanup, st_data_get(), st_empty_out(), st_length_int(), st_length_set(), STACIE_KEY_ROUNDS_MAX, STACIE_SALT_-LENGTH, and status.

Referenced by auth_stacie().

5.405.3.6 uint32_t stacie_derive_rounds (stringer_t * *password*, uint32_t *bonus*)

Calculate the number of hash rounds needed for the seed and key derivation stages.

Note:

This function has an effective maximum of 16,777,216 because STACIE requires the current round be appended to the string being hashed. This value is supplied as an unsigned 24 bit big endian integer. THe prescribed maximum is derived from the fact that the total number of possible values for an unsigned 24 bit integer is 16,777,216. This includes 0, since the values being appended by the derivation functions start at 0.

Remarks:

While on the subject of a maximum value, if 16,777,216 hash rounds doesn't provide sufficient protection then the the problem is likely the password, or the hash function, and not the number of rounds.

Parameters:

password A password which may contain any valid Unicode character (presumably encoded using UTF-8).

bonus The number of additional rounds which should be added beyond the number of dynamic rounds calculated using the password length.

Returns:

Valid passwords will return a value between 8 (the prescribed minimum) and 16,777,216 (the prescribed maximum). If an error occurs, then 0 will be returned.

Definition at line 28 of file passwords.c.

References log_pedantic, STACIE_KEY_ROUNDS_MAX, STACIE_KEY_ROUNDS_MIN, uint64_clamp(), and utf8_length_st().

Referenced by auth_stacie().

5.405.3.7 stringer_t* stacie_derive_seed (uint32_t *rounds*, stringer_t * *password*, stringer_t * *salt*)

passwords.c passwords.c

Note:

This implementation requires a seed value of 128 bytes because it was written specifically for Magma. However, the STACIE specification does technically allow the salt value to be empty, or of a different length, and provides additional logic in those circumstances. Those additional rules have not been implemented, so if this implementation does not receive a salt value that is exactly 128 bytes in length, it will return NULL to indicate the error.

Parameters:

rounds The derived number of rounds, based on the password length, bonus rounds, and applicable limits.

password The pre-processed password, encoded in UTF8 and normalized using the canonical composition form (aka NFC).

salt The user specific salt, which provides protection against precomputed lookup tables. The salt must be 128 bytes in length.

Returns:

provides a managed string with the entropy seed value stored in a secure memory buffer, or NULL if an error occurs. The length of the return value depends on the HMAC function being used. Magma currently uses an HMAC function based around SHA-512, which results in the output being exactly 64 bytes, at least it was 64 bytes every time I bothered to look.

Definition at line 81 of file passwords.c.

References CONTIGUOUS, count, EVP_sha512_d, HMAC_CTX_cleanup_d, HMAC_CTX_init_d, HMAC_Final_d, HMAC_Init_ex_d, HMAC_Update_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, SECURE, ssl_error_string(), st_alloc_opts(), st_cleanup, st_data_get(), st_empty_out(), st_length_set(), STACIE_KEY_ROUNDS_MAX, and STACIE_SALT_LENGTH.

Referenced by auth_stacie().

5.405.3.8 stringer_t* stacie_derive_token (stringer_t * *base*, stringer_t * *username*, stringer_t * *salt*, stringer_t * *nonce*)

tokens.c tokens.c

Note:

The token values are used for authentication with an untrusted server, which needs to authenticate a user, but does not know anything about the plain text password. Untrusted servers store the static verification token, and using this function, can verify ephemeral login tokens. Servers can also authenticate a password change request by checking whether the supplied password key, if passed to this the token derivation function, matches the stored verification token. The base value passed in is dependent upon which token is being derived. The result is obtained by applying the designated hash function over the input values a fixed number of times.

Parameters:

base The initial entropy being applied to the token derivation process. For the static verification token, this will be the password key value. For an ephemeral login token, this will be the verification token. Because the base value is a created using the designated hash function, its length must match output size. For Magma, which is using SHA-512, that means the base value must always be 64 bytes.

username The pre-processed username, encoded in UTF8. The rules for normalization and equivalence are different for every domain/deployment. Depending on those rules, the username passed in may be just the local part, or it may consist of the full email address, which would includes the separator (usually the '@' symbol) and a domain name (preferably a fully qualified domain).

salt The user specific salt, which provides protection against precomputed lookup tables. For Magma, the salt value must always be 128 bytes in length;

See also:

stacie_derive_seed() for more on the salt length.

Parameters:

nonce When deriving an ephemeral login token, an additional single use, randomly generated value is supplied as the nonce parameter. For Magma, this value must always be 128 bytes in length.

Returns:

provides a managed string with the derived token stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes, with a level of reliability that rivals death and taxes.

Definition at line 38 of file tokens.c.

References CONTIGUOUS, count, EVP_DigestFinal_d, EVP_DigestInit_ex_d, EVP_DigestUpdate_d, EVP_MD_CTX_cleanup_d, EVP_MD_CTX_init_d, EVP_sha512_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, SECURE, ssl_error_string(), st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_empty_out(), st_length_int(), st_length_set(), STACIE_NONCE_LENGTH, STACIE_SALT_LENGTH, and STACIE_TOKEN_ROUNDS.

Referenced by auth_stacie().

5.405.3.9 stringer_t* stacie_encrypt (uint16_t *serial*, stringer_t * *vector_key*, stringer_t * *tag_key*, stringer_t * *cipher_key*, stringer_t * *buffer*)

Parameters:

serial

vector_key

tag_key

cipher_key

buffer

Returns:

Definition at line 21 of file crypto.c.

References EVP_aes_256_gcm_d, EVP_CIPHER_CTX_cleanup_d, EVP_CIPHER_CTX_ctrl_d, EVP_CIPHER_CTX_init_d, EVP_-CIPHER_CTX_key_length_d, EVP_EncryptFinal_ex_d, EVP_EncryptInit_ex_d, EVP_EncryptUpdate_d, log_error, log_pedantic, MANAGEDBUF, mm_move(), PLACER, rand_write(), st_alloc(), st_data_get(), st_empty_out(), st_free(), st_length_get(), st_length_set(), st_-xor(), STACIE_BLOCK_LENGTH, STACIE_ENCRYPT_MAX, and STACIE_ENVELOPE_LENGTH.

5.405.3.10 stringer_t∗ stacie_realm_cipher (stringer_t ∗ *realm_key*)

realms.c realms.c

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the symmetric encryption key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 126 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

5.405.3.11 stringer_t∗ stacie_realm_key (stringer_t ∗ *master_key*, stringer_t ∗ *realm*, stringer_t ∗ *salt*, stringer_t ∗ *shard*)

Derive the symmetric encryption keys applicable to a given realm.

Note:

It is important that implementations use unique shard's for every realm. This ensures that if a realm key is ever compromised, the data in alternate realms will remain secure. Also, depending on the implementation, the shard might only be stored on the server. This means if the client device is ever lost, a user can protect the information on the device by changing their password. This ensures that any data residing on the lost device will remain protected, even if the lost device holds the plain text of the former password or the stale master key. This operational methodology won't work for everyone, as it also prevents data from being accessible offline.

Parameters:

master_key The master key, which was derived using the user's password.

realm Realm human readable name for the category of data protected using the given symmetric key.

salt The user specific salt value. For legacy derivations, this will be a shard duplicate.

shard The shard is the realm specific portion of the key. The shard must be exactly 64 bytes in length.

Returns:

provides a managed string with the realm specific key stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes. The output will contain the cipher key, and the initialization vector, which will need to parsed out.

Definition at line 30 of file realms.c.

References CONTIGUOUS, EVP_DigestFinal_d, EVP_DigestInit_ex_d, EVP_DigestUpdate_d, EVP_MD_CTX_cleanup_d, EVP_MD_-CTX_init_d, EVP_sha512_d, log_error, log_pedantic, MANAGED_T, MEMORYBUF, PLACER, SECURE, ssl_error_string(), st_alloc_-opts(), st_cleanup, st_empty_out(), st_xor(), and STACIE_KEY_LENGTH.

Referenced by meta_update_realms(), and register_data_insert_user().

5.405.3.12 stringer_t∗ stacie_realm_tag (stringer_t ∗ *realm_key*)

Extract the tag key from the realm key.

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the tag key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 170 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

5.405.3.13 stringer_t∗ stacie_realm_vector (stringer_t ∗ *realm_key*)

Extract the vector key from the realm key.

Parameters:

realm_key The complete realm key, which holds the vector, tag and cipher key values.

Returns:

provides a managed string with the vector key stored in a secure memory buffer, or NULL if an error occurs.

Definition at line 148 of file realms.c.

References CONTIGUOUS, log_error, MANAGED_T, PLACER, SECURE, st_data_get(), st_dupe_opts(), st_empty, and st_length_get().

Derive STACIE token values. `#include "magma.h"`

Functions

- stringer_t ∗ stacie_derive_token (stringer_t ∗base, stringer_t ∗username, stringer_t ∗salt, stringer_t ∗nonce)

  Derive the token values using the supplied input values. The base value supplied depends on which token is being derived.

5.406.1 Detailed Description

Derive STACIE token values.

Definition in file tokens.c.

5.406.2 Function Documentation

5.406.2.1 stringer_t∗ stacie_derive_token (stringer_t ∗ *base*, stringer_t ∗ *username*, stringer_t ∗ *salt*, stringer_t ∗ *nonce*)

Derive the token values using the supplied input values. The base value supplied depends on which token is being derived. tokens.c

Note:

The token values are used for authentication with an untrusted server, which needs to authenticate a user, but does not know anything about the plain text password. Untrusted servers store the static verification token, and using this function, can verify ephemeral login tokens. Servers can also authenticate a password change request by checking whether the supplied password key, if passed to this the token derivation function, matches the stored verification token. The base value passed in is dependent upon which token is being derived. The result is obtained by applying the designated hash function over the input values a fixed number of times.

Parameters:

base The initial entropy being applied to the token derivation process. For the static verification token, this will be the password key value. For an ephemeral login token, this will be the verification token. Because the base value is a created using the designated hash function, its length must match output size. For Magma, which is using SHA-512, that means the base value must always be 64 bytes.

username The pre-processed username, encoded in UTF8. The rules for normalization and equivalence are different for every domain/deployment. Depending on those rules, the username passed in may be just the local part, or it may consist of the full email address, which would includes the separator (usually the '@' symbol) and a domain name (preferably a fully qualified domain).

salt The user specific salt, which provides protection against precomputed lookup tables. For Magma, the salt value must always be 128 bytes in length;

See also:

stacie_derive_seed() for more on the salt length.

Parameters:

nonce When deriving an ephemeral login token, an additional single use, randomly generated value is supplied as the nonce parameter. For Magma, this value must always be 128 bytes in length.

Returns:

provides a managed string with the derived token stored in a secure memory buffer, or NULL if an error occurs. The length of the output depends on the hash function being used. Magma currently uses SHA-512, which will result in the output being exactly 64 bytes, with a level of reliability that rivals death and taxes.

5.407.3.4 uint64_t tank_count (void)

Count the number of objects in all local storage tanks.

Returns:

the total number of all objects contained in all tanks.

Definition at line 46 of file tank.c.

References count, log_pedantic, store, tanks_num, and tchdbrnum_d.

5.407.3.5 uint64_t tank_cycle (void)

Get the next storage tank.

Note:

This function cycles through all the storage tanks in order, to ensure homogeneous data distribution.

Returns:

the next storage tank in line.

Definition at line 28 of file tank.c.

References mutex_lock(), mutex_unlock(), tanks_lock, tanks_next, and tanks_num.

5.407.3.6 bool_t tank_delete (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Object handling. Delete a binary object on the file system.

Parameters:

hnum The host number.

tnum The tank number.

unum The user number.

onum The object number.

Returns:

Returns true if the object was deleted without an error.

Definition at line 89 of file tank.c.

References log_critical, log_error, store, tank_delete_object(), tchdbecode_d, tchdberrmsg_d, tchdbout_d, tran_commit(), tran_rollback(), and tran_start().

5.407.3.7 bool_t tank_delete_object (int64_t *transaction*, uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Delete a tank object from the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.

hnum the host number.

tnum the storage tank number.

unum the usernum of the user that owns the object.

onum the stored object id.

Returns:

false on failure, or true on success.

Definition at line 67 of file data.c.

References log_pedantic, mm_wipe(), and stmt_exec_affected_conn().

Referenced by tank_delete().

5.407.3.8 uint64_t tank_insert_object (int64_t *transaction*, uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *size*, uint64_t *flags*)

Insert a tank object into the mysql database.

Parameters:

transaction a mysql connection identifier for which a transaction has been started.

hnum the host number.

tnum the storage tank number.

unum the usernum of the user that owns the object.

size the length, in bytes, of the object to be stored.

flags 0 on failure, or the objectnum field for the newly inserted object.

Definition at line 19 of file data.c.

References mm_wipe(), and stmt_insert_conn().

Referenced by tank_store().

5.407.3.9 stringer_t* tank_load (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Load and decompress the data for the object described by the input parameters.

Parameters:

hnum The host number.

tnum The tank number.

unum The user number.

onum The object number.

Returns:

Returns the object data inside a stringer_t or NULL to indicate an error occurred.

Definition at line 150 of file tank.c.

References decompress_bzip(), decompress_lzo(), decompress_zlib(), log_check, log_error, log_pedantic, mm_copy(), record_t, st_import(), store, TANK_COMPRESS_BZIP, TANK_COMPRESS_LZO, TANK_COMPRESS_ZLIB, TANK_RECORD_VERSION, tcfree_d, tchdbecode_d, tchdberrmsg_d, and tchdbget_d.

5.407.3.10 void tank_maintain (void)

Maintenance. Maintenance.

Returns:

This function returns no value.

Definition at line 417 of file tank.c.

References store, tanks_num, and tchdbdefrag_d.

5.407.3.11 uint64_t tank_size (void)

Info functions. Info functions.

Returns:

the total number of bytes occupied by all objects in all storage tanks.

Definition at line 68 of file tank.c.

References store, tanks_num, and tchdbfsiz_d.

5.407.3.12 bool_t tank_start (void)

Initialize the local tank storage system.

Returns:

Returns true if all of the storage tanks were setup successfully and the system is ready to store data.

Definition at line 497 of file tank.c.

References log_critical, magma, MAGMA_FILEPATH_MAX, mm_alloc(), ns_length_get(), magma_t::storage, store, magma_t::tank, tank_open(), and tanks_num.

Referenced by process_start().

5.407.3.13 void tank_stop (void)

Startup and shutdown. Close all of the storage system file handles and release the resources they were using.

Definition at line 532 of file tank.c.

References mm_free(), store, tank_close(), and tanks_num.

Referenced by process_stop().

5.407.3.14 uint64_t tank_store (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, stringer_t * *data*, uint64_t *flags*)

Store a binary object on the file system.

Note:

Flags include (TANK_COMPRESS_LZO | TANK_COMPRESS_ZLIB | TANK_COMPRESS_BZIP),

Parameters:

hnum the host number.

tnum the tank number.

unum the userid number.

data a managed string (placer) with the data to be stored.

flags a bitmask of flags specifying encryption, compression, and replication.

Returns:

0 on failure, If the object is stored the object number is returned, or 0 if an error occurs.

Definition at line 256 of file tank.c.

References compress_body_length(), compress_bzip(), compress_free(), compress_lzo(), compress_total_length(), compress_zlib(), entry_t, log_error, mm_alloc(), mm_copy(), mm_free(), mm_wipe(), record_t, st_data_get(), st_length_get(), store, TANK_COMPRESS_BZIP, TANK_COMPRESS_LZO, TANK_COMPRESS_ZLIB, TANK_ENTRY_VERSION, tank_insert_object(), TANK_RECORD_VERSION, tanks_num, tchdbecode_d, tchdberrmsg_d, tchdbout_d, tchdbputasync_d, tran_commit(), tran_rollback(), and tran_start().

5.407.3.15 inx_t* tree_alloc (uint64_t *options*, void * *data_free*)

Create a new on-memory tree database.

See also:

tcndbnew2()

Parameters:

options

data_free

Returns:

Definition at line 285 of file tree.c.

References inx_t::append, inx_t::cursor_alloc, inx_t::cursor_free, inx_t::cursor_key_active, inx_t::cursor_key_next, inx_t::cursor_reset, inx_t::cursor_value_active, inx_t::cursor_value_next, inx_t::data_free, inx_t::delete, inx_t::find, inx_t::index, inx_t::index_free, inx_t::index_truncate, inx_t::insert, inx_t::last, log_pedantic, mm_alloc(), mm_free(), inx_t::options, tcndbnew2_d, tree_cmp(), tree_cursor_alloc(), tree_cursor_free(), tree_cursor_key_active(), tree_cursor_key_next(), tree_cursor_reset(), tree_cursor_value_active(), tree_cursor_value_next(), tree_delete(), tree_find(), tree_free(), tree_insert(), and tree_truncate().

Referenced by inx_alloc().

5.407.3.16 uint64_t tree_count (void * *inx*)

Binary trees. Binary trees.

See also:

tcndbrnum()

Parameters:

inx

Returns:

the record count.

Definition at line 38 of file tree.c.

References inx_t::index, and tcndbrnum_d.

  TCHDB ∗ system
  TCHDB ∗∗ tanks
  } store

5.408.1 Function Documentation

5.408.1.1 void tank_close (TCHDB ∗ *ctx*)

Cleanly closes a storage file context and releases the memory.

Parameters:

ctx The storage context that needs to be closed.

Definition at line 469 of file tank.c.

References log_error, tchdbclose_d, tchdbdefrag_d, tchdbdel_d, tchdbecode_d, tchdberrmsg_d, tchdboptimize_d, tchdbpath_d, and tchdbsync_d.

Referenced by tank_stop().

5.408.1.2 uint64_t tank_count (void)

Count the number of objects in all local storage tanks.

Returns:

the total number of all objects contained in all tanks.

Definition at line 46 of file tank.c.

References count, log_pedantic, store, tanks_num, and tchdbrnum_d.

5.408.1.3 uint64_t tank_cycle (void)

Get the next storage tank.

Note:

This function cycles through all the storage tanks in order, to ensure homogeneous data distribution.

Returns:

the next storage tank in line.

Definition at line 28 of file tank.c.

References mutex_lock(), mutex_unlock(), tanks_lock, tanks_next, and tanks_num.

5.408.1.4 bool_t tank_delete (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Object handling. Delete a binary object on the file system.

Parameters:

hnum The host number.

tnum The tank number.

unum The user number.

onum The object number.

Returns:

Returns true if the object was deleted without an error.

Definition at line 89 of file tank.c.

References log_critical, log_error, store, tank_delete_object(), tchdbecode_d, tchdberrmsg_d, tchdbout_d, tran_commit(), tran_rollback(), and tran_start().

5.408.1.5 stringer_t* tank_load (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, uint64_t *onum*)

Load and decompress the data for the object described by the input parameters.

Parameters:

hnum The host number.
tnum The tank number.
unum The user number.
onum The object number.

Returns:

Returns the object data inside a stringer_t or NULL to indicate an error occurred.

Definition at line 150 of file tank.c.

References decompress_bzip(), decompress_lzo(), decompress_zlib(), log_check, log_error, log_pedantic, mm_copy(), record_t, st_import(), store, TANK_COMPRESS_BZIP, TANK_COMPRESS_LZO, TANK_COMPRESS_ZLIB, TANK_RECORD_VERSION, tcfree_d, tchdbecode_d, tchdberrmsg_d, and tchdbget_d.

5.408.1.6 void tank_maintain (void)

Perform periodic maintenance on the storage tanks (defragment them in the background). Maintenance.

Returns:

This function returns no value.

Definition at line 417 of file tank.c.

References store, tanks_num, and tchdbdefrag_d.

5.408.1.7 TCHDB* tank_open (char * *location*)

Open a storage context for the given location. Use the store.tuner parameters to configure the context.

Parameters:

location The path to the file where the data is (or will be) stored.

Returns:

Returns a pointer to the storage context on success and NULL on failure.

Definition at line 431 of file tank.c.

References log_critical, tchdbdel_d, tchdbecode_d, tchdberrmsg_d, tchdbnew_d, tchdbopen_d, tchdbsetmutex_d, and tchdbtune_d.

Referenced by tank_start().

5.408.1.8 uint64_t tank_size (void)

Count the amount of space used by all local storage tanks. Info functions.

Returns:

the total number of bytes occupied by all objects in all storage tanks.

Definition at line 68 of file tank.c.

References store, tanks_num, and tchdbfsiz_d.

5.408.1.9 bool_t tank_start (void)

Initialize the local tank storage system.

Returns:

Returns true if all of the storage tanks were setup successfully and the system is ready to store data.

Definition at line 497 of file tank.c.

References log_critical, magma, MAGMA_FILEPATH_MAX, mm_alloc(), ns_length_get(), magma_t::storage, store, magma_t::tank, tank_open(), and tanks_num.

Referenced by process_start().

5.408.1.10 void tank_stop (void)

Startup and shutdown. Close all of the storage system file handles and release the resources they were using.

Definition at line 532 of file tank.c.

References mm_free(), store, tank_close(), and tanks_num.

Referenced by process_stop().

5.408.1.11 uint64_t tank_store (uint64_t *hnum*, uint64_t *tnum*, uint64_t *unum*, stringer_t * *data*, uint64_t *flags*)

Store a binary object on the file system.

Note:

Flags include (TANK_COMPRESS_LZO | TANK_COMPRESS_ZLIB | TANK_COMPRESS_BZIP),

Parameters:

hnum the host number.

tnum the tank number.

unum the userid number.

data a managed string (placer) with the data to be stored.

flags a bitmask of flags specifying encryption, compression, and replication.

Returns:

0 on failure, If the object is stored the object number is returned, or 0 if an error occurs.

Definition at line 256 of file tank.c.

References compress_body_length(), compress_bzip(), compress_free(), compress_lzo(), compress_total_length(), compress_zlib(), entry_t, log_error, mm_alloc(), mm_copy(), mm_free(), mm_wipe(), record_t, st_data_get(), st_length_get(), store, TANK_COMPRESS_BZIP, TANK_COMPRESS_LZO, TANK_COMPRESS_ZLIB, TANK_ENTRY_VERSION, tank_insert_object(), TANK_RECORD_VERSION, tanks_num, tchdbecode_d, tchdberrmsg_d, tchdbout_d, tchdbputasync_d, tran_commit(), tran_rollback(), and tran_start().

5.410.1 Function Documentation

5.410.1.1 struct __attribute__ ((packed)) [read]

Definition at line 10 of file tree.c.

5.410.1.2 inx_t∗ tree_alloc (uint64_t *options*, void ∗ *data_free*)

Create a new on-memory tree database.

See also:

tcndbnew2()

Parameters:

options

data_free

Returns:

Definition at line 285 of file tree.c.

References inx_t::append, inx_t::cursor_alloc, inx_t::cursor_free, inx_t::cursor_key_active, inx_t::cursor_key_next, inx_t::cursor_reset, inx_t::cursor_value_active, inx_t::cursor_value_next, inx_t::data_free, inx_t::delete, inx_t::find, inx_t::index, inx_t::index_free, inx_t::index_truncate, inx_t::insert, inx_t::last, log_pedantic, mm_alloc(), mm_free(), inx_t::options, tcndbnew2_d, tree_cmp(), tree_cursor_alloc(), tree_cursor_free(), tree_cursor_key_active(), tree_cursor_key_next(), tree_cursor_reset(), tree_cursor_value_active(), tree_cursor_value_next(), tree_delete(), tree_find(), tree_free(), tree_insert(), and tree_truncate().

Referenced by inx_alloc().

5.410.1.3 int tree_cmp (const char * *aptr*, int *asiz*, const char * *bptr*, int *bsiz*, void * *op*)

The return value is positive if the former is big, negative if the latter is big, 0 if both are equivalent. If asked to search for a NULL key pointer the function will always return 0. This allows us to match every record.

Parameters:

aptr a pointer to the region of the first key.

asize the length, in bytes, of the region of the first key.

bptr a pointer to the region of the second key.

bsiz the length, in bytes, of the region of the first key.

op an optional pointer to an opaque object.

Returns:

0 if the two blocks are identical; otherwise, a signed integer indicating the difference.

Definition at line 28 of file tree.c.

References cmp_mt_mt().

Referenced by tree_alloc().

5.410.1.4 uint64_t tree_count (void * *inx*)

Get the number of records in an in-memory tree. Binary trees.

See also:

tcndbrnum()

Parameters:

inx

Returns:

the record count.

Definition at line 38 of file tree.c.

References inx_t::index, and tcndbrnum_d.

5.410.1.5 void* tree_cursor_alloc (inx_t * *inx*)

Definition at line 182 of file tree.c.

Definition at line 43 of file tree.c.

References tcfree_d, and tcndbget3_d.

Referenced by tree_alloc().

5.410.1.15 void tree_free (void * *inx*)

Frees all of the resources used by a tree based index.

Parameters:

inx A pointer to the index that should be freed.

Definition at line 258 of file tree.c.

References inx_t::index, tcndbdel_d, and tree_truncate().

Referenced by tree_alloc().

5.410.1.16 bool_t tree_insert (void * *inx*, multi_t *key*, void * *data*)

Makes a copy of the key and then attempts to add the new entry to the tree index. Note that because this is a tree index, duplicates are not allowed, so if the key already exists, false is returned.

Parameters:

inx The index were adding the entry too.

key The retrieval key expressed as a multi_t.

data The data buffer being stored.

Returns:

Returns true if the entry was added, or false to indicate an existing duplicate key or an error.

Definition at line 87 of file tree.c.

5.411.1 Function Documentation

5.411.1.1 bool_t lib_load (void)

Load magmad.so dynamically and resolve all external dependencies from 3rd party providers.

Returns:

false on failure or true on success.

Definition at line 658 of file symbols.c.

```
#include "magma.h"
```

Functions

- int_t http_parse_origin (stringer_t *s, placer_t *output)
  Get the origin of a resource from a url.
- void http_parse_pairs (connection_t *con)
  Parse all the GET and POST parameters present in an http client request, and store them with the connection.
- void http_parse_context (connection_t *con, stringer_t *application, stringer_t *path)
  Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL.
- void http_parse_header (connection_t *con)
  Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's http.headers member.
- void http_parse_method (connection_t *con)
  Parse an http request and determine the request method and location.
- placer_t get_header_value_noopt (stringer_t *vstring)
  Get the simple value of an http header, with any optional parameters stripped away.
- placer_t get_header_opt (stringer_t *vstring, stringer_t *optname)
  Get the value of a named optional parameter from an http header value.
- bool_t multipart_get_boundary (connection_t *con, placer_t *output)
  Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.

5.415.1 Function Documentation

5.415.1.1 placer_t get_header_opt (stringer_t * *vstring*, stringer_t * *optname*)

Get the value of a named optional parameter from an http header value.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

optname a managed string with the name of the optional parameter to be found.

Returns:

a placer pointing to the named optional parameter of the specified http header value.

Definition at line 336 of file parse.c.

References pl_null(), pl_trim_start(), placer_t, st_cmp_cs_eq(), tok_get_count_st(), and tok_get_st().

Referenced by multipart_get_boundary(), and portal_upload().

5.415.1.2 placer_t get_header_value_noopt (stringer_t * *vstring*)

Get the simple value of an http header, with any optional parameters stripped away.

Note:

Only the value after the ":" in a header field is passed to this function (in other words, the header name is omitted).

Parameters:

vstring a managed string containing the single http header line value to be parsed.

Returns:

a placer pointing to the option-free header value of the specified input line.

Definition at line 313 of file parse.c.

References pl_init(), placer_t, st_char_get(), st_length_get(), tok_get_count_st(), and tok_get_st().

Referenced by http_parse_header(), and multipart_get_boundary().

5.415.1.3 void http_parse_context (connection_t * *con*, stringer_t * *application*, stringer_t * *path*)

Attempt to retrieve a connected user's associated session, by searching the cookie, the POST "session" variable, and the URL.

Parameters:

con a pointer to the connection object to be queried for a session id.

application a managed string containing the application associated with the connection's pending request.

path a managed string containing the path associated with the connection's pending request.

Returns:

This function returns no value.

TODO: Develop better logic for handling cookies. Namely add the ability to focibly trigger the Set-Cookie entity and if necessary delete the existing cookie.

Definition at line 115 of file parse.c.

References connection_t::http, HTTP_METHOD_POST, json_decref_d, json_loads_d, json_object_get_d, json_string_value_d, log_pedantic, NULLER, pl_init(), placer_t, sess_get(), st_char_get(), st_cmp_ci_starts(), st_length_get(), tok_get_pl(), and tok_get_st().

Referenced by json_api_dispatch(), portal_endpoint(), portal_process(), and portal_upload().

5.415.1.4 void http_parse_header (connection_t * *con*)

Parse and process the current line of input from an http client connection as an http request header, storing data in the connection's http.headers member.

Note:

If no more http headers can be read, control is returned by setting the connection http.mode to HTTP_RESPOND. Special actions are taken to store the "Host", "User-Agent", "Cookie", and "Connection" headers.

Parameters:

con the connection object of the http client to be read, and to store the results of the operation.

Returns:

This function returns no value.

LOW: Should we bother to throw an error if con->http.connection isn't HTTP_CONNECTION_NEUTRAL?

Definition at line 177 of file parse.c.

References con_print(), CONTIGUOUS, data, get_header_value_noopt(), HEAP, magma_t::http, connection_t::http, HTTP_-CONNECTION_CLOSE, HTTP_CONNECTION_KEEPALIVE, http_data_free(), http_data_header_parse(), HTTP_ERROR_500, HTTP_-RESPOND, int32_conv_bl(), inx_alloc(), inx_insert(), magma_t::log, log_info, lower_st(), M_INX_LINKED, M_TYPE_STRINGER, magma, MANAGED_T, http_data_t::name, PLACER, placer_t, multi_t::st, st_char_get(), st_cmp_ci_eq(), st_dupe_opts(), st_length_get(), st_length_int(), st_length_set(), st_search_cs(), multi_t::val, and http_data_t::value.

Referenced by http_process().

5.415.1.5 void http_parse_method (connection_t * *con*)

Parse an http request and determine the request method and location.

Note:

This function returns no value but sets the internal method, location, and state of the underlying connection object.

Parameters:

con the client connection making an http request.

Returns:

This function returns no value.

Definition at line 269 of file parse.c.

References CONTIGUOUS, HEAP, magma_t::http, connection_t::http, HTTP_METHOD_CONNECT, HTTP_METHOD_DELETE, HTTP_METHOD_GET, HTTP_METHOD_HEAD, HTTP_METHOD_OPTIONS, HTTP_METHOD_POST, HTTP_METHOD_PUT, HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, HTTP_PARSE_HEADER, connection_t::line, magma_t::log, log_info, magma, MANAGED_T, connection_t::network, PLACER, placer_t, st_char_get(), st_cmp_ci_starts(), st_dupe_opts(), st_length_int(), tok_-get_count_st(), and tok_get_pl().

Referenced by http_process().

5.415.1.6 int_t http_parse_origin (stringer_t * *s*, placer_t * *output*)

Get the origin of a resource from a url.

Note:

Usually we'll be give the value of the Origin header field to work with so we'll end up returning the entire string, but if we had to fall back and use the Referrer instead this should strip off the path portion.

Parameters:

s a managed string containing the url to be parsed.

output a pointer to a placer that will be set to point to the origin string inside the user-supplied url.

Returns:

0 on success or -1 on failure.

Definition at line 18 of file parse.c.

References pl_init(), PLACER, st_cmp_ci_starts(), st_data_get(), st_empty_out(), and st_uchar_get().

Referenced by http_response_allow_cross().

5.415.1.7 void http_parse_pairs (connection_t * *con*)

Parse all the GET and POST parameters present in an http client request, and store them with the connection.

Note:

All valid field parameters will be stored in the connection's http.pairs object.

Parameters:

con a pointer to the connection object generating the http requesting being processed.

Returns:

This function returns no value.

Definition at line 73 of file parse.c.

References count, data, connection_t::http, http_data_free(), HTTP_DATA_GET, HTTP_DATA_POST, http_data_value_parse(), HTTP_-ERROR_500, inx_alloc(), M_INX_LINKED, pl_init(), PLACER, placer_t, st_char_get(), st_length_get(), st_search_cs(), tok_get_count_st(), and tok_get_st().

Referenced by http_requeue(), and http_response().

5.415.1.8 bool_t multipart_get_boundary (connection_t * *con*, placer_t * *output*)

Get the boundary delimiter for a request by a connection specifying a Content-Type of multipart/form-data.

Parameters:

con a pointer to the connection object of the client making the http request.

output a pointer to the address of a managed string that will receive a copy of the value of the boundary string on success.

Returns:

true on success or false on failure.

Definition at line 373 of file parse.c.

References get_header_opt(), get_header_value_noopt(), http_data_get(), HTTP_DATA_HEADER, NULLER, pl_empty(), placer_t, and http_data_t::value.

Referenced by portal_upload().

Functions

- int_t imap_get_type_ar (imap_arguments_t *array, size_t element)

  TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers.

- void * imap_get_ptr (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as a generic pointer.

- stringer_t * imap_get_st_ar (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as a managed string.

- imap_arguments_t * imap_get_ar_ar (imap_arguments_t *array, size_t element)

  Return the value of a specified object in an array as an imap arguments array.

- int_t imap_parse_astring (stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of an atomic string and advance the position of the parser stream.

- int_t imap_parse_nstring (stringer_t **output, chr_t **start, size_t *length, chr_t type)
- int_t imap_parse_qstring (stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of a quoted string and advance the position of the parser stream.

- int_t imap_parse_literal (connection_t *con, stringer_t **output, chr_t **start, size_t *length)

  Extract the contents of a literal string and advance the position of the parser stream.

- int_t imap_parse_array (int_t recursion, connection_t *con, imap_arguments_t **array, chr_t **start, size_t *length)

  Extract the contents of an array argument and advance the position of the parser stream.

- int_t imap_parse_arguments (connection_t *con, chr_t **start, size_t *length)

  Parse a chunk of input into an array of IMAP arguments.

- void imap_command_log_safe (stringer_t *line)

  LOW: Have the merge related kinks in the argument parsing system been resolved? If so, can this function be returned to the graveyard?

- int_t imap_command_parser (connection_t *con)

  Parse an input line containing an IMAP command.

5.416.1 Function Documentation

5.416.1.1 void imap_command_log_safe (stringer_t * *line*)

LOW: Have the merge related kinks in the argument parsing system been resolved? If so, can this function be returned to the graveyard?

Definition at line 786 of file parse.c.

References chr_whitespace(), log_info, mm_dupe(), mm_free(), PLACER, st_char_get(), st_empty_out(), st_length_int(), and st_search_ci().

Referenced by imap_command_parser().

5.416.1.2 int_t imap_command_parser (connection_t * *con*)

Parse an input line containing an IMAP command. parse.c

Note:

This function updates the protocol-specific IMAP structure with parsed values for the session's tag, command, and arguments fields. Special handling is performed for any command that is preceded by a "UID" prefix.

Parameters:

con the IMAP client connection issuing the command.

Returns:

1 on success or < 0 on error. -1: the tag could not be read. -2: the IMAP command could not be read. -3: the arguments to the IMAP command could not be read.

Definition at line 886 of file parse.c.

References ar_free(), magma_t::imap, connection_t::imap, imap_command_log_safe(), imap_parse_arguments(), imap_parse_astring(), length, connection_t::line, magma_t::log, log_pedantic, magma, connection_t::network, PLACER, st_cleanup, st_cmp_ci_eq(), st_data_get(), st_free(), and st_length_get().

Referenced by imap_process().

5.416.1.3 imap_arguments_t* imap_get_ar_ar (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as an imap arguments array.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as an imap arguments array on success.

Definition at line 100 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_ARRAY, imap_get_type_ar(), and log_pedantic.

Referenced by imap_fetch_body(), imap_id(), imap_parse_dataitems(), imap_search_messages_inner(), and imap_status().

5.416.1.4 void* imap_get_ptr (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as a generic pointer.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value on success.

Definition at line 46 of file parse.c.

References ar_length_get(), and log_pedantic.

Referenced by imap_append(), imap_fetch_body(), and imap_store().

5.416.1.5 stringer_t* imap_get_st_ar (imap_arguments_t * *array*, size_t *element*)

Return the value of a specified object in an array as a managed string.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

NULL on failure, or a pointer to the specified object's value as a managed string on success.

Definition at line 71 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_ARRAY, imap_get_type_ar(), and log_pedantic.

Referenced by imap_append(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_fetch(), imap_fetch_body(), imap_fetch_-body_header(), imap_fetch_body_tag(), imap_flag_parse(), imap_id(), imap_list(), imap_login(), imap_lsub(), imap_parse_dataitems(), imap_rename(), imap_search_messages_inner(), imap_select(), imap_status(), imap_store(), and imap_subscribe().

5.416.1.6 int_t imap_get_type_ar (imap_arguments_t * *array*, size_t *element*)

TODO: The logic here is just plain ugly. Specifically the logic used to read from the network and advance the buffers. Get the type code for a specified object in an array.

Note:

Valid return values include IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_ASTRING, IMAP_ARGUMENT_-TYPE_QSTRING, IMAP_ARGUMENT_TYPE_NSTRING, and IMAP_ARGUMENT_TYPE_LITERAL.

Parameters:

array a pointer to an imap arguments array.

element the zero-based index of the object in the imap arguments array to be examined.

Returns:

IMAP_ARGUMENT_TYPE_EMPTY on failure, or the element type code of the specified object on success.

Definition at line 20 of file parse.c.

References ar_length_get(), IMAP_ARGUMENT_TYPE_EMPTY, and log_pedantic.

Referenced by imap_append(), imap_copy(), imap_create(), imap_delete(), imap_examine(), imap_fetch(), imap_fetch_body(), imap_fetch_-body_header(), imap_flag_parse(), imap_get_ar_ar(), imap_get_st_ar(), imap_id(), imap_list(), imap_login(), imap_lsub(), imap_parse_-dataitems(), imap_rename(), imap_search_messages_inner(), imap_select(), imap_status(), imap_store(), and imap_subscribe().

5.416.1.7 int_t imap_parse_arguments (connection_t * *con*, chr_t ** *start*, size_t * *length*)

Parse a chunk of input into an array of IMAP arguments.

See also:

imap_parse_qstring(), imap_parse_literal(), imap_parse_array(), imap_parse_astring()

Note:

This function scans a string for an array of arguments, performing the following logic when a particular character is encountered: : Parse argument as quoted string with imap_parse_qstring(). { : Parse argument as literal string with imap_parse_literal(). (or [: Parse argument as array with imap_parse_astring(). other : Defaults to parsing argument as atomic string with imap_parse_atomic(). The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

start the address of a pointer to the start of the buffer to be parsed, that will be continually updated to point to the next argument in the sequence during the parsing loop.

length a pointer to a size_t variable that contains the length of the string to be parsed, that will be continually updated with the input stream position during the parsing loop.

Returns:

-1 on parsing error or 1 on success.

Definition at line 709 of file parse.c.

References ar_append(), ar_free(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_ASTRING, IMAP_ARGUMENT_TYPE_LITERAL, IMAP_ARGUMENT_TYPE_QSTRING, imap_parse_array(), imap_parse_astring(), imap_parse_literal(), and imap_parse_qstring().

Referenced by imap_command_parser().

5.416.1.8 int_t imap_parse_array (int_t *recursion*, connection_t * *con*, imap_arguments_t ** *array*, chr_t ** *start*, size_t * *length*)

Extract the contents of an array argument and advance the position of the parser stream.

Note:

This function expects as input a string beginning either with '(' or '['.

Parameters:

length a pointer to a size_t variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

recursion d

con the client IMAP connection passing the array as input to the server.

array -

start -

length -

Returns:

Definition at line 595 of file parse.c.

References ar_append(), ar_free(), IMAP_ARGUMENT_TYPE_ARRAY, IMAP_ARGUMENT_TYPE_LITERAL, IMAP_ARGUMENT_TYPE_NSTRING, IMAP_ARGUMENT_TYPE_QSTRING, IMAP_ARRAY_RECURSION_LIMIT, imap_parse_array(), imap_parse_literal(), imap_parse_nstring(), imap_parse_qstring(), log_pedantic, and type().

Referenced by imap_parse_arguments(), and imap_parse_array().

5.416.1.9 int_t imap_parse_astring (stringer_t ** *output*, chr_t ** *start*, size_t * *length*)

Extract the contents of an atomic string and advance the position of the parser stream.

Note:

This function scans a string, expecting printable ASCII characters until it encounters a space, ,
, (, or [. If any other character is encountered before that point, an error will be returned. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

output the address of a managed string that will receive a copy of the atomic string's contents on success, or NULL on failure.

start the address of a pointer to the start of the buffer to be parsed, that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed atomic string.

Returns:

-1 on general error or if an invalid character was encountered, or 1 if the supplied atomic string was valid.

Definition at line 154 of file parse.c.

References log_pedantic, and st_import().

Referenced by imap_command_parser(), and imap_parse_arguments().

5.416.1.10 int_t imap_parse_literal (connection_t ∗ *con*, stringer_t ∗∗ *output*, chr_t ∗∗ *start*, size_t ∗ *length*)

Extract the contents of a literal string and advance the position of the parser stream.

Note:

This function expects as input a string beginning with '{' and followed by a numerical string, an optional '+', and a closing '}'. After reading in the numerical size parameter, it then attempts to read in that many bytes of input from the network stream.

Parameters:

con the client IMAP connection passing the literal string as input to the server.

output the address of a managed string that will receive a copy of the literal string's contents on success, or NULL on failure or if it is zero length.

start the address of a pointer to the start of the buffer to be parsed (beginning with '{'), that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and that will be updated to reflect the length of the remainder of the input string that follows the parsed literal string.

Returns:

-1 on general or parse error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 381 of file parse.c.

References connection_t::buffer, con_read(), con_read_line(), con_write_bl(), connection_t::line, line_pl_st(), log_pedantic, mm_copy(), mm_move(), connection_t::network, number, pl_empty(), pl_length_get(), pl_null(), st_alloc(), st_char_get(), st_free(), st_length_set(), and uint64_conv_bl().

Referenced by imap_parse_arguments(), and imap_parse_array().

5.416.1.11 int_t imap_parse_nstring (stringer_t ∗∗ *output*, chr_t ∗∗ *start*, size_t ∗ *length*, chr_t *type*)

Definition at line 197 of file parse.c.

References log_error, and st_import().

Referenced by imap_parse_array().

5.416.1.12 int_t imap_parse_qstring (stringer_t ** *output*, chr_t ** *start*, size_t * *length*)

Extract the contents of a quoted string and advance the position of the parser stream.

Note:

This function scans a string beginning with '"' for a terminating '"', returning an error if or
is encountered first. It is also able to handle escaped characters. The supplied start and length pointers will be updated to reflect the input stream if the quoted string is parsed successfully.

Parameters:

output the address of a managed string that will receive a copy of the quoted string's contents on success, or NULL on failure or if it is zero length.

start the address of a pointer to the start of the buffer to be parsed (beginning with \), that will also be updated to point to the next argument in the sequence on success.

length a pointer to a size_t variable that contains the length of the string to be parsed, and which will be updated to reflect the length of the remainder of the input string that follows the parsed quoted string.

Returns:

-1 on general error or if an enclosing pair of double quotes was not found, or 1 if the supplied quoted string was valid.

Definition at line 251 of file parse.c.

References log_pedantic, st_alloc(), st_char_get(), and st_length_set().

Referenced by imap_parse_arguments(), and imap_parse_array().

```
#include "magma.h"
```

Functions

- bool_t pop_num_parse (connection_t *con, uint64_t *outnum, bool_t required)
  Parse the argument to a POP3 command as an unsigned number.
- bool_t pop_top_parse (connection_t *con, uint64_t *number, uint64_t *lines)
  Parse the arguments to a POP3 TOP command.
- stringer_t * pop_pass_parse (connection_t *con)
  Parse a POP3 PASS command.
- stringer_t * pop_user_parse (connection_t *con)
  Parse a POP3 USER command.

5.417.1 Function Documentation

5.417.1.1 bool_t pop_num_parse (connection_t * *con*, uint64_t * *outnum*, bool_t *required*)

Parse the argument to a POP3 command as an unsigned number. parse.c

Parameters:

con the connection across which the pop command was issued.

outnum a pointer to an unsigned 64-bit integer to receive the numerical argument of the pop command on success.

required specifies whether or not a parameter is required.

Returns:

true if the pop command contained a valid unsigned number or false on failure.

Definition at line 17 of file parse.c.

References length, connection_t::line, log_pedantic, connection_t::network, st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by pop_dele(), pop_list(), pop_retr(), and pop_uidl().

5.417.1.2 stringer_t* pop_pass_parse (connection_t * *con*)

Parse a POP3 PASS command.

Note:

This function will stop reading in password characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the PASS command.

Returns:

a managed string containing the user supplied password, or NULL on failure.

Definition at line 191 of file parse.c.

References CONTIGUOUS, length, connection_t::line, log_error, log_pedantic, MANAGED_T, connection_t::network, SECURE, st_alloc_-opts(), st_copy_in(), st_data_get(), and st_length_get().

Referenced by pop_pass().

5.417.1.3 bool_t pop_top_parse (connection_t ∗ *con*, uint64_t ∗ *number*, uint64_t ∗ *lines*)

Parse the arguments to a POP3 TOP command.

Parameters:

con the POP3 client connection that issued the TOP command.

number a pointer to an unsigned 64 bit integer to receive the value of the TOP command's message sequence number.

lines a pointer to an unsigned 64 bit integer to receive the value of the TOP command's line number count.

Returns:

true on success or false if an error was encountered.

Definition at line 89 of file parse.c.

References length, connection_t::line, log_pedantic, connection_t::network, st_data_get(), st_length_get(), and uint64_conv_bl().

Referenced by pop_top().

5.417.1.4 stringer_t∗ pop_user_parse (connection_t ∗ *con*)

Parse a POP3 USER command.

Note:

The username can be at most 255 characters and will be returned in lowercase. This function will stop reading in username characters when an invalid character is encountered.

Parameters:

con the POP3 client connection that issued the USER command.

Returns:

a managed string containing the validated username, or NULL on failure.

Definition at line 257 of file parse.c.

References length, connection_t::line, log_pedantic, lower_chr(), connection_t::network, st_data_get(), st_import(), and st_length_get().

Referenced by pop_user().

```
#include "magma.h"
```

Functions

- stringer_t ∗ smtp_parse_rcpt_to (connection_t ∗con)
- stringer_t ∗ smtp_parse_auth (stringer_t ∗data)

  Parse the parameter specified to an SMTP AUTH PLAIN or SMTP AUTH LOGIN command.

- stringer_t ∗ smtp_parse_mail_from_path (connection_t ∗con)
- stringer_t ∗ smtp_parse_helo_domain (connection_t ∗con)

  Parse the domain specified as the parameter to an SMTP HELO or EHLO command.

5.418.1 Function Documentation

5.418.1.1 stringer_t∗ smtp_parse_auth (stringer_t ∗ *data*)

Parse the parameter specified to an SMTP AUTH PLAIN or SMTP AUTH LOGIN command. parse.c

Note:

This function will stop reading input when an invalid base64-encoding character is encountered.

Parameters:

con the SMTP client connection issuing the AUTH command.

Returns:

a managed string containing the domain specified by the AUTH command, or NULL on failure.

Definition at line 113 of file parse.c.

References length, log_pedantic, st_empty_out(), and st_import().

Referenced by smtp_auth_login(), and smtp_auth_plain().

5.418.1.2 stringer_t∗ smtp_parse_helo_domain (connection_t ∗ *con*)

Parse the domain specified as the parameter to an SMTP HELO or EHLO command.

Note:

Valid domain names may only contain letters, numbers, periods and hyphens. This function will return a lowercase domain name, and stop reading input when an invalid character is encountered.

Parameters:

con the SMTP client connection issuing the command.

Returns:

a managed string containing the domain specified by the HELO command, or NULL on failure.

Definition at line 310 of file parse.c.

References connection_t::command, magma_t::helo_length_limit, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim_end(), magma_t::smtp, st_import(), and command_t::string.

Referenced by smtp_ehlo(), and smtp_helo().

5.418.1.3 stringer_t∗ smtp_parse_mail_from_path (connection_t ∗ *con*)

Extract the provided path from the command line Reverse-path = Path Forward-path = Path Path = "<" [A-d-l ":"] Mailbox ">" A-d-l = At-domain ∗("," A-d-l) At-domain = @ domain

Parameters:

con A connection structure which presumably contains a the MAIL FROM value inside the line buffer.

Returns:

Returns a stringer with the path that was extracted or NULL to indicate a problem.

Definition at line 168 of file parse.c.

References magma_t::address_length_limit, connection_t::command, CONSTANT, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim(), pl_trim_end(), PLACER, placer_t, connection_t::smtp, magma_t::smtp, st_cmp_ci_starts(), st_cmp_cs_eq(), st_import(), command_t::string, smtp_session_t::suggested_eight_-bit, smtp_session_t::suggested_length, tok_get_bl(), tok_get_count_bl(), tok_get_pl(), and uint64_conv_pl().

Referenced by smtp_mail_from().

5.418.1.4 stringer_t∗ smtp_parse_rcpt_to (connection_t ∗ *con*)

LOW: The list of characters allowed in an email address needs to be verified against the RFC's. LOW: The parser should use different lists of valid characters for the the local and domain portions of an email address. Extract the provided path from the command line Reverse-path = Path Forward-path = Path Path = "<" [A-d-l ":"] Mailbox ">" A-d-l = At-domain ∗("," A-d-l) At-domain = @ domain

Parameters:

con A connection structure which presumably contains a the RCPT TO value inside the line buffer.

Returns:

Returns a stringer with the path that was extracted or NULL to indicate a problem.

Definition at line 24 of file parse.c.

References magma_t::address_length_limit, connection_t::command, length, connection_t::line, log_pedantic, lower_chr(), magma, connection_t::network, pl_char_get(), pl_empty(), pl_length_get(), pl_length_int(), pl_trim_end(), magma_t::smtp, st_import(), and command_t::string.

```
#include "magma.h"
```

Functions

- inx_t * portal_parse_json_str_array (json_t *json, size_t *nout)

  Parse a json string array into a linked list of managed strings.

- int_t portal_parse_context (stringer_t *context)

  Parse the context of a requested folder.

- int_t portal_parse_action (stringer_t *action)
- int_t portal_parse_sections (json_t *array, uint32_t *sections)

  Parse the json-rpc messages.load parameter "section" from an array of strings into a bitmask of section flags.

5.419.1 Function Documentation

5.419.1.1 int_t portal_parse_action (stringer_t * *action*)

Note:

This function is currently not called anywhere in the code and may be subject to removal.

Definition at line 121 of file parse.c.

References PLACER, PORTAL_ENDPOINT_ACTION_ADD, PORTAL_ENDPOINT_ACTION_INVALID, PORTAL_ENDPOINT_-ACTION_LIST, PORTAL_ENDPOINT_ACTION_REMOVE, PORTAL_ENDPOINT_ACTION_REPLACE, and st_cmp_ci_eq().

5.419.1.2 int_t portal_parse_context (stringer_t * *context*)

Parse the context of a requested folder.

Note:

If no context is specified, the "mail" context is assumed (PORTAL_ENDPOINT_CONTEXT_MAIL).

Parameters:

context a managed string containing the context (supported values are "mail", "contacts", "settings", and "help").

Returns:

PORTAL_ENDPOINT_CONTEXT_INVALID on failure, or the flag of the determined context on success.

Definition at line 90 of file parse.c.

References PLACER, PORTAL_ENDPOINT_CONTEXT_CONTACTS, PORTAL_ENDPOINT_CONTEXT_HELP, PORTAL_-ENDPOINT_CONTEXT_INVALID, PORTAL_ENDPOINT_CONTEXT_MAIL, PORTAL_ENDPOINT_CONTEXT_SETTINGS, and st_cmp_ci_eq().

Referenced by portal_endpoint_folders_add(), portal_endpoint_folders_remove(), portal_endpoint_folders_rename(), and portal_endpoint_-folders_tags().

5.419.1.3 inx_t* portal_parse_json_str_array (json_t * *json*, size_t * *nout*)

Parse a json string array into a linked list of managed strings. parse.c

Parameters:

json a json object containing an array of strings.

nout if not NULL, an optional pointer to a size_t to receive the item count of the json string array.

Returns:

NULL on failure, or a pointer to an inx holder containing the specified json array contents as a collection of managed strings.

Definition at line 16 of file parse.c.

References count, inx_alloc(), inx_free(), inx_insert(), json_array_get_d, json_array_size_d, json_string_value_d, log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, ns_length_get(), st_free(), st_import(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_messages_send().

5.419.1.4 int_t portal_parse_sections (json_t * *array*, uint32_t * *sections*)

Parse the json-rpc messages.load parameter "section" from an array of strings into a bitmask of section flags.

Parameters:

array a pointer to the json object representing the "section" string array of the json request message.

sections a pointer to an unsigned 32 bit integer that will receive the translated section flags on success.

Returns:

$<$ 0 on error (-3 for an internal server error, -2 if an unknown flag was received, or -1 on syntax error), 0 for an empty sections array, or 1 on success.

Definition at line 157 of file parse.c.

References count, json_array_get_d, json_array_size_d, json_string_value_d, NULLER, PLACER, PORTAL_ENDPOINT_MESSAGE_-ATTACHMENTS, PORTAL_ENDPOINT_MESSAGE_BODY, PORTAL_ENDPOINT_MESSAGE_HEADER, PORTAL_ENDPOINT_-MESSAGE_INFO, PORTAL_ENDPOINT_MESSAGE_META, PORTAL_ENDPOINT_MESSAGE_SECURITY, PORTAL_ENDPOINT_-MESSAGE_SERVER, PORTAL_ENDPOINT_MESSAGE_SOURCE, and st_cmp_ci_eq().

Referenced by portal_endpoint_messages_load().

```
#include "magma.h"
```

Functions

- void dmtp_session_reset (connection_t *con)
  Reset an DMTP session to its initialized state.
- void dmtp_session_destroy (connection_t *con)
  Destroy the data associated with an DMTP session.

5.420.1 Function Documentation

5.420.1.1 void dmtp_session_destroy (connection_t * *con*)

Destroy the data associated with an DMTP session.

Parameters:

con the DMTP client connection to be destroyed.

Returns:

This function returns no value.

Definition at line 25 of file session.c.

Referenced by con_destroy().

5.420.1.2 void dmtp_session_reset (connection_t * *con*)

Reset an DMTP session to its initialized state. session.c

Parameters:

con the DMTP client connection to be reset.

Returns:

This function returns no value.

Definition at line 15 of file session.c.

Referenced by dmtp_rset().

5.421 src/servers/smtp/session.c File Reference

```
#include "magma.h"
```

Functions

- void smtp_session_reset (connection_t *con)
  Reset an SMTP session to its initialized state.
- void smtp_session_destroy (connection_t *con)
  Destroy the data associated with an SMTP session.
- bool_t smtp_check_duplicate_recipient (connection_t *con, uint64_t usernum)
  Check whether the usernum on the inbound structure has already been used.
- bool_t smtp_add_recipient (connection_t *con, stringer_t *address)
  Add an entry to an SMTP session's recipients list for outbound/relayed mail.
- void smtp_add_inbound (connection_t *con, smtp_inbound_prefs_t *inbound)
  Add an entry to an SMTP session's inbound preferences list for local delivery.
- void smtp_add_outbound (connection_t *con, smtp_outbound_prefs_t *outbound)
  Attach a set of SMTP outbound mail preferences to an SMTP client connection.
- void smtp_free_recipients (smtp_recipients_t *recipients)
  Free a list of SMTP recipients and its underlying data.
- void smtp_free_outbound (smtp_outbound_prefs_t *outbound)
  Free a set of SMTP outbound mail preferences and its underlying data.
- void smtp_free_inbound (smtp_inbound_prefs_t *inbound)
  Free a list of SMTP inbound mail preferences and its underlying data.
- void smtp_list_free_filter (smtp_inbound_filter_t *filter)
  Free an SMTP inbound filter and its underlying data.

5.421.1 Function Documentation

5.421.1.1 void smtp_add_inbound (connection_t * *con*, smtp_inbound_prefs_t * *inbound*)

Add an entry to an SMTP session's inbound preferences list for local delivery. session.c

Parameters:

con the SMTP client connection specifying the added local recipient.
inbound a pointer to the SMTP inbound preferences object to be added to the SMTP session's inbound preferences list.

Returns:

true if the requested inbound preferences object was added successfully to the inbound preferences list, or false on failure.

Definition at line 150 of file session.c.

References smtp_session_t::in_prefs, smtp_inbound_prefs_t::next, smtp_session_t::num_recipients, and connection_t::smtp.

Referenced by smtp_rcpt_to().

5.421.1.2 void smtp_add_outbound (connection_t * *con*, smtp_outbound_prefs_t * *outbound*)

Attach a set of SMTP outbound mail preferences to an SMTP client connection.

Parameters:

con the SMTP client connection to which the outbound mail preferences should be attached.

outbound a pointer to the SMTP outbound mail preferences to be set for the specified connection.

Returns:

This function returns no value.

Definition at line 179 of file session.c.

References smtp_session_t::out_prefs, and connection_t::smtp.

Referenced by smtp_auth_login(), and smtp_auth_plain().

5.421.1.3 bool_t smtp_add_recipient (connection_t * *con*, stringer_t * *address*)

Add an entry to an SMTP session's recipients list for outbound/relayed mail.

Note:

If the recipients list does not exist, it will be created automatically.

Parameters:

con the SMTP client connection specifying the added recipient.

address a managed string containing the recipient's email address.

Returns:

true if the requested recipient was added successfully to the recipients list, or false on failure.

Definition at line 107 of file session.c.

References smtp_recipients_t::address, log_pedantic, mm_alloc(), mm_free(), smtp_recipients_t::next, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_outbound_prefs_t::recipients, connection_t::smtp, and st_dupe().

Referenced by smtp_rcpt_to().

5.421.1.4 bool_t smtp_check_duplicate_recipient (connection_t * *con*, uint64_t *usernum*)

Check whether the usernum on the inbound structure has already been used.

Definition at line 80 of file session.c.

References smtp_session_t::in_prefs, smtp_inbound_prefs_t::next, connection_t::smtp, and smtp_inbound_prefs_t::usernum.

Referenced by smtp_rcpt_to().

5.421.1.5 void smtp_free_inbound (smtp_inbound_prefs_t * *inbound*)

Free a list of SMTP inbound mail preferences and its underlying data.

Parameters:

inbound a pointer to the head of the SMTP inbound mail preferences list to be destroyed.

Returns:

This function returns no value.

Definition at line 228 of file session.c.

References smtp_inbound_prefs_t::address, smtp_inbound_prefs_t::domain, smtp_inbound_prefs_t::filters, smtp_inbound_prefs_t::forwarded, inx_cleanup(), mm_free(), smtp_inbound_prefs_t::next, prime_cleanup(), smtp_inbound_prefs_t::rcptto, smtp_inbound_prefs_t::signet, smtp_inbound_prefs_t::spamsig, and st_cleanup.

Referenced by smtp_fetch_inbound(), smtp_rcpt_to(), smtp_session_destroy(), and smtp_session_reset().

5.421.1.6 void smtp_free_outbound (smtp_outbound_prefs_t * *outbound*)

Free a set of SMTP outbound mail preferences and its underlying data.

Parameters:

outbound a pointer to the SMTP outbound mail preferences set to be destroyed.

Returns:

This function returns no value.

Definition at line 210 of file session.c.

References smtp_outbound_prefs_t::domain, mm_free(), smtp_outbound_prefs_t::recipients, smtp_free_recipients(), and st_cleanup.

Referenced by smtp_session_destroy().

5.421.1.7 void smtp_free_recipients (smtp_recipients_t * *recipients*)

Free a list of SMTP recipients and its underlying data.

Parameters:

recipients a pointer to the head of the recipients list to be destroyed.

Returns:

This function returns no value.

Definition at line 191 of file session.c.

References smtp_recipients_t::address, mm_free(), smtp_recipients_t::next, and st_cleanup.

Referenced by smtp_free_outbound(), and smtp_session_reset().

5.421.1.8 void smtp_list_free_filter (smtp_inbound_filter_t * *filter*)

Free an SMTP inbound filter and its underlying data.

Parameters:

filter a pointer to the SMTP inbound filter to be destroyed.

Returns:

This function returns no value.

Definition at line 249 of file session.c.

References smtp_inbound_filter_t::expression, smtp_inbound_filter_t::field, smtp_inbound_filter_t::label, mm_free(), and st_cleanup.

Referenced by smtp_fetch_inbound().

5.421.1.9 void smtp_session_destroy (connection_t * *con*)

Destroy the data associated with an SMTP session.

Parameters:

con the SMTP client connection to be destroyed.

Returns:

This function returns no value.

Definition at line 57 of file session.c.

References smtp_session_t::helo, smtp_session_t::in_prefs, mail_destroy_message(), smtp_session_t::mailfrom, smtp_session_t::message, smtp_session_t::out_prefs, connection_t::smtp, smtp_free_inbound(), smtp_free_outbound(), and st_cleanup.

Referenced by con_destroy().

5.421.1.10 void smtp_session_reset (connection_t * *con*)

Reset an SMTP session to its initialized state.

Parameters:

con the SMTP client connection to be reset.

Returns:

This function returns no value.

Definition at line 15 of file session.c.

References smtp_session_t::checked, smtp_session_t::dkim, smtp_session_t::in_prefs, mail_destroy_message(), smtp_session_t::mailfrom, smtp_session_t::max_length, smtp_session_t::message, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_session_t::rbl, smtp_outbound_prefs_t::recipients, connection_t::smtp, smtp_free_inbound(), smtp_free_recipients(), smtp_session_t::spf, st_cleanup, smtp_session_t::suggested_eight_bit, smtp_session_t::suggested_length, and smtp_session_t::virus.

Referenced by smtp_auth_login(), smtp_auth_plain(), smtp_data_inbound(), smtp_data_outbound(), smtp_mail_from(), smtp_rset(), and smtp_starttls().

5.422 src/servers/http/content.c File Reference

```
#include "magma.h"
```

Functions

- void http_free_content (http_content_t *page)

  LOW: We should use basename() and dirname() to cleanup path strings.

- void http_page_free (http_page_t *page)

  Free an http page object and all its underlying data.

- http_content_t * http_get_static (stringer_t *location)

  Get a cached copy of a static web page.

- http_content_t * http_get_template (chr_t *location)

  Return a template by location.

- http_page_t * http_page_get (chr_t *location)

  Get a template page and prepare its xml document root for use.

- bool_t http_load_file (int_t template, chr_t *filename)

  Load file content into the http server repository.

- bool_t http_content_load_directory (int_t template, chr_t *directory)

  Load the content from a directory into the http server repository, recursively.

- bool_t http_content_load_fonts (void)

  Load all fonts into the http server repository.

- bool_t http_content_start (void)

  Prime the the web app templates, static content, and fonts directories for future use.

- void http_content_stop (void)

  Purge the http contents repository of stored fonts, templates, and static web pages.

- bool_t http_content_refresh (void)

  Refresh the stored contents of the web app templates, static content, and fonts directories.

Variables

- struct {
  inx_t * fonts
  inx_t * pages
  inx_t * templates
  } content

5.422.1 Function Documentation

5.422.1.1 bool_t http_content_load_directory (int_t *template*, chr_t ∗ *directory*)

Load the content from a directory into the http server repository, recursively. content.c

See also:

http_load_file()

Parameters:

template a value specifying whether the specified directory contains templates or regular web content.

directory a null-terminated string specifying the pathname of the directory to be scanned recursively.

Returns:

0 on failure or 1 on success.

Definition at line 313 of file content.c.

References http_content_load_directory(), http_load_file(), log_info, MEMORYBUF, NULLER, PLACER, st_char_get(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_free(), and st_merge.

Referenced by http_content_load_directory(), http_content_refresh(), and http_content_start().

5.422.1.2 bool_t http_content_load_fonts (void)

Load all fonts into the http server repository.

Note:

This function will load all fonts of extension ".ttf" from the directory configured in magma.http.fonts.

Returns:

0 on failure or 1 on success.

Definition at line 362 of file content.c.

References magma_t::content, content, magma_t::http, inx_insert(), magma_t::log, log_info, log_pedantic, M_TYPE_UINT64, magma, MEMORYBUF, NULLER, PLACER, st_cmp_ci_ends(), st_cmp_cs_ends(), st_free(), st_merge, multi_t::u64, and multi_t::val.

Referenced by http_content_refresh(), and http_content_start().

5.422.1.3 bool_t http_content_refresh (void)

Refresh the stored contents of the web app templates, static content, and fonts directories.

Returns:

true if all content directories were successfully refreshed, or false on failure.

Definition at line 449 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), inx_free(), M_INX_LINKED, magma, and st_free().

Referenced by signal_refresh().

5.422.1.4 bool_t http_content_start (void)

Prime the the web app templates, static content, and fonts directories for future use.

Note:

This function makes sure that the web templates, static content, and fonts directory have been properly set, and loads and caches their content for future use.

Returns:

true on success or false on failure.

Definition at line 407 of file content.c.

References content, magma_t::http, http_content_load_directory(), http_content_load_fonts(), http_free_content(), inx_alloc(), log_pedantic, M_INX_LINKED, magma, NULLER, PLACER, st_cmp_cs_ends(), and st_free().

Referenced by process_start().

5.422.1.5 void http_content_stop (void)

Purge the http contents repository of stored fonts, templates, and static web pages.

Returns:

This function returns no value.

Definition at line 435 of file content.c.

References content, and inx_cleanup().

Referenced by process_stop().

5.422.1.6 void http_free_content (http_content_t ∗ *page*)

LOW: We should use basename() and dirname() to cleanup path strings. LOW: These functions should all be renamed to http_content_XXXX. The file and directory functions should be updated to use the x64/reentrant alternatives. Specifically open64/fstat64/readdir64_r. An update function that can be triggered with a SIGHUP would also be nice. Free a stored piece of http content and all its underlying data.

Parameters:

page a pointer to the loaded content page to be freed.

Returns:

This function returns no value.

Definition at line 27 of file content.c.

References http_content_t::location, mm_free(), http_content_t::resource, st_cleanup, and http_content_t::type.

Referenced by http_content_refresh(), http_content_start(), and http_load_file().

5.422.1.7 http_content_t∗ http_get_static (stringer_t ∗ *location*)

Get a cached copy of a static web page.

Parameters:

location a pointer to a managed string containing the location of the requested resource.

Returns:

NULL on failure, or a pointer to an http content object with the contents of the requested resource on success.

Definition at line 67 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, and http_content_t::type.

Referenced by http_response().

5.422.1.8 http_content_t∗ http_get_template (chr_t ∗ *location*)

Return a template by location.

Parameters:

location a string specifying the location of the template.

Returns:

NULL on failure, or a pointer to an http_content_t object containing the template.

Definition at line 83 of file content.c.

References content, inx_find(), M_TYPE_STRINGER, NULLER, and http_content_t::type.

Referenced by http_page_get(), register_print_message(), register_print_step1(), register_print_step2(), and register_print_step3().

5.422.1.9 bool_t http_load_file (int_t *template*, chr_t ∗ *filename*)

Load file content into the http server repository.

Note:

Each file that is loaded will be cached for retrieval by http clients, with its mime type determined automatically. Any files passed as a template will have the ".template" extension trimmed from the end of its resource path, and any file named 'index.html' will be read as the default directory index path. Each file will also be added to its respective parent page or template inx holder.

Parameters:

template a value specifying whether or not the specified file is a template.

filename a null-terminated string specifying the pathname of the file to be loaded.

Returns:

0 on failure or 1 on success.

Definition at line 149 of file content.c.

References magma_t::content, content, CONTIGUOUS, data, HEAP, magma_t::http, http_free_content(), inx_insert(), magma_t::log, log_-info, log_pedantic, M_TYPE_STRINGER, magma, MANAGED_T, MEMORYBUF, mm_alloc(), ns_length_get(), NULLER, PLACER, multi_t::st, st_alloc(), st_char_get(), st_cmp_ci_ends(), st_cmp_cs_ends(), st_cmp_cs_eq(), st_dupe(), st_dupe_opts(), st_free(), st_import(), st_length_get(), st_length_int(), st_length_set(), and multi_t::val.

Referenced by http_content_load_directory().

5.422.1.10 void http_page_free (http_page_t ∗ *page*)

Free an http page object and all its underlying data.

Parameters:

page a pointer to the http page object to be freed.

Definition at line 43 of file content.c.

References http_page_t::doc_ctx, http_page_t::doc_obj, mm_free(), xml_free_doc(), xml_free_parser_ctx(), xml_free_xpath_ctx(), and http_page_t::xpath_ctx.

Referenced by contact_print_form(), contact_print_message(), http_page_get(), portal_print_login(), statistics_process(), teacher_print_form(), and teacher_print_message().

5.422.1.11 http_page_t* http_page_get (chr_t * *location*)

Get a template page and prepare its xml document root for use.

Note:

Each page is affixed with an xpath with a namespace after passing through the xml parser.

Parameters:

location a pointer to a null-terminated string with the pathname of the template to be returned.

Returns:

NULL on failure, or a pointer to the http page object of the requested template.

Definition at line 100 of file content.c.

References http_page_t::content, http_page_t::doc_ctx, http_page_t::doc_obj, http_get_template(), http_page_free(), log_pedantic, mm_alloc(), http_content_t::resource, st_char_get(), st_length_get(), xml_create_doc(), xml_create_parser_ctx(), xml_create_xpath_ctx(), xml_xpath_set_namespace(), and http_page_t::xpath_ctx.

Referenced by contact_business_add_error(), contact_print_form(), contact_print_message(), portal_print_login(), statistics_process(), teacher_add_error(), teacher_print_form(), and teacher_print_message().

```
#include "magma.h"
```

Functions

- void http_close (connection_t *con)
  Close a connection corresponding to an http session.
- void http_requeue (connection_t *con)
  The main http server requeue entry point state machine for processing client data.
- void http_body (connection_t *con)
  Get the body of the http request by reading the value of the Content-Length header.
- void http_process (connection_t *con)
  Process data sent by an http client.
- void http_init (connection_t *con)
  Handle a new http client connection.

5.423.1 Function Documentation

5.423.1.1 void http_body (connection_t * *con*)

Get the body of the http request by reading the value of the Content-Length header. http.c

Note:

Any request errors will be handled directly without returns. This function sets the value of the connection's http.body member.

Parameters:

con a pointer to the connection object of the remote http client.

Returns:

This function returns no value.

Definition at line 73 of file http.c.

References connection_t::buffer, con_read(), CONTIGUOUS, data, HEAP, magma_t::http, connection_t::http, http_data_get(), HTTP_DATA_HEADER, HTTP_ERROR_400, HTTP_RESPOND, JOINTED, length, magma_t::log, log_pedantic, magma, MANAGED_T, MAPPED_T, connection_t::network, size_conv_bl(), st_alloc_opts(), st_append_opts(), st_char_get(), st_cleanup, st_data_get(), st_dupe_opts(), st_empty, st_length_get(), st_length_int(), and http_data_t::value.

Referenced by http_requeue().

5.423.1.2 void http_close (connection_t * *con*)

Close a connection corresponding to an http session.

Returns:

This function returns no value.

Definition at line 14 of file http.c.

References con_destroy().

Referenced by http_process(), and http_requeue().

5.423.1.3 void http_init (connection_t * *con*)

Handle a new http client connection.

Parameters:

con a pointer to the http client connection that was just accepted.

Returns:

This function returns no value.

Definition at line 178 of file http.c.

References con_reverse_enqueue(), and http_process().

Referenced by protocol_enqueue().

5.423.1.4 void http_process (connection_t * *con*)

Process data sent by an http client.

Note:

This is performed in two stages: first read the http method with http_parse_method(), then transfer control to http_parse_header(). If a failure occurs reading a line of data, or too many protocol violations occur, http_close() is called to drop the connection.

Parameters:

con the connection object from which to read data.

Returns:

This function returns no value.

Definition at line 137 of file http.c.

References con_read_line(), server_t::cutoff, enqueue(), connection_t::http, http_close(), http_parse_header(), HTTP_PARSE_HEADER, http_parse_method(), http_process(), HTTP_READY, http_requeue(), connection_t::line, log_pedantic, connection_t::network, pl_empty(), connection_t::protocol, requeue(), connection_t::server, connection_t::spins, server_t::violations, and connection_t::violations.

Referenced by http_init(), http_process(), and http_requeue().

5.423.1.5 void http_requeue (connection_t * *con*)

The main http server requeue entry point state machine for processing client data.

Returns:

This function returns no value.

Definition at line 24 of file http.c.

References con_status(), server_t::cutoff, enqueue(), connection_t::http, http_body(), http_close(), HTTP_CLOSE, HTTP_COMPLETE, HTTP_ERROR_400, HTTP_ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_ERROR_501, http_-parse_pairs(), HTTP_PARSE_PAIRS, http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_-print_501(), http_process(), HTTP_READ_BODY, http_requeue(), HTTP_RESPOND, http_response(), http_session_reset(), connection_-t::protocol, requeue(), connection_t::server, status, server_t::violations, and connection_t::violations.

Referenced by http_process(), and http_requeue().

5.424 src/servers/http/response.c File Reference

```
#include "magma.h"
```

Functions

- chr_t ∗ http_response_status (int_t status)

  Get a descriptive string for a numerical http status code.

- stringer_t ∗ http_response_cookie (connection_t ∗con)
- stringer_t ∗ http_response_allow_cross (connection_t ∗con)
- stringer_t ∗ http_response_connection (connection_t ∗con, int_t force)

  Get an appropriate value for the Connection header of an http response.

- void http_response_options (connection_t ∗con)

  Return a response to an http OPTIONS request.

- void http_response_header (connection_t ∗con, int_t status, stringer_t ∗type, size_t len)

  Send a full set of http response headers to the remote client.

- void http_response (connection_t ∗con)

  Make a response to an http client request.

5.424.1 Function Documentation

5.424.1.1 void http_response (connection_t ∗ *con*)

Make a response to an http client request. response.c

Note:

The following http methods aren't supported: PUT, DELETE, HEAD, TRACE, and CONNECT. The http server will first attempt to retrieve the requested url as a static page; otherwise the following special locations are supported: /portal, /portal/camel, /register, /contact, /report_abuse, /teacher, and /statistics.

Returns:

This function returns no value.

Definition at line 419 of file response.c.

References magma_t::abuse, magma_t::admin, con_write_st(), magma_t::contact, contact_process(), content, connection_t::http, HTTP_-ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_ERROR_501, http_get_static(), HTTP_METHOD_-CONNECT, HTTP_METHOD_DELETE, HTTP_METHOD_HEAD, HTTP_METHOD_OPTIONS, HTTP_METHOD_POST, HTTP_-METHOD_PUT, HTTP_METHOD_TRACE, HTTP_METHOD_UNSUPPORTED, http_parse_pairs(), HTTP_READ_BODY, HTTP_-RESPOND, http_response_header(), http_response_options(), json_api_dispatch(), magma, NULLER, PLACER, portal_endpoint(), portal_-process(), portal_upload(), register_process(), magma_t::registration, http_content_t::resource, st_cmp_ci_starts(), st_cmp_cs_eq(), st_cmp_-cs_starts(), st_length_get(), magma_t::statistics, statistics_process(), teacher_process(), http_content_t::type, and magma_t::web.

Referenced by http_requeue().

5.424.1.2 stringer_t* http_response_allow_cross (connection_t * *con*)

Definition at line 245 of file response.c.

References http_data_get(), HTTP_DATA_HEADER, http_parse_origin(), MANAGEDBUF, PLACER, placer_t, st_append, st_char_get(), st_cmp_ci_eq(), st_length_int(), st_quick(), upper_st(), and http_data_t::value.

Referenced by http_response_header(), and http_response_options().

5.424.1.3 stringer_t* http_response_connection (connection_t * *con*, int_t *force*)

Get an appropriate value for the Connection header of an http response.

Note:

If magma.http.close was set in the configuration options, the connection will be closed immediately.

Parameters:

con a pointer to the connection object of the outgoing response.

force either HTTP_CONNECTION_CLOSE, HTTP_CONNECTION_NEUTRAL, or HTTP_CONNECTION_KEEPALIVE. HTTP_-CONNECTION_CLOSE will result in the connection being terminated immediately, HTTP_CONNECTION_KEEPALIVE will result in a "Connection: keep-alive" response, and HTTP_CONNECTION_NEUTRAL will not result in any output.

Returns:

a pointer to a managed string containing the http Connection header field that should be used for the response.

Definition at line 288 of file response.c.

References CONTIGUOUS, HEAP, connection_t::http, magma_t::http, HTTP_CLOSE, HTTP_CONNECTION_CLOSE, HTTP_-CONNECTION_KEEPALIVE, magma, MANAGED_T, PLACER, and st_dupe_opts().

Referenced by http_response_header(), and http_response_options().

5.424.1.4 stringer_t* http_response_cookie (connection_t * *con*)

Definition at line 190 of file response.c.

References con_secure(), HEAP, connection_t::http, HTTP_COOKIE_DELETE, HTTP_COOKIE_SET, JOINTED, MANAGED_T, MANAGEDBUF, PLACER, st_append, st_aprint_opts(), st_char_get(), st_length_int(), st_quick(), and time_print_gmt().

Referenced by http_response_header().

5.424.1.5 void http_response_header (connection_t * *con*, int_t *status*, stringer_t * *type*, size_t *len*)

Send a full set of http response headers to the remote client.

Note:

If the mode is HTTP_RESPOND it will be changed to HTTP_COMPLETE, to tell the http requeue function to reset the context and enqueue request processor.

Parameters:

con a pointer to the connection object across which the response will be sent.

status an integer containing the http status code for the response.

type a managed string containing the value of the Content-Type header.

len the value of the Content-Length header.

Returns:

This function returns no value.

Definition at line 364 of file response.c.

References con_print(), magma_t::http, connection_t::http, HTTP_COMPLETE, HTTP_CONNECTION_NEUTRAL, HTTP_RESPOND, http_response_allow_cross(), http_response_connection(), http_response_cookie(), http_response_status(), magma, MANAGEDBUF, mm_wipe(), st_char_get(), st_cleanup, st_length_int(), and time_print_gmt().

Referenced by api_response(), contact_print_form(), contact_print_message(), http_print_400(), http_print_403(), http_print_404(), http_print_405(), http_print_500(), http_print_500_log(), http_print_501(), http_response(), portal_endpoint(), portal_endpoint_attachments_progress(), portal_endpoint_error(), portal_endpoint_response(), portal_endpoint_search(), portal_print_login(), register_print_message(), register_print_step1(), register_print_step2(), register_print_step3(), statistics_process(), and teacher_print_form().

5.424.1.6 void http_response_options (connection_t ∗ *con*)

Return a response to an http OPTIONS request.

Parameters:

con the client connection which made the OPTIONS request.

Returns:

This function returns no value.

LOW: I couldn't find a definitive answer about whether the OPTION response should always return a Content-Type of text/plain or use the Content-Type associated with the location provided in the request.

Definition at line 316 of file response.c.

Referenced by http_response().

5.424.1.7 chr_t∗ http_response_status (int_t *status*)

Get a descriptive string for a numerical http status code.

Parameters:

status the value of the http status code to be looked up.

Returns:

NULL on failure, or a pointer to a null-terminated string containing a description of the specified http status code on success.

Definition at line 15 of file response.c.

References log_pedantic.

Referenced by http_response_header().

Functions

- json_t ∗ portal_message_flags_array (meta_message_t ∗meta)

  Return a json array of flag descriptions for a mail message's flags bitmask.

- int_t portal_parse_flags (json_t ∗array, uint32_t ∗flags)
- json_t ∗ portal_message_tags_array (meta_message_t ∗meta)

5.428.1 Function Documentation

5.428.1.1 json_t∗ portal_message_flags_array (meta_message_t ∗ *meta*)

Return a json array of flag descriptions for a mail message's flags bitmask. flags.c

TODO: The messages.load method uses the flags/tags helper functions, but the messages.list and the messages.tags/flags methods still need to be updated.

Parameters:

meta a pointer to the meta message object of the mail message to have its flags parsed.

Returns:

NULL on failure, or a pointer to the json object of the specified mail message's flags.

Definition at line 18 of file flags.c.

References json_array_append_new_d, json_array_d, json_string_d, MAIL_MARK_BLACKHOLED, MAIL_MARK_INFECTED, MAIL_MARK_JUNK, MAIL_MARK_PHISHING, MAIL_MARK_SPOOFED, MAIL_STATUS_ANSWERED, MAIL_STATUS_APPENDED, MAIL_STATUS_DELETED, MAIL_STATUS_DRAFT, MAIL_STATUS_EMPTY, MAIL_STATUS_ENCRYPTED, MAIL_STATUS_FLAGGED, MAIL_STATUS_RECENT, MAIL_STATUS_SEEN, and meta_message_t::status.

5.429.1.6 void imap_create (connection_t ∗ *con*)

Create a new IMAP folder in response to the IMAP "CREATE" command.

See also:

imap_folder_create()

Parameters:

con the connection across which the folder creation request was made.

Returns:

This function returns no value.

Definition at line 472 of file imap.c.

References ar_length_get(), con_print(), FOLDER_LENGTH_LIMIT, connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_create(), IMAP_FOLDER_RECURSION_LMIIT, imap_get_st_ar(), imap_get_type_ar(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), serial_increment(), st_char_get(), and st_length_int().

5.429.1.7 void imap_delete (connection_t ∗ *con*)

Handle the IMAP "DELETE" command and delete the specified IMAP folder.

See also:

imap_folder_remove()

Parameters:

con a pointer to the connection object of the IMAP session generating the delete request.

Returns:

This function returns no value.

Definition at line 539 of file imap.c.

References ar_length_get(), con_print(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_remove(), imap_get_st_ar(), imap_get_type_ar(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, serial_get(), serial_increment(), st_char_get(), and st_length_int().

Definition at line 1766 of file imap.c.

References con_print(), connection_t::imap, st_char_get(), and st_length_int().

5.429.1.13 void imap_init (connection_t * *con*)

The main IMAP entry point for all inbound client connections, as dispatched by the generic protocol handler (display banner greeting).

Parameters:

con a pointer to the connection object of the newly connected client.

Returns:

This function returns no value.

Definition at line 1854 of file imap.c.

References build_version(), con_print(), con_reverse_enqueue(), con_secure(), server_t::domain, imap_requeue(), connection_t::server, st_char_get(), st_length_get(), and st_length_int().

Referenced by protocol_enqueue().

5.429.1.14 void imap_invalid (connection_t * *con*)

Respond to an invalid IMAP command from a client.

Parameters:

con a pointer to the client connection that issued the bad command.

Returns:

This function returns no value.

Definition at line 63 of file imap.c.

References con_print(), server_t::delay, connection_t::imap, connection_t::protocol, connection_t::server, st_char_get(), st_length_int(), server_t::violations, and connection_t::violations.

Referenced by imap_process(), and imap_starttls().

Definition at line 313 of file imap.c.

References ar_length_get(), con_print(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_name_escaped(), imap_-get_st_ar(), imap_get_type_ar(), imap_narrow_folders(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_reset(), inx_cursor_t, inx_-cursor_value_next(), inx_free(), log_pedantic, magma_folder_name(), meta_user_rlock(), meta_user_unlock(), meta_folder_t::name, NULLER, meta_folder_t::parent, PLACER, st_char_get(), st_cmp_ci_eq(), st_free(), and st_length_int().

5.429.1.16 void imap_login (connection_t ∗ *con*)

Attempt to perform a user login on an IMAP client connection.

Parameters:

con a pointer to the connection object of the remote session.

Returns:

This function returns no value.

HIGH: Inactivity locks shouldn't prevent a user from logging into the system.

Definition at line 106 of file imap.c.

References ar_length_get(), auth_free(), auth_login(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_-subnet(), con_print(), con_secure(), connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_get_st_ar(), imap_get_type_ar(), inx_count(), auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, MANAGEDBUF, auth_t::master, meta_data_update_log(), meta_get(), META_GET_FOLDERS, META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_PROTOCOL_IMAP, META_USER_ENCRYPT_DATA, meta_user_rlock(), META_USER_TLS, meta_user_unlock(), connection_t::protocol, auth_t::salt, auth_-t::seasoning, st_char_get(), st_dupe(), st_free(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.429.1.17 void imap_logout (connection_t ∗ *con*)

Terminate an IMAP session gracefully with a "BYE" message and destroy the underlying connection.

Parameters:

con the IMAP connection to be terminated.

Returns:

This function returns no value.

Definition at line 79 of file imap.c.

References con_destroy(), con_print(), con_status(), con_write_bl(), connection_t::imap, st_char_get(), st_length_int(), and status.

Definition at line 874 of file imap.c.

References ar_length_get(), con_print(), imap_folder_status_t::first, imap_folder_status_t::foldernum, meta_message_t::foldernum, connection_t::imap, IMAP_ARGUMENT_TYPE_ARRAY, imap_folder_status(), imap_get_st_ar(), imap_get_type_ar(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_RECENT, imap_folder_status_t::messages, meta_data_flags_remove(), meta_user_unlock(), meta_user_wlock(), imap_folder_status_t::recent, st_char_get(), st_length_int(), meta_message_t::status, status, and imap_folder_status_t::uidnext.

5.429.1.23 void imap_starttls (connection_t * *con*)

Create a secure connection for an IMAP session. TODO: Review error messages and update them with the appropriate response code. LOW: When should we check the serial number to see if the local data is stale and needs to be refreshed? LOW: Add function descriptions to all of the different IMAP commands.

Note:

RFC 2595 / section 3.1 specifies that STARTTLS is only available in a non-authenticated state.

Parameters:

con the connection on top of which the TLS session will be established.

Returns:

This function returns no value.

Definition at line 23 of file imap.c.

References connection_t::buffer, con_print(), con_secure(), connection_t::imap, imap_invalid(), connection_t::line, log_pedantic, M_SSL_-BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::server, connection_t::sockd, st_char_get(), st_length_get(), st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

```

Functions

- uint64_t pop_total_messages (inx_t *messages)
  Get the number of messages available to a POP3 user.
- uint64_t pop_total_size (inx_t *messages)
  Get the total size of all messages available to a POP3 user.
- uint64_t pop_get_last (inx_t *messages)
  Get the POP3 sequence number of the last message that isn't flagged as recent.
- meta_message_t * pop_get_message (inx_t *messages, uint64_t get)
  Get a message by its pop sequence number.

5.435.1 Function Documentation

5.435.1.1 uint64_t pop_get_last (inx_t * *messages*)

Get the POP3 sequence number of the last message that isn't flagged as recent. mailbox.c

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the sequence number of the last message that isn't flagged as recent, or 0 on failure.

Definition at line 74 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_-HIDDEN, MAIL_STATUS_RECENT, and meta_message_t::status.

Referenced by pop_last().

5.435.1.2 meta_message_t* pop_get_message (inx_t * *messages*, uint64_t *get*)

Get a message by its pop sequence number.

Parameters:

messages an inx holder containing the collection of the user's messages to be traversed.

number the zero-based pop sequence number of the message to be retrieved.

Returns:

NULL on failure or the meta message object of the message if it was found.

Definition at line 113 of file mailbox.c.

References count, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, and meta_-message_t::status.

Referenced by pop_dele(), pop_list(), pop_retr(), pop_top(), and pop_uidl().

5.435.1.3 uint64_t pop_total_messages (inx_t * *messages*)

Get the number of messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total number of messages available to the POP3 user, or 0 on failure.

Definition at line 16 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_-HIDDEN, and meta_message_t::status.

Referenced by pop_list(), pop_stat(), and pop_uidl().

5.435.1.4 uint64_t pop_total_size (inx_t * *messages*)

Get the total size of all messages available to a POP3 user.

Note:

This function only counts messages that aren't deleted or hidden, and weren't created by the IMAP APPEND command.

Parameters:

messages an inx holder containing a collection of messages to be analyzed.

Returns:

the total size, in bytes, of all messages available to the POP3 user, or 0 on failure.

Definition at line 45 of file mailbox.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_-HIDDEN, meta_message_t::size, and meta_message_t::status.

Referenced by pop_stat().

Functions

- void pop_starttls (connection_t *con)
  TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension.
- void pop_noop (connection_t *con)
  Execute a POP3 no-operation command.
- void pop_invalid (connection_t *con)
  A function handler for invalid POP3 commands.
- void pop_rset (connection_t *con)
  Reset the user's mailbox, in response to a POP3 RSET command.
- void pop_quit (connection_t *con)
  Gracefully destroy a POP3 session, whether because of an error or in response to a user QUIT command.
- void pop_user (connection_t *con)
  Accept a username for POP3 authentication.
- void pop_pass (connection_t *con)
  Accept and verify a password for POP3 authentication.
- void pop_capa (connection_t *con)
  Display the POP3 server capabilities, in response to a POP3 CAPA command.
- void pop_stat (connection_t *con)
  Display a user's message statistics, in response to a POP3 STAT command.
- void pop_last (connection_t *con)
  Get the sequence number of the last read message, in response to a POP3 LAST command.
- void pop_list (connection_t *con)
  Get the list of a user's messages, in response to a POP3 LIST command.
- void pop_dele (connection_t *con)
  Get a message, in response to a POP3 DELE command.
- void pop_uidl (connection_t *con)
  Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.
- void pop_top (connection_t *con)
  Get the top lines of a message or collection of messages, in response to a POP3 TOP command.
- void pop_retr (connection_t *con)
  Retrieve a user's message, in response to a POP3 RETR command.
- void pop_init (connection_t *con)
  Initialize a new POP3 connection.

5.436.1 Function Documentation

5.436.1.1 void pop_capa (connection_t ∗ *con*)

Display the POP3 server capabilities, in response to a POP3 CAPA command. pop.c

Note:

See RFC 2449 POP3 Extension Mechanism for details.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 343 of file pop.c.

References build_version(), con_print(), con_secure(), and connection_t::pop.

5.436.1.2 void pop_dele (connection_t ∗ *con*)

Get a message, in response to a POP3 DELE command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 479 of file pop.c.

References con_write_bl(), MAIL_STATUS_HIDDEN, meta_user_unlock(), meta_user_wlock(), number, connection_t::pop, pop_get_-message(), pop_invalid(), pop_num_parse(), and meta_message_t::status.

5.436.1.3 void pop_init (connection_t ∗ *con*)

Initialize a new POP3 connection.

Parameters:

con the newly connected POP3 client connection.

Returns:

This function returns no value.

Definition at line 724 of file pop.c.

References con_write_bl(), and pop_requeue().

Referenced by protocol_enqueue().

5.436.1.4 void pop_invalid (connection_t * *con*)

A function handler for invalid POP3 commands.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 67 of file pop.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by pop_dele(), pop_last(), pop_list(), pop_pass(), pop_process(), pop_retr(), pop_rset(), pop_starttls(), pop_stat(), pop_top(), pop_uidl(), and pop_user().

5.436.1.5 void pop_last (connection_t * *con*)

Get the sequence number of the last read message, in response to a POP3 LAST command.

See also:

pop_get_last()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 391 of file pop.c.

References con_print(), meta_user_rlock(), meta_user_unlock(), number, connection_t::pop, pop_get_last(), and pop_invalid().

5.436.1.6 void pop_list (connection_t * *con*)

Get the list of a user's messages, in response to a POP3 LIST command.

See also:

pop_total_messages(), pop_get_message()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 416 of file pop.c.

References con_print(), con_write_bl(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, connection_t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), pop_total_messages(), meta_message_t::size, and meta_message_t::status.

5.436.1.7 void pop_noop (connection_t * *con*)

Execute a POP3 no-operation command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 56 of file pop.c.

References con_write_bl().

5.436.1.8 void pop_pass (connection_t * *con*)

Accept and verify a password for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated, but which have already supplied a username. If the username/password combo was validated, the account information is retrieved and checked to see if it is locked. After successful authentication, this function will prohibit insecure connections for any user configured to use TLS only, and enforce the existence of only one POP3 session at a time. Finally, the database Log table for this user's POP3 access is updated, and all the user's messages are retrieved.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

HIGH: Inactivity locks shouldn't prevent a user from logging into the system.

Definition at line 168 of file pop.c.

References auth_free(), auth_login(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_secure(), con_write_bl(), inx_count(), auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, MANAGEDBUF, auth_t::master, meta_data_update_log(), meta_get(), META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_LOCKED, meta_messages_login_update(), META_PROTOCOL_POP, META_USER_ENCRYPT_DATA, meta_user_ref_protocol_total(), META_USER_TLS, meta_user_unlock(), meta_user_wlock(), connection_t::pop, pop_invalid(), pop_pass_parse(), connection_t::protocol, auth_t::salt, auth_t::seasoning, st_char_get(), st_dupe(), st_empty, st_free(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.436.1.9 void pop_quit (connection_t * *con*)

Gracefully destroy a POP3 session, whether because of an error or in response to a user QUIT command.

Parameters:

con the POP3 client connection to be shut down. This function returns no value.

Definition at line 107 of file pop.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by pop_process(), and pop_requeue().

5.436.1.10 void pop_retr (connection_t * *con*)

Retrieve a user's message, in response to a POP3 RETR command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 654 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message(), MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, PLACER, connection_t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), connection_t::server, st_char_get(), st_length_get(), st_replace(), meta_message_t::status, and mail_message_t::text.

5.436.1.11 void pop_rset (connection_t * *con*)

Reset the user's mailbox, in response to a POP3 RSET command.

See also:

pop_session_reset()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 82 of file pop.c.

References con_write_bl(), connection_t::pop, pop_invalid(), and pop_session_reset().

5.436.1.12 void pop_starttls (connection_t * *con*)

TODO: Review error messages and update them with the appropriate response code, as per RFC 3206 regarding the response codes extension. Initialize a TLS session for an unauthenticated POP3 session.

Note:

RFC 2595 / section 4 dictates that the STLS/STARTTLS command should only be available in the authorization state.

Parameters:

con the connection of the POP3 client requesting the transport layer security upgrade.

Returns:

This function returns no value (all error messages are written directly to the requesting client).

Definition at line 18 of file pop.c.

References connection_t::buffer, con_secure(), con_write_bl(), connection_t::line, log_pedantic, M_SSL_BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::pop, pop_invalid(), pop_session_reset(), connection_t::server, connection_t::sockd, st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

5.436.1.13 void pop_stat (connection_t ∗ *con*)

Display a user's message statistics, in response to a POP3 STAT command.

See also:

pop_total_messages(), pop_total_size()

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 365 of file pop.c.

References con_print(), count, meta_user_rlock(), meta_user_unlock(), connection_t::pop, pop_invalid(), pop_total_messages(), and pop_total_size().

5.436.1.14 void pop_top (connection_t ∗ *con*)

Get the top lines of a message or collection of messages, in response to a POP3 TOP command.

Note:

This function will fail if a deleted message was specified by the user.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 583 of file pop.c.

References con_print(), con_write_bl(), con_write_st(), mail_destroy(), mail_load_message_top(), MAIL_STATUS_HIDDEN, meta_user_rlock(), meta_user_unlock(), number, PLACER, connection_t::pop, pop_get_message(), pop_invalid(), pop_top_parse(), connection_t::server, st_char_get(), st_length_get(), st_replace(), meta_message_t::status, and mail_message_t::text.

5.436.1.15 void pop_uidl (connection_t ∗ *con*)

Get the UIDL for a message or collection of messages, in response to a POP3 UIDL command.

Parameters:

con the POP3 client connection issuing the command.

Returns:

This function returns no value.

Definition at line 518 of file pop.c.

References con_print(), con_write_bl(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MAIL_STATUS_APPENDED, MAIL_STATUS_HIDDEN, meta_message_t::messagenum, meta_user_rlock(), meta_user_unlock(), number, connection_t::pop, pop_get_message(), pop_invalid(), pop_num_parse(), pop_total_messages(), and meta_message_t::status.

5.436.1.16 void pop_user (connection_t * *con*)

Accept a username for POP3 authentication.

Note:

This command is only allowed for sessions which have not yet been authenticated. If the username has already been supplied pre-authentication, the old value will be overwritten with the new one.

Parameters:

con the POP3 client connection issuing the command. This function returns no value.

Definition at line 131 of file pop.c.

References con_write_bl(), connection_t::pop, pop_invalid(), pop_user_parse(), and st_cleanup.

```
#include "magma.h"
```

Functions

- int_t smtp_check_greylist (connection_t *con, smtp_inbound_prefs_t *prefs)

  Check to see if a transmitting address is in a user's greylist.

- int_t smtp_check_rbl (connection_t *con)

  Check the SMTP connection's remote address against a collection of real-time blacklists.

- int_t smtp_check_filters (smtp_inbound_prefs_t *prefs, stringer_t **local)

  checkers.c

- bool_t smtp_add_bypass_entry (stringer_t *subnet)

  Add an entry to the SMTP subnet bypass list.

- bool_t smtp_bypass_check (connection_t *con)

  Check if a connection should bypass certain SMTP checks.

5.438.1 Function Documentation

5.438.1.1 bool_t smtp_add_bypass_entry (stringer_t * *subnet*)

Add an entry to the SMTP subnet bypass list.

Parameters:

subnet a pointer to a managed string containing the IP address or subnet address to be bypassed for checks.

Returns:

true if the entry was valid and was added, or false on failure.

Definition at line 249 of file checkers.c.

References magma_t::bypass_subnets, inx_alloc(), inx_insert(), ip_subnet_st(), log_error, log_pedantic, M_INX_LINKED, M_TYPE_-UINT64, magma, mm_alloc(), mm_free(), magma_t::smtp, st_char_get(), multi_t::type, multi_t::u64, and multi_t::val.

Referenced by config_value_set().

5.438.1.2 bool_t smtp_bypass_check (connection_t * *con*)

Check if a connection should bypass certain SMTP checks.

Note:

This check is run against host and/or subnet masks configured in the magma.smtp.bypass_addr option.

Parameters:

con a pointer to the connection object to be checked.

Returns:

true if the specified connection meets the SMTP bypass check or false on failure or if it does not.

Definition at line 289 of file checkers.c.

References magma_t::bypass_subnets, con_addr(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), ip_matches_subnet(), magma, and magma_t::smtp.

Referenced by smtp_init().

5.438.1.3 int_t smtp_check_filters (smtp_inbound_prefs_t ∗ *prefs*, stringer_t ∗∗ *local*)

checkers.c Apply any user specific filters. Return -1 for errors, and -2 to delete a message. Return 1 if no action was taken, and 2 if the message was moved to a different folder, 3 if the message content was modified, and 4 if the message was marked read.

Definition at line 126 of file checkers.c.

References data, smtp_inbound_prefs_t::filters, smtp_inbound_prefs_t::foldernum, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), length, log_pedantic, mail_header_end(), mail_header_fetch_all(), mail_mod_subject(), smtp_inbound_prefs_t::mark, MEMORYBUF, mm_wipe(), pl_data_get(), pl_init(), pl_length_get(), pl_null(), PLACER, placer_t, SMTP_FILTER_ACTION_DELETE, SMTP_FILTER_ACTION_LABEL, SMTP_FILTER_ACTION_MARK_READ, SMTP_FILTER_ACTION_MOVE, SMTP_FILTER_LOCATION_BODY, SMTP_FILTER_LOCATION_ENTIRE, SMTP_FILTER_LOCATION_FIELD, SMTP_FILTER_LOCATION_HEADER, SMTP_MARK_NONE, SMTP_MARK_PHISH, SMTP_MARK_RBL, SMTP_MARK_READ, SMTP_MARK_SPAM, SMTP_MARK_SPOOF, SMTP_MARK_VIRUS, st_char_get(), st_cleanup, st_cmp_ci_eq(), st_length_get(), st_length_int(), and smtp_inbound_prefs_t::usernum.

Referenced by smtp_accept_message().

5.438.1.4 int_t smtp_check_greylist (connection_t ∗ *con*, smtp_inbound_prefs_t ∗ *prefs*)

Check to see if a transmitting address is in a user's greylist.

Note:

The greylist is configured in the Dispatch table and specifies the minimum time, in minutes, that a transmitting smtp relay server must wait in order to be able to send more messages to the same recipient address again.

Parameters:

con the connection to have its remote address checked against the user's greylist.

prefs the smtp inbound preferences of the user

Returns:

-1 on an internal server error, 0 if the sender must wait longer, and 1 if the check was passed.

Definition at line 18 of file checkers.c.

References BLOCK_T, smtp_session_t::bypass, cache_get(), cache_set(), con_addr_reversed(), CONTIGUOUS, smtp_inbound_prefs_t::greytime, HEAP, imap_fetch_response_t::key, log_pedantic, MANAGEDBUF, connection_t::smtp, st_alloc_opts(), st_char_get(), st_cleanup, st_data_get(), st_length_get(), st_length_int(), st_sprint(), smtp_inbound_prefs_t::usernum, and imap_fetch_response_t::value.

Referenced by smtp_rcpt_to().

5.438.1.5 int_t smtp_check_rbl (connection_t ∗ *con*)

Check the SMTP connection's remote address against a collection of real-time blacklists.

Note:

The connection's IP address will be checked against each of the servers configured in magma.smtp.blacklists.domain.

Parameters:

con the connection to have its address examined against the RBLs.

Returns:

-1 on general error, -2 if the address was blacklisted, or 1 if it passed the check.

Definition at line 77 of file checkers.c.

References magma_t::blacklists, con_addr_reversed(), log_pedantic, magma, MANAGEDBUF, mm_wipe(), magma_t::smtp, st_char_get(), and st_length_int().

Referenced by smtp_rcpt_to().

- void smtp_data (connection_t *con)
- void smtp_init (connection_t *con)

  The start of the protocol handler for the SMTP server.

- void submission_init (connection_t *con)

5.439.1 Function Documentation

5.439.1.1 void smtp_auth_login (connection_t ∗ *con*)

smtp.c

Definition at line 391 of file smtp.c.

References auth_free(), auth_login(), smtp_session_t::authenticated, base64_decode(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_read_line(), con_write_bl(), connection_t::line, lock_get(), lock_release(), log_info, MANAGEDBUF, smtp_session_t::max_length, connection_t::network, pl_char_get(), pl_length_get(), PLACER, connection_t::protocol, smtp_outbound_prefs_t::send_size_limit, connection_t::smtp, smtp_add_outbound(), smtp_fetch_authorization(), smtp_parse_auth(), smtp_session_reset(), st_char_get(), st_cleanup, st_cmp_ci_eq(), st_empty, st_free(), st_length_int(), st_populated, st_quick(), time_datestamp(), auth_t::tokens, auth_t::username, auth_t::verification, and connection_t::violations.

5.439.1.2 void smtp_auth_plain (connection_t ∗ *con*)

BUG: The SMTP server is not handling AUTH requests in accordance with RFC 2554 <http://tools.ietf.org/html/rfc2554> and RFC 4954 <http://tools.ietf.org/html/rfc4954>, according to a user.

In this particular case it's erroring out when users present an AUTH PLAIN request without the optional initial response. This could affect other protocols as well.

According to the RFC, a client can send either the following: 1. "AUTH mechanism" (e.g. "AUTH PLAIN"), which the server acknowledges with a "334 " (note the space). The client then sends the base64-encoded authentication response on a separate line.

2. "AUTH mechanism [initial response]" (e.g. "AUTH PLAIN dGVzdAB0ZXN0ADEyMzQ="), where user transmits the auth mechanism and the base64 authentication response in a single line, so as to minimize the back-and-forth traffic.

Definition at line 240 of file smtp.c.

References auth_free(), auth_login(), smtp_session_t::authenticated, base64_decode(), cache_decrement(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_read_line(), con_write_bl(), FOREIGNDATA, JOINTED, connection_t::line, lock_get(), lock_release(), log_info, MANAGEDBUF, smtp_session_t::max_length, mm_copy(), connection_t::network, pl_char_get(), pl_length_get(), PLACER, PLACER_T, placer_t, connection_t::protocol, smtp_outbound_prefs_t::send_size_limit, connection_t::smtp, smtp_add_outbound(), smtp_fetch_authorization(), smtp_parse_auth(), smtp_session_reset(), st_char_get(), st_cleanup, st_cmp_ci_eq(), st_empty, st_free(), st_length_get(), st_length_int(), st_populated, st_quick(), STACK, time_datestamp(), tok_get_st(), auth_t::tokens, auth_t::username, auth_t::verification, and connection_t::violations.

5.439.1.3 void smtp_data (connection_t ∗ *con*)

Definition at line 1137 of file smtp.c.

References smtp_session_t::authenticated, con_print(), con_write_bl(), smtp_session_t::helo, smtp_session_t::in_prefs, magma, mail_add_required_headers(), mail_count_received(), mail_create_message(), mail_destroy_message(), mail_message_cleanup(), smtp_session_t::mailfrom, smtp_session_t::max_length, smtp_session_t::message, smtp_session_t::out_prefs, smtp_outbound_prefs_t::recipients, magma_t::relay_limit, requeue(), magma_t::smtp, connection_t::smtp, smtp_data_inbound(), smtp_data_outbound(), smtp_data_read(), smtp_quit(), smtp_requeue(), and st_free().

Referenced by smtp_process().

5.439.1.4 void smtp_data_finish (connection_t ∗ *con*, size_t *read*, int_t *checker*)

Definition at line 791 of file smtp.c.

References connection_t::buffer, con_read(), connection_t::line, connection_t::network, st_char_get(), st_data_get(), st_data_set(), st_length_set(), and status.

Referenced by smtp_data_read().

5.439.1.5 void smtp_data_inbound (connection_t * *con*)

Definition at line 1089 of file smtp.c.

References con_print(), con_write_bl(), smtp_session_t::in_prefs, smtp_inbound_prefs_t::next, smtp_session_t::num_recipients, smtp_inbound_prefs_t::outcome, connection_t::smtp, smtp_accept_message(), smtp_bounce(), SMTP_OUTCOME_PERM_FAILURE, SMTP_OUTCOME_SUCESS, SMTP_OUTCOME_TEMP_LOCKED, SMTP_OUTCOME_TEMP_OVERQUOTA, SMTP_OUTCOME_TEMP_SERVER, and smtp_session_reset().

Referenced by smtp_data().

5.439.1.6 void smtp_data_outbound (connection_t * *con*)

Definition at line 996 of file smtp.c.

References auth_sanitize_address(), con_print(), con_write_bl(), con_write_st(), smtp_outbound_prefs_t::daily_send_limit, smtp_message_t::from, mail_extract_address(), smtp_session_t::mailfrom, smtp_session_t::message, smtp_session_t::num_recipients, smtp_session_t::out_prefs, pattern_check(), PLACER, connection_t::smtp, smtp_check_authorized_from(), smtp_check_transmit_quota(), smtp_relay_message(), smtp_session_reset(), smtp_update_transmission_stats(), st_char_get(), st_cleanup, st_cmp_ci_eq(), st_dupe(), st_free(), st_length_get(), smtp_message_t::text, smtp_outbound_prefs_t::usernum, and virus_check().

Referenced by smtp_data().

5.439.1.7 int_t smtp_data_read (connection_t * *con*, stringer_t ** *message*)

Definition at line 847 of file smtp.c.

References connection_t::buffer, con_read(), HEAP, JOINTED, connection_t::line, log_pedantic, MAPPED_T, smtp_session_t::max_length, connection_t::network, connection_t::smtp, smtp_data_finish(), st_alloc_opts(), st_char_get(), st_data_get(), st_data_set(), st_free(), st_length_set(), st_realloc(), and status.

Referenced by smtp_data().

5.439.1.8 void smtp_disabled (connection_t * *con*)

A stub function for an SMTP command that has not been implemented.

Note:

Executing a disabled command while result in a small delay and the protocol violation counter being incremented.

Returns:

This function returns no value.

Definition at line 163 of file smtp.c.

References connection_t::command, con_print(), server_t::delay, command_t::length, connection_t::protocol, connection_t::server, command_t::string, server_t::violations, and connection_t::violations.

5.439.1.9 void smtp_ehlo (connection_t * *con*)

Process an SMTP EHLO command.

See also:

smtp_parse_helo_domain()

Note:

Any prior domain specified by a HELO/EHLO command will be overwritten.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 98 of file smtp.c.

References con_print(), con_secure(), con_write_bl(), server_t::domain, smtp_session_t::esmtp, smtp_session_t::helo, magma, magma_t::message_length_limit, connection_t::server, magma_t::smtp, connection_t::smtp, smtp_parse_helo_domain(), st_char_get(), st_cleanup, and st_length_int().

5.439.1.10 void smtp_helo (connection_t ∗ *con*)

Process an SMTP HELO command.

See also:

smtp_parse_helo_domain()

Note:

Any prior domain specified by a HELO/EHLO command will be overwritten.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 127 of file smtp.c.

References con_print(), con_write_bl(), server_t::domain, smtp_session_t::esmtp, smtp_session_t::helo, connection_t::server, connection_t::smtp, smtp_parse_helo_domain(), st_char_get(), st_cleanup, and st_length_int().

5.439.1.11 void smtp_init (connection_t ∗ *con*)

The start of the protocol handler for the SMTP server.

Parameters:

con the new inbound SMTP client connection.

Returns:

This function returns no value.

Definition at line 1248 of file smtp.c.

References smtp_session_t::bypass, con_print(), con_reverse_enqueue(), server_t::domain, connection_t::server, connection_t::smtp, smtp_bypass_check(), smtp_requeue(), st_char_get(), and st_length_int().

Referenced by protocol_enqueue(), and submission_init().

5.439.1.12 void smtp_invalid (connection_t * *con*)

A function that is executed when an invalid SMTP command is executed.

Returns:

This function returns no value.

Definition at line 176 of file smtp.c.

References con_write_bl(), server_t::delay, connection_t::protocol, connection_t::server, server_t::violations, and connection_t::violations.

Referenced by smtp_process().

5.439.1.13 void smtp_mail_from (connection_t * *con*)

Specify the identity of a message's sender, in response to an SMTP MAIL FROM command.

See also:

smtp_parse_mail_from_path()

Note:

This command must be preceded by a HELO command and successful authentication. Any prior email address specified by a MAIL FROM command will be overwritten. If the SIZE parameter was specified with the MAIL FROM command, its value will be compared to the maximum value specified in the smtp.message_length_limit configuration option.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 57 of file smtp.c.

References smtp_session_t::authenticated, con_write_bl(), smtp_session_t::helo, magma, smtp_session_t::mailfrom, magma_t::message_length_limit, magma_t::smtp, connection_t::smtp, smtp_parse_mail_from_path(), smtp_session_reset(), st_free(), and smtp_session_t::suggested_length.

5.439.1.14 void smtp_noop (connection_t * *con*)

Perform an SMTP NOOP (no-operation) command.

Note:

This command does essentially nothing and is mostly a way to keep connections alive without timing out due to inactivity.

Returns:

This function returns no value.

Definition at line 152 of file smtp.c.

References con_write_bl().

5.439.1.15 void smtp_quit (connection_t ∗ *con*)

Gracefully terminate an SMTP session, especially in response to an SMTP QUIT command.

Note:

The standards specify that the receiver MUST send an OK reply, and then close the transmission channel.

Parameters:

the SMTP client connection to be terminated.

Returns:

This function returns no value.

Definition at line 191 of file smtp.c.

References con_destroy(), con_status(), and con_write_bl().

Referenced by smtp_data(), smtp_process(), and smtp_requeue().

5.439.1.16 void smtp_rcpt_to (connection_t ∗ *con*)

BUG: Detect messages 'from' a local user/domain and tell them to authenticate first.

Definition at line 531 of file smtp.c.

References magma_t::abuse, magma_t::admin, auth_sanitize_address(), smtp_session_t::authenticated, smtp_session_t::bypass, smtp_session_t::checked, con_addr(), con_addr_presentation(), con_print(), con_secure(), con_write_bl(), magma_t::contact, smtp_inbound_prefs_t::daily_recv_limit, smtp_inbound_prefs_t::daily_recv_limit_ip, smtp_outbound_prefs_t::daily_send_limit, smtp_inbound_prefs_t::forwarded, smtp_inbound_prefs_t::greylist, smtp_inbound_prefs_t::greytime, smtp_session_t::helo, lower_st(), magma, mail_domain_get(), smtp_session_t::mailfrom, MANAGEDBUF, smtp_session_t::max_length, MEMORYBUF, smtp_session_t::num_recipients, smtp_session_t::out_prefs, smtp_inbound_prefs_t::overquota, pl_null(), placer_t, smtp_session_t::rbl, smtp_inbound_prefs_t::rbl, smtp_inbound_prefs_t::rblaction, smtp_inbound_prefs_t::rcpttto, magma_t::recipient_limit, smtp_inbound_prefs_t::recv_size_limit, smtp_inbound_prefs_t::rollout, smtp_outbound_prefs_t::send_size_limit, smtp_outbound_prefs_t::sent_today, magma_t::smtp, connection_t::smtp, SMTP_ACTION_REJECT, smtp_add_inbound(), smtp_add_recipient(), smtp_check_duplicate_recipient(), smtp_check_greylist(), smtp_check_rbl(), smtp_check_receive_quota(), smtp_fetch_inbound(), smtp_free_inbound(), smtp_parse_rcpt_to(), smtp_session_t::spf, smtp_inbound_prefs_t::spf, spf_check(), smtp_inbound_prefs_t::spfaction, st_char_get(), st_cmp_ci_eq(), st_free(), st_length_int(), smtp_session_t::suggested_length, smtp_outbound_prefs_t::tls, and smtp_inbound_prefs_t::usernum.

5.439.1.17 void smtp_rset (connection_t ∗ *con*)

Reset the SMTP session, in response to an SMTP RSET command.

Note:

This command clears any sender, recipient, and mail data, along with all buffers and state tables. The connection structure is reset to the same it was in immediately after the HELO/EHLO command.

Parameters:

con the SMTP client connection issuing the command.

Returns:

This function returns no value.

Definition at line 215 of file smtp.c.

References con_write_bl(), and smtp_session_reset().

5.439.1.18 void smtp_starttls (connection_t * *con*)

TODO: Review error messages and update them with the appropriate response code. Initialize a TLS session for an unauthenticated SMTP session.

Parameters:

con the connection of the SMTP endpoint requesting the transport layer security upgrade.

Returns:

This function returns no value.

Definition at line 17 of file smtp.c.

References connection_t::buffer, con_secure(), con_write_bl(), connection_t::line, log_pedantic, M_SSL_BIO_NOCLOSE, connection_t::network, pl_null(), connection_t::server, smtp_session_reset(), connection_t::sockd, st_length_set(), stats_increment_by_name(), connection_t::status, connection_t::tls, and tls_server_alloc().

5.439.1.19 void submission_init (connection_t * *con*)

Definition at line 1265 of file smtp.c.

References connection_t::smtp, smtp_init(), and smtp_session_t::submission.

Referenced by protocol_enqueue().

5.440 src/servers/smtp/transmit.c File Reference

```
#include "magma.h"
```

Functions

- int_t smtp_relay_message (connection_t ∗con, stringer_t ∗∗result)

  Relay an outbound smtp message for a user.

- int_t smtp_forward_message (server_t ∗server, stringer_t ∗sender, stringer_t ∗address, stringer_t ∗message, stringer_t ∗id, int_t mark, uint64_t signum, uint64_t sigkey)
- int_t smtp_bounce (connection_t ∗con)

  transmit.c

- int_t smtp_reply (stringer_t ∗from, stringer_t ∗to, uint64_t usernum, uint64_t autoreply, int_t spf, int_t dkim)
- int_t smtp_send_message (stringer_t ∗to, stringer_t ∗from, stringer_t ∗message)

  Relay an outbound smtp message for the user.

5.440.1 Function Documentation

5.440.1.1 int_t smtp_bounce (connection_t ∗ *con*)

transmit.c

Definition at line 179 of file transmit.c.

References smtp_session_t::checked, crc64_checksum(), smtp_session_t::dkim, dkim_signature_create(), magma_t::domain, smtp_session_t::in_prefs, log_pedantic, magma, smtp_session_t::mailfrom, MANAGEDBUF, smtp_session_t::message, smtp_inbound_prefs_t::next, number, smtp_inbound_prefs_t::outcome, rand_choices(), smtp_inbound_prefs_t::rcptto, connection_t::smtp, smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_nullfrom(), smtp_client_send_rcptto(), SMTP_OUTCOME_BOUNCE_DKIM, SMTP_OUTCOME_BOUNCE_PHISH, SMTP_OUTCOME_BOUNCE_RBL, SMTP_OUTCOME_BOUNCE_SPAM, SMTP_OUTCOME_BOUNCE_SPF, SMTP_OUTCOME_BOUNCE_VIRUS, SMTP_OUTCOME_PERM_FAILURE, SMTP_OUTCOME_SUCESS, SMTP_OUTCOME_TEMP_LOCKED, SMTP_OUTCOME_TEMP_OVERQUOTA, SMTP_OUTCOME_TEMP_SERVER, smtp_session_t::spf, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_free(), st_length_int(), st_merge, st_sprint(), magma_t::system, and smtp_message_t::text.

Referenced by smtp_accept_message().

5.440.1.3 int_t smtp_relay_message (connection_t ∗ *con*, stringer_t ∗∗ *result*)

Relay an outbound smtp message for a user.

Note:

The following process occurs before the message will be sent: 1. Necessary outbound headers are attached to the message.∗ 2. An outbound connection to a mail relay server is established (with a premium or normal server pool). 3. Once the connection is negotiated, an RCPT TO command is issued for each of the message's recipients. 4. The mail message data is sent and the client connection is closed.

Parameters:

con a pointer to the connection object across which the outbound mail was attempted to be sent.

result a pointer to the address of a managed string that will receive the server's last response to the mail send attempt, regardless of whether or not it was successful.

Returns:

1 if the message was successfully sent or -1 on failure.

Definition at line 22 of file transmit.c.

References smtp_recipients_t::address, CONTIGUOUS, HEAP, smtp_outbound_prefs_t::importance, client_t::line, log_pedantic, mail_add_outbound_headers(), smtp_session_t::mailfrom, MANAGED_T, smtp_session_t::message, smtp_recipients_t::next, smtp_session_t::out_prefs, PLACER, smtp_outbound_prefs_t::recipients, connection_t::smtp, smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), smtp_client_send_rcptto(), st_dupe_opts(), st_replace(), and smtp_message_t::text.

Referenced by smtp_data_outbound().

5.440.1.4 int_t smtp_reply (stringer_t ∗ *from*, stringer_t ∗ *to*, uint64_t *usernum*, uint64_t *autoreply*, int_t *spf*, int_t *dkim*)

Definition at line 363 of file transmit.c.

Referenced by smtp_accept_message().

5.440.1.5 int_t smtp_send_message (stringer_t ∗ *to*, stringer_t ∗ *from*, stringer_t ∗ *message*)

Relay an outbound smtp message for the user.

Parameters:

to a managed string containing the name of the mail recipient.

from a managed string containing the address from which the email is being sent.

message a managed string containing the raw body of the mail message.

Returns:

-1 on error or 1 on success.

Definition at line 503 of file transmit.c.

References log_pedantic, smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), and smtp_client_send_rcptto().

5.441 src/web/contact/abuse.c File Reference

```
#include "magma.h"
```

Functions

- void contact_abuse_increment_history (connection_t *con)

  Increment the contact abuse history counter for an IP address.

- bool_t contact_abuse_checks (connection_t *con, chr_t *branch)

  Check to see that a client from a given IP address hasn't exceeded its daily quota of contact requests.

5.441.1 Function Documentation

5.441.1.1 bool_t contact_abuse_checks (connection_t * *con*, chr_t * *branch*)

Check to see that a client from a given IP address hasn't exceeded its daily quota of contact requests. abuse.c

Note:

Each IP address will be limited to at most 2 contact requests in any 24-hour period.

Parameters:

con a pointer to the connection object of the remote host making the contact request.

branch a null-terminated string specifying where the contact request was directed ("Abuse" or "Contact").

Returns:

true if the specified connection failed the abuse check or false if it did not.

Definition at line 34 of file abuse.c.

References cache_get_u64(), con_addr_presentation(), contact_print_message(), MANAGEDBUF, st_char_get(), st_length_int(), and st_sprint().

Referenced by contact_process().

5.441.1.2 void contact_abuse_increment_history (connection_t * *con*)

Increment the contact abuse history counter for an IP address.

Parameters:

con a pointer to the connection object of the remote host making the contact request.

Returns:

This function returns no value.

Definition at line 15 of file abuse.c.

References cache_increment(), con_addr_presentation(), MANAGEDBUF, st_char_get(), st_length_int(), and st_sprint().

Referenced by contact_business().

5.442 src/web/register/abuse.c File Reference

```
#include "magma.h"
```

Functions

- void register_blocklist_free (void)
  Free a registration blocked list.
- void register_blocklist_update (void)
  Update the registration blocklist from the database.
- bool_t register_abuse_check_blocklist (connection_t ∗con)
  Check to see if the remote client is on the registration blocklist; if so, increment the web registration blocked counter.
- void register_abuse_increment_history (connection_t ∗con)
  Increment the registration abuse counter for the requesting IP address.
- bool_t register_abuse_checks (connection_t ∗con)
  Check to see if a registration request is allowed by a remote host; if not, display a banner.

Variables

- inx_t ∗ register_blocklist = NULL
- pthread_rwlock_t register_blocklist_lock = PTHREAD_RWLOCK_INITIALIZER

5.442.1 Function Documentation

5.442.1.1 bool_t register_abuse_check_blocklist (connection_t ∗ *con*)

Check to see if the remote client is on the registration blocklist; if so, increment the web registration blocked counter. abuse.c

Parameters:

con the client connection to be checked.

Returns:

false if the check was passed, or true if the connection was made from an IP on the blocklist.

Definition at line 58 of file abuse.c.

References con_addr_standard(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MANAGEDBUF, register_-blocklist_lock, rwlock_lock_read(), rwlock_unlock(), st_char_get(), st_cmp_ci_starts(), st_length_get(), and stats_increment_by_name().

Referenced by register_abuse_checks().

5.442.1.2 bool_t register_abuse_checks (connection_t ∗ *con*)

Check to see if a registration request is allowed by a remote host; if not, display a banner.

Parameters:

con the remote connection to be checked.

Returns:

false if registration is allowed or true if not (remote host is on blocklist or registration has beean throttled).

Definition at line 112 of file abuse.c.

References cache_get_u64(), con_addr_presentation(), con_addr_standard(), MANAGEDBUF, NULLER, register_abuse_check_blocklist(), register_print_message(), and st_char_get().

Referenced by register_process().

5.442.1.3 void register_abuse_increment_history (connection_t ∗ *con*)

Increment the registration abuse counter for the requesting IP address.

Parameters:

con a pointer to the connection object of the client making the registration request.

Returns:

This function returns nov alue.

Definition at line 95 of file abuse.c.

References cache_increment(), con_addr_standard(), MANAGEDBUF, NULLER, and st_char_get().

Referenced by api_endpoint_register(), and register_business_step2().

5.442.1.4 void register_blocklist_free (void)

Free a registration blocked list.

Returns:

This function returns no value.

Definition at line 18 of file abuse.c.

References inx_free().

5.442.1.5 void register_blocklist_update (void)

Update the registration blocklist from the database.

Returns:

This function returns no value.

Definition at line 32 of file abuse.c.

References inx_free(), register_blocklist_lock, register_data_fetch_blocklist(), rwlock_lock_write(), and rwlock_unlock().

#include "magma.h"
```

Functions

- http_page_t ∗ contact_business_add_error (chr_t ∗branch, uchr_t ∗xpath, uchr_t ∗id, uchr_t ∗message)

  Return the contact/abuse page with a marked error indicator for the user in the event of a user submission error.

- bool_t contact_business_valid_email (stringer_t ∗email)

  Validate an email address.

- void contact_business (connection_t ∗con, chr_t ∗branch)

  Send the contents of a user submitted contact/abuse form to the configured contact email address.

5.443.1 Function Documentation

5.443.1.1 void contact_business (connection_t ∗ *con*, chr_t ∗ *branch*)

Send the contents of a user submitted contact/abuse form to the configured contact email address. business.c

Parameters:

con the connection of the web client making the request.

branch a null-terminated string containing the destination of the contact form: either "Abuse" or "Contact".

Returns:

This function returns no value.

Definition at line 127 of file business.c.

References magma_t::abuse, magma_t::admin, con_addr_presentation(), magma_t::contact, contact_abuse_increment_history(), contact_business_add_error(), contact_business_valid_email(), contact_print_form(), contact_print_message(), http_data_get(), HTTP_DATA_POST, log_error, magma, MANAGEDBUF, NULLER, PLACER, smtp_send_message(), st_cmp_cs_eq(), st_free(), st_merge, st_replace(), and http_data_t::value.

Referenced by contact_process().

5.443.1.2 http_page_t∗ contact_business_add_error (chr_t ∗ *branch*, uchr_t ∗ *xpath*, uchr_t ∗ *id*, uchr_t ∗ *message*)

Return the contact/abuse page with a marked error indicator for the user in the event of a user submission error.

Parameters:

branch a null-terminated string containing the source of the error: "Abuse" or "Contact"

xpath a null-terminated string containing the xpath of the element in the returned page that should be colored red.

id a null-terminated string containing the id of the error text element to be added to the document.

message a null-terminated string containing the actual error message text to be displayed to the user.

Returns:

NULL on failure, or a pointer to the processed contact page with error message on success.

Definition at line 18 of file business.c.

```
#include "magma.h"
```

Functions

- bool_t register_business_validate_password (stringer_t *password)
  Determine whether a registered password is valid.
- int_t register_business_validate_username (stringer_t *username)
  Determine whether a registered username is valid.
- chr_t * register_business_step1 (connection_t *con, register_session_t *reg)
  Perform verification checking on all step 1 completed user fields.
- chr_t * register_business_step2 (connection_t *con, register_session_t *reg)
  Perform verification checking on all step 2 completed user fields, and display a welcome banner on success.

5.444.1 Function Documentation

5.444.1.1 chr_t* register_business_step1 (connection_t * *con*, register_session_t * *reg*)

Perform verification checking on all step 1 completed user fields. business.c

Note:

Checks include captcha verification, username validation, and password reentry verification and validation.

Parameters:

con the underlying client connection.

reg the underlying registration session.

Returns:

NULL on success, or a descriptive error string on failure.

Definition at line 106 of file business.c.

References data, http_data_get(), HTTP_DATA_POST, register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, lower_-st(), register_session_t::password, register_business_validate_password(), register_business_validate_username(), register_data_check_-username(), REGISTER_PASSWORD_MAX_LENGTH, REGISTER_PASSWORD_MIN_LENGTH, st_char_get(), st_cmp_ci_eq(), st_-dupe(), st_length_int(), register_session_t::username, and http_data_t::value.

Referenced by register_process().

5.444.1.2 chr_t* register_business_step2 (connection_t * *con*, register_session_t * *reg*)

Perform verification checking on all step 2 completed user fields, and display a welcome banner on success.

Note:

Checks include plan type validation, and billing information processing. After step 2, the user's supplied information will be persisted into the database.

Parameters:

con the underlying client connection.

reg the underlying registration session.

Returns:

NULL on success, or a descriptive error string on failure.

Definition at line 174 of file business.c.

References magma_t::admin, magma_t::contact, data, magma_t::domain, http_data_get(), HTTP_DATA_POST, log_pedantic, magma, register_session_t::password, PLACER, register_session_t::plan, register_abuse_increment_history(), register_data_insert_user(), smtp_send_message(), st_cleanup, st_cmp_cs_eq(), st_dupe(), st_merge, magma_t::system, tran_commit(), tran_rollback(), tran_start(), register_session_t::username, register_session_t::usernum, and http_data_t::value.

Referenced by register_process().

5.444.1.3 bool_t register_business_validate_password (stringer_t * *password*)

Determine whether a registered password is valid.

Note:

Each password must be between REGISTER_PASSWORD_MIN_LENGTH (5) and REGISTER_PASSWORD_MAX_LENGTH (200) characters long.

Parameters:

password the user's password to be evaluated.

Returns:

false on failure (too long, too short, or bad characters) or true on success.

Definition at line 16 of file business.c.

References length, REGISTER_PASSWORD_MAX_LENGTH, st_char_get(), and st_length_get().

Referenced by register_business_step1().

5.444.1.4 int_t register_business_validate_username (stringer_t * *username*)

Determine whether a registered username is valid.

Parameters:

username a managed string containing the proposed username to be evaluated.

Returns:

-1 or 0 on failure (too long, too short, or bad characters) or 1 on success.

Definition at line 48 of file business.c.

References length, REGISTER_USERNAME_MAX_LENGTH, st_char_get(), and st_length_get().

Referenced by register_business_step1().

Functions

- void contact_print_message (connection_t ∗con, chr_t ∗branch, chr_t ∗message)

  Display the contact or abuse notification form to the requesting user.

- void contact_print_form (connection_t ∗con, chr_t ∗branch, http_page_t ∗page)

  Display the contact or abuse form to the user.

- void contact_process (connection_t ∗con, chr_t ∗branch)

  Process all user contact requests.

5.445.1 Function Documentation

5.445.1.1 void contact_print_form (connection_t ∗ *con*, chr_t ∗ *branch*, http_page_t ∗ *page*)

Display the contact or abuse form to the user. contact.c

Parameters:

con the connection across which the form will be returned.

branch a null-terminated string specifying the type of contact, either "Contact" or "Abuse".

page a pointer to an http page containing the contact document to be populated with the user's name, email, and message.

Returns:

This function returns no value.

Definition at line 71 of file contact.c.

References con_write_st(), contact_print_message(), http_page_t::content, data, http_page_t::doc_obj, http_data_get(), HTTP_DATA_POST, http_page_free(), http_page_get(), http_response_header(), mm_cleanup, NULLER, PLACER, st_char_get(), st_cmp_cs_eq(), st_free(), st_-length_get(), http_content_t::type, http_data_t::value, xml_dump_doc(), xml_encode(), xml_set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by contact_business(), and contact_process().

5.445.1.2 void contact_print_message (connection_t ∗ *con*, chr_t ∗ *branch*, chr_t ∗ *message*)

Display the contact or abuse notification form to the requesting user.

Note:

Both the contact and abuse forms operate on the underlying template found in "contact/message"

Parameters:

con a pointer to the connection object across which the response will be sent.

branch a null-terminated string specifying the type of contact, either "Contact" or "Abuse".

message a null-terminated string pointing to a custom message to be displayed to the user.

Returns:

This function returns no value.

Definition at line 18 of file contact.c.

References con_write_st(), http_page_t::content, http_page_t::doc_obj, http_page_free(), http_page_get(), http_print_500(), http_print_500_log(), http_response_header(), NULLER, PLACER, st_cmp_cs_eq(), st_free(), st_length_get(), http_content_t::type, xml_dump_doc(), xml_set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by contact_abuse_checks(), contact_business(), and contact_print_form().

5.445.1.3 void contact_process (connection_t * *con*, chr_t * *branch*)

Process all user contact requests.

Parameters:

con a pointer to the connection object generating the contact request.

branch a null-terminated string specifying the request type (can be "Abuse" or "Contact").

Definition at line 122 of file contact.c.

References con_secure(), contact_abuse_checks(), contact_business(), contact_print_form(), connection_t::http, http_data_get(), HTTP_DATA_POST, HTTP_PARSE_PAIRS, http_print_301(), NULLER, PLACER, and st_cmp_cs_eq().

Referenced by http_response().

Functions

- bool_t contact_abuse_checks (connection_t *con, chr_t *branch)
  abuse.c
- void contact_abuse_increment_history (connection_t *con)
  Increment the contact abuse history counter for an IP address.
- void contact_business (connection_t *con, chr_t *branch)
  business.c
- http_page_t * contact_business_add_error (chr_t *branch, uchr_t *xpath, uchr_t *id, uchr_t *message)
  Return the contact/abuse page with a marked error indicator for the user in the event of a user submission error.
- bool_t contact_business_valid_email (stringer_t *email)
  Validate an email address.
- void contact_print_form (connection_t *con, chr_t *branch, http_page_t *page)
  contact.c
- void contact_print_message (connection_t *con, chr_t *branch, chr_t *message)
  Display the contact or abuse notification form to the requesting user.
- void contact_process (connection_t *con, chr_t *branch)
  Process all user contact requests.

5.446.1 Function Documentation

5.446.1.1 bool_t contact_abuse_checks (connection_t * *con*, chr_t * *branch*)

abuse.c abuse.c

Note:

Each IP address will be limited to at most 2 contact requests in any 24-hour period.

Parameters:

con a pointer to the connection object of the remote host making the contact request.

branch a null-terminated string specifying where the contact request was directed ("Abuse" or "Contact").

Returns:

true if the specified connection failed the abuse check or false if it did not.

Definition at line 34 of file abuse.c.

References cache_get_u64(), con_addr_presentation(), contact_print_message(), MANAGEDBUF, st_char_get(), st_length_int(), and st_sprint().

Referenced by contact_process().

5.446.1.2 void contact_abuse_increment_history (connection_t * *con*)

Increment the contact abuse history counter for an IP address.

Parameters:

con a pointer to the connection object of the remote host making the contact request.

Returns:

This function returns no value.

Definition at line 15 of file abuse.c.

References cache_increment(), con_addr_presentation(), MANAGEDBUF, st_char_get(), st_length_int(), and st_sprint().

Referenced by contact_business().

5.446.1.3 void contact_business (connection_t * *con*, chr_t * *branch*)

business.c business.c

Parameters:

con the connection of the web client making the request.

branch a null-terminated string containing the destination of the contact form: either "Abuse" or "Contact".

Returns:

This function returns no value.

Definition at line 127 of file business.c.

References magma_t::abuse, magma_t::admin, con_addr_presentation(), magma_t::contact, contact_abuse_increment_history(), contact_business_add_error(), contact_business_valid_email(), contact_print_form(), contact_print_message(), http_data_get(), HTTP_DATA_POST, log_error, magma, MANAGEDBUF, NULLER, PLACER, smtp_send_message(), st_cmp_cs_eq(), st_free(), st_merge, st_replace(), and http_data_t::value.

Referenced by contact_process().

5.446.1.4 http_page_t* contact_business_add_error (chr_t * *branch*, uchr_t * *xpath*, uchr_t * *id*, uchr_t * *message*)

Return the contact/abuse page with a marked error indicator for the user in the event of a user submission error.

Parameters:

branch a null-terminated string containing the source of the error: "Abuse" or "Contact"

xpath a null-terminated string containing the xpath of the element in the returned page that should be colored red.

id a null-terminated string containing the id of the error text element to be added to the document.

message a null-terminated string containing the actual error message text to be displayed to the user.

Returns:

NULL on failure, or a pointer to the processed contact page with error message on success.

Definition at line 18 of file business.c.

References http_page_get(), NULLER, PLACER, st_cmp_cs_eq(), xml_node_add_sibling(), xml_node_free(), xml_node_new(), xml_node_set_content(), xml_node_set_property(), xml_xpath_eval(), and http_page_t::xpath_ctx.

Referenced by contact_business().

5.446.1.5 bool_t contact_business_valid_email (stringer_t * *email*)

Validate an email address.

Parameters:

email a managed string containing the email address to be validated.

Returns:

true if the specified email was valid and false if it was not.

Definition at line 60 of file business.c.

References length, lower_st(), st_char_get(), and st_length_get().

Referenced by config_validate_settings(), and contact_business().

5.446.1.6 void contact_print_form (connection_t * *con*, chr_t * *branch*, http_page_t * *page*)

contact.c contact.c

Parameters:

con the connection across which the form will be returned.

branch a null-terminated string specifying the type of contact, either "Contact" or "Abuse".

page a pointer to an http page containing the contact document to be populated with the user's name, email, and message.

Returns:

This function returns no value.

Definition at line 71 of file contact.c.

References con_write_st(), contact_print_message(), http_page_t::content, data, http_page_t::doc_obj, http_data_get(), HTTP_DATA_POST, http_page_free(), http_page_get(), http_response_header(), mm_cleanup, NULLER, PLACER, st_char_get(), st_cmp_cs_eq(), st_free(), st_length_get(), http_content_t::type, http_data_t::value, xml_dump_doc(), xml_encode(), xml_set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by contact_business(), and contact_process().

5.446.1.7 void contact_print_message (connection_t * *con*, chr_t * *branch*, chr_t * *message*)

Display the contact or abuse notification form to the requesting user.

Note:

Both the contact and abuse forms operate on the underlying template found in "contact/message"

Parameters:

con a pointer to the connection object across which the response will be sent.

branch a null-terminated string specifying the type of contact, either "Contact" or "Abuse".

message a null-terminated string pointing to a custom message to be displayed to the user.

Returns:

This function returns no value.

Definition at line 18 of file contact.c.

References con_write_st(), http_page_t::content, http_page_t::doc_obj, http_page_free(), http_page_get(), http_print_500(), http_print_500_-log(), http_response_header(), NULLER, PLACER, st_cmp_cs_eq(), st_free(), st_length_get(), http_content_t::type, xml_dump_doc(), xml_-set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by contact_abuse_checks(), contact_business(), and contact_print_form().

5.446.1.8 void contact_process (connection_t ∗ *con*, chr_t ∗ *branch*)

Process all user contact requests.

Parameters:

con a pointer to the connection object generating the contact request.

branch a null-terminated string specifying the request type (can be "Abuse" or "Contact").

Definition at line 122 of file contact.c.

References con_secure(), contact_abuse_checks(), contact_business(), contact_print_form(), connection_t::http, http_data_get(), HTTP_-DATA_POST, HTTP_PARSE_PAIRS, http_print_301(), NULLER, PLACER, and st_cmp_cs_eq().

Functions

- unsigned long jansson_flags (void)
- void api_error (connection_t ∗con, int_t http_code, int_t error_code, chr_t ∗message)

  Return a json-rpc error response to the remote client.

- void api_response (connection_t ∗con, int_t http_code, chr_t ∗format,...)

  Generate a json-rpc 2.0 response to a portal request.

5.448.1 Function Documentation

5.448.1.1 void api_error (connection_t ∗ *con*, int_t *http_code*, int_t *error_code*, chr_t ∗ *message*)

Return a json-rpc error response to the remote client.

Parameters:

con a pointer to the connection object across which the response will be sent.

http_code the http response code to be sent to the remote client in the response header.

error_code the numerical error code to be encoded in the json-rpc error message.

message a descriptive error string to be encoded in the json-rpc error message.

Returns:

This function returns no value.

Definition at line 25 of file helpers.c.

References api_response(), and connection_t::http.

Referenced by api_endpoint_auth(), api_endpoint_change_password(), api_endpoint_delete_user(), and api_endpoint_register().

5.448.1.2 void api_response (connection_t ∗ *con*, int_t *http_code*, chr_t ∗ *format*, ...)

Generate a json-rpc 2.0 response to a portal request.

See also:

json_vpack_ex()

Note:

This function indents the json response if specified in the configuration, and also automatically decreases the reference count of any json object that was packed for the reply.

Parameters:

con a pointer to the connection object across which the portal response will be sent.

format a pointer to a format string specifying the construction of the json-rpc response.

va_list a variable arguments style list of parameters to be passed to the json packing function.

Returns:

This function returns no value.

Functions

- void portal_endpoint_sort (void)
  Sort the web portal JSON command table to be ready for binary searches.
- int_t portal_endpoint_compare (const void *compare, const void *command)
  Internal bsearch() comparison function for dispatching the proper portal handler.
- bool_t portal_validate_request (connection_t *con, int err_mask, chr_t *method, bool_t has_params, size_t nparams)
  Verify that a session underlying a portal request has been authenticated.
- void portal_endpoint_error (connection_t *con, int_t http_code, int_t error_code, chr_t *message)
  Return a json-rpc error response to the remote client.
- void portal_endpoint_response (connection_t *con, chr_t *format,...)
  Generate a json-rpc 2.0 response to a portal request.
- void portal_endpoint_auth (connection_t *con)
  Obtain credentials and log a user into portal session in response to an "auth" json-rpc portal request.
- void portal_endpoint_logout (connection_t *con)
  Log a user out of a portal session in response to a "logout" json-rpc portal request.
- void portal_endpoint_alert_list (connection_t *con)
  Get the list of a user's alert messages in response to an "alert.list" json-rpc portal request.
- void portal_endpoint_alert_acknowledge (connection_t *con)
  Process user alert message acknowledgements in response to an "alert.acknowledge" json-rpc portal request.
- void portal_endpoint_aliases (connection_t *con)
  Return the list of a user account's aliases in response to an "aliases" json-rpc portal request.
- void portal_endpoint_cookies (connection_t *con)
  Return whether or not a user is using cookies, in response to a "cookies" json-rpc portal request.
- void portal_endpoint_folders_add (connection_t *con)
  Create a new folder in response to a "folders.add" json-rpc portal request.
- void portal_endpoint_folders_list (connection_t *con)
  Return a list of a user's folders in response to a "folders.list" json-rpc portal request.
- void portal_endpoint_folders_remove (connection_t *con)
  Remove a user's folder in response to a json-rpc "folders.remove" portal request.
- void portal_endpoint_folders_rename (connection_t *con)
  Rename a user's folder in response to a json-rpc "folders.rename" portal request.

- void portal_endpoint_folders_tags (connection_t *con)
- void portal_endpoint_messages_list (connection_t *con)

  Retrieve a list of the user's messages in response to a json-rpc "messages.list" portal request.

- void portal_endpoint_messages_copy (connection_t *con)
- void portal_endpoint_messages_flag (connection_t *con)
- void portal_endpoint_messages_move (connection_t *con)
- void portal_endpoint_messages_remove (connection_t *con)

  Remove a user's mail message in response to a "messages.reomve" json-rpc portal request.

- void portal_endpoint_messages_tags (connection_t *con)

  Get all of the message tags used by a specified user in response to a "messages.tags" json-rpc portal request.

- void portal_endpoint_messages_tag (connection_t *con)

  Perform a tag operation on a user's message, in response to a "messages.tag" json-rpc portal request.

- void portal_endpoint_messages_load (connection_t *con)
- void portal_endpoint_messages_compose (connection_t *con)

  Compose a new message in response to a "messages.compose" json-rpc portal request.

- void portal_endpoint_attachments_add (connection_t *con)

  Add an attachment to a message being composed in response to an "attachments.add" json-rpc portal request.

- void portal_endpoint_attachments_remove (connection_t *con)

  Remove an attachment from a message being composed in response to an "attachments.remove" json-rpc portal request.

- void portal_endpoint_messages_send (connection_t *con)

  Send a composed message in response to a "messages.send" json-rpc portal request.

- void portal_endpoint_contacts_copy (connection_t *con)
- void portal_endpoint_contacts_move (connection_t *con)

  Move a user's contact entry to another contacts folder in response to a "contacts.move" json-rpc portal request.

- void portal_endpoint_contacts_remove (connection_t *con)

  Remove a user's contact entry in response to a "contacts.remove" json-rpc portal request.

- void portal_endpoint_contacts_list (connection_t *con)

  List a user's contacts in response to a "contacts.list" json-rpc portal request.

- void portal_endpoint_contacts_add (connection_t *con)

  Add a contact in response to a "contacts.add" json-rpc portal request.

- void portal_endpoint_contacts_edit (connection_t *con)
- void portal_endpoint_config_edit (connection_t *con)

  Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

- void portal_endpoint_config_load (connection_t *con)

  Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

- void portal_endpoint_contacts_load (connection_t *con)

  Return information for a portal "contacts.load" json-rpc request.

- void portal_endpoint_ad (connection_t *con)

Return advertising information for a portal "ad" json-rpc request.

- void portal_endpoint_search (connection_t *con)
- void portal_endpoint_scrape_add (connection_t *con)
- void portal_endpoint_scrape (connection_t *con)
- void portal_endpoint_attachments_progress (connection_t *con)
- void portal_settings_identity (connection_t *con)

  Return information for a portal "settings.identity" json-rpc request.

- void portal_meta (connection_t *con)

  Return information for a portal "meta" json-rpc request.

- void portal_settings_changepass (connection_t *con)

  Change a user's password in response to a portal "settings.changepass" json-rpc request.

- void portal_endpoint (connection_t *con)

  The entry point for camel requests sent to the portal.

- attachment_t * portal_get_upload_attachment (connection_t *con)

  Get a user's attachment to a message composition uploaded via multipart form data.

- void portal_upload (connection_t *con)

  Process uploaded attachments for messages composed in conjunction with the portal interface.

- void portal_debug (connection_t *con)

  A portal debug function that will be disabled and/or deleted completely in production.

5.451.1 Function Documentation

5.451.1.1 void portal_debug (connection_t * *con*)

A portal debug function that will be disabled and/or deleted completely in production.

Note:

The debug output is displayed LOCALLY in the Magma console.

Definition at line 6213 of file endpoint.c.

5.451.1.2 void portal_endpoint (connection_t * *con*)

The entry point for camel requests sent to the portal. endpoint.c

Parameters:

con the connection object corresponding to the web client making the request.

Returns:

This function returns no value.

Definition at line 5872 of file endpoint.c.

References command, con_localhost(), con_secure(), command_t::function, connection_t::http, HTTP_ERROR_500, HTTP_MERGED, http_parse_context(), HTTP_PORTAL, http_print_301(), http_response_header(), json_integer_value_d, json_loads_d, json_object_get_d, JSON_RPC_2_ERROR_PARSE_MALFORMED, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, JSON_RPC_2_ERROR_SERVER_REQUEST, json_string_value_d, json_type_string_d, command_t::length, log_pedantic, magma, ns_length_get(), PLACER, magma_t::portal, portal_endpoint_compare(), portal_endpoint_error(), portal_methods, sess_create(), st_char_get(), command_t::string, uint64_conv_ns(), and magma_t::web.

Referenced by http_response().

5.451.1.3 void portal_endpoint_ad (connection_t * *con*)

Return advertising information for a portal "ad" json-rpc request. ^ finished / work area v ^ work area / stubs v

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2847 of file endpoint.c.

References connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, portal_endpoint_response(), and portal_validate_request().

5.451.1.4 void portal_endpoint_alert_acknowledge (connection_t * *con*)

Process user alert message acknowledgements in response to an "alert.acknowledge" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 440 of file endpoint.c.

References count, connection_t::http, json_array_get_d, json_array_size_d, json_integer_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, meta_data_acknowledge_alert(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALERT_ACKNOWLEDGE, portal_endpoint_response(), portal_validate_request(), st_char_get(), st_length_get(), tran_commit(), tran_rollback(), and tran_start().

5.451.1.5 void portal_endpoint_alert_list (connection_t * *con*)

Get the list of a user's alert messages in response to an "alert.list" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 392 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_array_append_new_d, json_array_d, json_decref_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, meta_alert_t, meta_data_fetch_alerts(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALERT_LIST, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.451.1.6 void portal_endpoint_aliases (connection_t ∗ *con*)

Return the list of a user account's aliases in response to an "aliases" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 509 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_array_append_new_d, json_array_d, json_decref_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_true_d, log_pedantic, meta_alias_t, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALIASES, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.451.1.7 void portal_endpoint_attachments_add (connection_t ∗ *con*)

Add an attachment to a message being composed in response to an "attachments.add" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1961 of file endpoint.c.

References attachment_t::attach_id, composition_t::attached, composition_t::attachments, attachment_t::filename, connection_t::http, inx_find(), inx_insert(), json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, mm_alloc(), mutex_lock(), mutex_unlock(), ns_length_get(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ATTACHMENTS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_release_attachment(), st_char_get(), st_import(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.8 void portal_endpoint_attachments_progress (connection_t ∗ *con*)

Definition at line 5737 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), PLACER, PORTAL_ENDPOINT_ERROR_ATTACHMENTS_PROGRESS, st_aprint(), st_free(), and st_length_get().

5.451.1.9 void portal_endpoint_attachments_remove (connection_t ∗ *con*)

Remove an attachment from a message being composed in response to an "attachments.remove" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2039 of file endpoint.c.

References composition_t::attachments, connection_t::http, inx_delete(), inx_find(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, mutex_lock(), mutex_unlock(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ATTACHMENTS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.10 void portal_endpoint_auth (connection_t ∗ *con*)

Obtain credentials and log a user into portal session in response to an "auth" json-rpc portal request.

Parameters:

con a pointer to the connection object of the user attempting to log in.

Returns:

This function returns no value.

Definition at line 194 of file endpoint.c.

References auth_free(), auth_login(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_localhost(), con_secure(), meta_user_t::flags, connection_t::http, HTTP_COOKIE_SET, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, log_pedantic, MANAGEDBUF, auth_t::master, meta_get(), META_GET_ALIASES, META_GET_CONTACTS, META_GET_FOLDERS, META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_PROTOCOL_WEB, META_USER_ENCRYPT_DATA, META_USER_TLS, NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AUTH, PORTAL_ENDPOINT_ERROR_MODE, portal_endpoint_response(), connection_t::protocol, auth_t::salt, auth_t::seasoning, SESSION_STATE_AUTHENTICATED, SESSION_STATE_NEUTRAL, st_char_get(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, meta_user_t::usernum, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.451.1.11 int_t portal_endpoint_compare (const void ∗ *compare*, const void ∗ *command*)

Internal bsearch() comparison function for dispatching the proper portal handler.

Parameters:

compare a pointer to a command_t object with a portal method name for string comparison.

command a pointer to a command_t object with a portal method name for string comparison.

Returns:

Definition at line 36 of file endpoint.c.

References command_t::length, PLACER, st_cmp_ci_eq(), and command_t::string.

Referenced by portal_endpoint(), and portal_endpoint_sort().

5.451.1.12 void portal_endpoint_config_edit (connection_t * *con*)

Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

Note:

Requires a user to be authenticated; failure will be communicated to the client via a json response.

Parameters:

con a pointer to a connection object over which the json response will be sent.

Returns:

This function returns no value.

HIGH: We aren't checking/validating the config entries! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2698 of file endpoint.c.

References content, connection_t::http, json_object_iter_d, json_object_iter_key_d, json_object_iter_next_d, json_object_iter_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_string_value_d, NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONFIG_EDIT, portal_endpoint_response(), portal_validate_request(), status, user_config_create(), user_config_edit(), user_config_free(), and user_config_t.

5.451.1.13 void portal_endpoint_config_load (connection_t * *con*)

Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

Note:

Requires a user to be authenticated; failure will be communicated to the client via a json response.

Parameters:

con a pointer to a connection object over which the json response will be sent.

Returns:

This function returns no value.

Definition at line 2757 of file endpoint.c.

References connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, portal_config_collection(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONFIG_LOAD, portal_endpoint_response(), portal_validate_request(), user_config_create(), user_config_free(), and user_config_t.

5.451.1.14 void portal_endpoint_contacts_add (connection_t * *con*)

Add a contact in response to a "contacts.add" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

HIGH: We aren't checking/validating the contact details! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2505 of file endpoint.c.

References contact_create(), contact_edit(), contact_free(), contact_t, contact_validate_detail(), contact_validate_name(), content, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), json_object_get_d, json_object_iter_d, json_object_iter_key_d, json_object_iter_next_d, json_object_iter_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_string_value_d, json_type_string_d, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, magma_folder_find_number(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), NULLER, OBJECT_CONTACTS, PLACER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_CONTACTS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_cmp_ci_eq(), st_cmp_cs_eq(), st_length_get(), status, multi_t::u64, and multi_t::val.

5.451.1.15 void portal_endpoint_contacts_copy (connection_t * *con*)

Note:

If the source and target folder are equal, a copy will be made with a different name.

Definition at line 2211 of file endpoint.c.

References contact_create(), contact_detail_t, contact_edit(), contact_find_number(), contact_free(), contact_t, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, magma_folder_find_number(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, PLACER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_CONTACTS_COPY, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_cleanup, st_length_get(), st_merge, multi_t::u64, and multi_t::val.

5.451.1.16 void portal_endpoint_contacts_edit (connection_t * *con*)

HIGH: We aren't checking/validating the contact details! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2621 of file endpoint.c.

References contact_edit(), contact_find_number(), contact_t, content, connection_t::http, json_object_iter_d, json_object_iter_key_d, json_object_iter_next_d, json_object_iter_value_d, json_object_size_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_string_value_d, json_unpack_ex_d, log_pedantic, magma_folder_find_number(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), NULLER, OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_EDIT, PORTAL_ENDPOINT_ERROR_ILLEGAL_COMBINATION, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_length_get(), and status.

5.451.1.17 void portal_endpoint_contacts_list (connection_t * *con*)

List a user's contacts in response to a "contacts.list" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2436 of file endpoint.c.

References contact_detail_t, contact_t, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_array_append_new_d, json_array_d, json_decref_d, json_object_set_new_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_string_d, json_unpack_ex_d, log_pedantic, magma_folder_find_number(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_LIST, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), st_char_get(), and st_length_get().

5.451.1.18 void portal_endpoint_contacts_load (connection_t ∗ *con*)

Return information for a portal "contacts.load" json-rpc request.

Note:

This function returns the all the stored details about a specified contact entry.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2793 of file endpoint.c.

References contact_t, connection_t::http, inx_find(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, magma_folder_find_number(), portal_contact_details(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_LOAD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.19 void portal_endpoint_contacts_move (connection_t ∗ *con*)

Move a user's contact entry to another contacts folder in response to a "contacts.move" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2318 of file endpoint.c.

References contact_find_number(), contact_move(), contact_t, connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, magma_folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_MOVE, PORTAL_ENDPOINT_ERROR_ILLEGAL_COMBINATION, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_length_get(), and status.

5.451.1.20 void portal_endpoint_contacts_remove (connection_t ∗ *con*)

Remove a user's contact entry in response to a "contacts.remove" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2381 of file endpoint.c.

References contact_delete(), contact_find_number(), contact_t, connection_t::http, inx_delete(), JSON_RPC_2_ERROR_SERVER_-INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, magma_-folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_-ERROR_CONTACTS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_length_get(), status, multi_t::u64, and multi_t::val.

5.451.1.21 void portal_endpoint_cookies (connection_t ∗ *con*)

Return whether or not a user is using cookies, in response to a "cookies" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 559 of file endpoint.c.

References connection_t::http, PLACER, PORTAL_ENDPOINT_ERROR_COOKIES, portal_endpoint_response(), portal_validate_-request(), and st_cmp_ci_starts().

5.451.1.22 void portal_endpoint_error (connection_t ∗ *con*, int_t *http_code*, int_t *error_code*, chr_t ∗ *message*)

Return a json-rpc error response to the remote client.

Parameters:

con a pointer to the connection object across which the response will be sent.

http_code the http response code to be sent to the remote client in the response header.

error_code the numerical error code to be encoded in the json-rpc error message.

message a descriptive error string to be encoded in the json-rpc error message.

Returns:

This function returns no value.

Definition at line 124 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), json_decref_d, json_dumps_d, json_pack_ex_-d, log_options, log_pedantic, M_LOG_CRITICAL, M_LOG_STACK_TRACE, magma, ns_append(), ns_free(), ns_length_get(), NULLER, PLACER, magma_t::portal, and magma_t::web.

5.451.1.23 void portal_endpoint_folders_add (connection_t * *con*)

Create a new folder in response to a "folders.add" json-rpc portal request.

Note:

Currently only contexts for new mail folders and contacts folders are supported.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 582 of file endpoint.c.

References count, connection_t::http, json_object_size_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_-SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, ns_length_get(), NULLER, PORTAL_ENDPOINT_CONTEXT_-CONTACTS, PORTAL_ENDPOINT_CONTEXT_INVALID, PORTAL_ENDPOINT_CONTEXT_MAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_INVALID_KEYWORD, portal_folder_contacts_-add(), portal_folder_mail_add(), portal_parse_context(), portal_validate_request(), st_char_get(), st_free(), st_import(), and st_length_get().

5.451.1.24 void portal_endpoint_folders_list (connection_t * *con*)

Return a list of a user's folders in response to a "folders.list" json-rpc portal request.

Note:

Currently only contexts for new mail folders and contacts folders are supported.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

LOW: User created folder names _could_ have a NULL byte. How should we handle that?

LOW: User created folder names _could_ have a NULL byte. How should we handle that?

Definition at line 643 of file endpoint.c.

5.451.1.25 void portal_endpoint_folders_remove (connection_t * *con*)

Remove a user's folder in response to a json-rpc "folders.remove" portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 726 of file endpoint.c.

References connection_t::http, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, NULLER, PORTAL_ENDPOINT_CONTEXT_CONTACTS, PORTAL_ENDPOINT_CONTEXT_INVALID, PORTAL_ENDPOINT_CONTEXT_-MAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_REMOVE, PORTAL_ENDPOINT_ERROR_INVALID_-KEYWORD, portal_folder_contacts_remove(), portal_folder_mail_remove(), portal_parse_context(), portal_validate_request(), st_char_-get(), and st_length_get().

5.451.1.26 void portal_endpoint_folders_rename (connection_t ∗ *con*)

Rename a user's folder in response to a json-rpc "folders.rename" portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

HIGH: Use the context and act appropriately!

Definition at line 767 of file endpoint.c.

5.451.1.27 void portal_endpoint_folders_tags (connection_t ∗ *con*)

HIGH: Right now we only have indexes with the mail folders so other context types generate an empty array result.

Definition at line 912 of file endpoint.c.

References meta_stats_tag_t::count, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_decref_d, json_integer_d, json_object_d, json_object_set_new_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, meta_folders_by_number(), meta_folders_-stats_tags(), meta_user_rlock(), meta_user_unlock(), NULLER, PORTAL_ENDPOINT_CONTEXT_MAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_TAGS, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_-parse_context(), portal_validate_request(), st_char_get(), st_length_get(), stats, and meta_stats_tag_t::tag.

5.451.1.28 void portal_endpoint_logout (connection_t ∗ *con*)

Log a user out of a portal session in response to a "logout" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 370 of file endpoint.c.

References connection_t::http, HTTP_COOKIE_DELETE, META_PROTOCOL_WEB, meta_user_ref_dec(), PORTAL_ENDPOINT_-ERROR_LOGOUT, portal_endpoint_response(), portal_validate_request(), and SESSION_STATE_TERMINATED.

5.451.1.29 void portal_endpoint_messages_compose (connection_t * *con*)

Compose a new message in response to a "messages.compose" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1901 of file endpoint.c.

References composition_t::attachments, composition_t::comp_id, connection_t::http, inx_alloc(), inx_find(), inx_insert(), json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_error, M_INX_LINKED, M_TYPE_UINT64, mm_alloc(), mutex_-lock(), mutex_unlock(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_COMPOSE, portal_endpoint_response(), portal_validate_request(), sess_release_attachment(), sess_release_composition(), multi_t::u64, and multi_t::val.

5.451.1.30 void portal_endpoint_messages_copy (connection_t * *con*)

HIGH: If a multiple message copy fails in the middle, go back and remove any messages that may have been copied before the error.

Definition at line 1075 of file endpoint.c.

References count, meta_message_t::foldernum, connection_t::http, inx_find(), json_array_append_new_d, json_array_d, json_array_get_-d, json_array_size_d, json_decref_d, json_integer_value_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_-2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, meta_message_t::messagenum, meta_-folders_by_number(), META_LOCKED, meta_messages_copier(), meta_messages_update_sequences(), meta_user_unlock(), meta_user_-wlock(), OBJECT_MESSAGES, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_COPY, PORTAL_ENDPOINT_-ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), serial_get(), serial_increment(), sess_trigger(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.31 void portal_endpoint_messages_flag (connection_t * *con*)

HIGH: This function needs restructuring pretty badly. We are setting collection to NULL so we can add a cleanup call below. But if the function works as intended the reference is stolen by the response. but if an error occurs and the we don't return a response the collection ends up as a memory leak without the cleanup call below.

TODO: Were holding onto the user lock while waiting on the response to be sent over the wire; and this function could probably use a rethink.

HIGH: See the sister comment a few lines back!

Definition at line 1164 of file endpoint.c.

5.451.1.35 void portal_endpoint_messages_remove (connection_t * *con*)

Remove a user's mail message in response to a "messages.reomve" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1459 of file endpoint.c.

References count, meta_message_t::foldernum, connection_t::http, inx_delete(), inx_find(), json_array_get_d, json_array_size_d, json_integer_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, mail_remove_message(), meta_message_t::messagenum, meta_folders_by_number(), meta_messages_update_sequences(), meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), serial_get(), serial_increment(), meta_message_t::server, sess_trigger(), meta_message_t::size, st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.36 void portal_endpoint_messages_send (connection_t * *con*)

Send a composed message in response to a "messages.send" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2095 of file endpoint.c.

References composition_t::attachments, connection_t::http, inx_delete(), inx_find(), inx_free(), json_object_size_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, mutex_lock(), mutex_unlock(), NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ILLEGAL_COMBINATION, PORTAL_ENDPOINT_ERROR_MESSAGES_SEND, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_outbound_checks(), portal_parse_json_str_array(), portal_smtp_create_data(), portal_smtp_relay_message(), portal_validate_request(), st_char_get(), st_free(), st_length_get(), multi_t::u64, and multi_t::val.

5.451.1.37 void portal_endpoint_messages_tag (connection_t * *con*)

Perform a tag operation on a user's message, in response to a "messages.tag" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

LOW: We don't need to add the flag to every message. Just the ones that don't already have the flag.

LOW: Like the line, were not checking whether the message even needs to have the flag removed. Were also not handling remove requests that result in a message having no tags.

If this is going supposed to be a replace operation, we truncate all of the message tags so we can insert the replacements below.

TODO: This is ugly. Were rebuilding the tags array from the database on each iteration because its easier than trying to figure out which slot needs to be removed.

TODO: If the update is triggered before the tagged flag is added to the database the refresh might not pull the data for who recently got tagged! We need to need to look for this type of sequence bug elsewhere too.

LOW: Were holding onto the user lock while were waiting on the response to be sent over the wire; and this function could probably use a rethink.

Definition at line 1599 of file endpoint.c.

5.451.1.38 void portal_endpoint_messages_tags (connection_t * *con*)

Get all of the message tags used by a specified user in response to a "messages.tags" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1548 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_array_append_new_d, json_array_d, json_decref_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_string_d, log_error, log_pedantic, meta_data_fetch_all_tags(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_TAGS, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.451.1.39 void portal_endpoint_response (connection_t * *con*, chr_t * *format*, ...)

Generate a json-rpc 2.0 response to a portal request.

See also:

json_vpack_ex()

Note:

This function indents the json response if specified in the configuration, and also automatically decreases the reference count of any json object that was packed for the reply.

Parameters:

con a pointer to the connection object across which the portal response will be sent.

format a pointer to a format string specifying the construction of the json-rpc response.

... a variable arguments style list of parameters to be passed to the json packing function.

Returns:

This function returns no value.

Definition at line 162 of file endpoint.c.

5.451.1.40 void portal_endpoint_scrape (connection_t * *con*)

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5726 of file endpoint.c.

References JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, and portal_validate_request().

5.451.1.41 void portal_endpoint_scrape_add (connection_t * *con*)

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5710 of file endpoint.c.

References JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, and portal_validate_request().

5.451.1.42 void portal_endpoint_search (connection_t * *con*)

Definition at line 5688 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), PLACER, PORTAL_ENDPOINT_ERROR_-SEARCH, st_aprint(), st_free(), and st_length_get().

5.451.1.43 void portal_endpoint_sort (void)

Sort the web portal JSON command table to be ready for binary searches. TODO: We use session locks to synchronize access to the user context. Should we also be using mailbox cluster locks? Cluster level locking might be appropriate for operations that delete data likes folders.remove and messages.remove.

Returns:

This function returns no value.

Definition at line 21 of file endpoint.c.

References portal_endpoint_compare(), and portal_methods.

Referenced by protocol_init().

5.451.1.44 attachment_t* portal_get_upload_attachment (connection_t * *con*)

Get a user's attachment to a message composition uploaded via multipart form data.

Note:

Parameters:

path a pointer to a managed string containing the full /attach path specified in the client's http POST request.

Definition at line 5962 of file endpoint.c.

References composition_t::attachments, attachment_t::filedata, connection_t::http, inx_find(), log_pedantic, M_TYPE_UINT64, mutex_-lock(), mutex_unlock(), placer_t, tok_get_count_st(), tok_get_st(), multi_t::u64, uint64_conv_st(), and multi_t::val.

Referenced by portal_upload().

5.451.1.45 void portal_meta (connection_t * *con*)

Return information for a portal "meta" json-rpc request.

Note:

This function returns various pieces of information about the user such as their plan type, quota, etc.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5793 of file endpoint.c.

References con_addr_presentation(), connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, MAGMA_PORTAL_VERSION, MANAGEDBUF, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_META, portal_-endpoint_response(), portal_validate_request(), and st_char_get().

5.451.1.46 void portal_settings_changepass (connection_t * *con*)

Change a user's password in response to a portal "settings.changepass" json-rpc request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5830 of file endpoint.c.

References connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, MAGMA_PORTAL_VERSION, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_SETTINGS_CHANGEPASS, portal_endpoint_response(), portal_validate_request(), st_char_get(), and st_length_get().

5.451.1.47 void portal_settings_identity (connection_t * *con*)

Return information for a portal "settings.identity" json-rpc request.

Note:

This function returns the full name, first name, last name, and website of the requested user.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5760 of file endpoint.c.

References connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_SETTINGS_IDENTITY, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.451.1.48 void portal_upload (connection_t * *con*)

Process uploaded attachments for messages composed in conjunction with the portal interface.

Definition at line 6033 of file endpoint.c.

References con_localhost(), con_secure(), data, attachment_t::filedata, get_header_opt(), connection_t::http, http_data_free(), http_data_header_parse_line(), HTTP_ERROR_401, HTTP_ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_MERGED, HTTP_METHOD_POST, http_parse_context(), HTTP_PORTAL, http_print_301(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_error, log_pedantic, magma, multipart_get_boundary(), http_data_t::name, NULLER, pl_char_get(), pl_empty(), pl_length_get(), pl_shrink_before_characters(), pl_skip_characters(), pl_skip_to_characters(), PLACER, placer_t, magma_t::portal, portal_get_upload_attachment(), st_char_get(), st_cmp_ci_eq(), st_import(), st_length_get(), str_tok_get_bl(), str_tok_get_count_bl(), http_data_t::value, and magma_t::web.

Referenced by http_response().

5.451.1.49 bool_t portal_validate_request (connection_t * *con*, int *err_mask*, chr_t * *method*, bool_t *has_params*, size_t *nparams*)

Verify that a session underlying a portal request has been authenticated.

Note:

If the session is not authenticated, an error message will be sent to the client, so the caller only needs to return from its function if this function returns false.

Parameters:

con a pointer to the connection object across which the portal request was made.

err_mask an optional error bitmask to be combined with any portal authentication error code.

method a pointer to a null-terminated string that will be used in an optional error logging message if it is not NULL.

has_params if true, return an error if the authenticated portal session supplied no method parameters; if false, return an error if the authenticated portal supplies params and they're not empty.

nparams if non-zero and has_params is also set, return an error if the portal session's parameters count does not match this value.

Returns:

Functions

- bool_t portal_outbound_checks (uint64_t usernum, stringer_t *username, stringer_t *verification, stringer_t *from, size_t num_recipients, stringer_t *body_plain, stringer_t *body_html, chr_t **errmsg)

  Perform a series of security-related checks on an outbound email message in a transport-independent manner.

- bool_t portal_smtp_relay_message (stringer_t *from, inx_t *to, stringer_t *data, size_t send_size, chr_t **errmsg)

  Send (relay) a message composed by a user via a portal session.

- stringer_t * portal_smtp_create_data (inx_t *attachments, stringer_t *from, inx_t *to, inx_t *cc, inx_t *bcc, stringer_t *subject, stringer_t *body_plain, stringer_t *body_html)

  Create the data of an outbound smtp message that will be specified with the smtp DATA command.

- stringer_t * portal_smtp_merge_headers (inx_t *headers, stringer_t *leading, stringer_t *trailing)

  Merge a list of smtp message headers into a single string, preceded by the leading text and followed by the trailing text.

5.452.1 Function Documentation

5.452.1.1 bool_t portal_outbound_checks (uint64_t *usernum*, stringer_t * *username*, stringer_t * *verification*, stringer_t * *from*, size_t *num_recipients*, stringer_t * *body_plain*, stringer_t * *body_html*, chr_t ** *errmsg*)

Perform a series of security-related checks on an outbound email message in a transport-independent manner. mail.c

See also:

smtp_data_outbound()

Note:

The checks include: Pattern matching for junk mail, authorization for the user to use the email address or domain specified in the From address, and finally, a virus check.

Parameters:

cred a credential structure obtained for the authenticated user's session.

usernum the numerical id of the user attempting to send the message.

from a managed string containing the email address specified as the From address.

nrecipients the number of recipients that will receive the sent message.

body_plain a managed string containing the plain text body of the message.

body_html a managed string containing the html body of the message.

errmsg the address of a pointer to a null-terminated string that will be set to a descriptive error message on failure.

Returns:

true if all security checks were passed or false otherwise.

Definition at line 24 of file mail.c.

References pattern_check(), smtp_check_authorized_from(), smtp_check_transmit_quota(), smtp_fetch_authorization(), and virus_check().

Referenced by portal_endpoint_messages_send().

5.452.1.2 stringer_t* portal_smtp_create_data (inx_t * *attachments*, stringer_t * *from*, inx_t * *to*, inx_t * *cc*, inx_t * *bcc*, stringer_t * *subject*, stringer_t * *body_plain*, stringer_t * *body_html*)

Create the data of an outbound smtp message that will be specified with the smtp DATA command.

Parameters:

attachments an optional inx holder containing a list of attachments to be included in the message.

from a managed string containing the email address sending the message.

to an inx holder containing a list of To: email recipients as managed strings.

cc an inx holder containing a list of 0 or more CC: recipients as managed strings.

bcc an inx holder containing a list of 0 or more BCC: recipients as managed strings.

subject a managed string containing the subject of the message.

body_plain an optional managed string containing the plain text body of the message.

body_html an optional managed string containing the html-formatted body of the message.

Returns:

NULL on failure or a managed string containing the packaged outbound smtp message data on success.

Definition at line 177 of file mail.c.

References ar_append(), ar_free(), ar_length_get(), ARRAY_TYPE_POINTER, attachment_t::filedata, attachment_t::filename, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_reset(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, mail_mime_encode_part(), mail_mime_generate_boundary(), mail_mime_get_smtp_envelope(), st_free(), and st_merge.

Referenced by portal_endpoint_messages_send().

5.452.1.3 stringer_t* portal_smtp_merge_headers (inx_t * *headers*, stringer_t * *leading*, stringer_t * *trailing*)

Merge a list of smtp message headers into a single string, preceded by the leading text and followed by the trailing text.

Parameters:

headers an inx holder containing a collection of header string data to be merged together.

leading a managed string containing text that will lead each header line.

trailing a managed string containing text that will trail each header line.

Returns:

NULL on failure or a managed string containing the merged headers on success.

Definition at line 301 of file mail.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_alloc(), st_cleanup, and st_merge.

5.452.1.4 bool_t portal_smtp_relay_message (stringer_t * *from*, inx_t * *to*, stringer_t * *data*, size_t *send_size*, chr_t ** *errmsg*)

Send (relay) a message composed by a user via a portal session.

See also:

smtp_relay_message() - a lot of logic borrowed from here.

Parameters:

from a pointer to a managed string containing the email address specified as the From address.

to a pointer to a managed string containing the destination email address of the message.

data a pointer to a managed string containing the raw data of the mail message.

send_size if greater than 0, specify the optional SIZE parameter to the MAIL FROM command.

errmsg the address of a pointer to a null-terminated string that will be set to a descriptive error message on failure.

Returns:

true if the mail message was sent successfully, or false otherwise.

Definition at line 86 of file mail.c.

Functions

- void portal_print_login (connection_t *con, chr_t *message)

  Display the http portal login page.

- void portal_process (connection_t *con)

  Process a connection to the web portal.

5.454.1 Function Documentation

5.454.1.1 void portal_print_login (connection_t * *con*, chr_t * *message*)

Display the http portal login page. portal.c

Note:

The portal login page can be found in 'portal/login.template'

Parameters:

con a pointer to the connection object of the client requesting the portal login page.

message a pointer to a null-terminated string that will be displayed to the user in the login page as the contents of the node with the id of "message" in the portal login template.

Returns:

This function returns no value.

Definition at line 18 of file portal.c.

Referenced by portal_process().

5.454.1.2 void portal_process (connection_t * *con*)

Process a connection to the web portal.

Note:

If magma.web.portal.safeguard is set, the user will be redirected to a secure login.

Parameters:

con a pointer to the connection of the http client requesting the portal.

Returns:

This function returns no value.

Definition at line 57 of file portal.c.

References con_localhost(), con_secure(), http_parse_context(), http_print_301(), magma, PLACER, magma_t::portal, portal_print_login(), and magma_t::web.

Functions

- json_t ∗ portal_config_collection (user_config_t ∗collection)

  config.c

- json_t ∗ portal_config_entry (user_config_entry_t ∗entry)
- json_t ∗ portal_config_entry_flags (user_config_entry_t ∗entry)

  Get a user config entry's flags as a json object.

- json_t ∗ portal_contact_detail_flags (contact_detail_t ∗detail)

  contacts.c

- json_t ∗ portal_contact_details (contact_t ∗contact)

  Retrieve all the details about a contact entry as a json object.

- void portal_endpoint (connection_t ∗con)

  endpoint.c

- void portal_endpoint_ad (connection_t ∗con)

  Return advertising information for a portal "ad" json-rpc request.

- void portal_endpoint_alert_acknowledge (connection_t ∗con)

  Process user alert message acknowledgements in response to an "alert.acknowledge" json-rpc portal request.

- void portal_endpoint_alert_list (connection_t ∗con)

  Get the list of a user's alert messages in response to an "alert.list" json-rpc portal request.

- void portal_endpoint_aliases (connection_t ∗con)

  Return the list of a user account's aliases in response to an "aliases" json-rpc portal request.

- void portal_endpoint_attachments_add (connection_t ∗con)

  Add an attachment to a message being composed in response to an "attachments.add" json-rpc portal request.

- void portal_endpoint_attachments_progress (connection_t ∗con)
- void portal_endpoint_attachments_remove (connection_t ∗con)

  Remove an attachment from a message being composed in response to an "attachments.remove" json-rpc portal request.

- void portal_endpoint_auth (connection_t ∗con)

  Obtain credentials and log a user into portal session in response to an "auth" json-rpc portal request.

- int_t portal_endpoint_compare (const void ∗compare, const void ∗command)

  Internal bsearch() comparison function for dispatching the proper portal handler.

- void portal_endpoint_config_edit (connection_t ∗con)

  Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

- void portal_endpoint_config_load (connection_t *con)

  Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

- void portal_endpoint_contacts_add (connection_t *con)

  Add a contact in response to a "contacts.add" json-rpc portal request.

- void portal_endpoint_contacts_copy (connection_t *con)
- void portal_endpoint_contacts_edit (connection_t *con)
- void portal_endpoint_contacts_list (connection_t *con)

  List a user's contacts in response to a "contacts.list" json-rpc portal request.

- void portal_endpoint_contacts_load (connection_t *con)

  Return information for a portal "contacts.load" json-rpc request.

- void portal_endpoint_contacts_move (connection_t *con)

  Move a user's contact entry to another contacts folder in response to a "contacts.move" json-rpc portal request.

- void portal_endpoint_contacts_remove (connection_t *con)

  Remove a user's contact entry in response to a "contacts.remove" json-rpc portal request.

- void portal_endpoint_cookies (connection_t *con)

  Return whether or not a user is using cookies, in response to a "cookies" json-rpc portal request.

- void portal_endpoint_error (connection_t *con, int_t http_code, int_t error_code, chr_t *message)

  Return a json-rpc error response to the remote client.

- void portal_endpoint_folders_add (connection_t *con)

  Create a new folder in response to a "folders.add" json-rpc portal request.

- void portal_endpoint_folders_list (connection_t *con)

  Return a list of a user's folders in response to a "folders.list" json-rpc portal request.

- void portal_endpoint_folders_remove (connection_t *con)

  Remove a user's folder in response to a json-rpc "folders.remove" portal request.

- void portal_endpoint_folders_rename (connection_t *con)

  Rename a user's folder in response to a json-rpc "folders.rename" portal request.

- void portal_endpoint_folders_tags (connection_t *con)
- void portal_endpoint_logout (connection_t *con)

  Log a user out of a portal session in response to a "logout" json-rpc portal request.

- void portal_endpoint_messages_compose (connection_t *con)

  Compose a new message in response to a "messages.compose" json-rpc portal request.

- void portal_endpoint_messages_copy (connection_t *con)
- void portal_endpoint_messages_flag (connection_t *con)
- void portal_endpoint_messages_list (connection_t *con)

  Retrieve a list of the user's messages in response to a json-rpc "messages.list" portal request.

- void portal_endpoint_messages_load (connection_t *con)
- void portal_endpoint_messages_move (connection_t *con)
- void portal_endpoint_messages_remove (connection_t *con)

Remove a user's mail message in response to a "messages.reomve" json-rpc portal request.

- void portal_endpoint_messages_tags (connection_t *con)

  Get all of the message tags used by a specified user in response to a "messages.tags" json-rpc portal request.

- void portal_endpoint_messages_tag (connection_t *con)

  Perform a tag operation on a user's message, in response to a "messages.tag" json-rpc portal request.

- void portal_endpoint_response (connection_t *con, chr_t *format,...)

  Generate a json-rpc 2.0 response to a portal request.

- void portal_endpoint_scrape (connection_t *con)
- void portal_endpoint_scrape_add (connection_t *con)
- void portal_endpoint_search (connection_t *con)
- void portal_settings_identity (connection_t *con)

  Return information for a portal "settings.identity" json-rpc request.

- void portal_meta (connection_t *con)

  Return information for a portal "meta" json-rpc request.

- void portal_endpoint_sort (void)

  Sort the web portal JSON command table to be ready for binary searches.

- void portal_upload (connection_t *con)

  Process uploaded attachments for messages composed in conjunction with the portal interface.

- void portal_endpoint_messages_send (connection_t *con)

  Send a composed message in response to a "messages.send" json-rpc portal request.

- void portal_debug (connection_t *con)

  A portal debug function that will be disabled and/or deleted completely in production.

- bool_t portal_outbound_checks (uint64_t usernum, stringer_t *username, stringer_t *verification, stringer_t *from, size_t num_recipients, stringer_t *body_plain, stringer_t *body_html, chr_t **errmsg)

  mail.c

- bool_t portal_smtp_relay_message (stringer_t *from, inx_t *to, stringer_t *data, size_t send_size, chr_t **errmsg)

  Send (relay) a message composed by a user via a portal session.

- stringer_t * portal_smtp_create_data (inx_t *attachments, stringer_t *from, inx_t *to, inx_t *cc, inx_t *bcc, stringer_t *subject, stringer_t *body_plain, stringer_t *body_html)

  Create the data of an outbound smtp message that will be specified with the smtp DATA command.

- stringer_t * portal_smtp_merge_headers (inx_t *headers, stringer_t *leading, stringer_t *trailing)

  Merge a list of smtp message headers into a single string, preceded by the leading text and followed by the trailing text.

- json_t * portal_message_flags_array (meta_message_t *meta)

  flags.c

- json_t * portal_message_tags_array (meta_message_t *meta)
- int_t portal_parse_flags (json_t *array, uint32_t *flags)
- void portal_folder_contacts_add (connection_t *con, stringer_t *name, uint64_t parent)

  folders.c

- void portal_folder_contacts_remove (connection_t *con, uint64_t foldernum)

  Remove a user's contacts folder.

- void portal_folder_mail_add (connection_t *con, stringer_t *name, uint64_t parent)

  Add a new mail folder for a user.

- void portal_folder_mail_remove (connection_t *con, uint64_t foldernum)

  Remove a user's mail folder.

- json_t * portal_message_attachments (meta_message_t *meta, mail_message_t *data)

  messages.c

- json_t * portal_message_body (meta_message_t *meta, mail_message_t *data)
- json_t * portal_message_header (meta_message_t *meta, mail_message_t *data)

  Build the "header" section response to a rpc-json "messages.load" request.

- json_t * portal_message_meta (meta_message_t *meta)
- json_t * portal_message_security (meta_message_t *meta)
- json_t * portal_message_server (meta_message_t *meta)
- json_t * portal_message_source (meta_message_t *meta)
- json_t * portal_message_info (meta_message_t *meta)

  Build the "info" section response to a rpc-json "messages.load" request.

- inx_t * portal_parse_json_str_array (json_t *json, size_t *nout)

  parse.c

- int_t portal_parse_action (stringer_t *action)
- int_t portal_parse_context (stringer_t *context)

  Parse the context of a requested folder.

- int_t portal_parse_sections (json_t *array, uint32_t *sections)

  Parse the json-rpc messages.load parameter "section" from an array of strings into a bitmask of section flags.

- void portal_print_login (connection_t *con, chr_t *message)

  portal.c

- void portal_process (connection_t *con)

  Process a connection to the web portal.

5.455.3 Function Documentation

5.455.3.1 json_t∗ portal_config_collection (user_config_t ∗ *collection*)

config.c config.c

Parameters:

collection a pointer to a user config object that contains all the config options pairs to be serialized.

Returns:

NULL on failure, or a pointer to a json object containing the collection of user config options on success.

Definition at line 62 of file config.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_decref_d, json_object_d, json_object_set_new_d, log_error, log_options, M_LOG_CRITICAL, portal_config_entry(), st_char_get(), USER_CONF_STATUS_CRITICAL, and user_config_entry_t.

Referenced by portal_endpoint_config_load().

5.455.3.2 json_t∗ portal_config_entry (user_config_entry_t ∗ *entry*)

Definition at line 35 of file config.c.

References json_decref_d, json_pack_ex_d, log_pedantic, portal_config_entry_flags(), st_char_get(), and st_length_int().

Referenced by portal_config_collection().

5.455.3.3 json_t* portal_config_entry_flags (user_config_entry_t * *entry*)

Get a user config entry's flags as a json object.

Parameters:

entry a pointer to the user config entry object to have its flags serialized.

Returns:

NULL on failure or a pointer to a json object storing the user's flags on success.

Definition at line 15 of file config.c.

References json_array_append_new_d, json_array_d, json_decref_d, json_string_d, and USER_CONF_STATUS_CRITICAL.

Referenced by portal_config_entry().

5.455.3.4 json_t* portal_contact_detail_flags (contact_detail_t * *detail*)

contacts.c contacts.c

Pack a json array representing the flags associated with a user contact entry detail.

Parameters:

detail a pointer to the user contact detail to have its flags queried.

Returns:

NULL on failure or a pointer to a json array containing strings describing the specified contact detail's flags.

Definition at line 16 of file contacts.c.

References CONTACT_DETAIL_FLAG_CRITICAL, json_array_append_new_d, json_array_d, and json_string_d.

Referenced by portal_contact_details().

5.455.3.5 json_t* portal_contact_details (contact_t * *contact*)

Retrieve all the details about a contact entry as a json object.

Parameters:

contact a pointer to the contact object whose details will be retrieved.

Returns:

a pointer to a json object containing the details of the specified contact entry.

Definition at line 35 of file contacts.c.

References contact_detail_t, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_array_d, json_decref_d, json_object_set_new_d, json_pack_ex_d, log_error, log_pedantic, portal_contact_detail_flags(), and st_char_get().

Referenced by portal_endpoint_contacts_load().

5.455.3.6 void portal_debug (connection_t * *con*)

A portal debug function that will be disabled and/or deleted completely in production.

Note:

The debug output is displayed LOCALLY in the Magma console.

Definition at line 6213 of file endpoint.c.

5.455.3.7 void portal_endpoint (connection_t ∗ *con*)

endpoint.c endpoint.c

Parameters:

con the connection object corresponding to the web client making the request.

Returns:

This function returns no value.

Definition at line 5872 of file endpoint.c.

References command, con_localhost(), con_secure(), command_t::function, connection_t::http, HTTP_ERROR_500, HTTP_MERGED, http_parse_context(), HTTP_PORTAL, http_print_301(), http_response_header(), json_integer_value_d, json_loads_d, json_object_get_d, JSON_RPC_2_ERROR_PARSE_MALFORMED, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, JSON_RPC_2_ERROR_SERVER_REQUEST, json_string_value_d, json_type_string_d, command_t::length, log_pedantic, magma, ns_length_get(), PLACER, magma_t::portal, portal_endpoint_compare(), portal_endpoint_error(), portal_methods, sess_create(), st_char_get(), command_t::string, uint64_conv_ns(), and magma_t::web.

Referenced by http_response().

5.455.3.8 void portal_endpoint_ad (connection_t ∗ *con*)

Return advertising information for a portal "ad" json-rpc request. ^ finished / work area v ^ work area / stubs v

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2847 of file endpoint.c.

References connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, portal_endpoint_response(), and portal_validate_request().

5.455.3.9 void portal_endpoint_alert_acknowledge (connection_t ∗ *con*)

Process user alert message acknowledgements in response to an "alert.acknowledge" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 440 of file endpoint.c.

References count, connection_t::http, json_array_get_d, json_array_size_d, json_integer_value_d, JSON_RPC_2_ERROR_SERVER_-INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, meta_data_acknowledge_alert(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALERT_ACKNOWLEDGE, portal_endpoint_response(), portal_validate_-request(), st_char_get(), st_length_get(), tran_commit(), tran_rollback(), and tran_start().

5.455.3.10 void portal_endpoint_alert_list (connection_t ∗ *con*)

Get the list of a user's alert messages in response to an "alert.list" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 392 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_array_append_-new_d, json_array_d, json_decref_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, meta_alert_t, meta_-data_fetch_alerts(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALERT_LIST, portal_endpoint_response(), portal_validate_-request(), and st_char_get().

5.455.3.11 void portal_endpoint_aliases (connection_t ∗ *con*)

Return the list of a user account's aliases in response to an "aliases" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 509 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), json_array_append_new_d, json_array_d, json_decref_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_true_d, log_pedantic, meta_alias_t, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ALIASES, portal_endpoint_response(), portal_validate_request(), and st_char_-get().

5.455.3.12 void portal_endpoint_attachments_add (connection_t ∗ *con*)

Add an attachment to a message being composed in response to an "attachments.add" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1961 of file endpoint.c.

References attachment_t::attach_id, composition_t::attached, composition_t::attachments, attachment_t::filename, connection_t::http, inx_find(), inx_insert(), json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, mm_alloc(), mutex_lock(), mutex_unlock(), ns_length_get(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ATTACHMENTS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_release_attachment(), st_char_get(), st_import(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.13 void portal_endpoint_attachments_progress (connection_t * *con*)

Definition at line 5737 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), PLACER, PORTAL_ENDPOINT_ERROR_ATTACHMENTS_PROGRESS, st_aprint(), st_free(), and st_length_get().

5.455.3.14 void portal_endpoint_attachments_remove (connection_t * *con*)

Remove an attachment from a message being composed in response to an "attachments.remove" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2039 of file endpoint.c.

References composition_t::attachments, connection_t::http, inx_delete(), inx_find(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, mutex_lock(), mutex_unlock(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ATTACHMENTS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.15 void portal_endpoint_auth (connection_t * *con*)

Obtain credentials and log a user into portal session in response to an "auth" json-rpc portal request.

Parameters:

con a pointer to the connection object of the user attempting to log in.

Returns:

This function returns no value.

Definition at line 194 of file endpoint.c.

References auth_free(), auth_login(), cache_increment(), con_addr_presentation(), con_addr_subnet(), con_localhost(), con_secure(), meta_user_t::flags, connection_t::http, HTTP_COOKIE_SET, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, auth_t::keys, lock_get(), lock_release(), auth_t::locked, log_info, log_pedantic, MANAGEDBUF, auth_t::master, meta_get(), META_GET_ALIASES, META_GET_CONTACTS, META_GET_FOLDERS, META_GET_KEYS, META_GET_MESSAGES, meta_inx_remove(), META_PROTOCOL_WEB, META_USER_ENCRYPT_DATA, META_USER_TLS, NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AUTH, PORTAL_ENDPOINT_ERROR_MODE, portal_endpoint_response(), connection_t::protocol, auth_t::salt, auth_t::seasoning, SESSION_STATE_AUTHENTICATED, SESSION_STATE_NEUTRAL, st_char_get(), st_length_int(), st_populated, st_quick(), auth_t::status, time_datestamp(), auth_t::tokens, auth_t::username, meta_user_t::usernum, auth_t::usernum, auth_t::verification, and connection_t::violations.

5.455.3.16 int_t portal_endpoint_compare (const void * *compare*, const void * *command*)

Internal bsearch() comparison function for dispatching the proper portal handler.

Parameters:

compare a pointer to a command_t object with a portal method name for string comparison.

command a pointer to a command_t object with a portal method name for string comparison.

Returns:

Definition at line 36 of file endpoint.c.

References command_t::length, PLACER, st_cmp_ci_eq(), and command_t::string.

Referenced by portal_endpoint(), and portal_endpoint_sort().

5.455.3.17 void portal_endpoint_config_edit (connection_t * *con*)

Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

Note:

Requires a user to be authenticated; failure will be communicated to the client via a json response.

Parameters:

con a pointer to a connection object over which the json response will be sent.

Returns:

This function returns no value.

HIGH: We aren't checking/validating the config entries! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2698 of file endpoint.c.

References content, connection_t::http, json_object_iter_d, json_object_iter_key_d, json_object_iter_next_d, json_object_iter_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_string_value_d, NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONFIG_EDIT, portal_endpoint_response(), portal_validate_request(), status, user_config_create(), user_config_edit(), user_config_free(), and user_config_t.

5.455.3.18 void portal_endpoint_config_load (connection_t * *con*)

Retrieve all of a user's config options and return them to the remote client in response to a portal "contacts.load" json-rpc request.

Note:

Requires a user to be authenticated; failure will be communicated to the client via a json response.

Parameters:

con a pointer to a connection object over which the json response will be sent.

Returns:

This function returns no value.

Definition at line 2757 of file endpoint.c.

References connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, portal_config_collection(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONFIG_LOAD, portal_endpoint_response(), portal_validate_request(), user_config_create(), user_-config_free(), and user_config_t.

5.455.3.19 void portal_endpoint_contacts_add (connection_t * *con*)

Add a contact in response to a "contacts.add" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

HIGH: We aren't checking/validating the contact details! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2505 of file endpoint.c.

References contact_create(), contact_edit(), contact_free(), contact_t, contact_validate_detail(), contact_validate_name(), content, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), json_object_get_d, json_-object_iter_d, json_object_iter_key_d, json_object_iter_next_d, json_object_iter_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_string_value_d, json_type_string_d, json_unpack_ex_d, log_pedantic, M_-TYPE_UINT64, magma_folder_find_number(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), NULLER, OBJECT_-CONTACTS, PLACER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_-ERROR_CONTACTS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_-serial_check(), st_char_get(), st_cmp_ci_eq(), st_cmp_cs_eq(), st_length_get(), status, multi_t::u64, and multi_t::val.

5.455.3.20 void portal_endpoint_contacts_copy (connection_t * *con*)

Note:

If the source and target folder are equal, a copy will be made with a different name.

Definition at line 2211 of file endpoint.c.

References contact_create(), contact_detail_t, contact_edit(), contact_find_number(), contact_free(), contact_t, connection_t::http, inx_-cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_insert(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic, M_TYPE_UINT64, magma_-folder_find_number(), meta_user_rlock(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, PLACER, portal_endpoint_-error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_CONTACTS_COPY, PORTAL_-ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_cleanup, st_length_get(), st_merge, multi_t::u64, and multi_t::val.

5.455.3.21 void portal_endpoint_contacts_edit (connection_t * *con*)

HIGH: We aren't checking/validating the contact details! And we should probably do our own duplication checks to avoid placing unnecessary load on the database.

Definition at line 2621 of file endpoint.c.

5.455.3.22 void portal_endpoint_contacts_list (connection_t ∗ *con*)

List a user's contacts in response to a "contacts.list" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2436 of file endpoint.c.

References contact_detail_t, contact_t, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_-next(), json_array_append_new_d, json_array_d, json_decref_d, json_object_set_new_d, json_pack_ex_d, JSON_RPC_2_ERROR_-SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_string_d, json_unpack_ex_d, log_pedantic, magma_folder_find_number(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_LIST, PORTAL_ENDPOINT_-ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), st_char_get(), and st_length_get().

5.455.3.23 void portal_endpoint_contacts_load (connection_t ∗ *con*)

Return information for a portal "contacts.load" json-rpc request.

Note:

This function returns the all the stored details about a specified contact entry.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2793 of file endpoint.c.

References contact_t, connection_t::http, inx_find(), JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_-METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, magma_folder_find_number(), portal_contact_details(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_LOAD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_-endpoint_response(), portal_validate_request(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.24 void portal_endpoint_contacts_move (connection_t ∗ *con*)

Move a user's contact entry to another contacts folder in response to a "contacts.move" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2318 of file endpoint.c.

References contact_find_number(), contact_move(), contact_t, connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_-RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, magma_folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONTACTS_MOVE, PORTAL_-ENDPOINT_ERROR_ILLEGAL_COMBINATION, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_-validate_request(), sess_serial_check(), st_char_get(), st_length_get(), and status.

5.455.3.25 void portal_endpoint_contacts_remove (connection_t ∗ *con*)

Remove a user's contact entry in response to a "contacts.remove" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2381 of file endpoint.c.

References contact_delete(), contact_find_number(), contact_t, connection_t::http, inx_delete(), JSON_RPC_2_ERROR_SERVER_-INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, magma_-folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_-ERROR_CONTACTS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), sess_serial_check(), st_char_get(), st_length_get(), status, multi_t::u64, and multi_t::val.

5.455.3.26 void portal_endpoint_cookies (connection_t ∗ *con*)

Return whether or not a user is using cookies, in response to a "cookies" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 559 of file endpoint.c.

References connection_t::http, PLACER, PORTAL_ENDPOINT_ERROR_COOKIES, portal_endpoint_response(), portal_validate_-request(), and st_cmp_ci_starts().

5.455.3.27 void portal_endpoint_error (connection_t ∗ *con*, int_t *http_code*, int_t *error_code*, chr_t ∗ *message*)

Return a json-rpc error response to the remote client.

Parameters:

con a pointer to the connection object across which the response will be sent.

http_code the http response code to be sent to the remote client in the response header.

error_code the numerical error code to be encoded in the json-rpc error message.

message a descriptive error string to be encoded in the json-rpc error message.

Returns:

This function returns no value.

Definition at line 124 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), json_decref_d, json_dumps_d, json_pack_ex_d, log_options, log_pedantic, M_LOG_CRITICAL, M_LOG_STACK_TRACE, magma, ns_append(), ns_free(), ns_length_get(), NULLER, PLACER, magma_t::portal, and magma_t::web.

5.455.3.28 void portal_endpoint_folders_add (connection_t * *con*)

Create a new folder in response to a "folders.add" json-rpc portal request.

Note:

Currently only contexts for new mail folders and contacts folders are supported.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 582 of file endpoint.c.

References count, connection_t::http, json_object_size_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, ns_length_get(), NULLER, PORTAL_ENDPOINT_CONTEXT_CONTACTS, PORTAL_ENDPOINT_CONTEXT_INVALID, PORTAL_ENDPOINT_CONTEXT_MAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_INVALID_KEYWORD, portal_folder_contacts_add(), portal_folder_mail_add(), portal_parse_context(), portal_validate_request(), st_char_get(), st_free(), st_import(), and st_length_get().

5.455.3.29 void portal_endpoint_folders_list (connection_t * *con*)

Return a list of a user's folders in response to a "folders.list" json-rpc portal request.

Note:

Currently only contexts for new mail folders and contacts folders are supported.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

LOW: User created folder names _could_ have a NULL byte. How should we handle that?

LOW: User created folder names _could_ have a NULL byte. How should we handle that?

5.455.3.32 void portal_endpoint_folders_tags (connection_t ∗ *con*)

HIGH: Right now we only have indexes with the mail folders so other context types generate an empty array result.

Definition at line 912 of file endpoint.c.

References meta_stats_tag_t::count, connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_decref_d, json_integer_d, json_object_d, json_object_set_new_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, meta_folders_by_number(), meta_folders_stats_tags(), meta_user_rlock(), meta_user_unlock(), NULLER, PORTAL_ENDPOINT_CONTEXT_MAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_TAGS, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_parse_context(), portal_validate_request(), st_char_get(), st_length_get(), stats, and meta_stats_tag_t::tag.

5.455.3.33 void portal_endpoint_logout (connection_t ∗ *con*)

Log a user out of a portal session in response to a "logout" json-rpc portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

Definition at line 370 of file endpoint.c.

References connection_t::http, HTTP_COOKIE_DELETE, META_PROTOCOL_WEB, meta_user_ref_dec(), PORTAL_ENDPOINT_ERROR_LOGOUT, portal_endpoint_response(), portal_validate_request(), and SESSION_STATE_TERMINATED.

5.455.3.34 void portal_endpoint_messages_compose (connection_t ∗ *con*)

Compose a new message in response to a "messages.compose" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1901 of file endpoint.c.

References composition_t::attachments, composition_t::comp_id, connection_t::http, inx_alloc(), inx_find(), inx_insert(), json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_error, M_INX_LINKED, M_TYPE_UINT64, mm_alloc(), mutex_lock(), mutex_unlock(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_COMPOSE, portal_endpoint_response(), portal_validate_request(), sess_release_attachment(), sess_release_composition(), multi_t::u64, and multi_t::val.

5.455.3.35 void portal_endpoint_messages_copy (connection_t ∗ *con*)

HIGH: If a multiple message copy fails in the middle, go back and remove any messages that may have been copied before the error.

Definition at line 1075 of file endpoint.c.

References count, meta_message_t::foldernum, connection_t::http, inx_find(), json_array_append_new_d, json_array_d, json_array_get_d, json_array_size_d, json_decref_d, json_integer_value_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, meta_message_t::messagenum, meta_folders_by_number(), META_LOCKED, meta_messages_copier(), meta_messages_update_sequences(), meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_COPY, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), serial_get(), serial_increment(), sess_trigger(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.36 void portal_endpoint_messages_flag (connection_t * *con*)

HIGH: This function needs restructuring pretty badly. We are setting collection to NULL so we can add a cleanup call below. But if the function works as intended the reference is stolen by the response. but if an error occurs and the we don't return a response the collection ends up as a memory leak without the cleanup call below.

TODO: Were holding onto the user lock while waiting on the response to be sent over the wire; and this function could probably use a rethink.

HIGH: See the sister comment a few lines back!

Definition at line 1164 of file endpoint.c.

5.455.3.37 void portal_endpoint_messages_list (connection_t * *con*)

Retrieve a list of the user's messages in response to a json-rpc "messages.list" portal request.

Parameters:

con a pointer to the connection object of the requesting user.

Returns:

This function returns no value.

LOW: Add the ability to track the recipient email address for a message, even if its not provided in the To field.

LOW: Add snippet support.

Definition at line 985 of file endpoint.c.

5.455.3.39 void portal_endpoint_messages_move (connection_t ∗ *con*)

HIGH: If a multiple message copy fails in the middle, go back and remove any messages that may have been copied before the error.

Definition at line 1363 of file endpoint.c.

References count, meta_message_t::foldernum, connection_t::http, inx_find(), json_array_get_d, json_array_size_d, json_integer_-value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, meta_folders_by_number(), META_LOCKED, meta_messages_mover(), meta_messages_update_-sequences(), meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_-ILLEGAL_COMBINATION, PORTAL_ENDPOINT_ERROR_MESSAGES_MOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), serial_get(), serial_increment(), sess_trigger(), st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.40 void portal_endpoint_messages_remove (connection_t ∗ *con*)

Remove a user's mail message in response to a "messages.reomve" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1459 of file endpoint.c.

References count, meta_message_t::foldernum, connection_t::http, inx_delete(), inx_find(), json_array_get_d, json_array_size_-d, json_integer_value_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_pedantic, M_TYPE_UINT64, mail_remove_message(), meta_message_t::messagenum, meta_folders_by_-number(), meta_messages_update_sequences(), meta_user_unlock(), meta_user_wlock(), OBJECT_MESSAGES, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), portal_validate_request(), serial_get(), serial_increment(), meta_message_t::server, sess_trigger(), meta_message_t::size, st_char_get(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.41 void portal_endpoint_messages_send (connection_t ∗ *con*)

Send a composed message in response to a "messages.send" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 2095 of file endpoint.c.

References composition_t::attachments, connection_t::http, inx_delete(), inx_find(), inx_free(), json_object_size_d, JSON_RPC_2_-ERROR_SERVER_INTERNAL, JSON_RPC_2_ERROR_SERVER_METHOD_PARAMS, json_unpack_ex_d, log_error, log_pedantic,

M_TYPE_UINT64, mutex_lock(), mutex_unlock(), NULLER, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_ILLEGAL_-COMBINATION, PORTAL_ENDPOINT_ERROR_MESSAGES_SEND, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_-endpoint_response(), portal_outbound_checks(), portal_parse_json_str_array(), portal_smtp_create_data(), portal_smtp_relay_message(), portal_validate_request(), st_char_get(), st_free(), st_length_get(), multi_t::u64, and multi_t::val.

5.455.3.42 void portal_endpoint_messages_tag (connection_t ∗ *con*)

Perform a tag operation on a user's message, in response to a "messages.tag" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

LOW: We don't need to add the flag to every message. Just the ones that don't already have the flag.

LOW: Like the line, were not checking whether the message even needs to have the flag removed. Were also not handling remove requests that result in a message having no tags.

If this is going supposed to be a replace operation, we truncate all of the message tags so we can insert the replacements below.

TODO: This is ugly. Were rebuilding the tags array from the database on each iteration because its easier than trying to figure out which slot needs to be removed.

TODO: If the update is triggered before the tagged flag is added to the database the refresh might not pull the data for who recently got tagged! We need to need to look for this type of sequence bug elsewhere too.

LOW: Were holding onto the user lock while were waiting on the response to be sent over the wire; and this function could probably use a rethink.

Definition at line 1599 of file endpoint.c.

5.455.3.43 void portal_endpoint_messages_tags (connection_t ∗ *con*)

Get all of the message tags used by a specified user in response to a "messages.tags" json-rpc portal request.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 1548 of file endpoint.c.

References connection_t::http, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), inx_free(), json_array_append_new_d, json_array_d, json_decref_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, json_string_d, log_error, log_pedantic, meta_data_fetch_all_tags(), portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_MESSAGES_TAGS, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.455.3.44 void portal_endpoint_response (connection_t * *con*, chr_t * *format*, ...)

Generate a json-rpc 2.0 response to a portal request.

See also:

json_vpack_ex()

Note:

This function indents the json response if specified in the configuration, and also automatically decreases the reference count of any json object that was packed for the reply.

Parameters:

con a pointer to the connection object across which the portal response will be sent.

format a pointer to a format string specifying the construction of the json-rpc response.

... a variable arguments style list of parameters to be passed to the json packing function.

Returns:

This function returns no value.

Definition at line 162 of file endpoint.c.

5.455.3.45 void portal_endpoint_scrape (connection_t * *con*)

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5726 of file endpoint.c.

References JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, and portal_validate_request().

5.455.3.46 void portal_endpoint_scrape_add (connection_t * *con*)

Note:

This function is not implemented and may be removed entirely in the future.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5710 of file endpoint.c.

References JSON_RPC_2_ERROR_SERVER_METHOD_UNAVAIL, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_AD, and portal_validate_request().

5.455.3.47 void portal_endpoint_search (connection_t * *con*)

Definition at line 5688 of file endpoint.c.

References con_write_st(), connection_t::http, HTTP_ERROR_500, http_response_header(), PLACER, PORTAL_ENDPOINT_ERROR_-SEARCH, st_aprint(), st_free(), and st_length_get().

5.455.3.48 void portal_endpoint_sort (void)

Sort the web portal JSON command table to be ready for binary searches. TODO: We use session locks to synchronize access to the user context. Should we also be using mailbox cluster locks? Cluster level locking might be appropriate for operations that delete data likes folders.remove and messages.remove.

Returns:

This function returns no value.

Definition at line 21 of file endpoint.c.

References portal_endpoint_compare(), and portal_methods.

Referenced by protocol_init().

5.455.3.49 void portal_folder_contacts_add (connection_t * *con*, stringer_t * *name*, uint64_t *parent*)

folders.c folders.c

Note:

If parent is 0, then the new folder is assumed to be a root folder. This function returns no value, but returns the appropriate portal json-rpc response directly.

Parameters:

con a pointer to the connection object across which the add folder response will be sent.

name a managed string containing the name of the new folder.

parent the numerical id of the folder that will be the parent of the new folder (or 0 to specify a root folder).

Returns:

This function returns no value.

Definition at line 82 of file folders.c.

References contact_folder_create(), connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, magma_folder_find_name(), magma_folder_find_number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_-ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), sess_serial_check(), and st_cleanup.

Referenced by portal_endpoint_folders_add().

5.455.3.50 void portal_folder_contacts_remove (connection_t * *con*, uint64_t *foldernum*)

Remove a user's contacts folder.

Parameters:

con a pointer to the connection object across which the remove folder response will be sent.

foldernum the numerical id of the contacts folder that will be removed.

Returns:

This function returns no value.

Definition at line 201 of file folders.c.

References contact_folder_remove(), connection_t::http, JSON_RPC_2_ERROR_SERVER_INTERNAL, magma_folder_find_-number(), meta_user_unlock(), meta_user_wlock(), OBJECT_CONTACTS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_-CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_FOLDERS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), and sess_serial_check().

Referenced by portal_endpoint_folders_remove().

5.455.3.51 void portal_folder_mail_add (connection_t * *con*, stringer_t * *name*, uint64_t *parent*)

Add a new mail folder for a user.

Note:

If parent is 0, then the new folder is assumed to be a root folder. This function returns no value, but returns the appropriate portal json-rpc response directly.

Parameters:

con a pointer to the connection object across which the add folder response will be sent.

name a managed string containing the name of the new folder.

parent the numerical id of the folder that will be the parent of the new folder (or 0 to specify a root folder).

Returns:

This function returns no value.

Definition at line 20 of file folders.c.

References meta_folder_t::foldernum, connection_t::http, imap_folder_create(), JSON_RPC_2_ERROR_SERVER_INTERNAL, meta_-folders_by_name(), meta_folders_by_number(), meta_folders_name(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_FOLDERS_ADD, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_-endpoint_response(), sess_serial_check(), st_cleanup, and st_merge.

Referenced by portal_endpoint_folders_add().

5.455.3.52 void portal_folder_mail_remove (connection_t * *con*, uint64_t *foldernum*)

Remove a user's mail folder.

Parameters:

con a pointer to the connection object across which the remove folder response will be sent.

foldernum the numerical id of the mail folder that will be removed.

Returns:

This function returns no value.

Definition at line 148 of file folders.c.

References connection_t::http, imap_folder_remove(), JSON_RPC_2_ERROR_SERVER_INTERNAL, meta_folders_by_number(), meta_folders_name(), meta_user_unlock(), meta_user_wlock(), OBJECT_FOLDERS, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_CONSTRAINT_VIOLATION, PORTAL_ENDPOINT_ERROR_FOLDERS_REMOVE, PORTAL_ENDPOINT_ERROR_REFERENCE, portal_endpoint_response(), sess_serial_check(), and st_cleanup.

5.455.3.63 void portal_meta (connection_t * *con*)

Return information for a portal "meta" json-rpc request.

Note:

This function returns various pieces of information about the user such as their plan type, quota, etc.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5793 of file endpoint.c.

References con_addr_presentation(), connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, MAGMA_PORTAL_VERSION, MANAGEDBUF, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_META, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.455.3.64 bool_t portal_outbound_checks (uint64_t *usernum*, stringer_t * *username*, stringer_t * *verification*, stringer_t * *from*, size_t *num_recipients*, stringer_t * *body_plain*, stringer_t * *body_html*, chr_t ** *errmsg*)

mail.c mail.c

See also:

smtp_data_outbound()

Note:

The checks include: Pattern matching for junk mail, authorization for the user to use the email address or domain specified in the From address, and finally, a virus check.

Parameters:

cred a credential structure obtained for the authenticated user's session.

usernum the numerical id of the user attempting to send the message.

from a managed string containing the email address specified as the From address.

nrecipients the number of recipients that will receive the sent message.

body_plain a managed string containing the plain text body of the message.

body_html a managed string containing the html body of the message.

errmsg the address of a pointer to a null-terminated string that will be set to a descriptive error message on failure.

Returns:

true if all security checks were passed or false otherwise.

Definition at line 24 of file mail.c.

References pattern_check(), smtp_check_authorized_from(), smtp_check_transmit_quota(), smtp_fetch_authorization(), and virus_check().

Referenced by portal_endpoint_messages_send().

5.455.3.65 int_t portal_parse_action (stringer_t * *action*)

Note:

This function is currently not called anywhere in the code and may be subject to removal.

Definition at line 121 of file parse.c.

References PLACER, PORTAL_ENDPOINT_ACTION_ADD, PORTAL_ENDPOINT_ACTION_INVALID, PORTAL_ENDPOINT_ACTION_LIST, PORTAL_ENDPOINT_ACTION_REMOVE, PORTAL_ENDPOINT_ACTION_REPLACE, and st_cmp_ci_eq().

5.455.3.66 int_t portal_parse_context (stringer_t * *context*)

Parse the context of a requested folder.

Note:

If no context is specified, the "mail" context is assumed (PORTAL_ENDPOINT_CONTEXT_MAIL).

Parameters:

context a managed string containing the context (supported values are "mail", "contacts", "settings", and "help").

Returns:

PORTAL_ENDPOINT_CONTEXT_INVALID on failure, or the flag of the determined context on success.

Definition at line 90 of file parse.c.

References PLACER, PORTAL_ENDPOINT_CONTEXT_CONTACTS, PORTAL_ENDPOINT_CONTEXT_HELP, PORTAL_-ENDPOINT_CONTEXT_INVALID, PORTAL_ENDPOINT_CONTEXT_MAIL, PORTAL_ENDPOINT_CONTEXT_SETTINGS, and st_cmp_ci_eq().

5.455.3.67 int_t portal_parse_flags (json_t * *array*, uint32_t * *flags*)

Definition at line 46 of file flags.c.

References count, json_array_get_d, json_array_size_d, json_string_value_d, MAIL_MARK_BLACKHOLED, MAIL_MARK_-INFECTED, MAIL_MARK_JUNK, MAIL_MARK_PHISHING, MAIL_MARK_SPOOFED, MAIL_STATUS_ANSWERED, MAIL_-STATUS_APPENDED, MAIL_STATUS_DELETED, MAIL_STATUS_DRAFT, MAIL_STATUS_FLAGGED, MAIL_STATUS_RECENT, MAIL_STATUS_SEEN, NULLER, PLACER, and st_cmp_ci_eq().

Referenced by portal_endpoint_messages_flag().

5.455.3.68 inx_t* portal_parse_json_str_array (json_t * *json*, size_t * *nout*)

parse.c parse.c

Parameters:

json a json object containing an array of strings.

nout if not NULL, an optional pointer to a size_t to receive the item count of the json string array.

Returns:

NULL on failure, or a pointer to an inx holder containing the specified json array contents as a collection of managed strings.

Definition at line 16 of file parse.c.

References count, inx_alloc(), inx_free(), inx_insert(), json_array_get_d, json_array_size_d, json_string_value_d, log_error, log_pedantic, M_INX_LINKED, M_TYPE_UINT64, ns_length_get(), st_free(), st_import(), multi_t::u64, and multi_t::val.

Referenced by portal_endpoint_messages_send().

5.455.3.69 int_t portal_parse_sections (json_t * *array*, uint32_t * *sections*)

Parse the json-rpc messages.load parameter "section" from an array of strings into a bitmask of section flags.

Parameters:

array a pointer to the json object representing the "section" string array of the json request message.

sections a pointer to an unsigned 32 bit integer that will receive the translated section flags on success.

Returns:

< 0 on error (-3 for an internal server error, -2 if an unknown flag was received, or -1 on syntax error), 0 for an empty sections array, or 1 on success.

Definition at line 157 of file parse.c.

References count, json_array_get_d, json_array_size_d, json_string_value_d, NULLER, PLACER, PORTAL_ENDPOINT_MESSAGE_-ATTACHMENTS, PORTAL_ENDPOINT_MESSAGE_BODY, PORTAL_ENDPOINT_MESSAGE_HEADER, PORTAL_ENDPOINT_-MESSAGE_INFO, PORTAL_ENDPOINT_MESSAGE_META, PORTAL_ENDPOINT_MESSAGE_SECURITY, PORTAL_ENDPOINT_-MESSAGE_SERVER, PORTAL_ENDPOINT_MESSAGE_SOURCE, and st_cmp_ci_eq().

5.455.3.70 void portal_print_login (connection_t * *con*, chr_t * *message*)

portal.c portal.c

Note:

The portal login page can be found in 'portal/login.template'

Parameters:

con a pointer to the connection object of the client requesting the portal login page.

message a pointer to a null-terminated string that will be displayed to the user in the login page as the contents of the node with the id of "message" in the portal login template.

Returns:

This function returns no value.

Definition at line 18 of file portal.c.

References con_write_st(), http_page_t::content, http_page_t::doc_obj, http_page_free(), http_page_get(), http_print_500(), http_response_-header(), st_free(), st_length_get(), http_content_t::type, xml_dump_doc(), xml_node_set_content(), xml_xpath_eval(), and http_page_-t::xpath_ctx.

Referenced by portal_process().

5.455.3.71 void portal_process (connection_t * *con*)

Process a connection to the web portal.

Note:

If magma.web.portal.safeguard is set, the user will be redirected to a secure login.

Parameters:

con a pointer to the connection of the http client requesting the portal.

Returns:

This function returns no value.

Definition at line 57 of file portal.c.

References con_localhost(), con_secure(), http_parse_context(), http_print_301(), magma, PLACER, magma_t::portal, portal_print_login(), and magma_t::web.

Referenced by http_response().

5.455.3.72 void portal_settings_identity (connection_t ∗ *con*)

Return information for a portal "settings.identity" json-rpc request.

Note:

This function returns the full name, first name, last name, and website of the requested user.

Parameters:

con a pointer to the connection object across which the json-rpc response will be sent.

Returns:

This function returns no value.

Definition at line 5760 of file endpoint.c.

References connection_t::http, json_object_d, json_pack_ex_d, JSON_RPC_2_ERROR_SERVER_INTERNAL, log_pedantic, portal_endpoint_error(), PORTAL_ENDPOINT_ERROR_SETTINGS_IDENTITY, portal_endpoint_response(), portal_validate_request(), and st_char_get().

5.455.3.73 stringer_t∗ portal_smtp_create_data (inx_t ∗ *attachments*, stringer_t ∗ *from*, inx_t ∗ *to*, inx_t ∗ *cc*, inx_t ∗ *bcc*, stringer_t ∗ *subject*, stringer_t ∗ *body_plain*, stringer_t ∗ *body_html*)

Create the data of an outbound smtp message that will be specified with the smtp DATA command.

Parameters:

attachments an optional inx holder containing a list of attachments to be included in the message.

from a managed string containing the email address sending the message.

to an inx holder containing a list of To: email recipients as managed strings.

cc an inx holder containing a list of 0 or more CC: recipients as managed strings.

bcc an inx holder containing a list of 0 or more BCC: recipients as managed strings.

subject a managed string containing the subject of the message.

body_plain an optional managed string containing the plain text body of the message.

body_html an optional managed string containing the html-formatted body of the message.

Returns:

NULL on failure or a managed string containing the packaged outbound smtp message data on success.

Definition at line 177 of file mail.c.

References ar_append(), ar_free(), ar_length_get(), ARRAY_TYPE_POINTER, attachment_t::filedata, attachment_t::filename, inx_cursor_alloc(), inx_cursor_free(), inx_cursor_reset(), inx_cursor_t, inx_cursor_value_next(), log_pedantic, mail_mime_encode_part(), mail_mime_generate_boundary(), mail_mime_get_smtp_envelope(), st_free(), and st_merge.

Referenced by portal_endpoint_messages_send().

5.455.3.74 stringer_t* portal_smtp_merge_headers (inx_t * *headers*, stringer_t * *leading*, stringer_t * *trailing*)

Merge a list of smtp message headers into a single string, preceded by the leading text and followed by the trailing text.

Parameters:

headers an inx holder containing a collection of header string data to be merged together.
leading a managed string containing text that will lead each header line.
trailing a managed string containing text that will trail each header line.

Returns:

NULL on failure or a managed string containing the merged headers on success.

Definition at line 301 of file mail.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_alloc(), st_cleanup, and st_merge.

5.455.3.75 bool_t portal_smtp_relay_message (stringer_t * *from*, inx_t * *to*, stringer_t * *data*, size_t *send_size*, chr_t ** *errmsg*)

Send (relay) a message composed by a user via a portal session.

See also:

smtp_relay_message() - a lot of logic borrowed from here.

Parameters:

from a pointer to a managed string containing the email address specified as the From address.
to a pointer to a managed string containing the destination email address of the message.
data a pointer to a managed string containing the raw data of the mail message.
send_size if greater than 0, specify the optional SIZE parameter to the MAIL FROM command.
errmsg the address of a pointer to a null-terminated string that will be set to a descriptive error message on failure.

Returns:

true if the mail message was sent successfully, or false otherwise.

Definition at line 86 of file mail.c.

References inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), smtp_client_close(), smtp_client_connect(), smtp_client_send_data(), smtp_client_send_helo(), smtp_client_send_mailfrom(), and smtp_client_send_rcptto().

Referenced by portal_endpoint_messages_send().

5.455.3.76 void portal_upload (connection_t * *con*)

Process uploaded attachments for messages composed in conjunction with the portal interface.

Definition at line 6033 of file endpoint.c.

References con_localhost(), con_secure(), data, attachment_t::filedata, get_header_opt(), connection_t::http, http_data_free(), http_data_header_parse_line(), HTTP_ERROR_401, HTTP_ERROR_403, HTTP_ERROR_404, HTTP_ERROR_405, HTTP_ERROR_500, HTTP_MERGED, HTTP_METHOD_POST, http_parse_context(), HTTP_PORTAL, http_print_301(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), log_error, log_pedantic, magma, multipart_get_boundary(), http_data_t::name, NULLER, pl_char_get(), pl_empty(), pl_length_get(), pl_shrink_before_characters(), pl_skip_characters(), pl_skip_to_characters(), PLACER, placer_t, magma_t::portal, portal_get_upload_attachment(), st_char_get(), st_cmp_ci_eq(), st_import(), st_length_get(), str_tok_get_bl(), str_tok_get_count_bl(), http_data_t::value, and magma_t::web.

```

Functions

- stringer_t ∗ register_captcha_random_font (void)

  LOW: We shouldn't have to actually scan the fonts directory to find a valid file. Instead we could cache a list of valid fonts and then pick from it randomly.

- void register_captcha_write_noise (gdImagePtr image, int_t x, int_t y)

  Fill an image's background partially with pixelated noise to make it more difficult to read.

- stringer_t ∗ register_captcha_generate (stringer_t ∗value)

  Generate a captcha image for a specified character string.

5.456.1 Function Documentation

5.456.1.1 stringer_t∗ register_captcha_generate (stringer_t ∗ *value*)

Generate a captcha image for a specified character string. captcha.c

Parameters:

value a managed string containing the text that is to become the basis of the captcha challenge.

Returns:

NULL on failure, or a managed string containing the path to the image file containing the captcha graphic on success.

Definition at line 106 of file captcha.c.

References gdFree_d, gdImageColorResolve_d, gdImageCreate_d, gdImageDestroy_d, gdImageGifPtr_d, gdImageStringFT_d, log_pedantic, mm_wipe(), rand_get_uint32(), register_captcha_random_font(), register_captcha_write_noise(), st_char_get(), st_import(), and st_length_get().

Referenced by register_print_captcha().

5.456.1.2 stringer_t∗ register_captcha_random_font (void)

LOW: We shouldn't have to actually scan the fonts directory to find a valid file. Instead we could cache a list of valid fonts and then pick from it randomly. Select a random truetype font from the directory specified in magma.http.fonts.

Returns:

NULL on failure, or a managed string containing the pathname of the randomly selected font file on success.

Definition at line 15 of file captcha.c.

References count, magma_t::http, log_pedantic, magma, NULLER, PLACER, rand_get_uint32(), st_aprint(), and st_cmp_ci_ends().

Referenced by register_captcha_generate().

5.456.1.3 void register_captcha_write_noise (gdImagePtr *image*, int_t *x*, int_t *y*)

Fill an image's background partially with pixelated noise to make it more difficult to read.

Parameters:

image a pointer to the gd image to be modified.

x the height, in pixels, of the image region to be filled.

y the width, in pixels, of the image region to be filled.

Returns:

This function returns no value.

Definition at line 77 of file captcha.c.

References gdImageColorResolve_d, gdImageSetPixel_d, and rand_get_uint32().

Referenced by register_captcha_generate().

```
#include "magma.h"
```

Functions

- void register_print_message (connection_t *con, chr_t *message)
  Display a custom message to the remote client using the register/message template.
- void register_print_captcha (connection_t *con, register_session_t *reg)
  Print out a captcha challenge for a specified registration process.
- void register_print_step1 (connection_t *con, register_session_t *reg, chr_t *message)
  Display step 1 of the registration process (collect username, password, and captcha challenge).
- void register_print_step2 (connection_t *con, register_session_t *reg, chr_t *message)
  Display step 2 of the registration process.
- void register_print_step3 (connection_t *con)
  Display the registration step 3 template for a connection that has successfully created a new user.
- void register_process (connection_t *con)
  Process a user registration request (/register).

5.457.1 Function Documentation

5.457.1.1 void register_print_captcha (connection_t * *con*, register_session_t * *reg*)

Print out a captcha challenge for a specified registration process. register.c

Parameters:

con the underlying client connection.

reg the pending registration session of the remote client.

Returns:

This function returns no value.

Definition at line 46 of file register.c.

References con_print(), con_write_st(), http_print_500(), register_session_t::hvf_value, log_info, rand_choices(), register_captcha_generate(), st_char_get(), st_free(), and st_length_get().

Referenced by register_process().

5.457.1.2 void register_print_message (connection_t * *con*, chr_t * *message*)

Display a custom message to the remote client using the register/message template.

Parameters:

con the client connection to receive the message.

message a pointer to a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 17 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500(), http_response_header(), NULLER, PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), and http_content_t::type.

Referenced by register_abuse_checks().

5.457.1.3 void register_print_step1 (connection_t * *con*, register_session_t * *reg*, chr_t * *message*)

Display step 1 of the registration process (collect username, password, and captcha challenge).

Parameters:

con a pointer to the connection object of the remote client making the registration request.

reg a pointer to the pending registration session of the remote client.

message if not NULL, an optional error message to be displayed inside the registration step 1 template.

Returns:

This function returns no value.

Definition at line 78 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500_log(), http_response_header(), register_session_t::name, ns_length_get(), PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), http_content_t::type, and register_session_t::username.

Referenced by register_process().

5.457.1.4 void register_print_step2 (connection_t * *con*, register_session_t * *reg*, chr_t * *message*)

Display step 2 of the registration process.

Note:

Previously, this step used to obtain information like the desired user plan and billing info. At the moment, however, this step effectively does nothing but display a page to be clicked-through.

Parameters:

con a pointer to the connection object of the remote client making the registration request.

reg a pointer to the pending registration session of the remote client.

message if not NULL, an optional error message to be displayed inside the registration step 2 template.

Returns:

This function returns no value.

Definition at line 125 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500_log(), http_response_header(), register_session_t::name, ns_length_get(), PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), and http_content_t::type.

Referenced by register_process().

5.457.1.5 void register_print_step3 (connection_t * *con*)

Display the registration step 3 template for a connection that has successfully created a new user.

Parameters:

the remote connection making the registration request.

Returns:

This function returns no value.

Definition at line 164 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500(), http_response_header(), http_content_t::resource, st_dupe(), st_free(), st_length_get(), and http_content_t::type.

Referenced by register_process().

5.457.1.6 void register_process (connection_t * *con*)

Process a user registration request (/register).

Note:

All requests will be redirected to a secure location. All new registration requests will also need to pass a test to ensure that they haven't been the product of abusive behavior. If an existing registration session can't be located, a new one will be generated. Depending on the user supplied http POST data, one of the three registration steps will be shown, or a captcha challenge will be presented to the user.

Returns:

This function returns no value.

Definition at line 190 of file register.c.

References con_secure(), connection_t::http, HTTP_COMPLETE, HTTP_DATA_GET, http_data_get(), HTTP_DATA_POST, HTTP_ERROR_500, http_print_301(), log_pedantic, register_abuse_checks(), register_business_step1(), register_business_step2(), register_print_captcha(), register_print_step1(), register_print_step2(), register_print_step3(), register_session_cache(), register_session_free(), register_session_generate(), register_session_get(), register_session_t::usernum, and http_data_t::value.

Referenced by http_response().

5.458.2 Function Documentation

5.458.2.1 bool_t register_abuse_check_blocklist (connection_t * *con*)

abuse.c abuse.c

Parameters:

con the client connection to be checked.

Returns:

false if the check was passed, or true if the connection was made from an IP on the blocklist.

Definition at line 58 of file abuse.c.

References con_addr_standard(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), MANAGEDBUF, register_-blocklist_lock, rwlock_lock_read(), rwlock_unlock(), st_char_get(), st_cmp_ci_starts(), st_length_get(), and stats_increment_by_name().

Referenced by register_abuse_checks().

5.458.2.2 bool_t register_abuse_checks (connection_t * *con*)

Check to see if a registration request is allowed by a remote host; if not, display a banner.

Parameters:

con the remote connection to be checked.

Returns:

false if registration is allowed or true if not (remote host is on blocklist or registration has beean throttled).

Definition at line 112 of file abuse.c.

References cache_get_u64(), con_addr_presentation(), con_addr_standard(), MANAGEDBUF, NULLER, register_abuse_check_blocklist(), register_print_message(), and st_char_get().

Referenced by register_process().

5.458.2.3 void register_abuse_increment_history (connection_t * *con*)

Increment the registration abuse counter for the requesting IP address.

Parameters:

con a pointer to the connection object of the client making the registration request.

Returns:

This function returns nov alue.

Definition at line 95 of file abuse.c.

References cache_increment(), con_addr_standard(), MANAGEDBUF, NULLER, and st_char_get().

Referenced by api_endpoint_register(), and register_business_step2().

5.458.2.4 void register_blocklist_free (void)

Free a registration blocked list.

Returns:

This function returns no value.

Definition at line 18 of file abuse.c.

References inx_free().

5.458.2.5 void register_blocklist_update (void)

Update the registration blocklist from the database.

Returns:

This function returns no value.

Definition at line 32 of file abuse.c.

References inx_free(), register_blocklist_lock, register_data_fetch_blocklist(), rwlock_lock_write(), and rwlock_unlock().

5.458.2.6 chr_t* register_business_step1 (connection_t * *con*, register_session_t * *reg*)

business.c business.c

Note:

Checks include captcha verification, username validation, and password reentry verification and validation.

Parameters:

con the underlying client connection.

reg the underlying registration session.

Returns:

NULL on success, or a descriptive error string on failure.

Definition at line 106 of file business.c.

References data, http_data_get(), HTTP_DATA_POST, register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, lower_-st(), register_session_t::password, register_business_validate_password(), register_business_validate_username(), register_data_check_-username(), REGISTER_PASSWORD_MAX_LENGTH, REGISTER_PASSWORD_MIN_LENGTH, st_char_get(), st_cmp_ci_eq(), st_-dupe(), st_length_int(), register_session_t::username, and http_data_t::value.

Referenced by register_process().

5.458.2.7 chr_t* register_business_step2 (connection_t * *con*, register_session_t * *reg*)

Perform verification checking on all step 2 completed user fields, and display a welcome banner on success.

Note:

Checks include plan type validation, and billing information processing. After step 2, the user's supplied information will be persisted into the database.

Parameters:

con the underlying client connection.

reg the underlying registration session.

Returns:

NULL on success, or a descriptive error string on failure.

Definition at line 174 of file business.c.

References magma_t::admin, magma_t::contact, data, magma_t::domain, http_data_get(), HTTP_DATA_POST, log_pedantic, magma, register_session_t::password, PLACER, register_session_t::plan, register_abuse_increment_history(), register_data_insert_user(), smtp_send_message(), st_cleanup, st_cmp_cs_eq(), st_dupe(), st_merge, magma_t::system, tran_commit(), tran_rollback(), tran_start(), register_session_t::username, register_session_t::usernum, and http_data_t::value.

Referenced by register_process().

5.458.2.8 bool_t register_business_validate_password (stringer_t * *password*)

Determine whether a registered password is valid.

Note:

Each password must be between REGISTER_PASSWORD_MIN_LENGTH (5) and REGISTER_PASSWORD_MAX_LENGTH (200) characters long.

Parameters:

password the user's password to be evaluated.

Returns:

false on failure (too long, too short, or bad characters) or true on success.

Definition at line 16 of file business.c.

References length, REGISTER_PASSWORD_MAX_LENGTH, st_char_get(), and st_length_get().

Referenced by register_business_step1().

5.458.2.9 int_t register_business_validate_username (stringer_t * *username*)

Determine whether a registered username is valid.

Parameters:

username a managed string containing the proposed username to be evaluated.

Returns:

-1 or 0 on failure (too long, too short, or bad characters) or 1 on success.

Definition at line 48 of file business.c.

References length, REGISTER_USERNAME_MAX_LENGTH, st_char_get(), and st_length_get().

Referenced by register_business_step1().

5.458.2.10 stringer_t∗ register_captcha_generate (stringer_t ∗ *value*)

captcha.c captcha.c

Parameters:

value a managed string containing the text that is to become the basis of the captcha challenge.

Returns:

NULL on failure, or a managed string containing the path to the image file containing the captcha graphic on success.

Definition at line 106 of file captcha.c.

References gdFree_d, gdImageColorResolve_d, gdImageCreate_d, gdImageDestroy_d, gdImageGifPtr_d, gdImageStringFT_d, log_pedantic, mm_wipe(), rand_get_uint32(), register_captcha_random_font(), register_captcha_write_noise(), st_char_get(), st_import(), and st_length_get().

Referenced by register_print_captcha().

5.458.2.11 stringer_t∗ register_captcha_random_font (void)

LOW: We shouldn't have to actually scan the fonts directory to find a valid file. Instead we could cache a list of valid fonts and then pick from it randomly. Select a random truetype font from the directory specified in magma.http.fonts.

Returns:

NULL on failure, or a managed string containing the pathname of the randomly selected font file on success.

Definition at line 15 of file captcha.c.

References count, magma_t::http, log_pedantic, magma, NULLER, PLACER, rand_get_uint32(), st_aprint(), and st_cmp_ci_ends().

Referenced by register_captcha_generate().

5.458.2.12 void register_captcha_write_noise (gdImagePtr *image*, int_t *x*, int_t *y*)

Fill an image's background partially with pixelated noise to make it more difficult to read.

Parameters:

image a pointer to the gd image to be modified.

x the height, in pixels, of the image region to be filled.

y the width, in pixels, of the image region to be filled.

Returns:

This function returns no value.

Definition at line 77 of file captcha.c.

References gdImageColorResolve_d, gdImageSetPixel_d, and rand_get_uint32().

Referenced by register_captcha_generate().

5.458.2.13 bool_t register_data_check_username (stringer_t * *username*)

datatier.c datatier.c

Parameters:

username the username to be checked against the database.

Returns:

true if the username is taken or false if it is not.

Definition at line 67 of file datatier.c.

References mm_wipe(), res_row_next(), res_table_free(), st_char_get(), st_length_get(), and stmt_get_result().

Referenced by register_business_step1().

5.458.2.14 inx_t* register_data_fetch_blocklist (void)

Fetch the blocklist for new user registration from the database. HIGH: The prepared statements being used aren't valid. The queries need to be copied over and created. register_fetch_blocklist still needs to be defined.

Returns:

an inx holder containing the registration blocklist as a collection of managed strings.

Definition at line 18 of file datatier.c.

References inx_alloc(), inx_free(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_UINT64, res_field_string(), res_row_next(), res_table_free(), st_free(), stmt_get_result(), multi_t::u64, and multi_t::val.

Referenced by register_blocklist_update().

5.458.2.15 bool_t register_data_insert_user (connection_t * *con*, uint16_t *plan*, stringer_t * *username*, stringer_t * *password*, int64_t *transaction*, uint64_t * *outuser*)

Insert a newly registered user into the database using information gathered by registration step #2.

Note:

The following steps occur: 1. Insert a new user into the Users table, supplying username, hashed password, plan info, and quota. 2. Insert a random shard value into the User_Realms table. 3. Insert a blank entry into the Profile table for the user. 4. Insert an entry into the Folders table for the user's "Inbox" folder. 5. Insert a new entry into the Log table containing the usernum and IP address of the client request. 6. Insert a new entry into the Dispatch table for the user, configuring the spam folder, inbox, send/receive/daily send/daily receive limits, etc. 7. Insert a new entry into the Mailboxes table for the user.

Parameters:

con a pointer to the connection object of the client making the registration request.

reg the current registration session of the user to be added.

transaction a mysql transaction id for all database operations, since they all need to be committed atomically or rolled back.

outuser a pointer to a numerical id to receive the newly generated and inserted user id.

Returns:

true if the new user account was successfully created, or false on failure.

LOW: This function should be passed a number of days (or years) to use for any of the pre-paid account plans. LOW: The IP address could be passed in as an ip_t or as a string to avoid the need for the entire connection object.

Definition at line 114 of file datatier.c.

References auth_stacie(), auth_stacie_cleanup(), base64_encode_mod(), con_addr_presentation(), magma_t::domain, auth_stacie_t::keys, log_pedantic, magma, MANAGEDBUF, auth_stacie_t::master, meta_crypto_keys_create(), mm_wipe(), ns_length_get(), PLACER, st_char_get(), st_cleanup, st_data_get(), st_length_get(), st_length_int(), st_merge, stacie_create_salt(), stacie_create_shard(), stacie_realm_key(), stmt_exec_conn(), stmt_insert_conn(), magma_t::system, auth_stacie_t::tokens, and auth_stacie_t::verification.

Referenced by api_endpoint_register(), and register_business_step2().

5.458.2.16 void register_print_captcha (connection_t * *con*, register_session_t * *reg*)

register.c register.c

Parameters:

con the underlying client connection.

reg the pending registration session of the remote client.

Returns:

This function returns no value.

Definition at line 46 of file register.c.

References con_print(), con_write_st(), http_print_500(), register_session_t::hvf_value, log_info, rand_choices(), register_captcha_generate(), st_char_get(), st_free(), and st_length_get().

Referenced by register_process().

5.458.2.17 void register_print_message (connection_t * *con*, chr_t * *message*)

Display a custom message to the remote client using the register/message template.

Parameters:

con the client connection to receive the message.

message a pointer to a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 17 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500(), http_response_header(), NULLER, PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), and http_content_t::type.

Referenced by register_abuse_checks().

5.458.2.18 void register_print_step1 (connection_t * *con*, register_session_t * *reg*, chr_t * *message*)

Display step 1 of the registration process (collect username, password, and captcha challenge).

Parameters:

con a pointer to the connection object of the remote client making the registration request.

reg a pointer to the pending registration session of the remote client.

message if not NULL, an optional error message to be displayed inside the registration step 1 template.

Returns:

This function returns no value.

Definition at line 78 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500_log(), http_response_header(), register_session_t::name, ns_length_get(), PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), http_content_t::type, and register_session_t::username.

Referenced by register_process().

5.458.2.19 void register_print_step2 (connection_t ∗ *con*, register_session_t ∗ *reg*, chr_t ∗ *message*)

Display step 2 of the registration process.

Note:

Previously, this step used to obtain information like the desired user plan and billing info. At the moment, however, this step effectively does nothing but display a page to be clicked-through.

Parameters:

con a pointer to the connection object of the remote client making the registration request.

reg a pointer to the pending registration session of the remote client.

message if not NULL, an optional error message to be displayed inside the registration step 2 template.

Returns:

This function returns no value.

Definition at line 125 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500_log(), http_response_header(), register_session_t::name, ns_length_get(), PLACER, http_content_t::resource, st_dupe(), st_free(), st_length_get(), st_replace(), and http_content_t::type.

Referenced by register_process().

5.458.2.20 void register_print_step3 (connection_t ∗ *con*)

Display the registration step 3 template for a connection that has successfully created a new user.

Parameters:

the remote connection making the registration request.

Returns:

This function returns no value.

Definition at line 164 of file register.c.

References con_write_st(), content, http_get_template(), http_print_500(), http_response_header(), http_content_t::resource, st_dupe(), st_free(), st_length_get(), and http_content_t::type.

Referenced by register_process().

5.458.2.21 void register_process (connection_t * *con*)

Process a user registration request (/register).

Note:

All requests will be redirected to a secure location. All new registration requests will also need to pass a test to ensure that they haven't been the product of abusive behavior. If an existing registration session can't be located, a new one will be generated. Depending on the user supplied http POST data, one of the three registration steps will be shown, or a captcha challenge will be presented to the user.

Returns:

This function returns no value.

Definition at line 190 of file register.c.

References con_secure(), connection_t::http, HTTP_COMPLETE, HTTP_DATA_GET, http_data_get(), HTTP_DATA_POST, HTTP_-ERROR_500, http_print_301(), log_pedantic, register_abuse_checks(), register_business_step1(), register_business_step2(), register_print_-captcha(), register_print_step1(), register_print_step2(), register_print_step3(), register_session_cache(), register_session_free(), register_-session_generate(), register_session_get(), register_session_t::usernum, and http_data_t::value.

Referenced by http_response().

5.458.2.22 bool_t register_session_cache (connection_t * *con*, register_session_t * *session*)

sessions.c sessions.c

Note:

The session is stored under the parent key "lavad.register.session."

Parameters:

con a pointer to the client connection underlying the user session.

session a pointer to the registration session to be persisted.

Returns:

false on failure or true if the session was cached successfully.

Definition at line 105 of file sessions.c.

References cache_set(), con_addr_presentation(), data, register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, MAN-AGEDBUF, register_session_t::name, NULLER, register_session_t::password, register_session_t::plan, serialize_st(), serialize_uint16(), serialize_uint64(), st_char_get(), st_cleanup, st_free(), st_length_int(), register_session_t::username, and register_session_t::usernum.

Referenced by register_process().

5.458.2.23 void register_session_free (register_session_t * *session*)

Destroy a registration session and all its associated data.

Returns:

This function returns no value.

Definition at line 14 of file sessions.c.

References register_session_t::hvf_input, register_session_t::hvf_value, mm_free(), register_session_t::name, register_session_t::password, st_cleanup, and register_session_t::username.

Referenced by register_process(), register_session_generate(), and register_session_get().

5.458.2.24 register_session_t* register_session_generate (void)

Generate a new registration session.

Returns:

NULL on failure, or a pointer to a new randomly named session on success.

Definition at line 35 of file sessions.c.

References log_pedantic, mm_alloc(), register_session_t::name, rand_choices(), and register_session_free().

Referenced by register_process().

5.458.2.25 register_session_t* register_session_get (connection_t * *con*, stringer_t * *name*)

Retrieve a registration session by a data key supplied in the user's http POST request.

Note:

The session is stored under the parent key "lavad.register.session."

Parameters:

con the client connection underlying the user request.

name a managed string containing the registration session identifier.

Returns:

NULL on failure, or a pointer to the user's registration session on success.

Definition at line 59 of file sessions.c.

References cache_get(), con_addr_presentation(), serialization_t::data, data, deserialize_st(), deserialize_uint16(), deserialize_uint64(), register_session_t::hvf_input, register_session_t::hvf_value, log_pedantic, MANAGEDBUF, mm_alloc(), mm_wipe(), register_session_t::name, NULLER, register_session_t::password, register_session_t::plan, register_session_free(), st_char_get(), st_dupe(), st_free(), st_length_int(), register_session_t::username, and register_session_t::usernum.

Functions

- void teacher_print_message (connection_t ∗con, chr_t ∗message)
  Display a custom message to the remote client using the teacher/message template.
- void teacher_print_form (connection_t ∗con, http_page_t ∗page, teacher_data_t ∗teach)
  Display a custom message to the remote client using the teacher/message template.
- http_page_t ∗ teacher_add_error (chr_t ∗xpath, chr_t ∗id, chr_t ∗message)
  Get the teacher/teacher template and add an error message to it.
- void teacher_add_cookie (connection_t ∗con, teacher_data_t ∗teach)
  Create a cookie for a successfully password-authenticated teacher request.
- void teacher_process (connection_t ∗con)
  The main entry point for the /teacher web application.

5.460.1 Function Documentation

5.460.1.1 void teacher_add_cookie (connection_t ∗ *con*, teacher_data_t ∗ *teach*)

Create a cookie for a successfully password-authenticated teacher request. teacher.c

Parameters:

con the connection of the web client accessing the teacher facility.

teach the spam signature associated with the cookie request; it supplies the identifying password stored in the cookie.

Returns:

This function returns no value.

Definition at line 146 of file teacher.c.

References connection_t::http, inx_alloc(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_STRINGER, ns_length_get(), teacher_-data_t::password, multi_t::st, st_char_get(), st_free(), st_import(), and multi_t::val.

Referenced by teacher_process().

5.460.1.2 http_page_t∗ teacher_add_error (chr_t ∗ *xpath*, chr_t ∗ *id*, chr_t ∗ *message*)

Get the teacher/teacher template and add an error message to it.

Parameters:

xpath a null-terminated string containing the xpath of the node in the template to be marked with the error message.

id a null-terminated string containing the id of the error message node to be added as the sibling of the node in the specified xpath.

message a null-terminated string containing the error message to be displayed to the user.

NULL on failure, or a pointer to the modified teacher/teacher template page on success.

Definition at line 107 of file teacher.c.

References http_page_get(), xml_node_add_sibling(), xml_node_free(), xml_node_new(), xml_node_set_content(), xml_node_set_property(), xml_xpath_eval(), and http_page_t::xpath_ctx.

Referenced by teacher_process().

5.460.1.3 void teacher_print_form (connection_t * *con*, http_page_t * *page*, teacher_data_t * *teach*)

Display a custom message to the remote client using the teacher/message template.

Parameters:

con the client connection to receive the message.

message a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 63 of file teacher.c.

References con_write_st(), http_page_t::content, teacher_data_t::disposition, http_page_t::doc_obj, http_page_free(), http_page_get(), http_print_500(), http_response_header(), teacher_data_t::keynum, teacher_data_t::signum, st_free(), st_length_get(), teacher_print_message(), http_content_t::type, xml_dump_doc(), xml_set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by teacher_process().

5.460.1.4 void teacher_print_message (connection_t * *con*, chr_t * *message*)

Display a custom message to the remote client using the teacher/message template.

Parameters:

con the client connection to receive the message.

message a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 16 of file teacher.c.

References con_print(), con_write_st(), http_page_t::content, http_page_t::doc_obj, connection_t::http, http_page_free(), http_page_get(), http_print_500(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_char_get(), st_free(), st_length_get(), http_content_t::type, xml_dump_doc(), xml_set_xpath_ns(), and http_page_t::xpath_ctx.

Referenced by teacher_print_form(), and teacher_process().

5.460.1.5 void teacher_process (connection_t * *con*)

The main entry point for the /teacher web application.

Note:

Each /teacher request must contain a spam signature and key specified by the user. If Magma was able to find the signature, the signature's key must match the user-specified key value. The signature must also not have been previously trained. On successful training, the signature will be freed in memory and in the database, but kept for a couple of hours in distributed cache. User password authentication is necessary for training, and this routine manages cookies for subsequent training requests.

Parameters:

con the connection object underlying the client /teacher request.

Returns:

This function returns no value.

TODO FIXME: Memory leaks here. This part isn't fixed to work with the new credentials functions, so be careful reusing this code.

Definition at line 220 of file teacher.c.

References auth_challenge(), auth_free(), teacher_data_t::completed, con_secure(), teacher_data_t::disposition, dspam_train(), connection_t::http, HTTP_COMPLETE, HTTP_DATA_ANY, http_data_get(), HTTP_DATA_HEADER, HTTP_DATA_POST, http_print_301(), teacher_data_t::keynum, teacher_data_t::password, PLACER, teacher_data_t::signature, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_cmp_cs_starts(), st_dupe(), st_length_get(), st_replace(), teacher_add_cookie(), teacher_add_error(), teacher_data_delete(), teacher_data_free(), teacher_data_get(), teacher_data_save(), teacher_print_form(), teacher_print_message(), auth_t::tokens, uint64_conv_st(), teacher_data_t::username, teacher_data_t::usernum, http_data_t::value, and auth_t::verification.

  The main entry point for the /teacher web application.

5.461.1 Function Documentation

5.461.1.1 void teacher_add_cookie (connection_t ∗ *con*, teacher_data_t ∗ *teach*)

teacher.c teacher.c

Parameters:

con the connection of the web client accessing the teacher facility.

teach the spam signature associated with the cookie request; it supplies the identifying password stored in the cookie.

Returns:

This function returns no value.

Definition at line 146 of file teacher.c.

References connection_t::http, inx_alloc(), inx_insert(), log_pedantic, M_INX_LINKED, M_TYPE_STRINGER, ns_length_get(), teacher_data_t::password, multi_t::st, st_char_get(), st_free(), st_import(), and multi_t::val.

Referenced by teacher_process().

5.461.1.2 http_page_t* teacher_add_error (chr_t * *xpath*, chr_t * *id*, chr_t * *message*)

Get the teacher/teacher template and add an error message to it.

Parameters:

xpath a null-terminated string containing the xpath of the node in the template to be marked with the error message.

id a null-terminated string containing the id of the error message node to be added as the sibling of the node in the specified xpath.

message a null-terminated string containing the error message to be displayed to the user.

NULL on failure, or a pointer to the modified teacher/teacher template page on success.

Definition at line 107 of file teacher.c.

References http_page_get(), xml_node_add_sibling(), xml_node_free(), xml_node_new(), xml_node_set_content(), xml_node_set_property(), xml_xpath_eval(), and http_page_t::xpath_ctx.

Referenced by teacher_process().

5.461.1.3 void teacher_data_delete (teacher_data_t * *teach*)

datatier.c datatier.c

HIGH: After training a signature, we should search the messages table for references to the signature being trained and update the message status flags. The UPDATE_SIGNATURE_FLAGS_ADD/UPDATE_SIGNATURE_FLAGS_REMOVE queries were created for that purpose but aren't being used right now. Note to self: retroactively brand messages as junk accordingly.

Note:

If the signature matched junk, all matching messages in the database belonging to the user will have their junk flag cleared. But if the signature didn't match junk, all matching messages in the database belonging to the user will have the junk flag added.

Parameters:

teach the spam signature to be removed from the database.

Returns:

This function returns no value.

Definition at line 38 of file datatier.c.

References teacher_data_t::completed, teacher_data_t::disposition, log_pedantic, MAIL_MARK_JUNK, mm_wipe(), teacher_data_t::password, teacher_data_t::signature, teacher_data_t::signum, st_cleanup, stmt_exec(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.461.1.4 teacher_data_t* teacher_data_fetch (uint64_t *signum*)

Fetch information about a spam signature from the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 137 of file datatier.c.

References teacher_data_t::disposition, teacher_data_t::keynum, mm_alloc(), mm_wipe(), teacher_data_t::password, res_field_int8(), res_field_string(), res_field_uint64(), res_row_next(), res_table_free(), teacher_data_t::signature, teacher_data_t::signum, stmt_get_result(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_data_get().

5.461.1.5 void teacher_data_free (teacher_data_t ∗ *teach*)

Free a spam signature object.

Parameters:

teach the spam signature object to be freed.

Returns:

This function returns no value.

Definition at line 15 of file datatier.c.

References mm_free(), teacher_data_t::password, teacher_data_t::signature, st_cleanup, and teacher_data_t::username.

Referenced by teacher_data_fetch(), teacher_data_get(), and teacher_process().

5.461.1.6 teacher_data_t∗ teacher_data_get (uint64_t *signum*)

Get information about a spam signature from the cache, or fall back to the database.

Parameters:

signum the numerical id of the spam signature to be retrieved.

NULL on failure, or a pointer to a newly allocated signature teacher object on success.

Definition at line 229 of file datatier.c.

References cache_get(), teacher_data_t::completed, serialization_t::data, data, deserialize_int32(), deserialize_st(), deserialize_uint64(), teacher_data_t::disposition, teacher_data_t::keynum, log_pedantic, mm_alloc(), mm_wipe(), teacher_data_t::password, PLACER, teacher_data_t::signature, teacher_data_t::signum, st_free(), teacher_data_fetch(), teacher_data_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.461.1.7 void teacher_data_save (teacher_data_t ∗ *teach*)

Save spam signature information to the cache.

Note:

The information will be cached for 2 hours.

Parameters:

teach the spam signature to be cached.

Returns:

This function returns no value.

Definition at line 189 of file datatier.c.

References cache_set(), teacher_data_t::completed, data, teacher_data_t::disposition, teacher_data_t::keynum, log_pedantic, teacher_data_t::password, PLACER, serialize_int32(), serialize_st(), serialize_uint64(), teacher_data_t::signature, teacher_data_t::signum, st_free(), teacher_data_t::username, and teacher_data_t::usernum.

Referenced by teacher_process().

5.461.1.8 void teacher_print_form (connection_t * *con*, http_page_t * *page*, teacher_data_t * *teach*)

Display a custom message to the remote client using the teacher/message template.

Parameters:

con the client connection to receive the message.

message a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 63 of file teacher.c.

References con_write_st(), http_page_t::content, teacher_data_t::disposition, http_page_t::doc_obj, http_page_free(), http_page_get(), http_print_500(), http_response_header(), teacher_data_t::keynum, teacher_data_t::signum, st_free(), st_length_get(), teacher_print_message(), http_content_t::type, xml_dump_doc(), xml_set_xpath_ns(), xml_set_xpath_property(), and http_page_t::xpath_ctx.

Referenced by teacher_process().

5.461.1.9 void teacher_print_message (connection_t * *con*, chr_t * *message*)

Display a custom message to the remote client using the teacher/message template.

Parameters:

con the client connection to receive the message.

message a null-terminated string containing the custom message to be displayed inside the template sent to the remote client.

Returns:

This function returns no value.

Definition at line 16 of file teacher.c.

References con_print(), con_write_st(), http_page_t::content, http_page_t::doc_obj, connection_t::http, http_page_free(), http_page_get(), http_print_500(), inx_cursor_alloc(), inx_cursor_free(), inx_cursor_t, inx_cursor_value_next(), st_char_get(), st_free(), st_length_get(), http_content_t::type, xml_dump_doc(), xml_set_xpath_ns(), and http_page_t::xpath_ctx.

Referenced by teacher_print_form(), and teacher_process().

5.461.1.10 void teacher_process (connection_t * *con*)

The main entry point for the /teacher web application.

Note:

Each /teacher request must contain a spam signature and key specified by the user. If Magma was able to find the signature, the signature's key must match the user-specified key value. The signature must also not have been previously trained. On successful training, the signature will be freed in memory and in the database, but kept for a couple of hours in distributed cache. User password authentication is necessary for training, and this routine manages cookies for subsequent training requests.

Parameters:

con the connection object underlying the client /teacher request.

Returns:

This function returns no value.

TODO FIXME: Memory leaks here. This part isn't fixed to work with the new credentials functions, so be careful reusing this code.

Definition at line 220 of file teacher.c.

References auth_challenge(), auth_free(), teacher_data_t::completed, con_secure(), teacher_data_t::disposition, dspam_train(), connection_t::http, HTTP_COMPLETE, HTTP_DATA_ANY, http_data_get(), HTTP_DATA_HEADER, HTTP_DATA_POST, http_print_301(), teacher_data_t::keynum, teacher_data_t::password, PLACER, teacher_data_t::signature, st_char_get(), st_cleanup, st_cmp_cs_eq(), st_cmp_cs_starts(), st_dupe(), st_length_get(), st_replace(), teacher_add_cookie(), teacher_add_error(), teacher_data_delete(), teacher_data_free(), teacher_data_get(), teacher_data_save(), teacher_print_form(), teacher_print_message(), auth_t::tokens, uint64_conv_st(), teacher_data_t::username, teacher_data_t::usernum, http_data_t::value, and auth_t::verification.
